UNITED STATES PATENT OFFICE.

GENNARO WUNDERLICH, OF PHILADELPHIA, PENNSYLVANIA, ASSIGNOR OF
ONE-HALF HIS RIGHT TO JOHN CRICK, OF SAME PLACE.

IMPROVEMENT IN POCKET TOILET-CASES.

Specification forming part of Letters Patent No. 147,731, dated February 17, 1874; application filed
September 26, 1873.

To all whom it may concern:

Be it known that I, GENNARO WUNDERLICH, of the city of Philadelphia, county of Philadelphia and State of Pennsylvania, have invented certain Improvements in Combined Brush, Comb, Looking-Glass, and Receptacle, of which the following is a specification:

The object of my invention is to provide for a convenient pocket-receptacle which shall hold, contain, and consist of a hair-brush, a pair of combs, and a looking-glass.

My invention consists of attaching a metallic plate to the back of a hair-brush, which, by preference, should be made in the form of an octagon, with two sides double the length of the other, although any other form may be employed as well. To one end of this plate is attached a metallic end piece, covering one end of the brush, to which are attached, by hinges, two arms of the same form and shape as the brush and back plate of the same, fitting the sides of the brush when closed and forming a convenient handle for the brush when opened and thrown back, back to back to each other. These arms are made somewhat broader than the bristles of the brush, so that a receptacle is formed, when the arms are shut, on the end of the bristles. In this receptacle is placed a looking-glass, having the same form as the back-plate of the brush, but somewhat smaller, with the glass toward the bristles and held thereto by aid of two pins, attached to the inside of the frame of the looking-glass, fitting into two eyelets fastened to the inner side of the arms, and also by aid of a double comb placed in a receiver on the back of the looking-glass frame. When it is desired to open the receptacle and use the looking-glass or the

combs, a catch attached to the end-piece holding the arms is slid down and the combs pushed toward the catch from a slot in the end of the arms, which also serves to hold the receptacle together when closed. The looking-glass is then lifted out of its place and is held for use by a folding handle, which, when closed, lies toward and over the glass.

In order to more fully describe my invention, I refer to the accompanying drawing forming a part of this specification.

Figure I is a top view of the receptacle or case, when closed, embodying my invention. Fig. II is the end view of the same. Fig. III is a plan view of the brush and arms, when opened, so as to form the handle. Fig. IV is a plan view of the looking-glass.

A is the plate on the back of the brush R; B, the metallic end piece, fastened to the plate A and having arms C C, hinged to the same at *n n*. *d d* are eyelets, fastened inside of the arms C C. *e e* are slots in the end of the arms C C. F is a clamp or catch hinged to the end piece B. G is the looking-glass frame, in the top of which is placed a comb-receiver, *h*. I is the comb; J, the looking-glass; K, the folding handle; L L, the pins fastened to the sides of the frame G.

Having thus described my invention, I desire to claim—

The combination of the case, brush, combs, and looking-glass, when constructed and arranged substantially as and for the purpose hereinbefore set forth.

GENNARO WUNDERLICH.
