Abstract

Disclosed is the use of silane and siloxane bis(biphenyl) triazine derivatives of formula (1), wherein n is a number from 1 to 4; if n=1, X is *-L-Sil; or a radical of formula (11'), L is a linker selected from a radical of formula (2); R1, R2, R3 independently from each other are C1-C2alkyl; C6-C2aryl; C1-C2alkoxy; or O—C6-C2aryl; R4, R5, R6 and R7 independently from each other are hydrogens; C1-C2alkyl; C6-C2aryl; C1-C2alkoxy; or O—C6-C2aryl; b is a number from 0 to 30; c is a number from 0 to 6; and d is a number from 0 to 1; if a = a number from 1 to 250; q is a number from 0 to 250; and Sil, Sil1, and Sil2 independently from each other are silane-, oligosiloxane or polysiloxane moieties; if n=2, X is a bivalent radical of formula (1a); or (1b); x is a number from 2 to 250; y is a number from 0 to 250; and z is a number from 1 to 50; if n=3, X is a trivalent radical containing a silane-, oligosiloxane or polysiloxane moiety; If n=4, X is a tetravalent radical of formula (1c); and A is a radical of formula (11') as UV absorbers.

USE OF SILANE AND SILOXANE BIS(BIPHENYL) TRIAZINE DERIVATIVES AS UV ABSORBERS

The present invention relates to the use of novel silane, siloxane or polysiloxane bis(biphenyl)-triazine derivatives as UV absorbers and their use in sunscreens and/or cosmetic compositions.

It is well known that ultraviolet radiation (light) is harmful to human skin. Depending on the wavelength UV radiation causes different types of skin damage. UV-B radiation (about 290 to about 320 nm) is responsible for sunburn and can cause skin cancer. UV-A radiation (about 320 to about 400 nm) while producing tanning of the skin, contributes also to sunburn and the induction of skin cancers. Moreover, the harmful effects of the UV-B radiation may be aggravated by UV-A radiation.

Therefore, an effective sunscreen formulation preferably comprises both at least one UV-A and UV-B filter and a broadband UV filter covering the full range from about 290 nm to about 400 nm to prevent the human skin from the damage of sunlight.

Besides their screening power on solar radiation UV filters must also have good resistance to water and perspiration and also satisfactory photostability.

Unfortunately, many effective organic UV filters have a poor oil-solubility at a certain concentration and tend to crystallization. As a consequence the UV protection efficacy is significantly decreased.

It is known that there are lipophilic UV filters like Butyl Methoxydibenzoylmethane (sold under the tradename “Parsol 1789” by DSM) which have the particularity and also the disadvantage of being solid at ambient temperature. As a result, their use in sunscreen cosmetic compositions implies certain constraints in terms of their formulation and their use, in particular the selection of specific suitable cosmetic solvents that afford a proper solubility of these UV filters. Thus, a UV filter should show high solubility in common cosmetic oils or should be a good solvent for other UV filters that show poor oil solubility.

Moreover the oil soluble UV filters should be included in cosmetic sun care products without any impact on the sensorial characteristic of the emulsions. For that reason the optimal distribution of the UV absorber within the hydro-lipid film left on the skin after spreading should be guaranteed.

It is therefore an object of the present invention to find UV absorber formulations which have improved properties regarding the UV absorber.

Surprisingly it has been found that specific silane and siloxane bis(biphenyl)triazine derivatives have very good properties as cosmetic UV-B absorbers.

Therefore, the instant invention relates to the use of silane and siloxane bis(biphenyl)triazine derivatives as UV absorbers represented by the following general formula

\[
\text{Sil}_1 \quad \text{L} \quad \text{Sil}_2
\]

wherein
\[n \text{ is a number from } 1 \text{ to } 4;\]
if \[n=1,\]
\[X \text{ is } { }^\circ \text{-Sil; or a radical of formula}\]

\[
\begin{align*}
R_1 & \quad R_2 & \quad R_3 \\
R_4 & \quad R_5 & \quad R_6 & \quad R_7 & \quad R_8
\end{align*}
\]

\[L \text{ is a linker selected from a radical of formula}\]

\[
\begin{align*}
R_1, R_2, R_3 \text{ independently form each other are } & C_1-C_2, \text{alkyl; } C_6-C_{20}, \text{aryl; } C_1-C_{22}, \text{alkoxy; or } O-C_6-C_{20}, \text{aryl;} \\
R_4, R_5, R_6 \text{ and } R_7 \text{ independently from each other are hydrogen; } & C_1-C_{22}, \text{alkyl; } C_6-C_{20}, \text{aryl; } C_1-C_{22}, \text{alkoxy; or } O-C_6-C_{20}, \text{aryl;} \\
b \text{ is a number from } 0 \text{ to } 30; & \\
c \text{ is a number from } 0 \text{ to } 6; & \\

q \text{ is a number from } 0 \text{ to } 250; & \\
\text{Sil, Sil}_1, \text{ and Sil}_2 \text{ independently from each other are a silane-; } & \\
\text{oligosiloxane or polysiloxane moiety;}
\]
if n=2, X is a bivalent radical of formula

\[
\begin{array}{c}
\text{R}_1 \quad \text{R}_1 \\
\text{L} \quad \text{L}
\end{array}
\]

\[
\begin{array}{c}
\text{R}_2 \quad \text{R}_2 \\
\text{L} \quad \text{L}
\end{array}
\]

x is a number from 2 to 250; y is a number from 0 to 250; and z is a number from 1 to 50;

if n=3, X is a trivalent radical containing a silane-, oligosiloxane or polysiloxane moiety;

if n=4, X is a tetravalent radical of formula

\[
\begin{array}{c}
\text{A} \\
\text{Si} \quad \text{Si} \\
\text{Si} \quad \text{Si}
\end{array}
\]

A is a radical of formula

Preferred are compounds of formula (1), wherein n is a number from 1 to 4;

if n=1, X is \( ^*-L\)-Sil;

L is a linker selected from a radical of formula

\[
\begin{array}{c}
\text{R}_4 \quad \text{R}_4 \\
\text{L} \quad \text{L}
\end{array}
\]

\[
\begin{array}{c}
\text{R}_5 \quad \text{R}_5 \\
\text{L} \quad \text{L}
\end{array}
\]

\[
\begin{array}{c}
\text{R}_6 \quad \text{R}_6 \\

\end{array}
\]

\[
\begin{array}{c}
\text{R}_7 \quad \text{R}_7 \\
\text{L} \quad \text{L}
\end{array}
\]

R_4, R_5, and R_6 independently from each other are hydrogen; \( C_1-C_{22}\)-alkyl; \( C_{6-20}\)-aryl; \( C_1-C_{22}\)-alkoxy; or \( O-C_6-C_{20}\)-aryl;

b is a number from 0 to 30;

c is a number from 0 to 6; and

d is a number from 0 to 1;

Sil, Sil_1 and Sil_2 independently from each other are a silane-, oligosiloxane or polysiloxane moiety;

R_1, R_2, and R_3 independently form each other are \( C_1-C_{22}\)-alkyl; \( C_6-C_{20}\)-aryl; \( C_1-C_{22}\)-alkoxy; or \( O-C_6-C_{20}\)-aryl;

x is a number from 2 to 250;

y is a number from 0 to 250; and

z is a number from 1 to 50;

if n=3, X is a trivalent radical containing a silane-, oligosiloxane or polysiloxane moiety;

If n=4, X is a tetravalent radical of formula (1c).

Preferred Sil is an oligosiloxane moiety selected from \( Si(R_1)_m(OSi(R_2))_n \); wherein m is 0; 1; or 2,

\[

\end{array}
\]

and

as UV absorbers.
R₁₁ and R₁₂ and R₁₃ independently form each other are C₁-C₃ alkyl; or C₁-C₃ alkoxy; and e is a number from 0 to 30.

Preferred are also compounds of formula (1), wherein X is a radical of formula

Wherein "alkylene" denotes a straight chained or branched C₂-C₁₃ alkylene;
R₈, R₉ and R₁₀ independently from each other are C₁-C₂ alkyl; or C₁-C₂ alkoxy; or a radical of formula

Examples of bisphenyltriazine compounds according to the present invention are listed in Table 1 below:

\end{align*}
\]

The compounds of formula (1) may be obtained conventionally employing a hydrosilylation reaction starting from...
compounds of the general formula (1) in which the group \( X \) contains an unsaturated \( \text{C—C} \) bond which can be subsequently hydrosilylated. Such compounds correspond for example to formula (3).

More preferably the group \( X \) is an allyl residue.

The hydrosilylation reaction is performed between the unsaturated compound and a \( \text{SiH} \) containing silane, oligosiloxane and polysiloxane in accordance with the following reaction scheme:

\[
\begin{align*}
\text{R}_4 \text{R}_6 & \quad \text{O} \quad \text{E} \quad \text{R}_8 \\
\text{OH} & \quad \text{N}_1 \quad \text{N}_2 \quad \text{N} \\
\text{H-silane} & \quad \text{Pt-catalyst} & \quad \text{H-siloxane} \\
\text{OH} & \quad \text{POLYSILOXANE} \\
\end{align*}
\]

In (3) \( \text{R}_8 \) is hydrogen; \( \text{C}_1-\text{C}_{22} \)-alkyl; \( \text{C}_5-\text{C}_{20} \)-aryl; \( \text{C}_1-\text{C}_{22} \)-alkoxy; or \( \text{O——C}_5-\text{C}_{20} \)-aryl;

\( b \) is a number from 0 to 30;
\( c \) is a number from 0 to 6; and
\( d \) is a number from 0 to 1; wherein at least one of \( c \) or \( d \) is not 0.

The hydrosilylation reaction is performed in the presence of a hydrosilylation catalyst.

Preferably the catalyst is a platinum(0) catalyst, most preferred it is the so-called Karstedt catalyst.

In general a mixture of the corresponding regioisomers of the hydrosilylation adducts is formed.

The following reaction scheme exemplifies the hydrosilylation reactions.

The silane and siloxane bis(biphenyl)triazine derivatives according to formula (1) may advantageously be used as actives in cosmetic preparations which additionally comprise cosmetically tolerable carriers or adjuvants.

The cosmetic preparation may also comprise, in addition to the mixtures of silane and siloxane bis(biphenyl)triazine derivatives according to formula (1) one or more further UV protective agents of the following substance classes:

1. \( p \)-aminobenzoic acid derivatives, for example 4-dimethylaminobenzoic acid 2-ethylhexyl ester;
2. salicylic acid derivatives, for example salicylic acid 2-ethylhexyl ester;
3. benzophenone derivatives, for example 2-hydroxy-4-methoxybenzophenone and its 5-sulfonic acid derivative;
4. dibenzoylmethane derivatives, for example 1-(4-tert-butylyphenyl)-3-(4-methoxyphenyl)propane-1,3-dione;
5. diphenylacrylates, for example 2-ethylhexyl 2-cyclo-3,3-diphenylacrylate, and 3-(benzofuran-2-yl) 2-cyanoacrylate;
6. 3-imidazol-4-ylacrylic acid and esters;
8. polymeric UV absorbers, for example the benzylidine malonate derivatives described in EP-A-700 080;
9. cinnamic acid derivatives, for example the 4-methoxycinnamic acid 2-ethylhexyl ester and isomyl ester or cinnamic acid derivatives disclosed in U.S. Pat. No. 5,601,811 and WO 97/00651;
10. camphor derivatives, for example 3-(4'-methyl)benzylidene-bornean-2-one, 3-benzylidenebornean-2-one, N-[2 and 4]-2-oxoylbrom-3-ylidene(methyl)benzylacrylamide polymer, 3-(4'-trimethylammonium)-benzylidene-bornean-2-one methyl sulfate, 3,3'-(1,4-phenylene-dimethine)-bis(7,7-dimethyl-2-oxo-bicycle[2,2,1]heptane-1-sulfonic acid) and salts, 3-(4'-sulfobenzylidene-bornean-2-one and salts; camphorbenzalkonium methosulfate;
11. hydroxyphenyltriazine compounds, for example 2-(4'-methoxyphenyl)-4,6-bis(2-hydroxy-4-n-octoxyphenyl)-1,3,5-triazine; 2,4-bis[[4-(3-(2-propiophenoxo)-2-hydroxy-phenyl)]-2-hydroxy-phenyl]-6-(4-methoxyphenyl)-1,3,5-triazine; 2,4-bis[[2-(4-ethylhexyloxy)-2-hydroxy-phenyl]-2-hydroxy-phenyl]-6-(4-methoxyphenyl)-1,3,5-triazine; 2,4-bis[[4-(tris(trimethylsilyloxy)-silylphenyl)]-2-hydroxy-phenyl]-6-(4-methoxyphenyl)-1,3,5-triazine; 2,4-bis[[4-(2'-methylpropenoyloxy)-2-hydroxy-phenyl]-6-(4-methoxyphenyl)-1,3,5-triazine; 2,4-bis[[4-(1'-methyl-1'-methylpropenoyloxy)-2-hydroxy-phenyl]-6-(4-methoxyphenyl)-1,3,5-triazine; 2,4-bis[[4-(1',1',1',3',5',5'-heptamethyltrisiliden-2'-methyl-propoxy)-2-hydroxy-phenyl]-6-(4-methoxyphenyl)-1,3,5-triazine; 2,4-bis[[4-(3-(2-propoxy)-2-hydroxy-propoxy)-2-hydroxy-phenyl]-6-(4-ethoxy(carboxyl)-phenylaminato)-1,3,5-triazine; 12. benzo triazole compounds, for example 2,2'-methylenebis(6-(2H-benzotriazol-2-yl)-4-(1,1,3,3-tetramethybutyl)-phenol
14. 2-phenylbenzimidazole-5-sulfonic acid and salts thereof;
15. methyl o-aminobenzoate;
16. TiO₂ (variously encapsulated), ZnO and mica.

The UV absorbers described in “Sunscreens”, Eds. N. J. Lowe, N. A. Shaheen, Marcel Dekker, Inc., New York and Basle or in Cosmetics & Toiletries (107), 50ff (1992) also can be used as additional UV protective substances.

Special preference is given to the light-protective agents indicated in the following Table:

</table>

Each of the above-mentioned light-protective agents, especially the light-protective agents in the above Table indicated as being preferred, can be used in admixture with the siloxane bis(biphenyl)triazine derivatives according to the invention. It will be understood in that connection that, in addition to the mixtures of the bis(biphenyl)triazine derivatives of the present invention, it is also possible for more than one of the additional light-protective agents to be used, for example, two, three, four, five or six such light-protective agents.

Other typical ingredients in such formulations are preservatives, bactericides and bacteriostatic agents, perfumes, dyes, pigments, thickening agents, moisturizing agents, humectants, fats, oils, waxes or other typical ingredients of cosmetic and personal care formulations such as alcohols, poly-alcohols, polymers, electrolytes, organic solvents, silicon derivatives, emollients, emulsifiers or emulsifying surfactants, surfactants, dispersing agents, antioxidants, anti-irritants and anti-inflammatory agents etc.

The cosmetic compositions contain, for example, from 0.1 to 30% by weight, preferably from 0.1 to 15% by weight and especially from 0.5 to 10% by weight, based on the total...
weight of the composition, of silane and siloxane bis(biphenyl)triazine derivatives of formula (1) and at least one cosmetically tolerable adjuvant.

The cosmetic compositions can be prepared by physically mixing silane and siloxane bis(biphenyl)triazine derivatives of formula (1) with the adjuvant using customary methods, for example by simply stirring together the individual components, especially by making use of the dissolution properties of already known cosmetic UV absorbers, for example OMC, salicylic acid isocetyl ester, inter alia. The UV absorber can be used, for example, without further treatment, or in the micronized state, or in the form of a powder.

The cosmetic compositions may be, for example, creams, gels, lotions, alcoholic and aqueous/alcoholic solutions, emulsions, wax/fat compositions, stick preparations, powders or ointments.

As water- and oil-containing emulsions (e.g. W/O, O/W, O/W/O and W/O/W emulsions or microemulsions) the compositions contain, for example, from 0.1 to 30% by weight, preferably from 0.1 to 15% by weight and especially from 0.5 to 10% by weight, based on the total weight of the composition, of the silane and siloxane bis(biphenyl)triazine derivatives of formula (1), from 1 to 60% by weight, especially from 5 to 50% by weight and preferably from 10 to 35% by weight, based on the total weight of the composition, of at least one oil component, from 0 to 30% by weight, especially from 1 to 30% by weight and preferably from 4 to 20% by weight, based on the total weight of the composition, of at least one emulsifier, from 10 to 90% by weight, especially from 30 to 90% by weight, based on the total weight of the composition, of water, and from 0 to 88.9% by weight, especially from 1 to 50% by weight, of further cosmetically tolerable adjuvants.

As oil components of oil-containing compositions (e.g. oils, W/O, O/W, O/W/O and W/O/W emulsions or microemulsions) there come into consideration, for example, Guerbet alcohols based on fatty alcohols having from 6 to 18, preferably from 8 to 10, carbon atoms, esters of linear C₆-C₈ fatty acids with linear C₆-C₈ alcohols, esters of branched C₆-C₈ carboxylic acids with linear C₆-C₈ fatty alcohols, esters of linear C₆-C₁₈ fatty acids with branched alcohols, especially 2-ethylhexanol, esters of hydroxyalkylarboxylic acids with linear or branched C₅-C₁₂ fatty alcohols, especially dioctyl malates, esters of linear and/or branched fatty acids with polyhydric alcohols (for example propylene glycol, dimer diol or trimethylol diol) and/or Guerbet alcohols, triglycerides based on C₆-C₁₀ fatty acids, liquid mono/di/tri-glyceride mixtures based on C₆-C₁₈ fatty acids, esters of C₆-C₈ fatty alcohols and/or Guerbet alcohols with aromatic carboxylic acids, especially benzoic acid, esters of C₅-C₁₂ dicarboxylic acids with linear or branched alcohols having from 1 to 22 carbon atoms or polyols having from 2 to 10 carbon atoms and from 2 to 6 hydroxy groups, vegetable oils (such as sunflower oil, olive oil, soybean oil, rapeseed oil, almond oil, jojoba oil, orange oil, pear kernel oil and the liquid components of coconut oil), branched primary alcohols, substituted cyclohexanes, linear and branched C₆-C₁₂ fatty alcohol carbonates, Guerbet carbonates, esters of benzoic acid with linear and/or branched C₆-C₁₀ alcohols (e.g. Finsolv® TN), linear or branched, symmetric or asymmetric dialkyl ethers having a total of from 12 to 36 carbon atoms, especially from 12 to 24 carbon atoms, for example di-n-octyl ether, di-n-decyl ether, di-n-nonyl ether, di-n-undecyl ether, di-n-dodecyl ether, n-hexyl n-octyl ether, n-octyl n-decyl ether, n-decyl n-undecyl ether, n-undecyl n-dodecyl ether, n-hexyl n-undecyl ether, di-1,2-ethyl ether, di-isopropyl ether, di-3-ethylhexyl ether, tert-butyl n-octyl ether, isopropyl n-octyl ether and 2-methyl pentyl n-octyl ether; ring-opening products of epoxidised fatty acid esters with polyols, silicone oils and/or aliphatic or naphthenic hydrocarbons. Also of importance are monoesters of fatty acids with alcohols having from 3 to 24 carbon atoms. That group of substances comprises the esterification products of fatty acids having from 8 to 24 carbon atoms, for example caprylic acid, caprylic acid, 2-ethylhexanoic acid, capric acid, lauric acid, isotridecanolic acid, myristic acid, palmitic acid, palmitoleic acid, stearic acid, isooleic acid, oleic acid, elaidic acid, olenolic acid, linoleic acid, linoeleic acid, elaeostearic acid, arachidic acid, gadoleic acid, behenic acid and erucic acid and technical-grade mixtures thereof (obtained, for example, in the pressure removal of natural fats and oils, in the reduction of aldehydes from Roelen’s oxosynthesis or in the dimerisation of unsaturated fatty acids) with alcohols, for example isopropyl alcohol, caprylic acid, caprylic acid, 2-ethylhexyl alcohol, caprylic acid, lauric acid, isosorbide alcohol, myristyl alcohol, cetyl alcohol, palm, cetyl alcohol, stearyl alcohol, isostearic alcohol, oleyl alcohol, elaityl alcohol, olenolic acid, linoleic acid, linoleyl acid, elaeostearic acid, arachidyl alcohol, behenyl alcohol, erucyl alcohol and brassidyl alcohol and technical-grade mixtures thereof (obtained, for example, in the high-pressure hydrogenation of technical-grade methyl esters based on fats and oils or aldehydes from Roelen’s oxosynthesis and as monomer fractions in the dimerisation of unsaturated fatty acids). Of special importance is isopropyl myristate, isononanoic acid C₁₀-C₁₈ alkyl esters, stearyl acid 2-ethylhexyl ester, cetyl oleate, glycerol tricaprylate, coconut fatty alcohol caprate/caprylate and n-butyl stearate. Further oil components that can be used are dicarboxylic acid esters, such as di-n-butyl adipate, di(2-ethylhexyl) adipate, di(2-ethylhexyl) succinate and dioctyldicylacetate, and also diolesters, such as ethylene glycol dioleate, ethylene glycol dioleate, propylene glycol (2-ethylhexanoate), propylene glycol distearate, propylene glycol dipalmitate, butanediol distearate and neopentyl glycol dicaprylate.

Preferred mono- or poly-ols are ethanol, isopropanol, propylene glycol, hexylene glycol, glycerol and sorbitol. It is also possible to use di- and/or tri-valent metal salts (alkaline earth metal, Al³⁺ inter alia) of one or more alkyl carboxylic acids.

The oil components can be used in an amount of, for example, from 1 to 60% by weight, especially from 5 to 50% by weight and preferably from 10 to 35% by weight, based on the total weight of the composition.

Any conventionally usable emulsifier can be used for the compositions.

As emulsifiers there come into consideration, for example, non-ionic surfactants from the following groups:

- Addition products of from 2 to 30 mol of ethylene oxide and/or from 0 to 5 mol of propylene oxide with linear fatty alcohols having from 8 to 22 carbon atoms, with fatty acids having from 12 to 22 carbon atoms and with alklyphenols having from 8 to 15 carbon atoms in the alkyl group, for example ceteareth-20 or ceteareth-12;
- C₂₅₋₃₀ fatty acid mono- and di-esters of addition products of from 1 to 30 mol of ethylene oxide with polyols having from 3 to 6 carbon atoms, especially with glycerol;
- Glycerol mono- and di-esters and sorbitan mono- and di-esters of saturated and unsaturated fatty acids having from 6 to 22 carbon atoms and ethylene oxide addition products thereof, for example glyceryl stearates, glyceryl isostearates, glyceryl oleates, sorbitan oleates or sorbitan sesquioleates;
C₅₋C₂₅ alkyl-monoo- and -oligo-glycosides and ethoxylated analogues thereof, degrees of oligomerisation of from 1 to 5, especially from 1.2 to 1.4, being preferred, and glucose being preferred as the sugar component; addition products of from 2 to 60 mol, especially from 15 to 30 mol, of ethylene oxide with castor oil and/or hydrogenated castor oil; polyvinyl esters and especially polyglycerol esters, for example diisostearoyl polyglyceryl 3-diisostearates, polyglyceryl 3-diisostearates, triglyceryl diisostearates, polyglyceryl 2-sesquiolesters or polyglyceryl dimers. Mixtures of compounds from a plurality of those substance classes are also suitable; partial esters based on linear, branched, unsaturated or saturated C₁₅-C₂₅ fatty acids, ricinoleic acid and also 12-hydroxystearic acid and on glycerol, polyglycerol, pentaoxytriol, dipentaerythritol, sugar alcohols (e.g. sorbitol), alkyl glucosides (e.g. methyl glucoside, butyl glucoside, lauryl glucoside) and also polyglycosides (e.g. cellulose), for example polyglyceryl 2-dihydroxy styrene or polyglyceryl 2-diacetates; mono-, di- and tri-alkylphosphates and also mono-, di- and/or tri-PEG-alkylphosphates and salts thereof; wool wax alcohols; one or more ethoxylated esters of natural derivatives, for example polyethoxylated esters of hydrogenated castor oil; silicone oil emulsifiers, for example silicone polyol; polyethoxylated/ polyether copolymers and corresponding derivatives, for example cetyl dimethicone copolyol; mixed esters of pentaoxytriol, fatty acids, citric acid and fatty alcohol (see DE-A 1 165 574) and/or mixed esters of fatty acids having from 6 to 22 carbon atoms, methylglucoside and polyols, preferably glycerol or polyglycerol, for example polyglyceryl 3-glycol, diesters, polyglyceryl 3-glycerol diolates, methyl glucose diolates or diglycol pentaerythryl distearate citrates and also polyalkylene glycols.

The addition products of ethylene oxide and/or of propylene oxide with fatty alcohols, fatty acids, alklyphenols, glycerol mono- and di-esters and also sorbitan mono- and di-esters of fatty acids, or with castor oil, are known, commercially available products. They are usually homologous mixtures, the average degree of alkylation of which corresponds to the ratio of the amounts of ethylene oxide and/or propylene oxide and substrate with which the addition reaction is carried out. C₁₂-C₁₈ fatty acid monoo- and di-esters of addition products of ethylene oxide with glycerol are known, for example, from DE-A 2 024 051 as fat-restoring substances for cosmetic preparations.

C₅₋C₂₅ alkyl-monoo- and -oligo-glycosides, their preparation and their use are known from the prior art. They are prepared especially by reacting glucose or oligosaccharides with primary alcohols having from 8 to 18 carbon atoms. Suitable glycoside radicals include monoglucosides in which a cyclic sugar radical is glycosidically bonded to the fatty alcohol and also oligomeric glycosides having a degree of oligomerisation of up to preferably about 8. The degree of oligomerisation is a statistical average value based on a homologue distribution customary for such technical-grade products.

It is also possible to use zwitterionic surfactants as emulsifiers. The term “zwitterionic surfactants” denotes especially surface-active compounds that carry at least one quaternary ammonium group and at least one carboxylic acid and/or sulfonate group in the molecule. Zwitterionic surfactants that are especially suitable are the so-called betaines, such as N-alkyl-N,N-dimethylammonium glycinites, for example cocaoyl isodimethylyaminomethyl glycinate, N-acylamidopropyl-N,N-dimethylammonium glycinites, for example cocoylamidopropyl dimethylylammonium glycinate, and 2-alkyl-3-carboxymethyl-3-hydroxyethylimidazolines each having from 8 to 18 carbon atoms in the alkyl or acyl group and also cocoylaminoethylhexadecylcarboxymethylglycinate. Special preference is given to the fatty acid amide derivative known by the CTA name cocamidopropyl betaine. Likewise suitable as emulsifiers are ampholytic surfactants. Ampholytic surfactants are to be understood as meaning especially those which, in addition to containing a C₅₋C₂₅ alkyl- or acyl group, contain at least one free amino group and at least one —COON or —SO₃H group in the molecule and are capable of forming internal salts. Examples of suitable ampholytic surfactants include N-alkylglycines, N-alkylproponic acids, N-alkylaminobutyric acids, N-alkylaminopropionic acids, N-hydroxyethyl-N-alkylaminopropionic acids, N-alkyltaurines, N-alkylsuccines, 2-alkylaminopropionic acids and alkylaminoacetic acids, each having approximately from 8 to 18 carbon atoms in the alkyl group.

Ampholytic surfactants to which special preference is given are N-coconutamido-propionato, cocoylaminomethylpropionate and C₁₂-C₁₈ acylsarcosine. In addition to the ampholytic emulsifiers there also come into consideration quaternary emulsifiers, special preference being given to those of the esterquat type, preferably methyl-quaternised di-fatty acid triethanolamine ester salts.

Non-ionic emulsifiers are preferred. Of the non-ionic emulsifiers mentioned, special preference is given to ethoxylated fatty alcohols having from 8 to 22 carbon atoms and from 4 to 30 EO units.

The emulsifiers may be used in an amount of, for example, from 1 to 30% by weight, especially from 4 to 20% by weight and preferably from 5 to 10% by weight, based on the total weight of the composition. It is, however, also possible in principle to dispense with the use of emulsifiers.

The compositions according to the invention, for example creams, gels, lotions, alcoholic and aqueous/alcoholic solutions, emulsions, wax/fat compositions, stick preparations, powders or ointments, may in addition contain, as further adjuvants and additives, mild surfactants, super-fattening agents, pearlescent waxes, consistency regulators, thickeners, polymers, silicone compounds, fats, waxes, stabilisers, biogenic active ingredients, deodorising active ingredients, anti-dandruff agents, film formers, swelling agents, further UV light-protective factors, antioxidants, hydrotrropic agents, preservatives, insect repellents, self-tanning agents, solubilizers, perfume oils, colorants, bacteria-inhibiting agents and the like.

Substances suitable for use as super-fattening agents are, for example, lanolin and lecithin and also polyethoxylated or acrylated lecithin and lecithin derivatives, polyol fatty acid esters, monoglycerides and fatty acid alkanolamides, the latter simultaneously acting as foam stabilisers.

Examples of suitable mild surfactants, that is to say surfactants especially well tolerated by the skin, include fatty alcohol polyglycol ether sulfates, monoglyceride sulfates, monoand/or di-alkyl sulfo succinates, fatty acid isethionates, fatty acid sarcosinates, fatty acid taurides, fatty acid glutamates, α-olefin sulfonates, ether carboxylic acids, alkyl oligoglycosides, fatty acid glucamides, alkylamidobetaines and/or protein fatty acid condensation products, the latter preferably being based on wheat proteins.
As pearlescent waxes there come into consideration, for example: alkylene glycol esters, especially ethylene glycol distearate; fatty acid alkanolamides, especially cocoyl fatty acid diethanolamide; partial glycerides, especially stearic acid monoglyceride; esters of polyvalent, unsubstituted or hydroxy-substituted carboxylic acids with fatty alcohols having from 6 to 22 carbon atoms, especially long-chained esters of tartaric acid; fatty substances, for example fatty alcohols, fatty ketones, fatty aldehydes, fatty ethers and fatty carbonates, which in total have at least 24 carbon atoms, especially laurone and distearyl ether; fatty acids, such as stearic acid, hydroxystearic acid or behenic acid, ring-opening products of olefin epoxides having from 12 to 22 carbon atoms with fatty alcohols having from 12 to 22 carbon atoms and/or polyls having from 2 to 15 carbon atoms and from 2 to 10 hydroxy groups, and mixtures thereof.

As consistency regulators there come into consideration especially fatty alcohols or hydroxy fatty alcohols having from 12 to 22 carbon atoms and preferably from 16 to 18 carbon atoms, and in addition partial glycerides, fatty acids and hydroxy fatty acids. Preference is given to a combination of such substances with alkyl-oligo glucosides and/or fatty acid N-methylglucamides of identical chain length and/or polyglycerol poly-12-hydroxy stearates. Suitable thickeners include, for example, Aerosil types (hydrophilic silicic acids), polysaccharides, especially xanthan gum, guar-guar, agar-agar, alginites and Tyloses, carboxymethyl cellulose and hydroxyethyl cellulose, also relatively high molecular weight polyethylene glycol mono- and diesters of fatty acids, polyacrylates (e.g. Carbopol® from Goodrich or Synthetic® from Sigma), polyacrylamides, polyvinyl alcohol and polyvinylpyrrolidone, surfactants, for example ethoxylated fatty acid glycerides, esters of fatty acids with polyols, for example pentacryltrimethyloltriaminopropyl, fatty acid ethoxylates with restricted homologue distribution and alkyl-oligo glucosides as well as electrolytes, such as sodium chloride or ammonium chloride.

Suitable cationic polymers are, for example, cationic cellulose derivatives, for example a quaternised hydroxymethyl cellulose obtainable under the name Polymer JR 400® from Amerchol, cationic starch, copolymers of diallylammonium salts and acrylamides, quaternised vinylpyrrolidone/vinyl imidazole polymers, for example Luviquat® (BASF), condensation products of polyglycols and amines, quaternised collagen polypeptides, for example lauryldimonomium hydroxy propylhydroxylized collagen (Lamequat®/L. Grünau), quaternised wheat polypeptides, polyethyleneimine, cationic silicic acid copolymers, for example amidomethicones, copolymers of adipic acid and dimethyldiallylammonium chloride (Merquat® 550/Chemviron), polyanionpolymers, as described, for example, in FR-A-2 252 840, and the crosslinked water soluble polymers thereof, cationic chitin derivatives, for example quaternised chitosan, optionally distributed as microcrystals; condensation products of dihaloalkyls, for example dibromobutane, with bisiodoalkanes, for example bisdimethylamino-1,3-propane, cationic gua gum, for example Jaguar® C-17, Jaguar® C-16 from Celanese, quaternised ammonium salt polymers, for example Mirapol® A-15, Mirapol® AD-1, Mirapol® AZ-1 from Miranol.

As anionic, zwitterionic, amphoteric and non-ionic polymers there witercome into consideration, for example, vinyl acetate/ethylene acid copolymers, vinylpyrrolidone/vinyl acrylate copolymers, vinyl acetate/butyl maleate/isobornyl acrylate copolymers, methyl vinyl ether/maleic anhydride copolymers and esters thereof, uncrosslinked polycrylic acids and polycrylic acids crosslinked with polyols, acrylamidopropyltrimethylammonium chloride/acrylate copolymers, octyl acrylamide/methyl methacrylate/tert-butyldimethacrylate/methyl methacrylate/2-hydroxypropyl methacrylate copolymers, polyvinylpyrrolidone, vinyl pyrrolidone/vinyl acetate copolymers, vinylpyrrolidone/dimethylaminoethyl methacrylate/vinyl caprolactam terpolymers and also optionally derivatised cellulose ethers and silicones.

Suitable silicone compounds are, for example, dimethylpolysiloxanes, methylphenylpolysiloxanes, cyclic silicones, and also amino-, fatty acid-, alcohol-, polyether-epoxy-, fluorine-, glycoside- and/or alkyl-modified silicone compounds, which at room temperature may be either liquid or viscous, also suitable are simethicones, which are mixtures of dimethicones having an average chain length of from 200 to 300 dimethilsiloxane units with hydrogenated silicates. A detailed survey by Todd et al., of suitable volatile silicones may in addition be found in Cosm. Toil. 91, 27 (1976).

Typical examples of fats are glycerides, and as waxes there come into consideration, inter alia, beeswax, carnauba wax, candelilla wax, montan wax, paraffin wax, hydrogenated castor oils and fatty acid esters or microwaxes solid at room temperature optionally in combination with hydrophilic waxes, e.g. cetylstearyl alcohol or partial glycerides. Metal salts of fatty acids, for example magnesiu and/or zinc stearate or ricinoleate, may be used as stabilisers.

Biogenic active ingredients are to be understood as meaning, for example, tocopherol, tocopherol acetate, tocopherol palmitate, ascorbic acid, deoxyribonucleic acid, retinol, bisabolol, allantoin, pyrantriol, panthenol, AHA acids, amino acids, ceramides, pseudoceramides, essential oils, plant extracts and vitamin complexes.

As deodorising active ingredients there come into consideration, for example, antiperspirants, for example aluminium chloride hydrates (see J. Soc. Cosm. Chem. 24, 281 (1975)). Under the trade mark Locron® of Hoechst AG, Frankfurt (FRG), there is available commercially, for example, an aluminium chloride hydrate corresponding to formula Al₃(OH)₆Clx·2H₂O, the use of which is especially preferred (see J. Pharm. Pharmacol. 26, 531 (1975)). Besides the chlorohydrides, it is also possible to use aluminium hydroxy-acetates and acidic aluminium/zirconium salts. Esterase inhibitors may be added as further deodorising active ingredients. Such inhibitors are preferably triaryl citrates, such as trimethyl citrate, tripalmitoyl citrate, trimethyl citrate and especially triaryl citrate (Hydrgen® CAT, Henkel KGaA, Düsseldorf/FRG), which inhibit enzyme activity and hence reduce odour formation. Further substances that come into consideration as esterase inhibitors are stearic sultates or phosphates, for example lanosterol, cholesteral, campesterol, stigmaster and sitosterol sultate or phosphate, diacylcarboxylic acids and esters thereof, for example glutaric acid, glutaric acid monomethyl ester, glutaric acid diethyl ester, adipic acid, adipic acid monomethyl ester, adipic acid diethyl ester, malonic acid and malonic acid diethyl ester and hydroxy carboxylic acids and esters thereof, for example citric acid, malic acid, tartaric acid or tartaric acid diethyl ester. Antibacterial active ingredients that influence the microbial flora and kill, or inhibit the growth of, sweat-decomposing bacteria can likewise be present in the preparations (especially in stick preparations). Examples include chitosan, phenoxyethanol and chlorhexidine gluconate. 5-Chloro-2-(2,4-dichlorophenoxy)-phenol (Irgasan®. Ciba Specialty Chemicals Inc.) has also proved especially effective.

As anti-dandruff agents there may be used, for example, clmboconazole, octinox and zinc pyrithione. Custumary film
formers include, for example, chitosan, microcrystalline chitosan, quaternised chitosan, polyvinylpyrrolidone, vinylpyrrolidone/vinyl acetate copolymers, polymers of quaternary cellulose derivatives containing a high proportion of acrylic acid, collagen, hyaluronic acid and salts thereof and similar compounds. As swelling agents for aqueous phases there may be used montmorillonites, clay mineral substances, Pemulen and also alkyl-modified types of Carbopol (Goodrich). Further suitable polymers and swelling agents can be found in the review by R. Lochhead in Cosm. Toli. 108, 95 (1993).

In addition to the primary light-protective substances it is also possible to use secondary light-protective substances of the antioxidant kind which interrupt the photochemical reaction chain triggered when UV radiation penetrates the skin or hair. Typical examples of such antioxidants are amino acids (e.g. glycine, histidine, tyrosine, tryptophan) and derivatives thereof; imidazoles (e.g. aromatic imidazoles and derivatives thereof; dithiols such as D,L-cystine, D-cystine, L-cystine and derivatives thereof (e.g. ascorbinate), carotenoïds, carotenoids (e.g. α-carotene, β-carotene, lycopene) and derivatives thereof, chlorogenic acid and derivatives thereof, lipoic acid and derivatives thereof (e.g. dihydrobiopolic acid), aurothioglycose, propylthiouracil and other thiols (e.g. thioredoxin, glutathione, cysteine, cystine, cystamine and the glycoal, N-acetyl, methyl, ethyl, propyl, amyl, butyl, lauryl, palmitoyl, oleoyl, γ-linoleyl, cholesterol and glyceryl esters thereof) and also sulfoxime compounds (e.g. bithionine sulfoximates, homocysteine sulfoxime, bithionine sulfoxides, penicillic acid and derivatives thereof (e.g. dithiopropionate, thiodiopropionate and derivatives thereof (esters, ethers, peptides, lipids, nucleotides, nucleosides and salts) and also sulfoxime compounds (e.g. bithionine sulfoximates, homocysteine sulfoxime, bithionine sulfoxides, penicillic acid and derivatives thereof)).

In addition, polyols that come into consideration for that purpose have preferably from 2 to 15 carbon atoms and at least two hydroxy groups.

US 8,986,662 B2

31 e.g. sage oil, camomile oil, clove oil, melissa oil, oil of cinnamon leaves, lime blossom oil, juniper berry oil, vetiver oil, olibanum oil, galbanum oil, labdanum oil and lavandin oil. Preference is given to the use of bergamot oil, dihydromyrcenol, lilial, lyril, citronellol, phenyl ethyl alcohol, α-hexyl cinnamaldehyde, geraniol, benzyl acetone, cyclamen aldehyde, linalool, boisambrene forte, ambroxan, indole, hedione, sandelcone, lemon oil, tangerine oil, orange oil, dialkyl acylglycinate, cyclotetralin, lavandin oil, muscatel sage oil, β-damascone, bourbon geranium oil, cyclocelixyl salicylate, verticin, coeur, iso-ε-Super, Fixodile NP, evelyn, indolein gummia, phenylacetic acid, geranyl acetate, benzyl acetate, rose oxide, romillat, irotol and floromut alone or in admixture with one another.

There may be used as colourants the substances that are suitable and permitted for cosmetic purposes, as compiled, for example, in the publication “Kosmetische Färbemittel” of the Farbstoffkommission der Deutschen Forschungs gemeinschaft, Verlag Chemie, Weinheim, 1984, pages 81 to 106. The colourants are usually used in concentrations of from 0.001 to 0.1% by weight, based on the total mixture.

32 Typical examples of bacteria-inhibiting agents are preservatives that have a specific action against gram-positive bacteria, such as 2,4,4'-trichloro-2'-hydroxydiphenyl ether, chlorhexidine (1,6-di(4-chlorophenyl)-biguanido)hexane) or TCC (3,4,4'-trichloroacarbanilide). A large number of aromatic substances and etherial oils also have antimicrobial properties. Typical examples are the active ingredients eugenol, menthol and thymol in clove oil, mint oil and thyme oil. A natural deodorizing agent of interest is the terpene alcohol farnesol (3,7,11-trimethyl-2,6,10-dodecatrien-1-ol), which is present in lime blossom oil. Glycol monolaureate has also proved to be a bacteriostatic agent. The amount of the additional bacteria-inhibiting agents present is usually from 0.1 to 2% by weight, based on the solids content of the preparations.

It is furthermore possible for the cosmetic compositions to contain, as adjuvants, antifoams, such as silicones, structurants, such as maleic acid, solubilizers, such as ethylene glycol, propylene glycol, glycerol or diethylene glycol, opacifiers, such as latex, styrene/PVP or styrene/acrylamide copolymers, complexing agents, such as EDTA, NTA, β-alaninodiacetic acid or phosphonic acids, propellants, such as propane/butane mixtures, N₂O₃, dimethyl ether, CO₂, N₂ or air, so-called coupler and developer components such as oxidation dye precursors, reducing agents, such as thioglycolic acid and derivatives thereof, thiolactic acid, cysteamine, thiomalic acid or α-mercaptopetanesulfonic acid, or oxidizing agents, such as hydrogen peroxide, potassium bromate or sodium bromate.

There come into consideration as insect repellents, for example, N,N-diethyl-m-toluamide, 1,2-pentanediol or insect repellent 3555; suitable self-tanning agents are, for example, dihydroxyacetone, erythrulose or mixtures of dihydroxyacetone and erythritol.

Cosmetic formulations according to the invention are contained in a wide variety of cosmetic preparations. There come into consideration, for example, especially the following preparations:

- skin-care preparations, e.g. skin-washing and cleansing preparations in the form of tablet-form or liquid soaps, synthetic detergents or washing pastes;
- bath preparations, e.g. liquid (foam baths, milks, shower preparations) or solid bath preparations, e.g. bath cubes and bath salts;
- skin-care preparations, e.g. skin emulsions, multi-emulsions or skin oils;
- cosmetic personal care preparations, e.g. facial make-up in the form of day creams or powder creams, face powder (loose of pressed), rouge or cream make-up, eye-care preparations, e.g. eyeshade preparations, mascara, eyeliner, eye creams or eye-fix creams; lip-care preparations, e.g. lipsticks, lip gloss, lip contour pencils, nail-care preparations, such as nail varnish, nail varnish removers, nail hardeners or cuticle removers;
- foot-care preparations, e.g. foot baths, foot powders, foot creams or foot balms, special deodorants and antiperspirants or callus-removing preparations;
- light-protective preparations, such as sun milks, lotions, creams or oils, sunblocks or tropics, pre-tanning preparations or after-sun preparations;
- skin-tanning preparations, e.g. self-tanning creams;
- depigmenting preparations, e.g. preparations for bleaching the skin or skin-lightening preparations;
- insect-repellents, e.g. insect-repellent oils, lotions, sprays or sticks;
- deodorants, such as deodorant sprays, pump-action sprays, deodorant gels, sticks or roll-ons;
- antiperspirants, e.g. antiperspirant sticks, creams or roll-ons;
- preparations for cleansing and caring for blemished skin, e.g. synthetic detergents (solid or liquid), peeling or scrub preparations or peeling masks;
- hair-removal preparations in chemical form (depilation), e.g. hair-removing powders, liquid hair-removing preparations, cream- or paste-form hair-removing preparations, hair-removing preparations in gel form or aerosol foams;
- shaving preparations, e.g. shaving soap, foaming shaving creams, non-foaming shaving creams, foams and gels, preshave preparations for dry shaving, aftershave or aftershave lotions;
- fragrance preparations, e.g. fragrances (eau de Cologne, eau de toilette, eau de parfum, parfum de toilette, perfume), perfume oils or perfume creams;
- cosmetic hair-treatment preparations, e.g. hair-washing preparations in the form of shampoos and conditioners, hair-care preparations, e.g. pretreatment preparations, hair tonics, styling creams, styling gels, pomades, hair rinses, treatment packs, intensive hair treatments, hair-structuring preparations, e.g. hair-waving preparations for permanent waves (hot wave, mild wave, cold wave), hair-straightening preparations, liquid hair-setting preparations, hair foams, hairsprays, bleaching preparations, e.g. hydrogen peroxide solutions, lightening shampoos, bleaching creams, bleaching powders, bleaching pastes or oils, temporary, semi-permanent or permanent hair colorants, preparations containing self-oxidising dyes, or natural hair colorants, such as henna or camomile.

The final formulations listed may exist in a wide variety of presentation forms, for example:

- in the form of liquid preparations as a W/O, O/W, O/W/O, W/O/W or P/T emulsion and all kinds of microemulsions,
- in the form of a gel,
- in the form of an oil, a cream, milk or lotion,
- in the form of a powder, a lacquer, a tablet or make-up,
- in the form of a stick,
- in the form of a spray (spray with propellant gas or pump-action spray) or an aerosol,
- in the form of a foam, or
- in the form of a paste.

Of special importance as cosmetic compositions for the skin are light-protective preparations, such as sun milks, lotions, creams, oils, sunblocks or tropics, pretanning preparations or after-sun preparations, also skin-tanning preparations, for example self-tanning creams. Of particular interest are sun protection creams, sun protection lotions, sun protection oils, sun protection milk and sun protection preparations in the form of a spray.
Of special importance as cosmetic compositions for the hair are the above-mentioned preparations for hair treatment, especially hair-washing preparations in the form of shampoos, hair conditioners, hair-care preparations, e.g. pretreatment preparations, hair tonics, styling creams, styling gels, pomades, hair rinses, treatment packs, intensive hair treatments, hair-straightening preparations, liquid hair-setting preparations, hair foams and hairsprays. Of special interest are hair-washing preparations in the form of shampoos.

A shampoo has, for example, the following composition: from 0.01 to 5% by weight of a UV absorber according to the invention, 12.0% by weight of sodium laureth-2-sulfate, 4.0% by weight of cocamidopropyl betaine, 3.0% by weight of sodium chloride, and water ad 100%.

For example, especially the following hair-cosmetic formulations may be used:

a) spontaneously emulsifying stock formulation, consisting of the UV absorber according to the invention, PEG-6-C10xoxoalcohol and sorbitan sesquioleate, to which water and any desired quaternary ammonium compound, for example 4% minikamidopropyl(dimethyl-2-hydroxyethylammonium chloride or Quaternium 80 is added;

b) spontaneously emulsifying stock formulation consisting of the UV absorber according to the invention, tributyl citrate and PEG-20 sorbitan monooleate, to which water and any desired quaternary ammonium compound, for example 4% minikamidopropyl(dimethyl-2-hydroxyethylammonium chloride or Quaternium 80 is added;

c) Quat-doped solutions of the UV absorber according to the invention in butytriglycol and tributyl citrate;

d) mixtures or solutions of the UV absorber according to the invention with n-alkylpyrrolidone.

The following examples illustrate the present invention without limiting.

**EXAMPLE 1**

Synthesis of Siloxane Bisphenyl Triazine S-1

0.72 g (0.00315 mol, 97%) of 1,1,3,5,5,7-heptamethyltrisiloxane were added to a mixture of 1.60 g (0.003 mol) of the allyl bisphenyl triazine 2-[4.6-bis[(1,1′-biphenyl]-4-yl]-1,3,5-triazine-2-yl]-5-(2-propene-1-oxo)-phenol (CAS-No. 357436-15-8; B-19) corresponding to formula for 18 h. After adding 25 mL of ethanol and 1 g of charcoal the mixture was stirred at 80°C for 1 h. The solid was filtered off and washed with a little amount of a 1/1 ethanol/toluene mixture. The filtrate was concentrated under vacuo, dried at 70-80°C, resulting in a highly viscous oil which solidifies on standing.

1,709 g (75% yield) of a yellowish powder.

UV (tetrahydrofuran): $\lambda_{max} = 319$ nm; $\epsilon = 72200$ M$^{-1}$ cm$^{-1}$.

**EXAMPLE 2**

Synthesis of Silane Bisphenyl Triazine S-2

The product was prepared analogously to example 1 by reacting 1.60 g (3 mmol) of the allyl bisphenyl triazine B-19, 0.39 g (3.3 mmol) triethyl silane and 15 drops of the platinum(0)-catalyst in 25 ml toluene.

1.55 g (80% yield) of a yellow resin was obtained which solidifies after several hours. On grinding a yellowish powder was obtained.

UV (tetrahydrofuran): $\lambda_{max} = 319$ nm, $\epsilon = 76300$ M$^{-1}$ cm$^{-1}$.

**EXAMPLE 3**

Synthesis of Siloxane Bisphenyl Triazine S-3

The product was prepared analogously to example 1 by reacting 1.60 g (3 mmol) of the allyl bisphenyl triazine B-19, 5.42 g (3.3 mmol) poly(dimethylsiloxane) (mono-hydrogen and mono-n-butyl terminated, average Mw=1000 Dalton, product name Silaplane FM-0111 purchased from Chisso Corp.) and 15 drops of the platinum(0)-catalyst in 25 ml toluene.

4.07 g (~88% yield) of a yellow wax was obtained.

UV (tetrahydrofuran): $\lambda_{max} = 319$ nm, $\epsilon = 68200$ M$^{-1}$ cm$^{-1}$.

**EXAMPLE 4**

Synthesis of Siloxane Bisphenyl Triazine S-4

The product was prepared analogously to example 1 by reacting 1.60 g (3 mmol) of the allyl bisphenyl triazine B-19, 0.82 g (0.5 mmol) poly(dimethylsiloxane-co-methylhydroisilane) (trimethylsilyl terminated, average Mw=1500 Dalton, 33 mol% MeHSiO and 15 drops of the platinum(0)-catalyst in 25 ml toluene.

1.13 g (~50% yield) of an yellow resin was obtained which solidifies after several hours. On grinding a yellowish powder was obtained.

UV (tetrahydrofuran): $\lambda_{max} = 316$ nm, $\epsilon = 35650$ M$^{-1}$ cm$^{-1}$.

**EXAMPLE 5**

Synthesis of Siloxane Bisphenyl Triazine S-5

The product was prepared analogously to example 1 by reacting 1.60 g (3 mmol) of the allyl bisphenyl triazine B-19, 0.96 g (1.7 mmol) poly(dimethylsiloxane) (hydride terminated, average Mw=580, CAS No. 70900-21-9, purchased from Aldrich) and 15 drops of the platinum(0)-catalyst in 25 ml toluene.

1.88 g (76% yield) of an yellow resin was obtained which solidifies after several hours. On grinding a yellowish powder was obtained.

Melting point: 46.8°C. UV (tetrahydrofuran): $\lambda_{max} = 319$ nm, $\epsilon = 118100$ M$^{-1}$ cm$^{-1}$.
EXAMPLE 6

Synthesis of Siloxane Bisbiphenyl Triazine S-6

The product was prepared analogously to example 1 by reacting 1.15 g (2.2 mmol) of the allyl bisbiphenyl triazine B-19, 0.15 g (0.6 mmol) 2,4,6,8-tetramethylcyclootetrasiloxane and 15 drops of the platinum(0)-catalyst in 25 ml toluene. 0.34 g of a yellow resin was obtained which solidifies after several hours. On grinding a brownish powder was obtained.

Melting point: 115.5°C.

UV (tetrahydrofuran): λ_{max} = 319 nm, ε = 29300 M^{-1} cm^{-1}.

EXAMPLE 7

Synthesis of Siloxane Bisbiphenyl Triazine S-7

The product was prepared analogously to example 1 by reacting 1.15 g (2.2 mmol) of the allyl bisbiphenyl triazine B-19, 0.71 g (0.5 mmol) poly(dimethylsiloxane-co-methylhydroxilane) (trimethylsilyl terminated, Mw≈1500 Dalton, 24 mol % MeH(SO) and 15 drops of the platinum(0)-catalyst in 25 ml toluene. 1.44 g of a brownish resin was obtained which solidifies after several hours. Upon grinding a beige powder was obtained.

Melting point: 79.7°C.

UV (tetrahydrofuran): λ_{max} = 318 nm, ε = 31300 M^{-1} cm^{-1}.

EXAMPLE 8

Synthesis of Siloxane Bisbiphenyl Triazine S-8

The product was prepared analogously to example 1 by reacting 1.15 g (2.2 mmol) of the allyl bisbiphenyl triazine B-19, 0.56 g (3.3 mmol) triethoxysilane and 15 drops of the platinum(0)-catalyst in 25 ml toluene. 0.57 g of a yellowish resin was obtained which solidifies after several hours. Upon grinding a yellowish powder was obtained.

Melting point: 62.23°C.

UV (tetrahydrofuran): λ_{max} = 320 nm, ε = 75800 M^{-1} cm^{-1}.

The solubility data of the bisbiphenyl triazine derivatives S-1, S-2, S-3 and S-5 containing silane and/or siloxane groups according to the instant invention suggest that the novel bisbiphenyl triazine derivatives are particularly high solubility UV absorbers.

Photostability

Measurement of Photostability

The method used for assessment of photostability is based on the irradiation of a highly diluted solution of the UV-filter. The analysis after certain doses of irradiation was performed by UV-spectroscopy. The concentration of the UV-absorber in ethanol is adjusted to values between 1·10^{-6} and 1·10^{-7} mol/l, such that the absorbance of the solution in cuvette of 1 cm optical pathlength is equal or smaller than 0.2. The mutual protection of filter molecules can be excluded under such conditions.

Prior to irradiation of a sample the UVB-intensity at the sample position is measured with a UV-radiometer (RM-12, Dr. Grobel Electronic GmbH). This radiometer was calibrated by comparison with a measurement of the spectral output of the metal halide lamp (including light guide and cut-off filter) using a wavelength-resolved radiometer (Gamma C11). Therefore the relationship of the reading of the RM-12 radiometer and the corresponding spectral output of the lamp is known, and one is able to determine the wavelength-resolved intensities by measuring the UVB-intensity.

By changing the distance between the end of the light guide and the cuvette, the UVB-intensity can be varied in the range of 100 μW/cm² and 4500 μW/cm².

For sample irradiation the highest possible intensity was used (4.5 mW/cm² UVB-intensity measured with the Macam 103 radiometer). The irradiation time was varied from 0 to 180 min. The dose the sample has received after 180 minutes corresponds to 60 MED. During irradiation the sample was stirred. After certain intervals of irradiation, the samples were analysed in a UV-spectrometer (Perkin Elmer, Lambda 16).

From the absorbance values at each dose of irradiation the concentration can be calculated using Lambert-Beer’s law. In order to get the half-life of the substance, a first order kinetic model was fitted to the experimental data. Since the UV-spectrum of the lamp and the UV-spectrum of the COLIPA standard sun are known, one can calculate the respective half-life of the UV-absorber under conditions of COLIPA standard sun irradiation [Hernd Herzog, Stefan Müller, Myriam Sohn, Uli Osterwalder, “New Insight and Prediction of Photostability of Sunscreens”, SÖFW Journal 133, 26-36 (2007)].

The investigated half-time values and recovery after irradiation (10 MED) of some specific benzotropolones are listed in the table below:

The compounds Nos. S-1, S-2, S-3, S-4, S-5, S-6, S-7 and S-8 according to the present invention possess high photostability and in all cases more than 99% of the silanes and siloxanes are recovered after irradiation of 10 MED.

UV Shielding Properties

The UV shielding properties of the bisbiphenyl triazine derivatives were investigated by measuring their UV spectra in ethanol. In the following table the investigated absorption maxima (λ_{max}) together with the corresponding A_{10^6} values are listed.
The bis(biphenyl)triazine compounds Nos. S-1, S-2, S-3, S-4, S-5, S-6, S-7 and S-8 according to the present invention possess high shielding properties in the UV region as indicated by $A_{1\text{cm}}^{\lambda_{\text{max}}}$ values above 700.

The invention claimed is:

1. A method of providing a sunscreen composition by adding to a cosmetic composition silane or siloxane bis(biphenyl)triazine UV absorber derivatives of formula

X is a bivalent radical of formula (1a)

\[ R_1 \quad R_1 \quad R_2 \quad R_2 \]

R_1, R_2, R_3, R_4, R_5, and R_6 independently from each other are C_1-C_{20} alkyl; C_1-C_{20} aryl; C_1-C_{20} alkoxy; or O—C_1-C_{20} aryl;
x is a number from 2 to 250;
y is a number from 0 to 250; and
z is a number from 1 to 50;
if n=3,
X is a trivalent radical containing a silane-, oligosiloxane or polysiloxane moiety;
if n=4,
X is a tetravalent radical of formula (1c)

3. The method according to claim 1, wherein
Sil, Sil_1, and Sil_2 independently from each other are an oligosiloxane moiety selected from
Sil(R_1)_m[OSi(R_2)]_o,
wherein
m is 0; 1; or 2,
o is 3, 2 or 1;
the sum of m and o are 3; and
R_1 and R_2 independently from each other are C_1-C_{20} alkyl;
C_1-C_{20} aryl; C_1-C_{20} alkoxy; or O—C_1-C_{20} aryl.

4. The method according to claim 1, wherein the silane groups are selected from trimethylsilyl, triethylsilyl, tripropylsilyl, trisopropylsilyl, dimethyl tert-butylsilyl, dimethylhexylsilyl, triphenylsilane and dimethylphenylsilane.

5. The method according to claim 1, wherein in formula (2)
R_4 and R_5, independently from each other are hydrogen; or
C_1-C_{20} alkyl;
b is a number from 1 to 30; and
c and d are 0.

6. The method according claim 5, wherein in formula (2)
R_4 and R_5, independently from each other are hydrogen; or
C_1-C_{20} alkyl.
7. The method according to claim 5, wherein in formula (2) $R_4$ and $R_8$, independently from each other are hydrogen; or methyl.

8. The method according to claim 5, wherein in formula (2) $b$ is a number from 1 to 5.

9. The method according to claim 1, wherein $X$ corresponds to the formula

\[
\begin{align*}
\text{alkylene} & \quad \text{denotes a straight chained or branched} \\
C_2-C_{12}\text{alkylene;}
\end{align*}
\]

$R_4$, $R_9$, and $R_{10}$ independently from each other are $C_1-C_{22}$alkyl; or $C_1-C_{22}$alkoxy; or a radical of formula

\[
\begin{align*}
R & \quad R & \quad R \\
& \quad \text{independently from each other are} \\
C-C_{12}\text{alkyl, or} \\C-C_{12}\text{alkoxy; and} \\
e & \quad \text{is a number from} \\
0 & \quad \text{to 30.}
\end{align*}
\]

10. The method according to claim 1, wherein $X$ is a radical of formula

\[
\begin{align*}
\text{alkylene} & \quad \text{denotes a straight chained or branched} \\
C_2-C_{12}\text{alkylene;}
\end{align*}
\]

$L$ is a linker selected from a radical of formula (2)

\[
\begin{align*}
\text{alkylene} & \quad \text{denotes a straight chained or branched} \\
C_2-C_{12}\text{alkylene;}
\end{align*}
\]

$p$ and $q$ independently from each other are a number from 1 to 20.

11. The method according to claim 10, wherein $p$ and $q$ independently from each other are a number from 3 to 15.
R₁, R₂, R₃ independently from each other are C₁-C₂₂ alkyl; C₆-C₂₀ aryl; C₁-C₂₂ alkoxy; or O-C₆-C₂₀ aryl; x is a number from 2 to 250; y is a number from 0 to 250; and z is a number from 1 to 50; if n=3, X is a trivalent radical containing a silane-, oligosiloxane or polysiloxane moiety; if n=4, X is a tetravalent radical of formula

13. Cosmetic composition comprising a triazine derivative of formula (1) according to claim 1, and at least one cosmetic acceptable carrier.
