Tissue Protective Peptides and Peptide Analogs for Preventing and Treating Diseases and Disorders Associated with Tissue Damage

Abstract
The present invention provides peptides and peptide analogs that have tissue protective activities while having little or no potentially undesirable hematopoietic effects. The peptides and peptide analogs are useful in preventing and treating a variety of diseases and disorders associated with tissue damage.

TISSUE PROTECTIVE PEPTIDES AND PEPTIDE ANALOGS FOR PREVENTING AND TREATING DISEASES AND DISORDERS ASSOCIATED WITH TISSUE DAMAGE

1. INTRODUCTION

[0002] The invention provides tissue protective peptides and peptide analogs for preventing or treating a disease or disorder associated with tissue damage and/or damage, an effect, or a symptom thereof, including, but not limited to, cancer, inflammation, and exposure to a toxic agent. In particular, the invention provides tissue protective peptides and peptide analogs that share consensus sequences with fragments of Type I cytokine receptor ligands that have little or no potentially undesirable hematopoietic effects of the full length ligands.

[0003] These peptides also include fragments, chimeras, as well as peptides designed to mimic the spatial localization of key amino acid residues within the tissue protective receptor ligands, e.g., EPO. This invention further provides methods and uses of these peptides to modulate a subject’s response and/or a symptom resulting from a disease or disorder associated with tissue damage for the purposes of treating, preventing orameliorating the disease or disorder.

[0004] Additionally, the present invention provides pharmaceutical compositions comprising a peptide and pharmaceutically acceptable carrier, excipient or diluent for the treatment of a disease or disorder associated with tissue damage; or damage, an effect or a symptom thereof, including, but not limited to, cancer, inflammation and exposure to a toxic agent, in a subject in need thereof.

2. BACKGROUND OF THE INVENTION

[0005] Tissue damage can be caused by a substantive loss of tissue due to ischemic, traumatic, toxic, or inflammatory injuries in which cells within the tissue are destroyed by apoptosis or necrosis. Tissue damage can occur in a number of acute and chronic diseases and conditions. The degree to which tissue damage occurs is mediated by many factors, including the type of disease or injury, the level of or severity of inflammation or trauma associated with the disease or injury, the location of the tissue damage, and the vascular sufficiency of the tissue.

[0006] Recent evidence suggests that erythropoietin (EPO), a member of the Type-1 cytokine family, commonly associated with the maintenance of hematocrit may also play an important role in attenuating tissue damage through the interaction with its receptor, EPOR (Brines et al., 2004, Proc. Natl. Acad. Sci. USA, 101(41):14907-12). Although it is hypothesized that EPO may provide compensatory responses that serve to improve hypoxic cellular environment and modulate programmed cell death caused by metabolic stress, the underlying molecular mechanism is yet to be clearly understood.

[0007] Based upon this observation, investigators have explored the use of EPO in various indications. As an example, investigators have explored the use of EPO as a potential treatment for cancers based upon the observation that EPO used to treat anemia in oncology patients not only rectified the anemia but resulted in an enhancement of the well-being of the oncology patient as well. (see U.S. Pat. No. 6,579,525 and Blau C. A., 2007, Stem Cells 25(8):2094-7). U.S. Pat. No. 6,579,525 to Haran-Ghara et al. relates to the use of recombinant EPO for the treatment of multiple myelomas and hypothesizes that EPO induces an immune response to the tumor. Additionally, U.S. patent application Ser. No. 11/093,177, publication no. US 2005/0267027, discloses the use of EPO to inhibit angiogenesis in tumors by reducing HIF-1α and/or VEGF expression in the tumors.

[0008] However, EPO as a potential tissue protective agent suffers from serious disadvantages due to its erythropoietic effect. In particular with chronic dosing, such as would be envisioned in indications such as cancer and inflammation, the frequent applications of therapeutic doses of EPO may significantly increase a subject’s hematocrit, which may lead to hypertension, seizures, and vascular thrombosis.

[0009] Further, with regard to cancer, the potential of EPO as a therapeutic has not been realized. It has been determined that several types of cancer, such as breast cancers, express, and tend to over-express, erythropoietin receptors. This has led to concerns that the therapeutic use of EPO to treat cancer would lead to further growth of the tumor as opposed to a regression of the tumor’s development (see Blau, 2007, supra, and U.S. patent application Ser. No. 10/432,899, published as US 2005/0260850). This concern has been borne out in the clinic as several trials of EPO within various cancer indications have been halted due to an increase in mortality due to tumor growth (Blau). In light of these adverse clinical outcomes the FDA has attached a Black Box warning on approved EPO products cautioning against their use in unapproved cancer indications.

[0010] Additionally, mature human EPO protein is a 165 amino acid protein having a molecular weight of about 30.4 kDa measured by mass spectroscopy. The recombinant protein can be produced in Chinese hamster ovary cells in an expensive and labor intensive process that is highly regulated. Further, EPO must be stored under stringent conditions to maintain its activity. Given these limitations EPO is not an ideal candidate to address public emergencies, such as the release of a toxic agent such as radiation or a chemical agent, either through an industrial accident or act of terrorism or war that would require the rapid mass production of the therapeutic for wide distribution.

[0011] Accordingly, there is a need for tissue protective treatments that have little or no potentially detrimental effects and can be made readily available to the public.

3. SUMMARY

[0012] The present invention provides isolated peptides and peptide analogs that have tissue protective activity in a responsive cell, tissue, or organ. In certain embodiments, the peptides and peptide analogs have little or no potentially
undesirable hematopoietic effects. In particular, the invention provides tissue protective peptides and peptide analogs that share consensus sequences with portions of EPO and Type I cytokine receptor ligands. In certain embodiments, an isolated peptide or peptide analog comprises a 9 to 29-residue amino acid sequence featuring a core structural motif selected from (1) two negatively charged amino acids and (2) one positively charged amino acid and one negatively charged amino acid. The core charged amino acids are flanked by 7 to 27 amino acids as described herein. In certain embodiments the core charged amino acids are immediately adjacent to each other. In certain embodiments, the charged amino acids are separated by 1 to 5 amino acids or by a single polar amino acid.

In certain aspects, the invention provides isolated peptides and peptide analogs that have at least one tissue protective activity. Exemplary tissue protective activities include, but are not limited to, protecting, maintaining, enhancing, and restoring the function or viability of a responsive mammalian cell, tissue, or organ. Accordingly, in one aspect, the present invention provides the use of an isolated peptides and peptide analogs of the present invention for the preparation of pharmaceutical compositions for protecting, maintaining, enhancing, or restoring the function or viability of responsive mammalian cells and their associated cells, tissues, and organs. In related embodiments, the compositions are for administration to a subject in need thereof.

In other aspects, the isolated peptides and peptide analogs of the invention also have little or no erythropoietic activity, e.g. they do not significantly increase hemoglobin or hematocrit in a subject, or more generally have little or no hematopoietic activity, e.g. they do not significantly increase blood cellular components such as erythrocyte, lymphoid, and myeloid cells. In specific embodiments, the isolated peptides and peptide analogs have little or no activity selected from vasoactive action (e.g., vasoconstriction), hyperactivating platelets, pro-coagulant activities, and stimulating proliferation or production of thrombocytes or erythropoietic-dependent cells (see, Coleman et al., 2006, Proc. Natl. Acad. Sci. USA 103:5965-5970).

The invention also provides pharmaceutical compositions comprising such tissue protective peptides and peptide analogs and a pharmaceutically acceptable carrier excipient or diluent, as well as methods for preparing such compositions and their use to treat diseases and disorders associated with tissue damage. In other aspects, the present invention provides methods of using an isolated peptide or peptide analog described herein for the preparation of a pharmaceutical composition for the protection against or prevention of a responsive tissue injury, for the restoration of, or for the rejuvenation of responsive tissue or responsive tissue function in a subject in need thereof. In one particular aspect, the responsive mammalian cells and their associated cells, tissues, or organs are distal to the vasculature by virtue of a tight endothelial cell barrier. In another particular aspect, the cells, tissues, organs or other bodily parts are isolated from a mammalian body, such as those intended for transplant. In certain aspects of the invention, the excitable tissue is central nervous system tissue, peripheral nervous system tissue, cardiac tissue or retinal tissue. In another aspect, the responsive cell or its associated cells, tissues, or organs are not excitable cells, tissues, or organs, nor do they predominantly comprise excitable cells or tissues.

In another embodiment the invention is drawn to a method of preventing, treating, ameliorating or managing inflammation, cancer or neoplastic disorders, or exposure to a toxic agent in a patient in need thereof by administering an effective amount of a peptide.

In certain embodiments, the invention relates to methods of modulating the activity of a mediator of cancer, the body's response to toxic agents, and inflammation. In particular, the invention relates to modulating the activity of an inflammatory mediator. Preferably, the peptides of the current invention are capable of modulating the effects of one or more inflammatory mediators.

In another embodiment, the invention relates to methods of arresting the growth of a cell comprising contacting a cell in need of growth arrestment with an effective amount of a peptide.

In another embodiment, the invention relates to methods of causing the death of a cancer or neoplastic cell comprising contacting a cancer or neoplastic cell with an effective amount of a peptide.

In another embodiment, the invention relates to methods of inhibiting blood vessel generation to the cancerous or neoplastic cells or reducing the production of molecules causing mitosis or angiogenesis.

In another embodiment, the invention relates to methods for treating or preventing the side-effects associated with chemotherapy or radiation therapy, comprising administering to a patient in need of such treatment or prevention an effective amount of a peptide. Side-effects associated with chemotherapy or radiation therapy include cachexia, low blood count, nausea, diarrhea, oral lesions, and alopecia.

In another embodiment, the invention relates to methods for treating or preventing cancer or neoplastic disease in a patient comprising contacting a cancer or neoplastic cell with an effective amount of a peptide.

In another embodiment, the invention relates to methods of treating or preventing cancer or neoplastic disease in a patient comprising administering to a patient in need of such treatment or prevention an effective amount of a peptide.

In certain embodiments, the invention relates to the use of the peptide for the prevention of a pharmaceutical composition for the prevention, treatment, amelioration, or management of cancer or neoplastic disorder in a subject in need thereof.

In another embodiment, the invention relates to methods of treating or preventing the symptoms associated with inflammation or an inflammatory condition. In a further embodiment, the invention relates to methods of treating or preventing inflammation or an inflammatory condition in a patient in need thereof. Amongst the inflammatory conditions treatable by the current method are allergies and allergic diseases, rheumatic diseases, and sports related injuries.

In another embodiment, the invention relates to methods of treating, preventing, ameliorating or managing the effects of exposure to a toxic agent in a person in need of treatment. Amongst the toxic agents considered are biological, chemical and radioactive agents.

In certain embodiments, the invention is also directed to pharmaceutical compositions comprising the aforementioned isolated peptides for administration to a subject in need thereof. In specific aspects in accordance with this embodiment, the pharmaceutical composition of
the invention further comprises a pharmaceutically acceptable carrier. Such pharmaceutical compositions may be formulated for oral, intranasal, ocular, inhalational, transdermal, rectal, sublingual, vaginal, or parenteral administration, or in the form of a parenteral solution for maintaining the viability of cells, tissues, or organs ex vivo. In related embodiments of the invention the subject is a mammalian animal, preferably a human.

4. ABBREVIATIONS AND TERMINOLOGY

4.1 Abbreviations

[0028] These and other features, aspects, and advantages of the present invention will become better understood with reference to the following description and appended claims.

[0029] As used herein, the abbreviations for the genetically encoded L-enantiomeric amino acids are conventional and are as follows:

4.2 Terminology

[0030] Unless defined otherwise, all technical and scientific terms used herein have the meaning commonly understood by a person skilled in the art to which this invention belongs. As used herein, the following terms have the meanings ascribed to them unless specified otherwise.

[0031] (i) As used herein, the terms “about” or “approximately” when used in conjunction with a number refer to any number within 1, 5, 10, 15 or 20% of the referenced number.

[0032] (ii) The term “administered in conjunction with” in the context of the methods of the invention means administering a compound prior to, at the same time as, and/or subsequent to the onset of a disease, disorder, or condition.

[0033] (iii) The term “allergen” refers to an antigenic substance capable of producing immediate type hypersensitivity (allergy). Common allergens include, but are not limited to bacteria, viruses, animal parasites, insects and insect stings, chemicals (latex), dust, dust mites, molds, animal dander, drugs (such as antibiotics, serums, sulfa drugs, anti-convulsants, insulin preparations, local anesthetics, iodine, and aspirin), foods (such as milk, chocolate, strawberries, eggs, soy, nuts, fish, shellfish, wheat), perfumes, plants, pollens, and smoke.

[0034] (iv) The term “allergic disease” refers to a condition or disease caused by or relating to an allergy. Allergic diseases include, but are not limited to, asthma, hypersensitivity lung diseases, rhinitis, rhinosinusitis, atopic eczema, contact dermatitis, allergic conjunctivitis (intermittent and persistent), vernal conjunctivitis (hayfever), atopic keratoconjunctivitis, giant papillary conjunctivitis, urticaria (hives), angioedema, hypersensitivity pneumonia, eosinophilic bronchitis, vasculitis, hypersensitivity vasculitis, anti-neutrophil cytoplasmic antibody (ANCA) associated vasculitis, Wegner’s granulomatosis, Churg Strauss vasculitis, microscopic polyangiitis, temporomandibular, celiac disease, mastocytosis, and anaphylaxis.

[0035] (v) The term “allergy symptom” or “allergic reaction” refers to the body’s response to an allergen. The allergic reaction can be localized to one area (skin that came into contact with allergen) or generalized. Allergic reactions may include, but are not limited to, rash, itching, hives, swelling, difficulty breathing, wheezing, angioedema, difficulty swallowing, nasal congestion, runny nose, shortness of breath, nausea, stomach cramps, abdominal pain, vomiting and/or low blood pressure.

[0036] (vi) The term “allergy” refers to a state of hypersensitivity induced by exposure to a particular antigen (allergen) resulting in harmful immunological reactions on subsequent exposures.

[0037] (vii) The term “amino acid” or any reference to a specific amino acid is meant to include naturally occurring proteogenic amino acids as well as non-naturally occurring amino acids such as amino acid analogs. Those skilled in the art would know that this definition includes, unless otherwise specifically noted, naturally occurring proteogenic (L)-amino acids, their optical (D)-isomers, chemically modified amino acids, including amino acid analogs such as penicillamine (3-mercapto-D-valine), naturally occurring non-proteogenic amino acids such as norleucine and chemically synthesized amino acids that have properties known in the art to be characteristic of an amino acid. Additionally, the term “amino acid equivalent” refers to compounds that depart from the structure of the naturally occurring amino acids, but which have substantially the structure of an amino acid, such that they can be substituted within a peptide, which retains its biological activity despite the substitution. Thus, for example, amino acid equivalents can include amino acids having side chain modifications or substitutions, and also include related organic acids, amides or the like. The term “amino acid” is intended to include amino acid equivalents. The term “residue” refers both to amino acids and amino acid equivalents. Amino acids may also be classified into the following groups as is commonly known in the art: (1) acidic—Asp, Glu; (2) basic—Lys, Arg, His; (3) nonpolar (hydrophobic)—Cys, Ala, Val, Leu, Ile, Pro, Phe, Met, Trp, Gly, Tyr; and (4) uncharged polar—Asn, Gln, Ser, Thr. Non-polar may be subdivided into: strongly hydrophobic—Ala, Leu, Ile, Met, Phe; and moderately hydrophobic—Gly, Pro, Cys, Tyr, Trp. In alternative fashion, the amino acid repertoire can be grouped as (1) acidic—Asp, Glu; (2) basic—Lys, Arg, His; (3) aliphatic—Gly, Ala, Val, Leu, Ile, Ser, Thr; with Ser and Thr optionally be grouped separately as aliphatic—hydroxy; (4) aromatic—Phe, Tyr, Trp; (5) amide—Asp, Glu; and (6) sulfur-containing—Cys and Met. (See, for example, Biochemistry, 4th ed., Ed. by L.
Stryer, WH Freeman and Co., 1995, which is incorporated by reference herein in its entirety.

[0038] (viii) The term “biological organism” as used herein refers to living organisms or the materials derived from them (such as bacteria, viruses, fungi, and toxins) that cause disease in or harm to humans, animals, or plants, or cause deterioration of materials. These biological agents are ubiquitous in nature and may be designed or optimized for use in warfare or terrorism (bioterrorism). These biological agents may consist of prions, viruses, microorganisms (bacteria and fungi), and some unicellular and multicellular eukaryotes (i.e., parasites). In particular, the biological agents (identified by their common name, biological name and the NATO Standard Reference letter code, where available) may include, but are not limited to, mycoplasma agents (Coccidioides mycosis, OC, Coccidioides posadai, Coccidioides immittis), bacterial agents (anthrax (cutaneous, inhalation, gastrointestinal) (Bacillus anthracis, N and TR), plague (bubonic; pneumonic) (Yersinia pestis, LE), tularemia (Francisella tularensis, UL (scha S4), TT (wet type), ZZ (dry type) and SR and JT (425)), cholera (Vibrio cholerae, H0), bovine brucellosis (AB), porcine brucellosis (US and NX), caprine brucellosis (AM and BX), Brucella abortus, Brucella melitensis, Brucella suis, bacterial dysentery (shigellosis, campylobacteriosis, salmonellosis) (Y), glanders (Burkholderia mallei, LA), melioidosis (Burkholderia pseudomallei, HI), diphtheria (Corynebacterium diphtheriae, DK), listeriosis (Listeria monocytogenes, TQ), chlamydial agents (psittacosis “Parrot Fever” (Chlamydia psittaci, SI), rickettsial agents (rocky mountain spotted fever (Rickettsia rickettsii, RI and UV), Q fever (Coxiella burnetii, OU, MN (wet type), and NT (dry type)), human typhus (Rickettsia prowazekii, YE), murine typhus (Rickettsia typhi, AV),) viral agents (yellow fever (Arbovirus flaviviridae, OI, U1, and LU), rift valley fever (RVF Plasmodium bivirulidae, FA), alphaviruses (e.g.: eastern equine encephalitis (ZE), western equine encephalitis, Venezuelan equine encephalitis (NU, TD, and FX), smallpox (ZL), Japanese B Encephalitis (AN), Cercoptisicene herpesvirus 1 (Herpes B virus), Crimean-Congo hemorrhagic fever virus, viral hemorrhagic fever (Filoviridae (ebola and Marburg virus) and Arenaviridae (Lassa and Machupo)), monkey pox virus, Reconstructed 1918 influenza virus, South American Hemorrhagic Fever viruses (Flexal, Guanarito, Junin, Machupo, Sabia), tick borne encephalitis (TBEV) Central European Tick-borne encephalitis, Far Eastern Tick-borne encephalitis, Kyasanur Forest disease, Omsk Hemorrhagic fever, Russian Spring and Summer virus), Hendra virus, Nipah virus, hantaviruses (Korean Hemorrhagic fever), African horse sickness virus, optimized swine fever virus, Akabane virus, avian influenza virus, bluetongue virus, camel pox virus, classical swine fever virus, foot-and-mouth disease virus, goat pox virus, lumpy skin disease virus, malignant catarrhal fever virus (Alcelaphine herpesvirus type 1), Menangle virus, New Castle disease virus, Porcine des petits ruminants virus, rabies virus, rinderpest virus, sheep pox virus, swine vesicular disease virus, vesicular somatitis virus, toxins (botulinum toxin (Clostridium, X and XR), ricin (Ricinus communis, W and WA), Staphylococcal enterotoxin B (UC and PG), Saxitoxin (paralytic shellfish poisoning) (TI and SS), tetrodotoxin (PF), conotoxins, clostridium perfringens epsilon toxin, trichothecene mycotoxins (T-2 toxins), shiga toxin), and simianus (molasses residuum (MR), Bacillus globigii (BG, BS, and U), Serratia marescens (SM and P), Aspergillus fumigatus mutant C-2 (AF), E. Coli (EC), Bacillus thuridius (BT), Erwinia herbicola (EH), fluorescent particle (FP), rye ergot, leprosy, rabies, intestinal typhoid, clostridium perfringens (gas gangrene), aflatoxins, Salmonella typhimurium, enterotoxins, Argentinian hemorrhagic fever, multi-drug resistant Tuberculosis (MTB), Bolivian hemorrhagic fever, legionella pneumophila, marine toxins, beriberi, malaria, pellagra, dengue fever, scirotium rolfoi, neurotrophic encephalitis, Shigella (Y), SEB (UC), and mycotoxins, Dianaeotoxyscine, Cowdria ruminantium, Mycoplasma capricolum M.F38/M, Mycobacterium tuberculosis, Mycobacterium mycolides, abrin. The biological agents may be targeted against humans (e.g. Small pox, Ebola virus, Reconstructed 1918 influenza virus, ricin, etc.), animals such as livestock (e.g. African horse sickness virus, African swine fever virus, foot-and-mouth disease, etc.) or both (Eastern equine encephalitis virus, etc.) Further, even non-lethal biological agents may pose a threat given that they may be reengineered for greater lethality for use as a biological weapon. Thus even the viruses responsible for the common cold may pose a risk.

[0039] (ix) The term “cancer” as used herein refers to any abnormal growth exhibiting malignant properties: the ability (1) to grow and divide without respect to normal limits, (2) to invade and destroy adjacent tissues, and (3) in some instances, spread to other locations in the body. Cancer includes cancers or neoplastic disorders of the central nervous system, peripheral nervous system, gastrointestinal/digestive system, genitourinary system, gynecological, head and neck, hematological/blood, musculoskeletal/soft tissue, respiratory, and breast. Further examples of cancers or neoplastic disorders include, but are not limited to, those of the brain (astrocytoma, glioblastoma, glioma), spinal cord, pituitary gland, breast (Infiltrating, Pre-invasive, inflammatory cancers, Paget’s Disease, Metastatic and Recurrent Breast Cancer), blood (Hodgkin’s Disease, Leukemia, Multiple Myeloma, Lymphoma), Lymph node cancer, Lung (Adenocarcinoma, Oat Cell, Non-small Cell, Small Cell, Squamous Cell, Mesothelioma), skin (melanoma, basal cell, squamous cell, Kaposis Sarcoma), Bone Cancer (Ewings Sarcoma, Osteosarcoma, Chondrosarcoma), head and neck (laryngeal, pharyngeal (nasal cavity and sinus cavity), and esophageal cancers), oral (jaw, salivary gland, throat, thyroid, tongue, and tonsil cancers), eye, gynecological (Cervical, Endometrial, Fallopian, Ovarian, Uterine, Vaginal, and Vulvari), genitourinary (bladder, kidney, penile, prostate, testicular, and urinary cancers), adrenal (cortical adenoma, cortical carcinoma, pheochromocytoma) and gastrointestinal (appendix, bile duct (extrahepatic bile duct) colon, gallbladder, gastric, intestinal, colon, liver, pancreatic, rectal, and stomach cancers) as well as those listed below: (for a review of such disorders, see Fishman et al., 1985, Medicine, 2d Ed., J.B. Lippincott Co., Philadelphia): Leukemia: acute leukemia, acute lymphocytic leukemia, acute myelocytic leukemia, myeloblastic, promyeloctytic, myelomonocytic, monocytic erythroleukemia, chronic leukemia, chronic myelocytic (granulocytic) leukemia, chronic lymphocytic leukemia, Polychromatemia vera, Gastric carcinoma, Lymphoma (malignant and non-malignant); Hodgkin’s disease, non-Hodgkin’s disease, Multiple myeloma, Waldenstrom’s macroglobulinemia, Heavy chain disease, Solid tumors sarcomas and carcinomas: fibrosarcoma, myosarcoma, liposarcoma, chondrosarcoma, osteogenic sarcoma,

The term “chemical agent” as used herein refers to chemical substances that cause severe death or harm to people or animals. To the extent that the chemical agent has been optimized to be delivered using munitions or a dispersal device, the agent is a chemical weapon. In general, chemical agents used as weapons can be classified by their method of action such as: blood agents, blister agents, nerve agents, pulmonary agents, and incapacitating agents. Each of the chemical agents below are identified by their NATO standard Reference letter code where available.

“Blood agents” refer to those chemical agents that prevent cells from using oxygen. Chemical agents within this category include, but are not limited to Arsine (diphenylaminechloroarsine), Clark I (diphenyl-chloroarsine), Clark II (diphenylcycnarsine)) and Cyanide (cyanogen chloride (CK), hydrogen cyanide (AC), etc.) compounds. Arsine compounds cause intravascular hemolysis that leads to renal failure. Cyanide compounds prevent the cells from using oxygen and the cells then resort to anaerobic respiration creating an excess of lactic acid leading to metabolic acidosis. Victims of blood agents may exhibit symptoms including, but not limited to, headaches, dizziness, nausea, vomiting, mucosal irritation, dyspnea, impaired consciousness, coma, convulsions, tachy- and brady-dysrhythmias, hypotension, cardiovascular collapse, and acyanosis.

“Aortic agents” refer to those chemical agents that inactivate the enzyme acetylcholinesterase. The resulting buildup of the neurotransmitter acetylcholine in the victim’s synapses leads to muscularic and nicotinic effects. Compounds within this category include, but are not limited to, cyclosarin (cyclohexylmethylphosphonofluoridate, GF), sarin (isopropyl methylphosphonofluoridate, VX), thioarson, soman (pinacolylmethylphosphonofluoridate, GC), tabun (ethyl N, N-dimethylphosphonodicyanide, GA), VX (O-ethyl-[S]-2-diisopropylaminomethyl-methylphosphono-thiolyte), VR (N,N-diethyl-2-(methylpropoxy) phosphorylsufanylthiamine), VE (O-ethyl-S42-(diethylaminoethyl)methylphosphonothioate), VG (O,O-diethyl-S[2-(diethylamino)ethyl]phosphonothioate), VM (O-ethyl-S[2-(diethylamino)ethyl]methylphosphonothioate), ethyl sarin (isopropylmethylphosphonofluoridate, GF), EDMP (ethyl-2-diisopropylaminoethylmethylphosphonate), DF (methylphosphonyldifluoride), Novichok Agents, GV (P2-(dimethylamino)ethyl]-N,N-dimethylphosphonamidic fluoride), Gd42, Gd83, Tammelin Esters, fluorophosphocholines, phosphothioicholates, DFP, and insecticides (phenothenazines, organophosphates (dichloro, malathion, parathion, fenithion, amidon, paraoxon, chloropyrifos, styxost, pyrophosphate, TOCP)). Victims of nerve agents may exhibit symptoms including, but not limited to, bradycardia, myosis, excessive salivation, vomiting, diarrhea, involuntary micturition, muscle fasciculation, initial depolarizing flaccid paralysis, spike discharges and convulsions, intermediate syndrome, neurotoxic esterase inhibition, and organophosphate-induced delayed neuropathy.

“Blister Agents” refer to agents that are acid-forming compounds that damage the victim’s skin and respiratory system resulting in burns and respiratory problems. Chemical agents within this category include, but are not limited to, sulfur mustards (1,2 bis(2-chloroethylthio) ethane (Sesquimustard, Q), 1,3 bis(2-chloroethylthio)-n-propane, 1,4-bis(2-chloroethylthio)-n-butane, 1,5-bis(2-chloroethylthio)-n-pentane, 2-Chloroethylchloromethyl sulfide, Bis(2-chloroethyl)sulfide (HD), Bis(2-chloroethylthio) methane, Bis(2-chloroethylimethyl) ether, Bis(2-chloroethylthioethyl) ether, di-2-chloroethylsulfide and combinations thereof (HT, HL, HQ)), nitrogen mustards (Bis(2-chloroethyl)ethylamine (HN1), Bis(2-chloroethyl) methylamine (HN2), Tris(2-chloroethyl)amine (HN3), 2-chloro-N-(2-chloroethyl)-N-methylthethanamine-N-oxide hydrochloride, cyclophosphamide, chlorambucil, uramustine, melphalan), lewisites (2-Chlorovinylidichloroarsine, Bis(2-chlorovinyl) chloroarsines, Tris(2-chlorovinyl)arsine, dichloro(2-chlorovinyl)arsine, ethylidichloroarsine, methyl dichloroarsine, phenyldichloroarsine, and phosgene oxime (dichloroformoxime). Victims of blister agents may exhibit symptoms including, but not limited to, erythema, edema, necrosis and vesicles, melanoderma, tracheobronchitis, bronchospasms, bronchial obstruction, hemorrhagic pulmonary edema, respiratory failure, bacterial pneumonia, eye erythema, lachrymation, discomfort of the eyes, severe pain in the eyes, blepharospasm, iritis, blindness, nausea, vomiting, bone narrow suppression, lewisite shock, hepatic necrosis, and renal failure secondary to hypoperfusion.

“Pulmonary Agents” refer to agents that are similar to blister agents but have a more pronounced effect on the respiratory system resulting in the respiratory system being flooded and the victim suffocating. Chemical agents within this category include, but are not limited to, adamsite, Acrolein, Bis(chloroethyl)ether, chlorine, Chloropicrin, diphosphogene, methyl chlorosulfate, stannic chloride, hydrogen chloride, nitrogen oxides, and phosgene. Victims of pulmonary agents may exhibit symptoms including, but not limited to, burning sensations (eyes, nasopharynx, oropharynx), profuse tearing, rhinorrhea, coughing hoarseness, dyspnea, odynophagia, conjunctivitis, corneal injury, naso-oropharyngeal injury/edema, respiratory distress due to inflammation of the glottic structures, secretions, and/or laryngospasms, acute respiratory syndromes, and reactive airway dysfunction syndrome.

“Incapacitating agents” refer to agents that are less lethal and are intended largely to incapacitate through physiological or mental effects or both. A common class of incapacitating agents is lachrymatory agents, chemical agents that irritate the eyes causing tearing, pain, and even temporary blindness. Lachrymatory agents include, but are not limited to, a-chlorotoluene, benzyl bromide, Bromoc-
etone (BA), Bromobenzyleanide (CA), Bromomethyl ethyl ketone, Capsaicin (OC), Chloracetophenone (CN), chloromethyl chlorofomate, Dibenzoazepine (CR), Ethyl isocyanate, Ortho-chlorobenzylidene malonitrile (CS), Trichloromethyl chlorofomate, and xylol bromide. Additional incapacitating agents include, but are not limited to, 3-Quinuclidinyl benzilate (psychedelic; BZ), hydrocyanic acid (paralytic), diphenylchloroarsine (stermatory; DA), diphenylcycloarsine (DC), KOLOKOL-1 (fentanyl derivative), Datura stramonium, Heliborne, Belladonna, Hydrocyanus fale-zlez, indoles (lysergic acid diethylamide (LSD-25)), marijuana derivatives (DMJIP), amphetamines, cocaine, caffeine, nicotine, strychnine, metrazole, barbiturates (methohexital), opioids, antipsychotics (haloperidol), benzo diazepines, fentanyl congeners, pilocycin, ibogaine, harmine, ecstasy, PCP, atropine, scopolamine, oxybutynin, ditropan, anticholinergic antihistamines, benactyzine, and tranquilizers.

[0046] Many of the above noted chemicals have uses beyond their use as weapons and are used within manufacturing. Thus, the accidental or intentional release of these chemical agents from manufacturing or chemical plants will pose a risk to the employees of the plant as well as the populations living in the vicinity of these plants. Examples of toxic industrial manufacturing chemicals include, but are not limited to, ammonia, arsenic, boron trichloride, boron trifluoride, carbon disulfide, chlorine, diborane, ethylene oxide, florine, formaldehyde, hydrogen bromide, hydrogen chloride, hydrogen cyanide, hydrogen fluoride, hydrogen sulfide, nitric acid, phosgene, phosphorous trichloride, sulfur dioxide, sulfuric acid, tungsten hexafluoride, acetone cyanhydrin, acrolein, acrylonitrile, allyl alcohol, allyl amine, allyl chloride, carbon tetrachloride, boron tribromide, carbon monoxide, carbonyl sulfide, chloroacetaldehyde, chloroacetylchloride, chlorine sulfonic acid, diketone, 1,2-dimethyl hydradine, ethylene dibromide, hydrogen selenide, methane sulfonyl chloride, methyl bromide, methyl chloroformate, methyl chlorosilane, methyl hydrazine, methyl isocyanate, methyl mercapatan, nitrogen dioxide, phosphine, phosphorous oxychloride, phosphorous pentahydroflouride, selenium hexafluoride, silicon tetrafluoride, stilbene, sulfur trioxide, sulfuryl chloride, sulfuryl fluoride, tellurium hexafluoride, n-octyl mercaptan, titanium tetrachloride, trichloroacetyl chloride, trichloroacetyl chloride, allyl isothiocyanate, arsenic trichloride, bromine, bromine chloride, bromine penta fluorite, bromine trifluoride, carbonyl fluoride, chlorine penta fluoride, chlorine trifluoride, chloroacetylatedelyde, chloroacetylchloride, crotonaldehyde, cyanogen chloride, dimethyl sulfate, diphenylmethane-4,4′-disocyanate, ethyl chloroformate, ethyl chlorothioformate, ethyl phosphonothioic dichloride, ethyl phosphonodic dichloride, ethyleneleneimine, hexachlorocyclopentadiene, hydrogen iodine, iron pentacarbonyl, isobutyl chloroformate, isopropyl chloroformate, isopropyl isocyanate, n-butyl chloroformate, n-butyl isocyanate, nitric oxide, n-propyl chloroformate, parathion, perchloromethyl mercaptan, sec-butyl isocyanate, tert-butyl isocyanate, tetraethyl lead, tetraethyl pyrophosphate, tetra methyl lead, toluene 2,4-disocyanate, and toluene 2,6-disocyanate.

[0047] As used herein, an “effective amount” includes that amount of a peptide sufficient to modulate any disease or disorder associated with tissue damage or the damage, effects, or symptoms thereof, preferably to inhibit, suppress, or moderate the deleterious effects of the body’s response to the disease or disorder associated with the tissue damage including, but not limited to, the body’s response to cancer, inflammation, or exposure to toxic agents. Additionally, an “effective amount” includes the amount of the peptide sufficient to mitigate, ameliorate, diminish or prevent any disease or disorder associated with tissue damage or provide a therapeutic benefit to a patient afflicted with a disease or disorder associated with tissue damage.

[0048] (xii) As used herein, “erythropoietic activity” means any significant increase in the levels of hemoglobin or hematocrit in a subject. “Little or no erythropoietic activity” means that an increased level of a subject’s hemoglobin or hematocrit meets the criteria accepted in the art as an insufficient increase to cause an adverse effect in a subject. “Significantly increased erythropoietic activity” means that the a difference in the level of a subject’s hemoglobin or hematocrit compared to a control meets the criteria accepted in the art as significant, which may, inter alia, increase the likelihood of hypertension, seizures, and vascular thrombosis.

[0049] (xiii) “Excitable tissue” means tissue that contains excitable cells. Excitable cells are cells that respond actively to an electric stimulus and have an electrical charge differential across their cellular membranes. Excitable cells are generally capable of undergoing an action potential. Such cells typically express channels, such as voltage-gated, ligand-gated, and stretch channels, which allow flow of ions (potassium, sodium, calcium, chloride, etc.) across the membrane. Excitable tissue includes neuronal tissue, muscle tissue, and glandular tissue. Excitable tissue includes, but is not limited to, neuronal tissues such as tissue of the peripheral nervous system (eard and retina) and central nervous system (brain and spinal cord); cardiovascular tissue such as the cells of the heart and associated nerves; and glandular tissue such as the pancreas where T-type calcium channels along with cell-to-cell gap junctions participate in secretion of insulin. An exemplary list of excitable tissue includes organs and tissues that include nerves, skeletal muscle, smooth muscle, cardiac muscle, uterus, central nervous system, spinal cord, brain, retina, olfactory system, auditory system, etc.

[0050] (xiv) The term “hematopoietic activity” means any significant increase in blood cellular components such as erythroid, lymphoid, and myeloid cells. Further hematopoietic activity refers to whether an isolated peptide or peptide analog posses activity selected from vasoactive action (e.g., vasconstriction), hyperactivating platelets, pro-coagulant activities, and stimulating proliferation or production of thrombocytes or erythropoetin-dependent cells.

[0051] (xv) The term “host cell” as used herein refers to the particular subject cell transfected with a nucleic acid molecule and the progeny or potential progeny of such a cell. Progeny of such a cell may not be identical to the parent cell transfected with the nucleic acid molecule due to mutations or environmental influences that may occur in succeeding generations or integration of the nucleic acid molecule into the host cell genome.

[0052] (xvi) The term “inflammatory conditions” as used herein refers to various diseases or traumas, whether mechanically or chemically induced, that have an inflammatory component. It includes conditions giving rise to inflammation in one or more organs or tissues including, but not limited to, the brain, spinal cord, connective tissue, heart, lung, kidney, urinary tract, pancreas, eyes and prostate. Non-limiting examples of such conditions include, but are
not limited to, appendicitis, blepharitis, bronchitis, bursitis, cervicitis, cholangitis, choleoeyritis, chorioamnionitis, conjunctivitis, cystitis, dacryoadenitis, dermatitis, endocarditis, endometritis, epicondylitis, epididymitis, fibrosis, gastritis, gingivitis, glossitis, hidradenitis suppurativa, iritis, laryngitis, mastitis, myocarditis, myositis, nephritis, onychomadesis, orchitis, osteitis, otitis, parotitis, pericarditis, peritonitis, pharyngitis, pleuritis, pneumonitis (pneumonia), prostatitis, pyelonephritis, rhinitis, salpingitis, sinusitis, stomatitis, synovitis, tonsillitis, uveitis, urticaria, vaginitis, vulvitis, asthma, systemic lupus erythematosus, myasthenia gravis, tendonitis, anitis, chronic bronchitis, pancreatitis, osteomyelitis, arthritis (rheumatoid and psoriatic), glomeronephritis, optic neuritis, temporal arteritis, encephalitis, meningitis, traverse myelitis, dermato myositis, polynuromyositis, necrotizing fasciitis, hepatitis, necrotizing enterocolitis, pelvic inflammatory disease, inflammatory bowel disease (ulcerative colitis, Crohn’s disease, ileitis, and enteritis), proctitis, vasculitis, vascular stenosis, restenosis, hypotension, Type-1 diabetes, Kawasaki disease, Decum’s disease, chronic obstructive pulmonary disease, psoriasis, arteriosclerosis, scleroderma, Sjogren’s syndrome, mixed connective tissue disease, rosacea, gastric ulcers, duodenal ulcers, Alzheimer’s disease, adult onset Still’s disease, acute retinal pigment epitheliitis, Tietze’s disease, Behçet’s disease, white dot syndrome (acute posterior multifocal placoid pigment epitheliopathy), serpiginous choroiditis, birdshot chorioretinitis, multifocal choroiditis with panuveitis, diffuse subretinal fibrosis syndrome, punctuate inner choroidopathy, multiple evanescent white dot syndrome, and diffuse unilateral subacute neuro retinitis), granuloma annulare, irritable bowel syndrome, gastroenteritis, Grave’s disease, multiple sclerosis, Dupuytren’s contracture, graft rejection diseases (including allograft rejection and graft-vs-host disease), e.g., skin graft rejection, solid organ transplant rejection, bone marrow transplant rejection, inflammatory dermatoses, viral cutaneous pathologies such as those derived from human papilloma virus, HIV, or RLV infection, bacterial, fungal and or other parasitic cutaneous pathologies, cutaneous lupus erythematosus, and Hyper IgG4 disease. Further “Inflammatory condition” may refer to inflammation resulting from ischemic or non-ischemic conditions, including but not limited to, blunt trauma, contusions, allergies and allergic diseases, rheumatic disease (childhood arthritis, rheumatoid arthritis, Chuck-Strauss syndrome, fibromyalgia, giant cell (temporal) arteritis, gout, Henoch-Schoenlein purpura, hypersensitivity vasculitis, ankylosing spondylitis, capsulitis, rheumatic fever, rheumatic heart disease, systemic lupus erythematosus, polymyalgia rheumatica, osteoarthritis (hand, hip, knee, etc.) polyarteritis nodosa, Reiter’s syndrome), sports related injuries (runner’s knee, tennis elbow, frozen shoulder, Achilles tendonitis, plantar fasciitis, bursitis, Osgood-Schlatter disease), repetitive stress injuries (cumulative trauma diseases, focal dystonia, carpal tunnel syndrome, intersection syndrome, reflex sympathetic dystrophy syndrome, tenosynovitis (De Quervain’s syndrome, trigger finger/trigger thumb), thoracic outlet syndrome, tendinitis, tenosynovitis, radial tunnel syndrome, Raynaud’s disease, ganglion, gamer’s thumb, Wii-itis, etc.) infections including viral, fungal and bacterial. The “inflammatory condition” may be acute or chronic.

An “isolated” or “purified” peptide is substantially free of cellular material or other contaminating proteins from the cell or tissue source from which the protein or peptide is derived, or substantially free of chemical precursors or other chemicals when chemically synthesized. The language “substantially free of cellular material” includes preparations of a peptide in which the peptide is separated from cellular components of the cells from which it is isolated or recombinantly produced. Thus, a peptide that is substantially free of cellular material includes preparations of peptides having less than about 30%, 20%, 10%, or 5% (by dry weight) of heterologous protein (also referred to herein as a “contaminating protein”). When the peptide is recombinantly produced, it is also preferably substantially free of culture medium, i.e., culture medium represents less than about 20%, 10%, or 5% of the volume of the protein preparation. When the peptide is produced by chemical synthesis, it is preferably substantially free of chemical precursors or other chemicals, i.e., it is separated from chemical precursors or other chemicals which are involved in the synthesis of the protein. Accordingly such preparations of the peptide have less than about 30%, 20%, 10%, 5% (by dry weight) of chemical precursors or compounds other than the peptide of interest. In a preferred embodiment, peptides of the invention are isolated or purified.

[0054] (xvii) An “isolated” nucleic acid molecule is one which is separated from other nucleic acid molecules which are present in the natural source of the nucleic acid molecule. Moreover, an “isolated” nucleic acid molecule, such as a cDNA molecule, can be substantially free of other cellular material, or culture medium when produced by recombinant techniques, or substantially free of chemical precursors or other chemicals when chemically synthesized. In a specific embodiment, a nucleic acid molecule(s) encoding a peptide of the invention is isolated or purified.

[0055] (xix) As used herein, the term “management” includes the provision of one or more beneficial side effects that a patient derives from a peptide which, in an embodiment, does not reverse the damage, effects or symptoms of a disease or disorder associated with tissue damage. In certain embodiments, a patient is administered a peptide to “manage” the symptoms of a disease or disorder associated with tissue damage so as to prevent the progression or worsening of the symptoms.

[0056] (xx) The terms “modulate,” “modulations” and the like refer to the ability of a compound to increase or decrease the function and/or expression of mediators of the body’s response to a disease or disorder associated with tissue damage, including transcription of regulatory activity and/or protein binding. Modulation, as described herein, includes the inhibition, antagonism, partial antagonism, activation, agonism or partial agonism of a function or characteristic associated with the mediator, either directly or indirectly, and/or the upregulation or downregulation of the expression of the mediator. In a preferred embodiment, the modulation is direct, and more preferably the modulation occurs through an inhibitor or antagonist of the mediator, a compound that binds to, partially or totally blocks stimulation, decreases, prevents, inhibits, delays activation, inactivates, desensitizes, or downregulates signal transduction. The ability of a particular peptide useful in the method of the current invention to inhibit the function of a mediator can be demonstrated in a biochemical assay, e.g. binding assay, cell based assay, e.g. transient transfection assay, or in vivo assay, e.g. animal model of neuronal injury, cancer, inflammation, or chemical or radiation injury such as a rat or murine model.
As used herein in reference to a structure within a peptide, the term “motif” refers either to a set of consecutive amino acids within the amino acid sequence of the peptide chain and/or to a set of linearly or spatially adjacent amino acids within the secondary and/or tertiary structure of said peptide. Because the motif may be formed all or in part as a result of protein folding, amino acids that are adjacent in the described motif may be separated by 0, 1 or more, 5 or more, 10 or more, 15 or more or 20 or more amino acids within the linear amino acid sequence of the peptide.

As used herein, the terms “peptide,” “polypeptide” and “protein” are used interchangeably and in their broadest sense to refer to constrained (that is, having some element of structure as, for example, the presence of amino acids which initiate β turn or β pleated sheet, or for example, cyclized by the presence of disulfide bonded Cys residues) or unconstrained (e.g., linear) amino acid sequences. In certain embodiments, the peptide of the invention consists of less than 30 amino acids. However, upon reading the instant disclosure, the skilled artisan will recognize that it is not the length of a particular peptide but the ability to bind to a tissue protective receptor complex and/or compete with the binding of a peptide described herein that distinguishes the peptides useful in the method of the current invention. The terms “peptide,” “polypeptide,” and “protein” also refer to compounds containing amino acid equivalents or other non-amino acid groups, while still retaining the desired functional activity of a peptide or protein. Peptide equivalents can differ from conventional peptides by the replacement of one or more amino acids with related organic acids (such as PABA), amino acid equivalents or the like or the substitution or modification of side chains or functional groups.

The term “preventing the damages, effects or symptoms of a disease or disorder associated with tissue damage” means delaying the onset, hindering the progress, hindering the appearance, protection against, inhibiting or eliminating the emergence, or reducing the incidence, of such damages, effects or symptoms. Use of the term “prevention” is meant to imply that all patients in a patient population administered a preventative therapy will never be affected by or develop symptoms in response to the disease or disorder associated with tissue damage targeted for prevention, but rather that the patient population will exhibit a reduction in the damage, effects, or symptoms of the disease or disorder. For example, many flu vaccines are not 100% effective at preventing flu in those administered the vaccine. One skilled in the art can readily identify patients and situations for whom preventative therapy would be beneficial, such as, but not limited to, individuals about to engage in activities that may expose them to various toxic agents or trauma (e.g., soldiers engaging in military operations, chemical or food processing workers, emergency personnel or first responders, etc.), or individuals that may be subjected to exposure to a toxic agent (e.g., individuals living in the vicinity of chemical, nuclear, or manufacturing facilities, or individuals under threat of military or terrorist attack).

As used herein, a “prophylactically effective amount” refers to that amount of a peptide sufficient to result in the prevention of the damage, effects or symptoms resulting from a disease or disorder associated with tissue damage. A prophylactically effective amount can refer to the amount of a peptide sufficient to prevent the damage, effects or symptoms resulting from a disease or disorder associated with tissue damage. Further, a prophylactically effective amount with respect to another prophylactic agent means that amount of that prophylactic agent in combination with a peptide that provides a prophylactic benefit in the prevention of damage, effects or symptoms resulting from a disease or disorder associated with tissue damage. Used in connection with an amount of a peptide, the term “prophylactically effective amount” can encompass an amount that improves overall prophylaxis or enhances the prophylactic efficacy of or provides a synergistic affect with another prophylactic agent.

The term “neoplasm” refers to abnormal growths that lack the malignant properties of cancerous tumors, and are generally mild and non-progressive tumors. Neoplasms, include but are not limited to moles, uterine fibroids, thyroid adenomas, adrenocortical adenomas, pituitary adenomas, and teratomas.

The term “radiation agent” as used herein means any radioactive material that may kill or injure a subject, and may be used to cause disruption upon a city or nation. Exposure to a radiation agent may occur through deployment of a weapon (nuclear bomb, fusion, neutron, boosted fission, or salted bombs), shells containing depleted uranium, terrorist device (“dirty bomb”), or fallout resulting from the detonation of a nuclear weapon or failure of a nuclear plant. Radioactive agents may include, but are not limited to, ¹³¹I, ¹³³Ba, ¹³³Cs, ¹³⁷Cs, ¹⁴⁰Ce, ¹⁴⁵Ce, ¹⁴⁷Pm, ¹⁴⁷Sm, ¹⁴⁸Sm, ¹⁴⁹Sm, ¹⁵⁰Sm, ¹⁵⁰Nd, ¹⁵¹Nd, ¹⁵⁳Nd, ¹⁵⁵Nd, ¹⁵⁶Nd, ¹⁵⁷Nd, ¹⁵⁸Nd, ¹⁵⁸La, ¹⁵⁹La, ¹⁷⁵Yb, ¹⁷⁵Lu, ¹⁷⁶Lu, ¹⁷⁷Lu, ¹⁷⁸Lu, ¹⁷⁹Lu, ¹⁸⁵Re, ¹⁸⁷Re, and ¹⁸⁷Os. Exposure to the radioactive agents can result in carcinogenesis, sterilization, cataract formation, radiodermatitis, beta burns, gamma burns, loss of cells (in particular bone marrow, digestive tract cells), damage to the hematopoietic, gastrointestinal, central nervous, cardiovascular, skin, and/or reproductive systems, acute radiation syndrome, chronic radiation syndrome, and cutaneous radiation syndrome. Acute radiation syndrome generally results from large doses of radiation to a subject’s body occurring in a short period of time. The syndrome has a predictable course starting with a feeling of nausea, vomiting, general illness and fatigue, immune system depression, loss of hair, uncontrollable bleeding (mouth, under the skin, kidneys), massive diarrhea, delirium, coma and death. Cutaneous radiation syndrome is a subset of acute radiation syndrome and refers to radiation effects on the skin, which include, but are not limited to, inflammation, erythema, dry or moist desquamation, hair loss, blistering, reddening, ulceration, damage to sebaceous and sweat glands, atrophy, fibrosis, decreased or increased skin pigmentation, and necrosis.

As used herein, the terms “subject,” “patient” and “victim” are used interchangeably. As used herein, the terms “subject” and “subjects” refer to an animal, preferably a mammal including a non-primate (e.g., a cow, pig, horse, cat, dog, rat, and mouse) and a primate (e.g., a monkey, ape, or a human), and more preferably a human.

As used herein, the term “syndromes associated with neoplasms or cancers” refers to syndromes resulting from the direct action of the tumors through “mass effect” (compression of vital organs due to tumor) or “functional tumors” (overproduction of hormones by organ afflicted with tumor). Such syndromes include, but are not

[0065] (xxviii) As used herein, the term “tissue protective activity” or “tissue protection” refers to the effect of inhibiting or delaying damage or death of a cell, tissue, or organ. Unless otherwise noted, the “delay” in damage or death of a cell, tissue or organ is evaluated relative to a control condition in the absence of a peptide of the invention. Tissue protective activity is specific to tissue, cells, and/or organs expressing a tissue protective receptor complex (i.e., a responsive tissue cell, and/or organ, respectively), such as, but not limited to, the tissues of the central nervous system. In specific embodiments, the responsive cells are not erythrocyte progenitor cells.

[0066] (XXX) The term “tissue protective receptor complex” as used herein means a complex comprising at least one erythropoietin receptor subunit and at least one beta common receptor subunit. The tissue protective receptor complex may contain multiple erythropoietin receptor subunits and/or beta common receptor subunits, as well as other types of receptors or proteins. See WO 2004/096148, which is hereby incorporated by reference herein in its entirety.

[0067] (xxxi) The term “toxic agent” as used herein refers to the biological, chemical and radiation agents mentioned above.

[0068] (xxxii) To determine the percent identity of two amino acid sequences, the sequences are aligned for optimal comparison purposes. The amino acid residues at corresponding amino acid positions are then compared. When a position in the first sequence is occupied by the same amino acid residue as the corresponding position in the second sequence, then the molecules are identical at that position. The percent identity between the two sequences is a function of the number of identical positions shared by the sequences (i.e., % identity=number of identical overlapping positions/bases 100/total number of positions). In one embodiment, the two sequences are the same length. In an alternate embodiment, the sequences are of different length and, accordingly, the percent identity refers to a comparison of the shorter sequence to a portion of the longer sequence, wherein said portion is the same length as said shorter sequence.

[0069] (xxxiii) As used herein, the term “treatment” includes the elimination, reduction, management or control of damage, effects or symptoms resulting from a disease or disorder associated with tissue damage or the damage, effects, or symptoms thereof.

5. BRIEF DESCRIPTION OF THE FIGURES

[0070] FIG. 1 is a chart regarding the proliferation of UT-7 EPO cells in the presence of EPO or Peptide ID (SEQ ID NO: 282). As shown in the graph, EPO led to a proliferation of the UT-7 EPO cells whereas Peptide ID at all doses did not result in proliferation of the cells, demonstrating that Peptide ID is not erythropoietic.

[0071] FIG. 2 is a chart indicating the hemoglobin concentration in Sprague Dawley rats administered Peptide ID twice daily i.v. over a 28 day period. As shown in the graph, the hemoglobin concentration of the rats that received no peptide was the same as those that received Peptide ID, thereby demonstrating that Peptide ID is non erythropoietic.

[0072] FIG. 3A-3C is a series of bar graphs illustrating the (a) hemoglobin concentration, (b) hematocrit, and (c) platelet count in blood samples taken from New Zealand White Rabbits administered various doses of Peptide ID twice daily i.v. for a period of 28 days. As shown in the graphs, the administration of Peptide ID, at all doses, had no effect on the hemoglobin concentration, hematocrit, or platelet count of the animals.

[0073] FIG. 4 is a bar graph indicating the relative survival of motoneurons subjected to kainic acid. As is shown in the graph, those cells pretreated with either Peptide B (SEQ ID NO: 3) or EPO exhibited improved survival rates.

[0074] FIG. 5 is a chart illustrating the De Ryck scores of rats subjected to a foot fault test following middle cerebral artery occlusion and treatment with either saline, Peptide ID or Peptide IX (SEQ ID NO: 299). As shown in the chart, Peptide ID significantly improved the rats performance in the foot fault protocol (11.2±1.1 foot faults) in comparison to the saline treated rats (20.2±0.8 foot faults) and Peptide IX treated rats (20.1±2.1 foot faults).

[0075] FIG. 6A-6C is a series of graphs relating to the concentration of creatinine (Graph A), urea (Graph B), and aspartate aminotransferase (AST) (Graph C) in the serum of mice that had been subjected to 30 minutes of bilateral renal ischemia followed by a period of 24 hrs of reperfusion and received either a control (PBS), 1 µg/kg of Peptide IH at 1 minute into reperfusion, 1 µg/kg of Peptide IH at 30 minutes into reperfusion, 1 µg/kg of Peptide IH at 6 hours into reperfusion, or 10 µg/kg of Peptide IH at 6 hours into reperfusion. As shown in each graph, 1 µg/kg of Peptide IH at 6 hours into reperfusion or 10 µg/kg of Peptide IH at 6 hours into reperfusion resulted in a reduction in these biochemical markers of renal dysfunction.

[0076] FIG. 7A-7C is series of graphs relating to the concentration of creatinine (Graph A), urea (Graph B), and aspartate aminotransferase (AST) (Graph C) in the serum of mice that had been subjected to 30 minutes of bilateral renal ischemia followed by a period of 24 hrs of reperfusion and received either multiple doses of a control (PBS), 0.1 µg/kg of Peptide IH, 1 µg/kg of Peptide IH, or 10 µg/kg of Peptide IH at 1 minute, 6 hours and 12 hours into reperfusion. As shown in each graph, 1 µg/kg of Peptide IH or 10 µg/kg of
Peptide IH resulted in a reduction in these biochemical markers of renal dysfunction.

FIG. 8 is a chart illustrating the reduction in wound area over a period of treatment in a full thickness punch biopsy wound assay in rats receiving Peptide ID (24 nmol/kg of bw) daily s.c. As shown in the chart, the wounds on rats receiving Peptide ID healed more rapidly.

FIG. 9 is a bar graph showing the results from a novel object recognition test performed on adult Wistar rats that received saline, positive control galantamine (3 mg/kg of bw), or Peptide ID (24 nmol/kg of bw) at various time points. As shown in the graph, galantamine and Peptide ID increased the rats' recognition of the novel objects.

FIG. 10 is a graph comparing the volume of urine produced by rats treated with cisplatin, cisplatin and peptide IC (SEQ ID NO: 281), or control (PBS). The graph illustrates that the urine volume of the cisplatin and Peptide IC treated rats was substantially like that of the control (PBS) group. Thus the graph demonstrates that in a model of cisplatin induced nephropathy in rats that Peptide IC administered three times weekly at a dose of 0.4 μg/kg over a 5 week period protected the treated rats against renal damage due to the cisplatin.

FIG. 11 is a graph comparing the times it took a rat to withdraw a paw from the hot plate in rats treated with cisplatin, cisplatin with Peptide IC or control (PBS). The graph illustrates that the time it took the rats treated with cisplatin and Peptide IC to withdraw their paw from the hotplate was substantially similar to the control group (PBS). Thus the graph demonstrates that in a model of cisplatin induced neuropathy in rats that Peptide IC administered three times weekly at a dose of 0.4 μg/kg over a 5 week period protected the treated rats against peripheral neuropathy due to the cisplatin.

FIG. 12 is a graph comparing relative volume of a cortical tumor implanted in a rat’s brain in accordance with the protocol of Lampson L. A. et al., 193, Cancer Res. 53(1):176-82 after 25 days. The graph shows that the relative volume of the tumors in the rats treated by saline increased by slightly greater than 0.4 cm³ whereas the rats treated with Peptide ID following implantation showed no increase in the relative volume of the tumor.

FIG. 13 is a graph comparing the relative volume of a cortical tumor implanted in a rat’s brain in accordance with the protocol of Lampson L. A. et al., 193, Cancer Res. 53(1):176-82 after 25 days. The graph shows that the relative volume of the tumors in the rats treated by saline starting two weeks after implantation is about 300 mm³ greater whereas treatment with Peptide ID and Peptide IW (an extended half-life peptide, SEQ ID NO: 298) starting two weeks after implantation reduced the size of tumor in both cases. Administration of Peptide IW at 2 weeks resulted in a reduction in size of the tumor equivalent to that achieved by immediate treatment with Peptide ID.

FIG. 14 is a comparison of cortical tumor size in rats treated with saline daily, Peptide ID, or Peptide IW after a two week delay. The darkened areas on the photograph illustrate the presence of the tumor. The comparative photos clearly demonstrate that the administration of Peptide IW after two weeks led to a similar reduction in size of the tumor as administration of Peptide ID immediately after implantation of the tumor.

FIG. 15 is a difference in ear thickness in the ears of Sprague Dawley rats intradermally injected with histamine diphosphate. The rats were treated either with Peptide ID intravenously or saline. The ears of the rats treated with Peptide ID, exhibited less inflammation in response to the histamine challenge than the ears of the rats treated with saline.

FIG. 16 is a chart demonstrating the difference in wheal (hivae) size on rat abdomens in response to intradermally administered histamine in those rats pretreated with saline and those pretreated with Peptide ID. The chart illustrates the anti-inflammatory effects of Peptide ID up to 24 hours following the histamine injection.

FIG. 17 is a chart demonstrating the difference in wheal (hivae) area in response to a histamine challenge in rats between those rats treated with EPO and those rats treated with saline. The wheal area after fifteen (15) minutes was less in those treated with EPO than those rats treated with saline.

FIG. 18 is a chart comparing the difference in wheal (hivae) size (lesion area) in rats challenged with histamine and treated using saline, Peptide ID (SEQ ID NO: 299), Peptide ID and Peptide IW. Animals treated with either Peptide ID or Peptide IW exhibited nearly half the lesion area (about 0.35 cm² and 0.3 cm² respectively) of the lesion on the saline and Peptide ID treated animals (about 0.6 cm²).

FIG. 19 is a chart comparing the difference in wheal (hivae) size (lesion area) in rats challenged with histamine and treated using saline, Peptide JA (SEQ ID NO: 301), Peptide IW, Peptide IZ (SEQ ID NO: 300), and Peptide ID. Animals treated with either peptide IW, IZ, or ID exhibited a smaller lesion area (0.3 cm², 0.35 cm², and 0.4 cm² respectively) in comparison to the saline and peptide JA treated animals (both about 0.6 cm²).

FIG. 20 is a chart comparing the difference in wound (ulcer) size (area) in rats subjected to a pressure ulcer and treated using saline, Peptide ID dosed twice, Peptide ID dosed daily or EPO administered daily. The chart demonstrates that the Peptide ID and EPO treated rats exhibited better wound healing than the saline treated rats. With the Peptide ID daily treated animals had the smallest wound size.

FIG. 21 shows Kaplan Meier Survival Curves for mice irradiated with 796cGy (A) or 831cGy (B) and then treated with Peptide ID subcutaneously daily for 29 days following irradiation or with PBS subcutaneously for 29 days. At both doses of radiation, Peptide ID significantly increased the overall survival time of the mice at day 30 (45% survival at day 30 at 796cGy, 20% survival at day 30 at 831cGy).

FIG. 22 is a chart showing the survival rate of mice that received partial body irradiation of 150Gy and then were treated with Peptide ID at day 1 and daily thereafter or PBS at day one and daily thereafter. As the chart shows, the number of mice surviving to day 20 was substantially greater amongst those receiving Peptide ID in comparison to those receiving PBS (6 peptide treated mice vs. 1 PBS treated mouse).

6. DETAILED DESCRIPTION OF THE INVENTION

6.1 Isolated Polypeptides

[0092] The current invention provides a method of modulating the effects of the body’s response to a disease or disorder associated with tissue damage. Further, the current
invention provides a method of preventing, treating, ameliorating, or managing damage, effects or symptoms in a patient afflicted with a disease or disorder associated with tissue damage by administering a peptide that is derived from erythropoietin or another Type-1 cytokine. Preferably, the peptide used in the current method is tissue protective, neuroprotective, neurotrophic, or anti-apoptotic.

Several peptides derived from Type-1 cytokines, such as EPO, have been disclosed in the art, such as: (a) and (b) Brines et al. in PCT/US2006/031061, published as WO 2007/018545, and US patent application “Tissue Protective Peptides and Peptide Analogs for Preventing and Treating Diseases and Disorders Associated with Tissue Damage,” Ser. No. 61/062,012, filed Jan. 22, 2008; “EPO-derived Tissue Protective Peptides and Peptide Analogs for Preventing and Treating Disorders Associated with Tissue Damage,” Ser. No. 61/062,022, filed Jan. 22, 2008; and “Method of Treating Inflammation or Inflammatory Conditions and Symptoms Thereof with EPO,” Ser. No. 61/133,912, filed Jul. 3, 2008 (“Brines”); (c) Bock et al. in PCT Application No. DK2006/000246 published as WO 2006/119767 and WO 2007/071249 (“Bock”); (d) O’Brien et al. in U.S. Pat. Nos. 5,571,787, 5,700,909, 5,696,080, 5,714,459, 5,690,074, 6,559,124, 6,271,196, 6,268,347, and 6,649,602 (“O’Brien”); (e) Smith-Swintosky et al. in U.S. Pat. No. 7,259,146 and U.S. Publication No. 20030130197 (“Smith-Swintosky”), and (f) Yuan et al. in PCT/IB2006/ 003581 published as WO/2007/052154 (“Yuan”) each of these inventions is hereby incorporated in their entirety.

For purposes of discussing the above-motifs, the three dimensional structure of EPO is accepted as described by Cheetham et al., 1998, Nat. Struct. Biol. 5: 861-866, hereby incorporated by reference in its entirety, and as set forth in SEQ ID NO:1 (also available as data deposited in the Protein Data Bank of the National Center for Biotechnology Information as entry “1BUY”).

As stated above, peptides useful for the modulation of the body’s response to a disease or disorder associated with tissue damage and/or useful in the prevention, treatment, amelioration and management of damage, effects or symptoms in a subject afflicted with a disease or disorder associated with tissue damage have a motif based on one or more of the above-idented fragments on the amino acid sequences of EPO, derived from the three-dimensional structural configuration of the EPO protein, and in particular, were derived from those regions of EPO facing away from the ligand binding sites and/or the internal portion of the EPO homodimer. These fragments are derived from the following EPO structures: (1) loop AB and N-terminal portion of helix B (Peptide A: NITVPDKTVNLYAWKRMVEG, SEQ ID NO:2, corresponding to amino acids 38-57 of SEQ ID NO:1); (2) C-terminal portion of helix B (Peptide B: QQAVEVWQLALLSEAVLROQALV, SEQ ID NO:3, corresponding to amino acids 58-82 of SEQ ID NO:1); and (3) a portion of the A-B loop consisting of a small cysteine loop and a β-sheet (Peptide C: C6GCAEHCSDLNENITVPDKTVN, SEQ ID NO:4, corresponding to amino acids 28-47 of SEQ ID NO:1).

Specifically, these motifs may be: (a) Structural Motif A.

In this structural motif, the peptide useful for the prevention, treatment, amelioration, or management of a disease or disorder associated with tissue damage or damages, effects or symptoms resulting therefrom possesses two negatively charged amino acids, which can be separated by up to 5 amino acids, flanked by hydrophobic amino acids. Structurally this can be represented as H1-Ni-(Xn)2-N2-H2, wherein n is 0-5, SEQ ID NO: 5; or alternatively as:

(a) HNNH, SEQ ID NO:6;
(b) HNXXNH, SEQ ID NO:7;
(c) HNXXNH, SEQ ID NO:8;
(d) HNXXNH, SEQ ID NO:9;
(e) HNXXNH, SEQ ID NO:10;
(f) HNXXNH, SEQ ID NO:11.

where 11 represents hydrophobic amino acids (e.g., the moderately hydrophobic amino acids: Gly (G), Pro (P), Cys (C), Tyr (Y), and Trp (W), and preferably the highly hydrophobic amino acids: Ala (A), Val (V), Ile (I), Met (M), Leu (L), Phe (F)), N represents a negatively charged amino acid such as Glu (E) or Asp (D), and X represents any amino acid, although preferably a hydrophilic one.

A variation of this structural motif, structurally represented as H1-Ni-(Xn)2-N2-L1, wherein n is 0-5, SEQ ID NO: 12, or L1-Ni-(Xn)2-N2-H2, wherein n is 0-5, SEQ ID NO: 13, is disclosed where one of the flanking hydrophobic amino acids has been replaced with a polar amino acid such as Ser (S), Thr (T), Asn (N), or Gln (Q).

Examples of this motif are:

(SEQ ID NO: 14)
Peptide D APPPLCIDSREWLRELEKAE,

(SEQ ID NO: 2)
Peptide A NITVPDKTVNLYAWKRMVEG,

(SEQ ID NO: 3)
Peptide B QQAVEVWQLALLSEAVLROQALV.

In a particular embodiment of Structural Motif A, a class of the isolated peptides and peptide analogs useful for the prevention, treatment, amelioration, management of a disease or disorder associated with tissue damage or damages, effects or symptoms resulting therefrom may have the structural formula I (SEQ ID NO: 15):

wherein:

X1 is Cys (C) or Pro (P);
X2 is Asp (D) or Pro (P);
X3 is Ser (S) or Arg (R);
X4 is Arg (R) or Leu (L);
X5 is Val (V) or Ile (I);
X6 is Leu (L) or Cys (C);
X7 is Glu (E) or Asp (D);
X8 is Arg (R) or Ser (S);
X9 is Thr (Y) or Arg (R);
X10 is Leu (L) or Val (V);
X11 is Leu (L) or Ala (A);
X12 is a negatively charged amino acid;
X13 is (Z)n is an amino acid, wherein n is 1-5;
X14 is a negatively charged amino acid;
X15 is Ala (A) or Leu (L);
X16 is Glu (E) or Lys (K);
X17 is Asn (N), Glu (E) or Lys (K);
X18 is Ile (I) or Ala (A);
X19 is Thr (T), Glu (E) or Gly (G);
In certain embodiments, isolated peptides and peptide analogs of Formula I may not include Peptide D, APPRLICDSDLVRELLEAKAE (SEQ ID NO:14); Peptide A, NITVDPDKVNYAWKRMEEVG (SEQ ID NO: 2); Peptide B, QQAVEWQGLALLSEAVLRGQALLV (SEQ ID NO: 3). Peptide C, GCAEHCSLNEITVPDKVN (SEQ ID NO: 4) or Peptide E, RYLLEAKEAENITITGC (SEQ ID NO:15).

In certain embodiments, the isolated peptides and peptide analogs can contain fewer than 24 amino acid residues. Indeed truncated or internally deleted forms of structural Formula I containing as few as 23, 22, 21, 20, 19, 18, 17, 16, 15, 14, 13, 12, 11, or even 10 amino acid residues that substantially retain the overall characteristics and tissue protective properties of the isolated peptides and peptide analogs of structural Formula I.

Due to the surmise importance of the spatially compact change configuration at the internal residues of the isolated peptides and peptide analogs of structural Formula I, in certain embodiments of the invention, residues comprising the polar, negatively and positively charged, and immediately adjacent amino acids are not deleted. Thus, in certain embodiments, residues X11, X12, X13, and X14 are not deleted.

The isolated peptides and peptide analogs of Formula I can also be extended at one or both termini or internally with additional amino acid residues that do not substantially interfere with, and in some embodiments even enhance, the structural and/or functional properties of the peptides or peptide analogs. Indeed, extended core peptides and peptide analogs containing as many as 25, 26, 27, 28, or 29 amino acid residues and are considered to be within the scope of the present invention. Preferably, such extended peptides will substantially retain the tissue protective properties of the peptide analogs of Formula I.

Certain amino acid residues in the core peptides and peptide analogs of Formula I can be replaced with other amino acid residues without significantly deleteriously affecting, and in many cases even enhancing, the activity of the peptides and peptide analogs. Thus, also contemplated by the present invention are altered or mutated forms of the isolated peptides and peptide analogs of Formula I wherein at least one and up to eight amino acid residues in the formula are conservatively substituted with another amino acid residue. In certain embodiments, seven, six, five, four, three, two, or one amino acid is conservatively substituted.

In specific embodiments, the isolated peptides and peptide analogs consists of the amino acid sequence:

- **Peptide F:** CDSRVLERYLLEAKEAENITTGCASN (SEQ ID NO: 16)
- **Peptide G:** PPRLICDSRVLERYLLEAKEAENITITGCASN (SEQ ID NO: 17)
- **Peptide H:** ADRELEKIGA (SEQ ID NO: 18)

In this structural motif, the peptide has a positive amino acid next to a negative amino acid and both charged amino acids are flanked by single hydrophobic amino acids. Structurally this can be represented as:

- SEQ ID NO: 19
  - (b1) HSHPH
  - or
  - (b2) HPHR

- SEQ ID NO: 20
  - (b3) HHLPH
  - (b4) HPLLH

Wherein P represents positively charged amino acids such as arginine, lysine or histidine and N represents the negatively charged amino acids glutamate or aspartate.

In a variation of this particular motif, the negative and positive amino acids can be separated by a polar amino acid, e.g.,

- SEQ ID NO: 21
  - (b3) HHLPH
  - (b4) HPLLH

Wherein L represents a polar amino acid such as serine, threonine, asparagine, or glutamine. Alternatively, the above structural motifs may be represented as H1-Nr-(L)_r-P1-H2, wherein r is 0-1, SEQ ID NO: 23, or H1-P1-(L)_r-Nr-H2, wherein r is 0-1, SEQ ID NO: 24, as well. An example of this motif is peptide C (GCAEHCSLNEITVPDKVN, SEQ ID NO:4).

In certain embodiments, isolated peptides and peptide analogs of the particular embodiments of Structural Motif B disclosed below in Formulas II-IV may not include Peptide D, APPRLICDSDLVRELLEAKAE (SEQ ID NO:14): Peptide A, NITVDPDKVNYAWKRMEEVG (SEQ ID NO: 2); Peptide B, QQAVEWQGLALLSEAVLRGQALLV (SEQ ID NO: 3). Peptide C, GCAEHCSLNEITVPDKVN (SEQ ID NO: 4) or Peptide E, RYLLEAKEAENITITGC (SEQ ID NO:15).

In a particular embodiment of Structural Motif B, a class of the isolated peptides and peptide analogs useful for the prevention, treatment, amelioration, management of a disease or disorder associated with tissue damage or damages, effects or symptoms resulting therefrom may comprise 10 to 28 consecutive amino acid residues, which have the structural Formula II (SEQ ID NO:25):

Wherein:

- X1 is Ser (S);
- X2 is Arg (R);
- X3 is Val (V);
- X4 is Leu (L);
- X5 is Gln (E);
- X6 is Arg (R);
- X7 is Tyr (Y);
- X8 is Leu (L);
- X9 is Leu (L);
- X10 is Glu (E);
- X11 is Ala (A);
In certain embodiments, the isolated peptides and peptide analogs can contain fewer than 24 amino acid residues. Indeed, truncated or internally deleted forms of structural Formula II containing as few as 23, 22, 21, 19, 18, 17, 16, 15, 14, 12, 11, or even 10 amino acid residues that substantially retain the overall characteristics and tissue protective properties of the isolated peptides and peptide analogs of structural Formula II.

Due to the surmised importance of the spatially compact charge configuration at the internal residues of the isolated peptides and peptide analogs of structural Formula II, in certain embodiments of the invention, residues comprising the negatively and positively charged and immediately adjacent amino acids are not deleted. Thus, in certain embodiments, residues X11, X12, X13, and X14 are not deleted.

The isolated peptides and peptide analogs of Formula II can also be extended at one or both termini or internally with additional amino acid residues that do not substantially interfere with, and in some embodiments even enhance, the structural and/or functional properties of the peptides or peptide analogs. Indeed, extended core peptides and peptide analogs containing as many as 25, 26, 27, 28, or 29 amino acid residues and are considered to be within the scope of the present invention. Preferably, such extended peptides will substantially retain the tissue protective properties of the peptide analogs of Formula II.

Certain amino acid residues in the core peptides and peptide analogs of Formula II can be replaced with other amino acid residues without significantly deleteriously affecting, and in many cases even enhancing, the activity of the peptides and peptide analogs. Thus, also contemplated by the present invention are altered or mutated forms of the isolated peptides and peptide analogs of Formula II wherein at least one and up to eight amino acid residues in the formula are conservatively substituted with another amino acid residue. In certain embodiments, seven, six, five, four, three, two, or one amino acid is conservatively substituted.

In specific embodiments, the isolated peptide or peptide analog consists of the amino acid sequence:

Peptide 1

<table>
<thead>
<tr>
<th>Peptide 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>SRVLERYLLEAKEAENITTGCASH</td>
</tr>
</tbody>
</table>

In a further embodiment of Structural Motif B, a class of the isolated peptides and peptide analogs useful for the prevention, treatment, amelioration, management of a disease or disorder associated with tissue damage or damages, effects or symptoms resulting therefrom, have the structural Formula III (SEQ ID NO: 27):
In certain embodiments, seven, six, five, four, three, two, or one amino acid is conservatively substituted.

In specific embodiments, the isolated peptides and peptide analogs are selected from the group of peptides set forth below:

**Peptide J** (SEQ ID NO: 28)

PPRLCDSERVVELLEAAE
d

**Peptide K** (SEQ ID NO: 29)

KEAENITTGOAEHCSLNNITVPP,
d

**Peptide L** (SEQ ID NO: 30)

SQPWEPLQLHVDKAVSGLRLSLTTL,
d

**Peptide M** (SEQ ID NO: 32)

APPRLICDSRVLERYLLEAKE;

**Peptide N** (SEQ ID NO: 33)

ADRELEKIGA.

In yet another embodiment of Structural Motif B, a class of the isolated peptides and peptide analogs useful for the prevention, treatment, amelioration, management of a disease or disorder associated with tissue damage or damage, effects or symptoms resulting therefrom, the isolated peptides and peptide analogs have the structural Formula IV (SEQ ID NO: 31):

$$X_1X_2X_3X_4X_5X_6X_7X_8X_9X_{10}X_{11}X_{12}X_{13}X_{14}X_{15}X_{16}X_{17}X_{18}X_{19}X_{20}X_{21}X_{22}X_{23}$$

wherein:

- **X_1** is His (H);
- **X_2** is Cys (C);
- **X_3** is Ser (S);
- **X_4** is Leu (L);
- **X_5** is Ala (A) or Asn (N);
- **X_6** is Pro (P) or Glu (E);
- **X_7** is Pro (P) or Asn (N);
- **X_8** is Arg (R) or Ile (I);
- **X_9** is Leu (L) or Thr (T);
- **X_10** is Ile (I) or Val (V);
- **X_11** is Cys (C) or Pro (P);
- **X_12** is a negatively charged amino acid;
- **X_13** is a polar amino acid;
- **X_14** is a positively charged amino acid;
- **X_15** is Val (V);
- **X_16** is Leu (L) or Asn (N);
- **X_17** is Glu (E) or Phe (F);
- **X_18** is Arg (R) or Tyr (Y);
- **X_19** is Tyr (Y) or Ala (A);
- **X_20** is Leu (L) or Trp (W);
- **X_21** is Leu (L) or Lys (K);
- **X_22** is Glu (E) or Arg (R);
- **X_23** is Ala (A) or Met (M);
- **X_24** is Lys (K) or Glu (E);
- **X_25** is Glu (E) or Val (V).

In certain embodiments, the isolated peptides and peptide analogs can contain fewer than 25 amino acid residues. Indeed, truncated or internally deleted forms of structural Formula IV containing as few as 24, 23, 22, 21, 20, 19, 18, 17, 16, 15, 14, 13, 12, 11, or even 10 amino acid residues that substantially retain the overall characteristics and tissue protective properties of the isolated peptides and peptide analogs of structural Formula IV.

Due to the surmised importance of the spatially compact charge configuration at the internal residues of the isolated peptides and peptide analogs of structural Formula IV, in certain embodiments of the invention, residues comprising the polar, negatively and positively charged, and immediately adjacent amino acids are not deleted. Thus, in certain embodiments, residues X_{11}, X_{12}, X_{13}, X_{14}, and X_{15} are not deleted.

The isolated peptides and peptide analogs of Formula IV can also be extended at one or both termini or internally with additional amino acid residues that do not substantially interfere with, and in some embodiments even enhance, the structural and/or functional properties of the peptides or peptide analogs. Indeed, extended core peptides and peptide analogs containing as many as 26, 27, 28, or 29 amino acid residues and are considered to be within the scope of the present invention. Preferably, such extended peptides will substantially retain the tissue protective properties of the peptide analogs of Formula IV.

Certain amino acid residues in the core peptides and peptide analogs of Formula IV can be replaced with other amino acid residues without significantly deleteriously affecting, and in many cases even enhancing, the activity of the peptides and peptide analogs. Thus, also contemplated by the present invention are altered or mutated forms of the isolated peptides and peptide analogs of Formula IV wherein at least one and up to eight amino acid residues in the formula are conservatively substituted with another amino acid residue. In certain embodiments, seven, six, five, four, three, two, or one amino acid is conservatively substituted.

In specific embodiments, the isolated peptides and peptide analogs are selected from the group of peptides set forth below:

**Peptide M** (SEQ ID NO: 32)

APPRLICDSRVLERYLLEAKE;

**Peptide N** (SEQ ID NO: 33)

HCSLNNITVPOTCVNHYAHMK.

One of ordinary skill in the art will recognize that it is the above noted structural motifs A and B that is important to the current invention. Thus one of ordinary skill in the art would recognize that the isolated peptide may have less than 90%, less than 85%, less than 80%, less than 75%, less than 70%, less than 65%, less than 60%, less than 55%, less than 50%, less than 45%, less than 40%, less than 35%, less than 30%, or less than 20 percent sequence identity with any portion of the amino acid sequence of mature human EPO set forth in SEQ ID NO: 1, wherein said portion of EPO contains the same number of amino acid residues as said peptide.

Applicants further propose that the tissue protective activity of structural motifs A and B is due to an appropriate, spatially compact charge configuration generated by the motifs. The proximity of these charges may occur via the linear structure imposed by peptide bonding, i.e., the structure may be formed by consecutive amino acids in a polypeptide chain, or alternatively, proximity can also occur via a spatial relationship between different parts of the
EPO molecule (or other related Type 1 cytokine molecules) imparted by the protein's secondary and/or tertiary structure, i.e., three dimensional structure. Not wishing to be bound to any specific theory, Applicants believe that, in general, this requirement dictates that a tissue protective peptide will have a distinct tertiary structure (e.g., helices or pleated sheets) that provides for the required spatial location of the pair of charged amino acids (i.e., the two negatively charged amino acids and/or the positively and negatively charged amino acid). A simple exception is a linear peptide wherein the amino acid pair is immediately adjacent to each other, with the required rigidity imparted by the peptide backbone. Accordingly, the structural motif A, is encompassed by a linear sequence of amino acid residues, e.g., H1-N2-H3-H4-H5 (SEQ ID NO:5), or by a linear sequence of amino acid residues wherein N1 and N2 are separated by 1, 2, 3, 4, 5, 6, or more intervening residues, e.g., H-N-X-X-X-N-X (SEQ ID NO:10).

Not wishing to be bound by any particular theory, Applicants believe that for tissue protection, the pair of charged amino acids in the peptide must be spatially oriented such that the carbamyl carbons are about 3 angstroms (Å) to about 5 Å apart, preferably, about 4 Å to about 5 Å apart, and more preferably about 4.4 Å to about 4.8 Å apart. This can be accomplished in a number of ways, for example, by adjacent charged amino acids in a simple linear peptide or for peptides that can form an alpha helix, charged amino acids separated by an intervening amino acid residue. It is to be noted that tertiary structure (e.g., an alpha helix in amphipathic peptides) can also be imparted when the peptide is within a specific microenvironment, such as at the extracellular-cell surface membrane interface (see, Segrest, 1990, Proteins 8:103-117, hereby incorporated by reference in its entirety).

Further, tissue protective activity is predicted for peptides that contain pairs of charged amino acids such that the charged side-chains (either positive and negative or two negatives) be confined spatially to within about 6.5 Å to about 9 Å of each other. This can be provided for in an alpha helix by the charged pair being separated by one or two amino acids, which will provide for the charges to be more or less on the same side of the helix with the required about 6.5 Å to about 9 Å separation. One skilled in the art can devise a tertiary structure for the peptide that is generally required to obtain the appropriate three dimensional location of the charged amino acids, as well as the design of small molecules to mimic the charge separation within the peptide.

The spatial distances between the carbamyl carbons of any two amino acids or between the side chains of any two amino acids can be deduced by any method known in the art or described herein. For example, where the three-dimensional structure of the protein is known, the charge separation of two side chains or the spatial distance between two carbamyl carbons within a portion of interest of said protein can be calculated based on the published, or otherwise art-accepted, three-dimensional coordinates of the amino acid residues in said portion of interest. Where the three-dimensional structure of the protein and, therefore, the portion of interest is unknown, or wherein a fully synthetic peptide is constructed based on the teachings herein, whose three dimensional structure is unknown, the charge separation of two side chains or the spatial distance between two carbamyl carbons within said peptide can be estimated using the three-dimensional structure predicted by protein modeling software as is known in the art. Non-limiting examples of such software are MOE™ by Chemical Computing Group (Quebec, Canada) and Modeler by Accelrys (San Diego, Calif.). Similarly such predictive software, available from the above-named companies as well, is also known in the art for the design of small molecules as and, accordingly, one of ordinary skill in the art, based upon the teachings herein, would be able to make small molecules that emulate the disclosed structural motifs.

Another structural motif exhibited by peptides useful for the prevention, treatment, amelioration and management of a disease or disorder associated with tissue damage or damage, effects or symptoms resulting therefrom of the current invention is:

\[ \text{X}_1-\text{X}_2-\text{X}_3-\text{X}_4-\text{X}_5-\text{X}_6 \] (SEQ ID NO:34)

wherein \( \text{X}_1 \) is a charged amino acid residue, \( \text{X}_6 \) is a hydrophobic amino acid residue or A, and \( \text{X}_2, \text{X}_3, \text{X}_4 \) and \( \text{X}_5 \) is any amino acid residue.

Beyond the presence of the charged residue in position \( \text{X}_1 \) of the motif, preferably the negatively charged residue, and a hydrophobic amino acid residues in position \( \text{X}_6 \), preferably Leu (L), Val (V) or Ile (I), the sequence may further comprise i) a Ser (S) in position \( \text{X}_2 \) and/or ii) a hydrophobic residue in position \( \text{X}_5 \) and/or hydrophobic residue in position \( \text{X}_6 \) of the motif. Examples of such preferred motifs may be the sequences (i) R-S-X_1-X_2-X_3-L (SEQ ID NO:35), and (ii) R-V-X_1-X_2-X_3-A (SEQ ID NO:36), R-V-L-X_1-X_2-X_3-Y (SEQ ID NO:37), K-A-V-X_1-X_2-L (SEQ ID NO:38), R-X_2-L-X_3-X_4-L (SEQ ID NO:39), or R-S-L-X_2-X_3-X_4-L (SEQ ID NO:40). Yet, Ser (S) or Thr (T) is in some cases preferred in position \( \text{X}_5 \) independently of the presence of a hydrophobic residue in position \( \text{X}_2 \) and/or \( \text{X}_6 \).

A group of peptides useful in the prevention, treatment, amelioration, or management of a disease or disorder associated with tissue damage or damages, effects or symptoms resulting therefrom that exhibit Structural Motif C are:

\[ \text{Peptide } O \] (SEQ ID NO:41)

\[ \text{DSRVFLEKLEEMKE} \]
\[ \text{Peptide } P \] (SEQ ID NO:42)

\[ \text{NEHVTPDTKSWNYAKER} \]
\[ \text{Peptide } Q \] (SEQ ID NO:43)

\[ \text{QLVYIDAVVQSLDLTLTLLRA} \]
and
\[ \text{Peptide } R \] (SEQ ID NO:44)

\[ \text{RVSNIFIRGKLYKTYRE} \]

Another structural motif exhibited by peptides useful in the prevention, treatment, amelioration, or management of a disease or disorder associated with tissue damage or damage, effects or symptoms resulting therefrom, is based on a neurotrophic peptide consensus sequence found in a number of neurotrophic and hematopoietic cytokines which will stimulate both neurite outgrowth and mimic the activity of prosaposin. This consensus sequence is derived from a comparison of the active 22-mer peptide derived from saposin C has the amino acid sequence set forth in SEQ ID NO:45 (C-
FLYKEVTKLIDNNKTEKEIL) and a 20-mer CNTF peptide with the amino acid sequence set forth in SEQ ID NO:46 (YVKHQLGLKNINLDSDVVGVP) with various cytokines and growth factors revealed sequence similarity to EPO.

0253 The consensus sequence is:

\[ A(X)_1B(X)_2C(X)_3D(X)_4E(X)_5F(X)_6G(X)_7H(X)_8I(X)_9J(X)_{10}\]

0254 wherein X is Asp (N), A is a Leu (L) or Ile (I), X is independently any amino acid, n is 2-3, o is 0-1, p is 1-7, b is one or more charged amino acids (Asp (D), Lys (K), Glu (E), or Arg (R)), q is 4-7, and C is one of more hydrophobic amino acids (Ala (A), Leu (L), Thr (T), Val (V), or X is a bond; X is 6-10 amino acids from the second asparagine residue. An example of a peptide exhibiting Structural Motif D is Peptide T:AEHCNENITPDTKU (SEQ ID NO: 48) derived from the EPO AB-1oop. A further sequence in accordance with Structural Motif D is LIRX, NNIX, TX, X4X, X, X4X, X5, X6, X7, X8, X9, X10, X11 (SEQ ID NO:49) wherein X can be Cys (C), Glu (E), Ala (A), α-amino-γ-bromobutyric acid, or Hoc, where Hoc is homocysteine; X can be Arg (R), His (H), Tyr (Y), Leu (L), or Thr (T), or X is a bond; X can be Met (M), Phe (F), or Ile (I); X is independently any one of the 20 genetically coded L-amino acids or the stereoisomeric D-amino acids; X can be Asp (D), Glu (E), Ile (I), Leu (L), or Val (V); and X can be Cys (C), Lys (K), Ala (A), α-amino-γ-bromobutyric acid, or Hoc, where Hoc is homocysteine, provided that either X or X is Cys (C) or Hoc are useful in the prevention, treatment, amelioration, or management of a disease or disorder associated with tissue damage or damage, effects or symptoms resulting therefrom are:

0256 Further, peptides comprising a core amino acid sequence of X1, X2, X3, X4, GPX, TX1, TX2, X8 (SEQ ID NO: 49) wherein X can be Cys (C), Glu (E), Ala (A), α-amino-γ-bromobutyric acid, or Hoc, where Hoc is homocysteine; X can be Arg (R), His (H), Tyr (Y), Leu (L), or Thr (T), or X is a bond; X can be Met (M), Phe (F), or Ile (I); X is independently any one of the 20 genetically coded L-amino acids or the stereoisomeric D-amino acids; X can be Asp (D), Glu (E), Ile (I), Leu (L), or Val (V); and X can be Cys (C), Lys (K), Ala (A), α-amino-γ-bromobutyric acid, or Hoc, where Hoc is homocysteine, provided that either X or X is Cys (C) or Hoc are useful in the prevention, treatment, amelioration, or management of a disease or disorder associated with tissue damage or damage, effects or symptoms resulting therefrom are:

Peptide S (SEQ ID NO: 57)

Peptide T (SEQ ID NO: 58)

Peptide U (SEQ ID NO: 59)

Peptide V (SEQ ID NO: 60)

Peptide W (SEQ ID NO: 61)

Peptide X (SEQ ID NO: 62)

Peptide Y (SEQ ID NO: 63)

Peptide Z (SEQ ID NO: 64)

Peptide AA (SEQ ID NO: 65)

0257 Particular peptides in accordance with the Structural Motif E that are useful in the prevention, treatment, amelioration, and management of a disease or disorder associated with tissue damage or damage, effects or symptoms resulting therefrom are:
Further peptides derived from the AB loop of EPO are contemplated as well. This AB loop peptide may further be stabilized by chemically adding a small bicyclic molecule to at least one of the N-terminal end or the C-terminal end of the peptide’s amino acid sequence.

Particular peptides in accordance with the Structural Motif F that are useful in the prevention, treatment, amelioration, and management of a disease or disorder associated with tissue damage or damage, effects or symptoms resulting therefrom are:

Peptide BG  
D-biotin-ABHCSLNENITVPDVTKV;  
Peptide BH  
D-Biotin-ABHCSLNENITVP;
Moreover, the peptides may be stabilized by a disulfide bond formed between a sulphydryl group of a first amino acid residue and a sulphydryl group of a second amino acid residue along the peptide sequence. A particular embodiment of the peptide has at least 6 amino acids having the peptide sequence XAEHYS (SEQ ID NO: 101), wherein X is a first amino acid residue containing a sulphydryl group and Y is a second amino acid residue containing a sulphydryl group, and wherein the sulphydryl group of the first amino acid residue is at an appropriate distance from the sulphydryl group of the second amino acid residue to form the disulfide bond with the sulphydryl group of the second amino acid residue within the peptide sequence, thus stabilizing the peptide (Formula I).

Particular peptides in accordance with the Structural Motif F, Formula I, that are useful in the prevention, treatment, amelioration, and management of a disease or disorder associated with tissue damage or damage, effects or symptoms resulting therefrom are:

Peptide BK (SEQ ID NO: 102)

Peptide BL (SEQ ID NO: 103)

Peptide BM (SEQ ID NO: 104)

Peptide BN (SEQ ID NO: 105)

Peptide BO (SEQ ID NO: 106)

Peptide BP (SEQ ID NO: 107)

Peptide BQ (SEQ ID NO: 108)

Peptide BR (SEQ ID NO: 109)

Peptide BS (SEQ ID NO: 110)

In another embodiment, the disulfide bond-stabilized isolated EPO-derived peptide is further stabilized by chemically adding a small bicyclic molecule to at least one of the N-terminal end or the C-terminal end of the peptide’s amino acid sequence.
[0269] Consideration of the secondary structure of EPO provides guidance for the preparation of a candidate peptide via the spatial arrangement of amino acids derived from homologous amino acids located within homologous secondary structures within other Type-1 cytokine receptor ligands: e.g., GM-CSF and IL-3 (Kanan, 2000, Neuroimmunomod. 8:132-141, hereby incorporated by reference in its entirety), among others, have been shown to possess potent neurotrophic and neuroprotective activities, due in large part, Xe, by stimulating a tissue protective receptor. For example, considering helix B of these type I cytokines: Homologous amino acids in thrombopoietin (TPO; Protein Data Bank (PDB) accession 1V7M) comprise D62, G65, T68, L69, E72, A76 and Q80, where these amino acids are spatially adjacent to one another in a linear arrangement; homologous amino acids in leukemia inhibitory factor (LIF; PDB accession 1EMR) comprise E61, R64, Y68, S72, N75, and D79; homologous amino acids in ciliary neurotrophic factor (CNTF; PDB accession 1CNT) comprise E71, E75. These all are examples of Structural Motif A described above wherein the underlined amino acids are negatively charged.

[0270] In certain embodiments of Structural Motif A disclosed below as Formulas V-V1, isolated peptides and peptide analogs may not include Peptide BV, WEIVNAIQEARRLL (SEQ ID NO: 114); Peptide BV, LSKLLLDSVHLH (SEQ ID NO: 115); Peptide BX, KIRS-DLTATSEYVKH (SEQ ID NO: 116); Peptide BY, GTEKAKILVRYRIVVVL (SEQ ID NO: 117) or Peptide BZ, SIMIDEIIHIKRPNNPL (SEQ ID NO: 118).

[0271] In an embodiment of Structural Motif A, Type-1 cytokine derived peptides and peptide analogues have the structural formula (V) (SEQ ID NO:119):

\[
X_1 X_2 X_3 X_4 X_5 X_6 X_7 X_8 X_9 X_{10} X_{11} X_{12} X_{13} X_{14} X_{15} X_{16} X_{17} X_{18} X_{19} X_{20}
\]

wherein:

[0272] \( X_1 \) is Trp (W), Val (V), Ala (A), Ile (I), Pro (P), Leu (L), Ser (S), Asp (D), or Thr (T);

[0273] \( X_2 \) is any amino acid;

[0274] \( X_3 \) is any amino acid;

[0275] \( X_4 \) is any amino acid;

[0276] \( X_5 \) is any amino acid;

[0277] \( X_6 \) is any amino acid;

[0278] \( X_7 \) is any amino acid;

[0279] \( X_8 \) is any amino acid;

[0280] \( X_9 \) is Ile (I), Phe (F), Leu (L), Val (V), Pro (P), Tyr (Y), or Gly (G);

[0281] \( X_{10} \) is a negatively charged amino acid;

[0282] \( X_{11} \) is a negatively charged amino acid;

[0283] \( X_{12} \) is Ile (I), Leu (L), Ala (A), Gly (G), Phe (F), Val (V), or Pro (P);

[0284] \( X_{13} \) is Ile (I), Met (M), Tyr (Y), Ser (S), Val (V), Phe (F), Lys (K), Leu (L), Glu (E), or Asp (D);

[0285] \( X_{14} \) is any amino acid;

[0286] \( X_{15} \) is His (H), Leu (L), Pro (P), Thr (T), Arg (R), Cys (C), Ile (I), Tyr (Y), Gln (Q), or Ala (A);

[0287] \( X_{16} \) is Leu (L), Lys (K), Thr (T), Val (V), Phe (F), Ala (A), or Gln (Q);

[0288] \( X_{17} \) is Lys (K), Glu (E), Met (M), Gly (G), Asn (N), Gln (Q), Thr (T), or Val (V);

[0289] \( X_{18} \) is any amino acid;

[0290] \( X_{19} \) is Pro (P), Lys (K), Arg (R), Ile (I), Asn (N), Ser (S), Gln (Q), or Phe (F);

[0291] \( X_{20} \) is Pro (P), Ile (I), Tyr (Y), Leu (L), Phe (F), Ser (S), Ala (A), Asp (D), Asn (N), or Lys (K).

[0292] In certain embodiments, the isolated peptides and peptide analogs can contain fewer than 19 amino acid residues. Indeed, truncated or internally deleted forms of structural formula V containing as few as 18, 17, 16, 15, 14, 13, 12, 11, or even 10 amino acid residues that substantially retain the overall characteristics and tissue protective properties of the isolated peptides and peptide analogs of structural formula V.

[0293] Due to the surmised importance of the spatially compact charge configuration at the internal residues of the isolated peptides and peptide analogs of Formula V in tissue protective activity, in certain embodiments of the invention, residues comprising the polar, negatively and positively charged, and immediately adjacent amino acids are not deleted. Thus, in certain embodiments, residues X_8, X_9, X_{10}, and X_{11} are not deleted.

[0294] The isolated peptides and peptide analogs of Formula V can also be extended at one or both termini with additional amino acid residues that do not substantially interfere with, and in some embodiments even enhance, the structural and/or functional properties of the peptides or peptide analogs. Indeed, extended core peptides and peptide analogs containing as many as 20, 21, 22, 23, 24, 25, 26, 27, 28, or 29 amino acid residues and are considered to be within the scope of the present invention. Preferably, such extended peptides will substantially retain the tissue protective properties of the peptide analogs of Formula V.

[0295] Certain amino acid residues in the core peptides and peptide analogs of Formula V can be replaced with other amino acid residues without significantly deleteriously affecting, and in many cases even enhancing, the activity of the peptides and peptide analogs. Thus, also contemplated by the present invention are altered or modified forms of the isolated peptides and peptide analogs of Formula V wherein at least one and up to eight amino acid residues in the formula are conservatively substituted with another amino acid residue. In certain embodiments, seven, six, five, four, three, two, or one amino acid is conservatively substituted.

[0296] In specific embodiments, the isolated peptides and peptide analogs of Formula V are selected from the group of peptides set forth below:

- **Peptide CA**
  - (SEQ ID NO: 120)
  - KTENWANGIDEIIITHLKQPLL
- **Peptide CB**
  - (SEQ ID NO: 121)
  - LQVAAAYQIEHMLLEYKFR
- **Peptide CC**
  - (SEQ ID NO: 122)
  - HQLAPDYQFBFEEAIPKEQKGF
- **Peptide CD**
  - (SEQ ID NO: 123)
  - DSNVYDLLKLEQITQLMGRLED
- **Peptide CE**
  - (SEQ ID NO: 124)
  - NEQIQLMGRLEDGSQPRGQIPRQ
- **Peptide CF**
  - (SEQ ID NO: 125)
  - SVWKEFEGGD
-continued

Peptide CG (SEQ ID NO: 126)
YSIDELVNVDDLVECVKHERSSK;

Peptide CH (SEQ ID NO: 127)
FKSPEPPIFTVEFFDRIFNSIDA;

Peptide CI (SEQ ID NO: 128)
LDLLILKSSLLEDPKGYLGCQALS;

Peptide CJ (SEQ ID NO: 129)
QALSMMIQYFLEKVPQAHRDQPD;

Peptide CK (SEQ ID NO: 130)
LQCLKELKPLEYLHLAQSKPH;

Peptide CL (SEQ ID NO: 131)
AQDLVSGMSTLEDKLGAMPMPH;

Peptide CM (SEQ ID NO: 132)
VPDSTALRELIELVNIWQKAP;

Peptide CN (SEQ ID NO: 133)
IFPDQMLAVDLEKQMNLPSKET;

Peptide CO (SEQ ID NO: 134)
MVTSVQPKSLEDPKYTKKLKC;

Peptide CP (SEQ ID NO: 135)
FPMACLQSIYDELKMYQVDFKTM;
and

Peptide CQ (SEQ ID NO: 136)
CIGRNMFDDPEFREDKQLQDQKED.

[0297] In another embodiment of Structural Motif A, the isolated peptides and peptide analogs based on Type-1 cytokines and useful in the method of the current invention have the structural Formula VI (SEQ ID NO:137):

\[
X_1X_2X_3(\text{Leu})X_4
\]

wherein:

[0299] \(X_1\) is Phe (F), Val (V), Ala (A), Gly (G), Pro (P), Leu (L), Tyr (Y), Ile (I), Cys (C) or Met (M);

[0300] \(X_2\) is a negatively charged amino acid;

[0301] \((Z)_n\) is an amino acid, wherein \(n\) is 1-5;

[0302] \(X_3\) is a negatively charged amino acid;

[0303] \(X_4\) is Pro (P), Met (M), Val (V), Ile (I), Phe (F), Gly (G), Ala (A), Tyr (Y), and Trp (W).

[0304] In certain embodiments, the isolated peptides and peptide analogs can contain fewer than 9 amino acid residues. Indeed, truncated or internally deleted forms of structural formula VI containing as few as 8, 7, 6, or even 5 amino acid residues that substantially retain the overall characteristics and tissue protective properties of the isolated peptides and peptide analogs of structural formula VI.

[0305] Due to the surmise importance of the spatially compact charge configuration at the internal residues of the isolated peptides and peptide analogs of Formula VI, in certain embodiments of the invention, residues comprising the negatively and positively charged and immediately adja-

cent amino acids are not deleted. Thus, in certain embodiments, residues \(X_1, X_2, X_3,\) and \(X_4\) are not deleted.

[0306] The isolated peptides and peptide analogs of Formula VI can also be extended at one or both termini or internally with additional amino acid residues that do not substantially interfere with, and in some embodiments even enhance, the structural and/or functional properties of the peptides or peptide analogs. Indeed, extended core peptides and peptide analogs containing as many as 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, or 29 amino acid residues and are considered to be within the scope of the present invention. Preferably, such extended peptides will substantially retain the tissue protective properties of the peptide analogs of Formula VI.

[0307] Certain amino acid residues in the core peptides and peptide analogs of Formula VI can be replaced with other amino acid residues without significantly detrimental affecting, and in many cases even enhancing, the activity of the peptides and peptide analogs. Thus, also contemplated by the present invention are altered or mutated forms of the isolated peptides and peptide analogs of Formula VI wherein at least one and up to five amino acid residues in the formula are conservatively substituted with another amino acid residue. In certain embodiments, four, three, two or one amino acids are conservatively substituted.

[0308] In specific embodiments, the isolated peptides and peptide analogs of Formula VI are selected from the group of peptides set forth below:

Peptide CR (SEQ ID NO: 138)
NETVEVISEMPDGQEPCLQTRLELY;

Peptide CS (SEQ ID NO: 139)
NLKDEPLVIVPFDQEPQVE;

Peptide CT (SEQ ID NO: 140)
RDTAABMSNETVEVISEMPDQEPCLQ;

Peptide CU (SEQ ID NO: 141)
ALLHHGLRDTAABMSNETVEVISEMPDQEP;

Peptide CV (SEQ ID NO: 142)
LPLDDLHNLTEODQILKEMHLRPH;

Peptide CW (SEQ ID NO: 143)
PTRHPIEKIDQGKEFRELTFLKMT;

Peptide CX (SEQ ID NO: 144)
NVGHVDTYPDTSQKEDPVKQKLLCSL;

Peptide CY (SEQ ID NO: 145)
NHQGHLHHLGDSAGSHPVASTDQNS;

Peptide CZ (SEQ ID NO: 146)
WSELTABEQELQVAREVNH;

Peptide DA (SEQ ID NO: 147)
LRAHRQALAPDTYQEEFEEYFPEQK;

---
Further examples of tissue protective peptides useful in the methods of treatment of the current invention derived from the Type-1 cytokines that exemplify Structural Motif B described above, and disclosed within PCT/US2006/031061, include, but are not limited to, GM-CSF helix A fragment, Peptide BV: WEHVNAIQEARRLL (SEQ ID NO: 114); TPO helix A fragment, Peptide BW: LSKL...
LRDSHVLH (SEQ ID NO:115); TPO helix B fragment: E56, K59; CNTF helix A fragment, Peptide BX: K IRSDLTALTESYVKH (SEQ ID NO:116); CNTF helix B fragment: R89, E92, LIF helix B fragment, Peptide BY: G TEKAKLVELYRIVVY (SEQ ID NO:117); and interleukin 3 (IL-3) helix A fragment, Peptide BZ: SIM IDEIHHILKRPPNL. (SEQ ID NO: 118).

0310 In certain embodiments of Structural Motif B disclosed below as Formulas VII-X, isolated peptides and peptide analogs may not include Peptide BX: WEIYVNAQFQARRLL (SEQ ID NO:114); Peptide BW, LSKLLRDSHVLH (SEQ ID NO: 115); Peptide BX, KIRSDLTALTESYVKH (SEQ ID NO: 116), Peptide BY, GTEKAKLVELYRIVVY (SEQ ID NO: 117) or Peptide BZ, SIMIDEIHHILKRPPNL. (SEQ ID NO: 118).

0311 Further Type-1 cytokine derived peptides exhibiting structural motif B that are useful in the current method of preventing, treating, ameliorating and managing a disease or disorder associated with tissue damage or damage, effects or symptoms resulting therefrom are those that exhibit structural Formula VII:

\[ X_1 - X_2 - X_3 - X_4 \] (SEQ ID NO: 184)

0312 where:
0313 \( X_1 \) is Leu (L), Ile (I), Gly (G), Val (V), Phe (F), Pro (P), or Ala (A);
0314 \( X_2 \) is a positively charged amino acid;
0315 \( X_3 \) is a negatively charged amino acid;
0316 \( X_4 \) is Phe (F), Gly (G), Val (V), Leu (L), Ala (A), or Tyr (Y);
0317 In one embodiment of the invention, Type-I cytokine derived peptides have the structural Formula VII(a):

\[ X_1 - X_2 - X_3 - X_4 - X_5 - X_6 \] (SEQ ID NO:302)

0318 where:
0319 \( X_1 \) is Leu (L), Ile (I), Gly (G), Val (V), Phe (F), Pro (P), or Ala (A);
0320 \( X_2 \) is a positively charged amino acid;
0321 \( X_3 \) is a negatively charged amino acid;
0322 \( X_4 \) is Phe (F), Gly (G), Val (V), Leu (L), Ala (A), or Tyr (Y);
0323 \( X_5 \) is Arg (R), Asp (D), Glu (E), Asn (N), Ser (S), Thr (T), Phe (F), Val (V), or Tyr (Y);
0324 \( X_6 \) is His (H), Lys (K), Asp (D), Glu (E), Gln (Q), Asn (N), Ser (S), Leu (L), Trp (W), or Phe (F).

0325 In certain embodiments, the isolated peptides and peptide analogs can contain fewer than 5 or even 4 amino acid residues. Indeed, truncated or internally deleted forms of structural Formulas VII or VIIa containing as few as 6 or even 5 amino acid residues that substantially retain the overall characteristics and tissue protective properties of the isolated peptides and peptide analogs.

0326 Due to the surmised importance of the spatially compact charge configuration at the internal residues of the isolated peptides and peptide analogs of structural Formulas VII or VIIa, in certain embodiments of the invention, residues comprising the negatively and positively charged and immediately adjacent amino acids are not deleted. Thus, in certain embodiments, residues \( X_1, X_2, X_3, \) and \( X_4 \) are not deleted.

0327 The isolated peptides and peptide analogs of Formula VII and Formula IIa can also be extended at one or both termini or internally with additional amino acid residues that do not substantially interfere with, and in some embodiments even enhance, the structural and/or functional properties of the peptides or peptide analogs. Indeed, extended core peptides and peptide analogs containing as many as 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, or 29 amino acid residues and are considered to be within the scope of the present invention. Preferably, such extended peptides will substantially retain the tissue protective properties of the peptide analogs of Formula VII or Formula IIa.

0328 Certain amino acid residues in the core peptides and peptide analogs of Formula VII or Formula IIa can be replaced with other amino acid residues without significantly deleteriously affecting, and in many cases even enhancing, the activity of the peptides and peptide analogs. Thus, also contemplated by the present invention are altered or mutated forms of the isolated peptides and peptide analogs of Formula VII wherein at least one and up to two amino acid residues in the formula are conservatively substituted with another amino acid residue.

0329 In specific embodiments, the isolated peptides and peptide analogs of Formula VII or Formula IIa are selected from the group of peptides set forth below:

Peptide EL (SEQ ID NO: 185)

Peptide EM (SEQ ID NO: 186)

Peptide EN (SEQ ID NO: 187)

Peptide EO (SEQ ID NO: 188)

Peptide EP (SEQ ID NO: 189)

Peptide EQ (SEQ ID NO: 190)

Peptide ER (SEQ ID NO: 191)

Peptide ES (SEQ ID NO: 192)

Peptide ET (SEQ ID NO: 193)

Peptide EU (SEQ ID NO: 194)

Peptide EV (SEQ ID NO: 195)

Peptide EW (SEQ ID NO: 196)
Peptide EX (SEQ ID NO: 197)
QASQKRLPRPDLISHININVILE;

Peptide EY (SEQ ID NO: 198)
QDPYVKEARLKKYPHAG;

Peptide EZ (SEQ ID NO: 199)
VTDLVQRKAIHELQMQAELEPA;

Peptide FA (SEQ ID NO: 200)
PGDAROQTVLRLDFRAVVLHSH;

Peptide FB (SEQ ID NO: 201)
WFLALNCSVPSARKQMSTLMPIE;

Peptide FC (SEQ ID NO: 202)
DMTHFYFREKFLQSSRNLRAQ;

Peptide PD (SEQ ID NO: 203)
GPPVPSRALELIIEEEVITIQH;

Peptide FE (SEQ ID NO: 204)
EDLHLHKLPFGRLRPH;

Peptide FF (SEQ ID NO: 205)
EDTIKVQAVPPVQDLNKLKPFLRE;

Peptide FG (SEQ ID NO: 206)
LDQIPYLNHILLNTRGLPPG;

Peptide FH (SEQ ID NO: 207)
SPRISNPDFVQIKRLHDYLYQQPV;

Peptide FI (SEQ ID NO: 208)
YYGRILHLKAEKBECCATTVV.

In yet another embodiment of the peptides useful in the prevention, treatment, amelioration, or management of a disease or disorder associated with tissue damage or damage, effects or symptoms resulting therefrom, the isolated peptides or peptide analogs derived from Type-1 cytokines and exhibiting Structural Motif B have the structural formula (VIII) (SEQ ID NO:209):

\[
\begin{align*}
X_1 &- X_2 - X_3 - X_4 - X_5 - X_6 - X_7 - X_8 - X_9 - X_{10} - X_{11} - X_{12} - X_{13} - X_{14} - X_{15} - X_{16} - X_{17} - X_{18} - X_{19} - X_{20} - X_{21} - X_{22} - X_{23} - X_{24} - \\
X_{25} &- \ldots
\end{align*}
\]

wherein:

[0332] \( X_1 \) is Ala (A), Thr (T), Ser (S), Tyr (Y), Leu (L), Val (V), Ile (I), Phe (F), or Glu (E);

[0333] \( X_2 \) is any amino acid;

[0334] \( X_3 \) is Ser (S), Gln (Q), Asp (D), Leu (L), Glu (E), Cys (C), Asn (N), Arg (R), or Ala (A);

[0335] \( X_4 \) is Pro (P), Gly (G), Gln (Q), Leu (L), Thr (T), Asn (N), Ser (S), Phe (F), or Ile (I);

[0336] \( X_5 \) is any amino acid;

[0337] \( X_6 \) is Pro (P), Ser (S), Cys (C), Val (V), Lys (K), Thr (T), Leu (L), Ile (I), or Gln (Q);

[0338] \( X_7 \) is any amino acid;

[0339] \( X_8 \) is Thr (T), Pro (P), Leu (L), Arg (R), Gly (G), Tyr (Y), Gln (Q), Glu (E), Ile (I) or Ala (A);

[0340] \( X_9 \) is any amino acid;

[0341] \( X_{10} \) is Pro (P), Asn (N), Glu (E), Asp (D), Thr (T), Leu (L), Ile (I), Gln (Q), Phe (F), or Trp (W);

[0342] \( X_{11} \) is Trp (W), Leu (L), Ala (A), Met (M), Val (V), Ile (I), Phe (F), or Tyr (Y);

[0343] \( X_{12} \) is a negatively charged amino acid;

[0344] \( X_{13} \) is a positively charged amino acid;

[0345] \( X_{14} \) is Val (V), Leu (L), or Ala (A);

[0346] \( X_{15} \) is any amino acid;

[0347] \( X_{16} \) is any amino acid;

[0348] \( X_{17} \) is any amino acid;

[0349] \( X_{18} \) is any amino acid;

[0350] \( X_{19} \) is any amino acid;

[0351] \( X_{20} \) is any amino acid;

[0352] \( X_{21} \) is Arg (R), Asp (D), Tyr (Y), Val (V), Ile (I), Leu (L), Lys (K), Ser (S), or Thr (T);

[0353] \( X_{22} \) is any amino acid;

[0354] \( X_{23} \) is any amino acid;

[0355] \( X_{24} \) is Leu (L), Pro (P), Phe (F), Arg (R), Tyr (Y), Cys (C), Gly (G), Val (V), or Lys (K).

In certain embodiments, the isolated peptides and peptide analogs can contain fewer than 24 amino acid residues. Indeed, truncated or internally deleted forms of structural Formula VIII containing as few as 23, 22, 21, 20, 19, 18, 17, 16, 15, 14, 13, 12, 11, or even 10 amino acid residues that substantially retain the overall characteristics and tissue protective properties of the isolated peptides and peptide analogs of structural formula VIII.

Due to the summarized importance of the spatially compact charge configuration at the internal residues of the isolated peptides and peptide analogs of Formula VIII in tissue protective activity, in certain embodiments of the invention, residues comprising the negatively and positively charged and immediately adjacent amino acids are not deleted. Thus, in certain embodiments, residues \( X_{11}, X_{12}, X_{13}, \) and \( X_{14} \) are not deleted.

The isolated peptides and peptide analogs of Formula VIII can also be extended at one or both termini or externally with additional amino acid residues that do not substantially interfere with, and in some embodiments even enhance, the structural and/or functional properties of the peptides or peptide analogs. Indeed, extended core peptides and peptide analogs containing as many as 25, 26, 27, 28, or 29 amino acid residues and are considered to be within the scope of the present invention. Preferably, such extended peptides will substantially retain the tissue protective properties of the peptide analogs of Formula VIII.

Certain amino acid residues in the core peptides and peptide analogs of Formula VIII can be replaced with other amino acid residues without significantly deleteriously affecting, and in many cases even enhancing, the activity of the peptides and peptide analogs. Thus, also contemplated by the present invention are altered or mutated forms of the isolated peptides and peptide analogs of Formula VIII wherein at least one and up to eight amino acid residues in the formula are conservatively substituted with another amino acid residue. In certain embodiments, seven, six, five, four, three, two, or one amino acid is conservatively substituted.

In specific embodiments, the isolated peptides and peptide analogs of Formula VIII are selected from the group of peptides set forth below:
In another embodiment of the invention, the isolated peptides and peptide analogs based on Type-1 cytokines that exhibit Structural Motif B have the structural Formula IX (SEQ ID NO:228):

\[
X_1\cdots X_{12}, X_{13}, X_{14}, X_{15}, X_{16}, X_{17}, X_{18}, X_{19}, X_{20}, X_{21}, X_{22}, X_{23}, X_{24}, X_{25}
\]

[0362] wherein:

- \( X_1 \) is Cys (C), Tyr (Y), or Ala (A);
- \( X_2 \) is Ser (S), Leu (L), or Glu (E);
- \( X_3 \) is Arg (R), Gln (Q), or Asn (N);
- \( X_4 \) is Ser (S) or Leu (L);
- \( X_5 \) is Ile (I), Leu (L), or Lys (K);
- \( X_6 \) is Trp (W), Leu (L), or Lys (K);
- \( X_7 \) is Leu (L), Phe (F), or Tyr (Y);
- \( X_8 \) is Ala (A), Asn (N), or Phe (F);
- \( X_9 \) is Arg (R), Pro (P), or Asn (N);
- \( X_{10} \) is Lys (K), Leu (L), or Ala (A);
- \( X_{11} \) is Ile (I), Val (V), or Gly (G);
- \( X_{12} \) is a positively charged amino acid;
- \( X_{13} \) is a polar amino acid;
- \( X_{14} \) is a negatively charged amino acid;
- \( X_{15} \) is Leu (L), Gly (G), or Val (V);
- \( X_{16} \) is Thr (T), Ile (I), or Ala (A);
- \( X_{17} \) is Ala (A), Cys (C), or Asp (D);
- \( X_{18} \) is Leu (L), Arg (R) or Asn (N);
- \( X_{19} \) is Thr (T), Asn (N), or Gly (G);
- \( X_{20} \) is Glu (E), Arg (R), or Thr (T);
- \( X_{21} \) is Ser (S), Val (V), or Leu (L);
- \( X_{22} \) is Tyr (Y), Thr (T), Phe (F);
- \( X_{23} \) is Asn (N) or Leu (L);
- \( X_{24} \) is Asn (N) or Gly (G);
- \( X_{25} \) is Val (V) or Ile (I).

[0389] In certain embodiments, the isolated peptides and peptide analogs can contain fewer than 25 amino acid residues. Indeed, truncated or internally deleted forms of structural Formula IX containing as few as 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, or more amino acids residues are not deleted. Thus, in certain embodiments, residues \( X_{11}, X_{12}, X_{13}, X_{14}, X_{15}, X_{16}, \) and \( X_{17} \) are not deleted.

[0390] The isolated peptides and peptide analogs of Formula IX can also be extended at one or both termini or internally with additional amino acid residues that do not substantially interfere with, and in some embodiments even enhance, the structural and/or functional properties of the peptides or peptide analogs. Indeed, extended core peptides and peptide analogs containing as many as 26, 27, 28, or 29 amino acid residues and are considered to be within the scope of the present invention. Preferably, such extended peptides will substantially retain the tissue protective properties of the peptide analogs of Formula XI.

[0391] Certain amino acid residues in the core peptides and peptide analogs of Formula XI can be replaced with other amino acid residues without significantly deleteriously affecting, and in many cases even enhancing, the activity of the peptides and peptide analogs. Thus, also contemplated by the present invention are altered or mutated forms of the isolated peptides and peptide analogs of Formula XI wherein at least one and up to eight amino acid residues in the
formula are conservatively substituted with another amino acid residue. In certain embodiments, seven, six, five, four, three, two, or one amino acid is conservatively substituted.

[0392] In specific embodiments, the isolated peptides and peptide analogs are selected from the group of peptides set forth below:

- Peptide GB
  
  CSRSWLRKRDALTHERSYVKH;

- Peptide GC
  
  ELMLILYKPREADEGMPNVDDG;

- Peptide GD
  
  YLQQPLLFLVKTGFCRNKTVNN;

- Peptide GE
  
  AEINLEYFRAGSHSVDAGNKLFGI.

[0393] In another embodiment of the invention, the isolated peptides and peptide analogs of type-I cytokines that exhibit structural motif B have the structural formula X (SEQ ID NO:233):

\[
X_1 \cdot X_2 \cdot X_3 \cdot X_4 \cdot X_5 \cdot X_6 \cdot X_7 \cdot X_8 \cdot X_9 \cdot X_{10} \cdot X_{11} \cdot X_{12} \cdot X_{13} \\
X_14 \cdot X_{15} \cdot X_{16} \cdot X_{17} \cdot X_{18} \cdot X_{19} \cdot X_{20} \cdot X_{21} \cdot X_{22} \cdot X_{23} \\
X_{24} \cdot X_{25}
\]

wherein:

- [0395] \( X_1 \) is Leu (L);
- [0396] \( X_2 \) is Gly (G);
- [0397] \( X_3 \) is Cys (C);
- [0398] \( X_4 \) is Val (V);
- [0399] \( X_5 \) is Leu (L);
- [0400] \( X_6 \) is His (H);
- [0401] \( X_7 \) is Arg (R);
- [0402] \( X_8 \) is Leu (L);
- [0403] \( X_9 \) is Ala (A);
- [0404] \( X_{10} \) is Asp (D);
- [0405] \( X_{11} \) is Leu (L);
- [0406] \( X_{12} \) is a negatively charged amino acid;
- [0407] \( X_{13} \) is a polar amino acid;
- [0408] \( X_{14} \) is a positively charged amino acid;
- [0409] \( X_{15} \) is Leu (L);
- [0410] \( X_{16} \) is Pro (P);
- [0411] \( X_{17} \) is Lys (K);
- [0412] \( X_{18} \) is Ala (A);
- [0413] \( X_{19} \) is Glu (Q);
- [0414] \( X_{20} \) is Asp (D);
- [0415] \( X_{21} \) is Leu (L);
- [0416] \( X_{22} \) is Glu (E);
- [0417] \( X_{23} \) is Arg (R);
- [0418] \( X_{24} \) is Ser (S);
- [0419] \( X_{25} \) is Gly (G).

[0420] In certain embodiments, the isolated peptides and peptide analogs can contain fewer than 25 amino acid residues. Indeed, truncated or internally deleted forms of structural Formula X containing as few as 24, 23, 22, 21, 20, 19, 18, 17, 16, 15, 14, 13, 12, 11, or even 10 amino acid residues that substantially retain the overall characteristics and tissue protective properties of the isolated peptides and peptide analogs of structural Formula X.

[0421] Due to the surmised importance of the spatially compact charge configuration at the internal residues of the isolated peptides and peptide analogs of Formula X in tissue protective activity, in certain embodiments of the invention, residues comprising the polar, negatively and positively charged, and immediately adjacent amino acids are not deleted. Thus, in certain embodiments, residues \( X_{11}, X_{12}, X_{13}, X_{14}, \) and \( X_6 \) are not deleted.

[0422] The isolated peptides and peptide analogs of Formula X can also be extended at one or both termini or internally with additional amino acid residues that do not substantially interfere with, and in some embodiments even enhance, the structural and/or functional properties of the peptides or peptide analogs. Indeed, extended core peptides and peptide analogs containing as many as 26, 27, 28, or 29 amino acid residues and are considered to be within the scope of the present invention. Preferably, such extended peptides will substantially retain the tissue protective properties of the peptide analogs of Formula X.

[0423] Certain amino acid residues in the core peptides and peptide analogs of Formula X can be replaced with other amino acid residues with significantly deleteriously affecting, and in many cases even enhancing, the activity of the peptides and peptide analogs. Thus, also contemplated by the present invention are altered or mutated forms of the isolated peptides and peptide analogs of Formula X wherein at least one and up to eight amino acid residues in the formula are conservatively substituted with another amino acid residue. In certain embodiments, seven, six, five, four, three, two, or one amino acid is conservatively substituted.

[0424] In specific embodiments, the isolated peptides and peptide analogs consists of the amino acid sequence:

- Peptide GF
  
  LGCULHRDLEQLRPLKQDWLREG.

[0425] Further examples of peptides derived from the Type-I cytokines that exemplify Structural Motif C described herein above include, but are not limited to, human thrombopoietin derived, Peptide GD: DLRLVSLKL-LRDHSV (SEQ ID NO:235); Peptide GHEP:TPYVLPAVDF-SLGWEKQTQM (SEQ ID NO: 236); Peptide GEF: TAPKDP-NAIFLSFQHLRGKVRFL (SEQ ID NO: 237); and Peptide GHN:PNRTSGLLETNFAS (SEQ ID NO: 238); GM-CSF derived, Peptide GK: PSTQFWHEVNAEQARR (SEQ ID NO: 239); Peptide GJ: NETVEVISE (SEQ ID NO: 240); Peptide GM: QTRLEDYKQCGLRGSUTKLLKGPLTM (SEQ ID NO: 241); and Peptide GN: KDFLLVIPFDCCWEPVQE (SEQ ID NO: 242); CNF2 derived, Peptide GO: CSRSWLRKRDAS (SEQ ID NO: 243); Peptide GP: NKNLNLSDAGMPFVAST (SEQ ID NO: 244); Peptide GQ: LLQVAAFAYQEEIMLALLEYK (SEQ ID NO: 245); and Peptide GR: ELSQWTVRSLHDLRFISS (SEQ ID NO: 246); IL-6 derived, Peptide GS: SERIDQKRYLQDGIS (SEQ ID NO: 247); and Peptide GT: AENNLNLKPKMAEKD (SEQ ID NO: 248); Peptide GUE: EQARAVQMSVKVLQI (SEQ ID NO: 249) and Peptide GV: RSFKEFLQISSR (SEQ ID NO: 250); IL-3 derived, Peptide GW: SCNMIDEITHL-LKQ (SEQ ID NO: 251); Peptide GX: ENNLRRPNIPEAF- NRAVSK (SEQ ID NO: 252); and Peptide IY: HIKGDW- WNNEFRRKLFTPYK (SEQ ID NO: 253); human interleukin alpha derived, Peptide GZ: SSCLMDRFDFGH- PQIEFDIQ (SEQ ID NO: 254); Peptide HAQQIFN-
Further examples of peptides derived from the Type-1 cytokines that exemplify Structural Motif D described herein above include, but are not limited to, Saposin C derived, Peptide HR:CEFLKVEVTKLIDNKK-TEKEIL (SEQ ID NO: 45); hCNTF AB loop derived, Peptide HS:YVKHQLNKINLNSVDGBP (SEQ ID NO: 46); hIL-6 AB loop derived Peptide HT:EAFLNINLNLPKAM (SEQ ID NO: 272); hIL-2 AB loop derived Peptide HU:LQMLINGVINKNPKLT (SEQ ID NO: 273); hIL-3 AB loop derived Peptide HV:ILMENILRRPNL (SEQ ID NO: 274); hIL-gamma AB loop derived Peptide HW:YFLRNNQIYAGTL (SEQ ID NO: 275); hIL AB loop derived, Peptide HX:IYAQGEPPPNVVELKLCAP (SEQ ID NO: 276); hIL-1 beta helix C derived Peptide HX:EKFIKNKLEFESA (SEQ ID NO: 277), and hONC-M helix C derived Peptide HZ:RNPLGLRNNIYCMACQL (SEQ ID NO: 278).

Further examples of peptides derived from the Type-1 cytokines that exemplify Structural Motif F described herein above include, but are not limited to, hCNFTF derived, Peptide IA:YVKHQLNKINLNSVDGBP-biotin (SEQ ID NO: 279) and hIL-3 derived Peptide IB: DBI:0-LMENILRRPNL (SEQ ID NO: 280).

These aforementioned amino acids are merely exemplary from some members of the cytokine superfamily that signal through Type 1 cytokine receptors, and homologous regions on other members of the cytokine superfamily will be readily identified by the skilled artisan.

6.3 Chimeras

"Chimeric" peptides—linear amino acid sequences that incorporate non-linear structural elements of the externally-facing amino acids of the EPO molecule or other type 1 cytokines that exhibit the above-noted structural motifs—are also contemplated by the current invention. Chimeric peptides useful in the current invention may consist of combining structural elements of separate amino acid sequences into a single peptide. In other words, a chimeric peptide may be comprised of amino acid sequences derived from non-linear but adjacent structural elements such as a fragment derived from amino acid sequences 110-115, 133-136, and 160-165, of SEQ ID NO:1 which would allow structural elements of the C terminal portion of helix C and N-terminal portion of loop C-D, the beta-pleated sheet in loop C-D, and the C-terminal portion of EPO to be contained in a single peptide. Additionally, chimeric peptides may be used to select out the important features of a particular structure, for example the externally-facing amino acids of a particular tertiary structure. Thus, a chimeric peptide useful in the methods of the current invention may consist of a fragment comprised of helix B amino acids 58, 62, 65, 69, 72, 76, 79, 80, 83, 84, and 85 (e.g., peptide IC: QEQERALNSS, SEQ ID NO: 281) or, in other words, all of the exterior-presenting amino acids of helix B of EPO, as disclosed in PCT/US2006/031061. Further, a chimeric peptide in which the first glutamine is replaced with pyroglutamate (e.g., peptide ID: UEQERALNSS, SEQ ID NO: 282) is contemplated by the current invention as well.

Further, non-naturally occurring or chimeric peptides can be designed to mimic the critical spatial proximities between carbamyl carbons of any two amino acids or between the side chains of any two amino acids in erythropoietin or another Type-1 cytokine described herein above via a linear sequence of amino acids and may provide a guide in evaluating possible tissue protective chimeras derived from other proteins. The present invention is, therefore, directed to novel chimeric tissue protective peptides, including those that exhibit these structural motifs and critical spatial proximities that trigger tissue protection.
terminal Pro of the above chimeric peptide with the sequence TR (Peptide IQQEQERALNSLRRYINML-TRTR, SEQ ID NO:294).

[0432] Additionally, instead of the above-noted helices, other tertiary structures can be attached to the peptides. For example, the helix B exterior-presenting amino acids can be linked to the beta pleated sheet (Peptide JR:CSLNLNI, SEQ ID NO:295) found within the AB loop of EPO to form a chimeric peptide having the sequence Peptide IC:CSLENQIQEQLERALNNS (SEQ ID NO:296). Additionally, the presenting amino acids of the terminal portion of helix C (Peptide IT:ALGKA, SEQ ID NO:297, corresponding to amino acids 111,112,113,116, and 118 of SEQ ID NO:1) may be combined with all or part of loop CD-partial (Peptide IU:LAGAQKEAISSPPDAASAAAPLRTI, SEQ ID NO:298, corresponding to amino acids 112-133 of SEQ ID NO:1) to form Peptide IV:ALGKLAGAQKEAISSPPDAASAAAPLRTI (SEQ ID NO:299).

[0433] Additionally, isolated peptides exhibiting the various motifs disclosed above—Structural Motifs A (including Formulas I-IV), Structural Motif B (including Formulas V-X), Structural Motif C, Structural Motif D, Structural Motif E and Structural Motif F—may be combined to form various chimeras as well. In certain embodiments, the chimeras will exclude Peptide IC:QEQERALNSLRRYINMLTR, SEQ ID NO:281. Peptide IP:QEQERALNSLRRYINMLTR, SEQ ID NO:293, Peptide IQQEQERALNSLRRYINMLTR, SEQ ID NO:294, Peptide IC:CSLENQIQEQLERALNNS, SEQ ID NO:296, Peptide IT:ALGKA, SEQ ID NO:297, and Peptide IV:ALGKLAGAQKEAISSPPDAASAAAPLRTI, SEQ ID NO:299.

[0434] Preferably, a linking arm will be present between the fused peptides to provide for flexibility so that the joined peptides can assume the proper structural orientation to bind with the tissue protective receptor complex. Such fusion peptides may have a synergistic effect, obtaining a greater tissue protective effect jointly as opposed to individually possibly through enhanced binding with the tissue protective receptor complex or increased biological half life.

[0435] One of ordinary skill in the art will recognize the benefit of combining various desired structural elements in to a single peptide for maximizing the effectiveness of such compound in the method of preventing, treating, ameliorating or managing damages, effects, or symptoms resulting from exposure to a toxic agent in accordance with the current invention. Such chimeras may comprise amino acids peptides, and non-amino acid elements, such as linkers or bridging atoms or moieties.

[0436] 6.4 Fusion Peptides

[0437] The present invention further contemplates that two or more of the above noted peptides, fragment derived or chimera, may be linked to a related or unrelated protein such as erythropoietin, albumin, etc. Such fusion peptides may be generated in order to achieve synergistic benefits, increased the circulating half-life of the peptide, or increase the ability of the peptide to penetrate endothelial barriers, such as the blood-brain barrier, blood-retina barrier, etc., or vice versa, i.e. to act as a transport mechanism similar to that disclosed in PCT/US01/49479 published as WO 2002/055380 hereby incorporated in its entirety by reference.

[0438] 6.5 Manufacture of Peptides

[0439] Peptides useful in the method of the current invention may be made using recombinant or synthetic techniques well known in the art. In particular, solid phase protein synthesis is well suited to the relatively short length of the peptides and may provide greater yields with more consistent results. Additionally, the solid phase protein synthesis may provide additional flexibility regarding the manufacture of the peptides. For example, desired chemical modifications may be incorporated into the peptide at the synthesis stage: homocitrulline could be used in the synthesis of the peptide as opposed to lysine, thereby obviating the need to carboxylate the peptide following synthesis or amino acids with protected functional groups may be left on the peptide during synthesis.

[0440] Synthesis

[0443] Recombinant Techniques

[0444] A variety of host-expression vector systems may be utilized to produce the peptides and peptide analogues. Such host-expression systems represent vehicles by which the peptide of interest may be produced and subsequently purified, but also represent cells that may, when transformed or transfected with the appropriate nucleotide coding sequences, exhibit the modified erythropoietin gene product in situ. These include but are not limited to, bacteria, insect, plant, mammalian, including human host systems, such as, but not limited to, insect cell systems infected with recombinant virus expression vectors (e.g., baculovirus) containing the peptide coding sequences; plant cell systems infected with recombinant virus expression vectors (e.g., cauliflower mosaic virus, CaMV; tobacco mosaic virus, TMV) or transformed with recombinant plasmid expression vectors (e.g., T plasmid) containing erythropoietin-related molecule coding sequences; or mammalian cell systems, including human cell systems, e.g., HT1080, COS, CHO, BHK, 293, 3T3, PERC6 harboring recombinant expression constructs containing promoters derived from the genome of mammalian cells, e.g., metallothionein promoter, or from mammalian viruses, e.g., the adenovirus late promoter; the vaccinia virus 7.5K promoter.

[0445] In addition, a host cell strain may be chosen that modulates the expression of the inserted sequences, or modifies and processes the gene product in the specific fashion desired. Such modifications and processing of pro-
tein products may be important for the function of the protein. As known to those of ordinary skill in the art, different host cells have specific mechanisms for the post-translational processing and modification of proteins and gene products. Appropriate cell lines or host systems can be chosen to ensure the correct modification and processing of the foreign protein expressed. To this end, eukaryotic host cells that possess the cellular machinery for proper processing of the primary transcript, glycosylation, and phosphorylation of the gene product may be used. Such mammalian host cells, including human host cells, include but are not limited to HT1080, CHO, VERO, BHK, HeLa, COS, MDCK, 293, 3T3, and WI38.

For long-term, high-yield production of recombinant peptides, stable expression is preferred. For example, cell lines that stably express the recombinant tissue protective cytokine–related molecule gene product may be engineered. Rather than using expression vectors that contain viral origins of replication, host cells can be transformed with DNA controlled by appropriate expression control elements, e.g., promoter, enhancer, sequences, transcription terminators, polyadenylation sites, and the like, and a selectable marker. Following the introduction of the foreign DNA, engineered cells may be allowed to grow for 1-2 days in an enriched media, and then are switched to a selective media. The selectable marker in the recombinant plasmid confers resistance to the selection and allows cells to stably integrate the plasmid into their chromosomes and grow to form foci that in turn can be cloned and expanded into cell lines. This method may advantageously be used to engineer cell lines that express the tissue-protective protein. Such engineered cell lines may be particularly useful in screening and evaluation of compounds that affect the endogenous activity of the EPO-related molecule gene product.

Further Modifications

Peptides with additional modifications can also be used in the method of the present invention for preventing, treating, ameliorating or managing a disease or disorder associated with tissue damage or damage, effects or symptoms resulting therefrom. For example, the peptides of the above-noted structural motifs may be synthesized with one or more (D)-amino acids. The choice of including an (L)- or (D)-amino acid into a peptide of the present invention depends, in part, upon the desired characteristics of the peptide. For example, the incorporation of one or more (D)-amino acids can confer increasing stability on the peptide in vitro or in vivo. The incorporation of one or more (D)-amino acids can also increase or decrease the binding activity of the peptide as determined, for example, using the bioassays described herein, or other methods well known in the art.

Replacement of all or part of a sequence of (L)-amino acids by the respective sequence of entantiomeric (D)-amino acids renders an optically isomeric structure in the respective part of the peptide chain. Inversion of the sequence of all or part of a sequence of (L)-amino acids renders retro-analogues of the peptide. Combination of the enantiomeric (L to D, or D to L) replacement and inversion of the sequence renders retro-inverso-analogues of the peptide. It is known to those skilled in the art that enantiomeric peptides, their retro-analogues, and their retro-inverso-analogues maintain significant topological relationship to the parent peptide, and especially high degree of resemblance is often obtained for the parent and its retro-inverso-analogues. This relationship and resemblance can be reflected in biochemical properties of the peptides, especially high degrees of binding of the respective peptides and analogs to a receptor protein. The synthesis of the properties of retro-inverso analogues of peptides have been discussed for example in Methods of Organic Chemistry (Houben-Weyl), Synthesis of Peptides and Peptidomimetics—Workbench Edition Volume E22c (Editor-in-chief Goodman M.) 2004 (George Thieme Verlag Stuttgart, New York), and in references cited therein, all of which are hereby incorporated by reference herein in their entirety.

Amino acid “modification” refers to the alteration of a naturally occurring amino acid to produce a non-naturally occurring amino acid. Derivatives of the peptides of the present invention with non-naturally occurring amino acids can be created by chemical synthesis or by site specific incorporation of unnatural amino acids into peptides during biosynthesis, as described in Christopher J. Noren, Spencer J. Anthony-Cahill, Michael C. Grifith, Peter G Schultz, 1989 Science, 244:182-188, hereby incorporated by reference herein in its entirety.

In another embodiment, a particularly preferred non-peptide linkage is —CH₂—NH—. Such peptide mimetics may have significant advantages over peptide embodiments, including, for example: more economical production, greater chemical stability, enhanced pharmacological properties (half-life, absorption, potency, efficacy, etc.), altered specificity (e.g., a broad-spectrum of biological activities), reduced antigenicity, and others.

A variety of designs for peptide mimetics are possible. For example, cyclic peptides, in which the necessary conformation is stabilized by non-peptides, are specifically contemplated, U.S. Pat. No. 5,192,746 to Lobl et al., U.S. Pat. No. 5,756,423 to Aversa et al., U.S. Pat. No. 5,051,448 to Shashoua, and U.S. Pat. No. 5,559,103 to

Further modifications following synthesis may be implemented. For example, the peptides may be further chemically modified, i.e. carbamylated, acetylated, succinylated, guanidinated, nitrated, tri-nitrophenylated, amidated, etc., in accordance with U.S. patent application Ser. No. 10/188,905, which published as 20030072373-A1 on Apr. 17, 2003 and discloses chemically modified EPA, and in accordance with U.S. patent application Ser. No. 10/612,665, filed Jul. 1, 2003, and U.S. patent application Ser. No. 09/753,132, filed Dec. 29, 2003, which are incorporated herein by reference.

Additionally, the peptides may consist of recombinant peptides—mutagens. The disclosed mutations may include substitutions, deletions, including internal deletions, additions, including additions yielding fusion proteins, or conservative substitutions of amino acid residues within and/or adjacent to the amino acid sequence, but that result in a “silent” change, and non-conservative amino acid changes and larger insertions and deletions, as previously disclosed in PC1TUS03/209644 entitled Recombinant Tissue Protective Cytokines and Encoding Nucleic Acids Thereto for Protection, Restoration, and Enhancement of Responsive Cells, Tissues, and Organs (which is incorporated by reference herein in its entirety)

Either conservative or non-conservative amino acid substitutions can be made at one or more amino acid residues. Both conservative and non-conservative substitutions can be made. Conservative replacements are those that take place within a family of amino acids that are related to their side chains. Genetically encoded amino acids can be divided into four families: (1) acidic—Asp (D), Glu (G); (2) basic—Lys (K), Arg (R), His (H); (3) nonpolar (hydrophobic)—Cys (C), Ala (A), Val (V), Leu (L), Ile (I), Pro (P), Phe (F), Met (M), Trp (W), Gly (G), Tyr (Y); and (4) uncharged polar—Asn (N), Gln (Q), Ser (S), Thr (T). Non-polar may be subdivided into: strongly hydrophobic—Ala (A), Val (V), Leu (L), Ile (I), Met (M), Phe (F); and moderately hydrophobic—Gly (G), Pro (P), Cys (C), Tyr (Y), Trp (W). In alternative fashion, the amino acid repertoire can be grouped as (1) acidic—Asp (D), Glu (G); (2) basic—Lys (K), Arg (R), His (H), (3) aliphatic—Gly (G), Ala (A), Val (V), Leu (L), Ile (I), Ser (S), Thr (T), with Ser (S) and Thr (T) optionally be grouped separately as aliphatic-hydroxy; (4) aromatic—Ph (F), Trp (W); (5) amide—Asn (N), Gln (Q); and (6) sulfur-containing—Cys (C) and Met (M). (See, for example, Biochemistry, 4th ed., Ed. by L. Stryer, W.H. Freeman and Co., 1995, which is incorporated by reference herein in its entirety).

Alternatively, mutations can be introduced randomly along or part of the coding sequence of a peptide, such as by saturation mutagenesis, and the resultant mutants can be screened for biological activity to identify mutants that retain activity. Following mutagenesis, the encoded peptide can be expressed recombinantly and the activity of the recombinant peptide can be determined.

In another embodiment, the peptide may be further modified through the additions of polymers (such as polyethylene glycol), sugars, or additional proteins (such as a fusion construct) in an effort to extend the half-life of the peptide or enhance the peptide’s tissue protective effects. Examples of such modifications are disclosed within WO/04022577A3 and WO/05025606A1, which are incorporated herein by reference. For example, a polyethylene glycol polymer can be attached to Peptide IC to result in a Peptide IW (SEQ ID NO. 298) PEG-QEQLERALNSS.

Depending on the conjugation chemistry selected and the number of reactive sites already present or created on the peptide, one, two, or a selected number of polymers can be appended in a reproducible manner. The principal mode of attachment of a PEG, and its derivatives, to peptides is a non-specific bonding through a peptide amino acid residue (see e.g., U.S. Pat. No. 4,088,538, U.S. Pat. No. 4,496,689, U.S. Pat. No. 4,414,147, U.S. Pat. No. 4,055,635, and PCT WO 87/00056). Another mode of attaching PEG to peptides is through the non-specific oxidation of glycosyl residues on a glycopeptide (see e.g., WO 94/05332). In these non-specific methods, PEG is added in a random, non-specific manner to reactive residues on a peptide backbone.

7. ASSAYS FOR TESTING PEPTIDES

Various assays can be used to determine the utility of the above noted peptides for use in the therapeutic methods of the current invention. The peptides tissue protective activity would be confirmed using various assays known in the art and disclosed within U.S. patent application Ser. Nos. 10/554,517, 10/612,665 and 11/997,898. Further, the peptides lack of erythropoietic activity or reduced erythropoietic activity will be confirmed using various in vitro assays, such as EPO dependent cell lines (UT-7), mouse spleen bioassay (Krystol, G (1983) (a simple microassay for erythropoietin based on 3H-thymidine incorporation into spleen cells for phenylhydrazine treated mice. Exp. Hematol. 11, 649-660), or clonal assays (Spivak, J. L., Seifer, F. (1983). Erythropoietin. Horm. Norm. Abnorm. Hum. Tissues 3, 63-96), and in vivo assays, such as the ex hypoxic polycythemic mouse assay (Cotes P M, Bangham D R, Bio-assay of erythropoietin in mice made polycythemic by exposure to air at a reduced pressure, Nature. 1961 Sep. 9: 191;1065-7). Additionally, one of ordinary skill in the art will recognize that the peptide’s ability to prevent, mitigate or treat a disease or disorder associated with tissue damage or damage, effects or symptoms resulting therefrom may be confirmed through various assays both in vitro and in vivo, although in certain embodiments in vivo assays may be preferred.

7.1 Tissue Protective Assays and Models

The peptides utilized in the current method exhibit tissue protective properties, i.e. anti-apoptotic, neurotogenic, neuroprotective, etc. Peptides in accordance with the present invention may be tested for tissue protective activity, e.g., protecting cells, tissues or organs. Protective activities may be further tested using in vitro and in vivo assays. In vitro tests that are indicative of tissue protective activity include, for example, cell proliferation assays, cell differentiation assays, or detecting the presence of proteins or nucleic acids.
upregulated by tissue protective receptor complex, e.g. tissue protective cytokine receptor complex, activity, e.g., nucleolin, neuroglobin, cytoglobin, or fratixin. Neuroglobin, for example, may be involved in facilitating the transport or the short-term storage of oxygen. Therefore, oxygen transport or storage assays may be used as an assay to identify or screen for compounds which modulate tissue protective activity.

[0462] Neuroglobin is expressed in cells and tissues of the central nervous system in response to hypoxia or ischemia and may provide protection from injury (Sun et al. 2001, PNAS 98:15306-15311; Schmid et al., 2003, J. Biol. Chem. 276:1932-1935, each of which is incorporated by reference herein in its entirety). Cytoglobin may play a similar role in protection, but is expressed in a variety of tissues at varying levels (Pesch et al., 2002, EMBO J 3:1146-1151, which is incorporated by reference herein in its entirety). In one embodiment of the invention, the levels of an upregulated protein in a cell may be measured before and after contacting the peptide to a cell. In certain embodiments, the presence of an upregulated protein associated with tissue protective activity in a cell, may be used to confirm the tissue protective activities of a peptide.

[0463] Nucleolin may protect cells from damage. It plays numerous roles in cells including modulation of transcription processes, sequence specific RNA-binding protein, cytokinesis, nucleogenesis, signal transduction, apoptosis induced by l-cells, chromatin remodelling, or replication. It can also function as a cell surface receptor DNA/RNA helicase, DNA-dependent ATPase, protein shuttle, transcription factor component, or transcriptional repressor (Strvstava and Pollard, 1999, FASEB J., 13:1911-1922; and Giniety et al., 1999, J. Cell Sci., 112:761-772, each of which is incorporated by reference herein in its entirety).

[0464] Fratixin is a protein involved with mitochondrial iron metabolism and has previously been shown to be strongly up-regulated by EPO both in vivo and in vitro (Sturin et al. (2005) Eur J Clin Invest 35: 711, which is incorporated by reference herein in its entirety)

[0465] Expression of an upregulated protein may be detected by detecting mRNA levels corresponding to the protein in a cell. The mRNA can be hybridized to a probe that specifically binds a nucleic acid encoding the upregulated protein. Hybridization may consist of, for example, Northern blot, Southern blot, array hybridization, affinity chromatography, or in situ hybridization.

[0466] Tissue protective activity of the peptide of the invention can also be detected using in vitro neuroprotection assays. For example, primary neuronal cultures may be prepared from newborn rat hippocampi by trypsinization, and cultured as by any method known in the art and/or described herein e.g. in MEM-II growth medium (Invitrogen), 20 mM D-glucose, 2 mM L-glutamine, 10% Nuer-serum (bovine; Becton Dickinson, Franklin Lakes, N.J.), 2% B27 supplement (Invitrogen), 26.2 mM NaHCO3, 100 U/mL penicillin, and 1 mg/mL streptavidin (see, e.g., Leist et al., 2004, Science 305:239-242, hereby incorporated by reference in its entirety). One day after seeding, 1 μM cyto-sinearabinofuranoside is added. Thirteen day old cultures are then preincubated with increasing doses of the peptide of interest (3-3000 pm) for 24 h. On day 14, the medium is removed and the cultures challenged with 300 μM NMDA in PBS at room temperature (RT). After 5 min. pre-conditioned medium is returned to the cultures which are then returned to the incubator for 24 h. The cells are fixed in paraformaldehyde, stained by Hoechst 33342 (Molecular Probes, Eugene, Ore.) and condensed apoptotic nuclei may be counted. NGF (50 ng/ml) and MK801 (1 μM) are included as positive controls.

[0467] Animal model systems can be used to demonstrate the tissue protective activity of a compound or to demonstrate the safety and efficacy of the compounds identified by the screening methods of the invention described above. The compounds identified in the assays can then be tested for biological activity using animal models for a type of tissue damage, disease, condition, or syndrome of interest. These include animals engineered to contain the tissue protective receptor complex coupled to a functional readout system, such as a transgenic mouse.

[0468] Animal models that can be used to test the efficacy of the cell or tissue protective activity of an identified compound are known in the art and include, for example, protection against the onset of acute experimental allergic encephalomyelitis in Lewis rats, restoration or protection from diminished cognitive function in mice after receiving brain trauma, cerebral ischemia (“stroke”) or seizures stimulated by excitotoxins (Brines et al., 2000, PNAS, 97:10295-10672, which is incorporated by reference herein in its entirety), protection from induced retinal ischemia (Rosenbaum et al., 1997, Vis. Res. 37:3443-51 which is incorporated by reference herein in its entirety), protection from injury to the sciatic nerve, and protection from ischemia-reperfusion injury to the heart (in vitro cardiomyocyte studies and in vivo ischemia-reperfusion injury, see, e.g., Calvillo et al. 2003, PNAS 100:4802-4806 and Fiordaliso et al. 2005, PNAS 102:2046-2051, each of which is hereby incorporated by reference in its entirety). Such assays are described in further detail in Grasso et al. (2004) Med Sci Monit 10: BR1-3, PCT publication no. WO02/053580, or PCT application PCT/US2006/031061 each of which is incorporated by reference herein in its entirety. The in vivo methods described therein are directed towards administration of EPO, however, tissue protective proteins administered in place of EPO have been identified to also exhibit similar biologic activity, e.g., Leist et al. (2004) Science 305: 239-242, which is incorporated by reference herein in its entirety. Peptides may be substituted for testing as well. Other assays for determining tissue protective activity of a peptide are well known to those of skill in the art.

[0469] Alternatively, cell binding assays can be for evaluation of the peptides of the invention. For example, the peptide of interest can be bound to a biological marker such as a fluorescent or radiolabeled marker for ease of detection and tested for binding to transfected BaF3 cells expressing EPO and/or β receptor. In a 96 well plate, eight 1:2 serial dilutions of the peptide of interest in growth medium (RPMI 1640, 10% fetal bovine serum, 1 mM sodium pyruvate, 2 mM L-glutamine) are plated, such that the final volume in each well is about 100 μl. The BaF3 parental line and BaF3 cells transfected with EPO and/or β receptor can be washed three times in growth media (see above), pellets resuspended in growth medium, and cells counted and diluted in growth media to 5,000 cells/100 μl. 100 μl of diluted cells are then added to each peptide dilution. The assay plate is then incubated at a 37°C incubator for three to four days. The plate/cells are then washed and the plate is read on a fluorescent plate reader or by other suitable method.
to detect the level of biomarker associated with the biological activity of the peptide of interest. [0470] Similarly, a competitive assay can be utilized to determine if a peptide is tissue protective. In the competitive assay, a compound known to be tissue protective including, but not limited to, tissue protective cytokines such as those disclosed in U.S. patent application Ser. Nos. 10/188,905 and 10/185,841 (each of which is incorporated by reference herein in its entirety), can be attached to a suitable bio marker. [0471] In a 96 well plate eight 1:2 serial dilutions of a known tissue protective compound/biomarker in suitable growth medium, and the same dilution series of the known tissue protective compound/biomarker and an excess of the peptide of interest are plated. The final volume of each dilution should be about 100 µl. Once again, the BaF3 cells are seeded into the plates as disclosed supra and allowed to incubate. After an appropriate amount of time, the cells are washed and the plate is read on a fluorescent plate reader or by any other suitable method known in the art to detect the biomarker. If the readout of the plates and/or wells containing the known tissue protective compound/biomarker and peptide of interest is less than the readout of the plates containing only the known tissue protective compound/biomarker then the peptide of interest is tissue protective. [0472] Many protein factors discovered to date, including all known cytokines, have exhibited activity in one or more factor-dependent cell proliferation assays, and hence these assays serve as a convenient confirmation of cytokine activity. The activity of a peptide can be evidenced by any one of a number of routine factor dependent cell proliferation assays for cell lines including, without limitation, 32D, DA2, DA1G, T10, B9, B9/11, BaF3, MC9/G, M4(PreB M4), 2E8, RB5, DA1, 123, T1165, HLT2, CTLL2, TF-1, M0 and CMK. These cells are cultured in the presence or absence of a peptide, and cell proliferation is detected by, for example, measuring incorporation of tritiated thymidine or by colorimetric assay based on the metabolic breakdown of 3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyl tetrazolium bro mide (MTT) (Mosman, 1983, J. Immunol. Meth. 63:55-63, which is incorporated by reference herein in its entirety). [0473] If a peptide exhibits a tissue protective activity, one of ordinary skill in the art would recognize that it would be beneficial to verify the result using one of the neuroprotective and tissue protective assays known to those skilled in the art, such as, but not limited to, P-19 and PC-12 cell assays. Additionally, various in vivo models such as animal models related to spinal cord injury, ischemic stroke, peripheral nerve damage, wounds, or damage to the heart, eyes, kidneys, etc. would be helpful in further characterizing the peptide. Suitable in vitro and in vivo assays are disclosed in U.S. patent application Ser. Nos. 10/188,905 and 10/185,841, each of which is incorporated by reference herein in its entirety.

7.2 Assays for Specific Indications

[0475] The isolated peptides to be used within the method of the current invention may be demonstrated to inhibit damage, effects or symptoms resulting from exposure to a toxic agent in vitro or in vivo using a variety of assays known in the art, or described herein.

[0476] Further peptides used within the method of the Invention, may be tested in various in vitro assays in the art to determine their ability to prevent, treat, ameliorate, or manage damage, effects or symptoms resulting from exposure to a toxic agent. In general, this is accomplished by selecting an appropriate cell line, subjecting that cell to a toxic agent of interest and treating a portion of the cells with a peptide of interest and determining the cells survival or response in the presence of the toxic agent and in the presence of the toxic agent and the peptide of interest. If the cell exhibits improved survival or a reduction of damage, effects or symptoms in the presence of the peptide, the peptide can be considered to be a possible therapeutic for toxic exposure. Further one of ordinary skill in the art will recognize that the peptides ability as a protectant can be evaluated by treating the cells with the peptide prior to the toxic agent challenge.

B. Inflammation

Additionally, various in vitro models of inflammation may be used to evaluate a peptide's ability to protect or treat the damage, symptoms, or effects of inflammation on the body. Initially, the ability of the peptide to modulate an inflammatory mediator can be confirmed by measuring the levels of the inflammatory mediator in an inflammatory assay after treatment with the peptide by known methods, including but not limited to, ELISA, cytometric bead array analysis, high-sensitivity and immunonephelometric assays. For example to determine if the peptide modulates either TNF-α or IL-1, a murine model of LPS-mediated cytokine production would be performed. Some mice in the murine model would be pretreated with the peptide of interest and then challenged with LPS while others would be saline treated. Blood would then be collected and the TNF-α and IL-1 levels in the blood could be determined by an ELISA kit (OPF-ELISA mouse TNF-α and IL-1 ELISA kits (BD Biosciences). If the TNF-α levels in the treated animals are lower than the TNF-α levels in the saline treated animals then the peptide could be considered to modulate TNF-α. Preferably, the peptide would be tested for its ability to modulate more than one inflammatory mediator, and more preferably it would be a mediator other than or in addition to TNF-α, and most preferably it would be histamine. Similarly, the peptides may be tested in additional in vitro assays including, but not limited to, those disclosed in Lopata, Andreas L., Specialized in vitro Diagnostic Methods In The Evaluation Of Hypersensitivity—An Overview, Current Allergy & Clinical Immunology; March 2006, Vol. 19, No. 1, (histamine and tryptase assays), and Arainvohit et al., Pharmacological Investigations of Sapindus trifoliatus in various in vitro and in vivo models of inflammation, Indian Journal of Pharmacology, vol. 37(2), 96-102 (2005) 5-lipoxygenase (5-LO), cyclo-oxygenase (COX), Lenkorine B4 (LTB4) and nitric oxide synthase (NOS)).

Further, in vivo assays of inflammation may be useful in evaluating the peptides utility as a therapeutic against toxic agents. In vivo assays, including, but not limited to, murine FAE models, those utilizing transgenic mice such as MBDBioscience DSS IBID murine model of severe colitis, the MBDBioscience TNBS IBID murine model of inflammatory bowel disease, models involving IL-1 knockout mice disclosed within U.S. Pat. No. 6,437,216, or models of transgenic mice involving TNF-α as disclosed within Probert et al. Spontaneous inflammatory demyelinating disease in transgenic mice showing CNS-specific expression of tumor necrosis factor α. Proc. Natl. Acad. Sci. 1995 USA 92, 11294-11298, Kontoyianni et al. Impaired on/off regulation of TNF biosynthesis in mice lacking TNF AU-rich elements: implications for joint and gut-associated immunopathologies. Immunity 10:387-398, 1999, Keffler et al. Transgenic mice expressing human tumour necrosis factor: a predictive genetic model of arthritis. EMBO J. 1991 December; 10(13):4025-31, or models using chemical or synthetic challenges to induce the inflammation such as models of asthma and chronic obstructive pulmonary disease disclosed in WO 07:373-385, 2003, adjuvant arthritis models as disclosed in EP 1 777 234; murine LPS shock models, murine LPS lung models, acute paw inflammation models, or histidine challenge when formation model as disclosed in detail below.

C. Cancer.

The isolated peptides to be used within the method of the current invention may be demonstrated to inhibit tumor cell proliferation, cell transformation and tumorgenesis in vitro or in vivo using a variety of assays known in the art, or described herein. Such assays can use cells of a cancer cell line or cells from a patient. Many assays well-known in the art can be used to assess such survival and/or growth; for example, cell proliferation can be assayed by measuring ³H-thymidine incorporation, by direct cell count, by detecting changes in transcription, translation or activity of known
genes such as proto-oncogenes (e.g., fos, myc) or cell cycle markers (Rb, cdc2, cyclin A, D1, D2, D3 or E). The levels of such protein and mRNA and activity can be determined by any method well known in the art. For example, protein can be quantitated by known immunodiagnostic methods such as Western blotting or immunoprecipitation using commercially available antibodies (for example, many cell cycle marker antibodies are from Santa Cruz, Inc.). mRNA can be quantitated by methods that are well known and routine in the art, for example, by northern analysis, RNAse protection, the polymerase chain reaction in connection with the reverse transcription, etc. Cell viability can be assessed by using trypan-blue staining or other cell death or viability markers known in the art. Differentiation can be assessed visually based on changes in morphology, etc.

[0485] The present invention provides for cell cycle and cell proliferation analysis by a variety of techniques known in the art, including but not limited to the following:

[0486] As one example, bromodeoxyuridine (“BrdU”) incorporation may be used as an assay to identify proliferating cells. The BrDU assay identifies a cell population undergoing DNA synthesis by incorporation of BrDU into newly synthesized DNA. Newly synthesized DNA may then be detected using an anti-BrdU antibody (see Hoshino et al., 1986, *Int. J. Cancer* 38, 369; Campagna et al., 1988, *J. Immunol. Meth.* 107, 79).

[0487] Cell proliferation may also be examined using (3H)-thymidine incorporation (see e.g., Chen, J., 1996, *Oncogene* 13:1395-403; Jeong, J. 1995, *J. Biol. Chem.* 270:18367 73). This assay allows for quantitative characterization of S-phase DNA synthesis. In this assay, cells synthesizing DNA will incorporate 3H-thymidine into newly synthesized DNA. Incorporation may then be measured by standard techniques in the art such as by counting of radioisotope in a Scintillation counter (e.g., Beckman LS 3800 Liquid Scintillation Counter).

[0488] Detection of proliferating cell nuclear antigen (PCNA) may also be used to measure cell proliferation. PCNA is a 36 kilodalton protein whose expression is elevated in proliferating cells, particularly in early G1 and S phases of the cell cycle and therefore may serve as a marker for proliferating cells. Positive cells are identified by immunostaining using an anti-PCNA antibody (see Li et al., 1996, *Carr. Biol.* 6:189 199; Vassilev et al., 1995, *J Cell Sci.* 108:1205 15).

[0489] Cell proliferation may be measured by counting samples of a cell population over time (e.g., daily cell counts). Cells may be counted using a hemacytometer and light microscopy (e.g., Hylite hemacytometer, Hauser Scientific). Cell number may be plotted against time in order to obtain a growth curve for the population of interest. In a preferred embodiment, cells counted by this method are first mixed with the dye Trypan-blue (Sigma), such that living cells exclude the dye, and are counted as viable members of the population.

[0490] DNA content and/or mitotic index of the cells may be measured, for example, based on the DNA ploidy value of the cell. For example, cells in the G1 phase of the cell cycle generally contain a 2N DNA ploidy value. Cells in which DNA has been replicated but have not progressed through mitosis (e.g., cells in S-phase) will exhibit a ploidy value higher than 2N and up to 4N DNA content. Ploidy value and cell-cycle kinetics may be further measured using propidium iodide assay (see e.g., Turner, T., et al., 1998, *Prostate* 34:175 81). Alternatively, the DNA ploidy may be determined by quantitation of DNA Feulgen staining (which binds to DNA in a stoichiometric manner) or on a computer-ized microdensitometry scanning system (see e.g., Baco, S., 1989, *Am. J. Pathol.* 135:783 92). In another embodiment, DNA content may be analyzed by preparation of a chromosomal spread (Zabulon, S., 1994, *Hereditas* 120:127 40; Purdie, 1994, *Meoth. Cell Biol.* 44:333 351).

[0491] The expression of cell-cycle proteins (e.g., CdcE, CdcG, CdcH, CdcD, cdc2, Cdk4/6, Rb, p21 or p27) provide crucial information relating to the proliferative state of a cell or population of cells. For example, identification in an anti-proliferation signaling pathway may be indicated by the induction of p21cip1. Increased levels of p21 expression in cells results in delayed entry into G1 of the cell cycle (Harper et al., 1993, *Cell* 75:805 816; Li et al., 1996, *Curr. Biol.* 6:189 199). p21 induction may be identified by immunostaining using a specific anti-p21 antibody available commercially (e.g., from Santa Cruz, Inc.). Similarly, cell-cycle proteins may be examined by Western blot analysis using commercially available antibodies. In another embodiment, cell populations are synchronized prior to detection of a cell cycle protein. Cell-cycle proteins may also be detected by FACS (fluorescence-activated cell sorter) analysis using antibodies against the protein of interest.

[0492] Detection of changes in length of the cell cycle or speed of cell cycle may also be used to measure inhibition of cell proliferation by a peptide of the Invention. In one embodiment the length of the cell cycle is determined by the doubling time of a population of cells (e.g., using cells contacted or not contacted with one or more peptide of the Invention). In another embodiment, FACS analysis is used to analyze the phase of cell cycle progression, or purify G1, S, and G2/M fractions (see e.g., Delia, D. et al., 1997, *Oncogene* 14:2137 47).

[0493] Lapse of cell cycle checkpoint(s), and/or induction of cell cycle checkpoint(s), may be examined by the methods described herein, or by any method known in the art. Without limitation, cell cycle checkpoint is a mechanism which ensures that a certain cellular events occur in a particular order. Checkpoint genes are defined by mutations that allow late events to occur without prior completion of an early event (Weinert, T., and Hartwell, L., 1993, *Genetics* 134:63 80). Induction or inhibition of cell cycle checkpoint genes may be assessed, for example, by Western blot analysis, or by immunostaining, etc. Lapse of cell cycle checkpoints may be further assessed by the progression of a cell through the checkpoint without prior occurrence of specific events (e.g. progression into mitosis without complete replication of the genomic DNA).

[0494] In addition to the effects of expression of a particular cell cycle protein, activity and post-translational modifications of proteins involved in the cell cycle can play an integral role in the regulation and proliferative state of a cell. The invention provides for assays involved detected post-translational modifications (e.g., phosphorylation) by any method known in the art. For example, antibodies that detect phosphorylated tyrosine residues are commercially available, and may be used in Western blot analysis to detect proteins with such modifications. In another example, modifications such as myristylation, may be detected on thin layer chromatography or reverse phase h.p.l.c. (see e.g., Glover, C., 1988, *Biochem. J.* 250:485 91; Paige, L., 1988, *Biochem* 1; 250:485 91).
Activity of signaling and cell cycle proteins and/or protein complexes is often mediated by a kinase activity. The present invention provides for analysis of kinase activity by assays such as the histone H1 assay (e.g., Delia, D. et al., 1997, Oncogene 14:213747).

The peptides used within the method of the Invention can also be demonstrated to alter cell proliferation in cultured cells in vitro using methods which are well known in the art. Specific examples of cell culture models include, but are not limited to, for lung cancer, primary rat lung tumor cells (Swafford et al., 1997, Mol. Cell. Biol., 17:1366 1374) and large-cell undifferentiated cancer cell lines (Mabry et al., 1991, Cancer Cells, 3:53 58); colonocetal cell lines for colon cancer (Park and Gazdar, 1996, J. Cell Biochem. Suppl. 24:131 141); multiple established cell lines for breast cancer (Hambly et al., 1997, Breast Cancer Res. Treat. 43:247 258; Gierthy et al., 1997, Chemosphere 34:1495 1505; Prasad and Church, 1997, Biochem. Biophys. Res. Commun. 232:14 19); a number of well-characterized cell models for prostate cancer (Webber et al., 1996, Prostate, Part 1, 29:386 394; Part 2, 30:58 64; and Part 3, 30:136 142; Boulakis, 1997, Anticancer Res. 17:1471 1505); for gondoerycancers, human cervical cancer cell lines (Ribeiro et al., 1997, Int. J. Radiat. Biol. 72:11 20); organ cultures of transitional cell carcinomas (Booth et al., 1997, Lab Invest. 76:843 857) and rat progression models (Vet al., 1997, Biochim. Biophys. Acta 1360 39 448); and established cell lines for leukemias and lymphomas (Drexler, 1994, Leuk. Res. 18:919 927; Tohyama, 1997, Int. J. Hematol. 65:309 317).

The peptides of the Invention can also be demonstrated to inhibit cell transformation (or progression to malignant phenotype) in vitro. In this embodiment, cells with a transformed cell phenotype can be contaminated with one or more peptides of the Invention, and examined for change in morphology and tumor-like ability in vivo, for example, but not limited to, colony formation in soft agar, a more rounded cell morphology, slower substrate attachment, loss of contact inhibition, loss of anchorage dependence, release of proteases, such as plasminogen activator, increased sugar transport, increased serum requirement, or expression of fetal antigens, etc. (see Luria et al., 1978, General Virology, 3d Ed., John Wiley & Sons, New York, pp. 436446).

Loss of invasiveness or decreased adhesion may also be used to demonstrate the anti-cancer effects of the peptides used in the method of the Invention. For example, a critical aspect of the formation of a metastatic tumor is the ability of a precancerous or cancerous cancerous cell to detach from the primary site of disease and establish a novel colony of growth at a secondary site. The ability of a cell to invade peripheral sites is reflective of a potential for a cancerous state. Loss of invasiveness may be measured by a variety of techniques known in the art including, for example, induction of E-cadherin-mediated cell-cell adhesion. Such E-cadherin-mediated adhesion can result in phenotypic reversion and loss of invasiveness (Hordijk et al., 1997, Science 278:1464 66).

Loss of invasiveness may further be examined by inhibition of cell migration. A variety of 2-dimensional and 3-dimensional cellular matrices are commercially available (Calbiochem-Novabiochem Corp. San Diego, Calif.). Cell migration across or into a matrix may be examined by microscopy, time-lapsed photography or videography, or by any method in the art allowing measurement of cellular migration. In a related embodiment, loss of invasiveness is examined by response to hepatocyte growth factor (HGF). HGF-induced cell scattering is correlated with invasiveness of cells such as Madin-Darby canine kidney (MDCK) cells. This assay identifies a cell population that has lost cell scattering activity in response to HGF (Hordijk et al., 1997, Science 278:1464 66).

Alternatively, loss of invasiveness may be measured by cell migration through a chemotaxis chamber (Neuropore/Precision Biochemicals Inc. Vancouver, BC). In such assay, a chemo-attractant agent is incubated on one side of the chamber (e.g., the bottom chamber) and cells are plated on a filter separating the opposite side (e.g., the top chamber). In order for cells to pass from the top chamber to the bottom chamber, the cells must actively migrate through small pores in the filter. Checkerboard analysis of the number of cells that have migrated may then be correlated with invasiveness (see e.g., Ohnishi, T., 1993, Biochem. Biophys. Res. Commun. 193:518 25).

For example, a peptide to be used in the method of the Invention can be administered to a test animal, in one embodiment a test animal predisposed to develop a type of
tumor, and the test animal subsequently examined for a decreased incidence of tumor formation in comparison with an animal not administered the peptide of the Invention. Alternatively, a peptide of the Invention can be administered to test animals having tumors (e.g., animals in which tumors have been induced by introduction of malignant, neoplastic, or transformed cells, or by administration of a carcinogen) and subsequently examining the tumors in the test animals for tumor regression in comparison to animals not administered the peptide of the Invention.

8. THERAPEUTIC USE

[0503] A. Modulation of Mediators of the Body's Response

[0504] One of ordinary skill in the art would recognize that the peptides of the current invention may be used to modulate the effects of the body's response to a disease or disorder associated with tissue damage. In particular, one example of mediators the peptides noted above may be used to modulate are inflammatory mediators, including but not limited to, plasma derived inflammatory mediators, such as bradykinins, C3, C5a, Factor XII, membrane attack complex, Hageman factor, plasmin, thrombin, lymphokines (macrophage activating factor (MAF), macrophage migration inhibition factor (MMIF), macrophage chemotactic factor (MCF), leukocyte migration inhibition factor (LIMIF), histamine releasing factors (HRFs), and transfer factor (TF)); interleukins (IL-1, IL-2, IL-3, IL-4, . . . IL-15); Tumor necrosis factors (TNF-α (cachectin), TNF-β (lymphotoxin)); Interferons (IFN-α, IFN-β, IFN-γ, IFN-ω, IFN-τ); Colony stimulating factors (granulocyte colony stimulating factor (G-CSF), granulocyte-macrophage colony stimulating factor (GM-CSF), macrophage colony stimulating factor (M-CSF), and multi colony stimulating factor (IL-3)); poly-peptide growth factors (acidic fibroblast growth factor (aFGF), basic fibroblast growth factor (bFGF), epidermal growth factor (EGF); nerve growth factor (NGF), platelet derived growth factor (PDGF), and vascular endothelial growth factor (VEGF)); Transforming growth factors (TGF-α & TGF-β); α-Chemokines (IL-8, neutrophil activating protein 2 (NAP-2), platelet factor-4 (PF-4), and β-thromboglobulin (BTG)); β-Chemokines (monocyte chemotactic protein 1 (MCP-1), MCP-3, MIP-1α, macrophage inflammatory protein 1β (MIP-1β)), regulated upon activation normal T expressed and presumably secreted chemoattractant (RANTES)) and Stress proteins (heat shock proteins (HSPs), glucose related proteins (GSPs), ubiquitin, and superoxide dismutase (SOD)). Leukemia inhibitory factor (LIF), oncostatin (OSM), ciliary neurotrophic factor (CNTF), platelet basic protein (VIP), lysosome granules, histamine, serotonin, leukotriene B4, nitric oxide, and/or prostaglandins. In a preferred embodiment the peptides inhibit or suppress the activity of the mediators and more preferably inhibit the activity of TNF-α, histamine, nitric oxide, and interleukins. Most preferably, the peptides inhibit the activity of two or more inflammatory mediators.

[0505] B. Treatment or Prevention of Various Diseases, Disorders, and Conditions

[0506] The tissue protective peptides and peptide analogs of the current invention are also useful as therapeutics for treatment or prevention of various diseases, disorders, and conditions. One skilled in the art would also recognize that such peptides and peptide analogs can be used to achieve modulation of a tissue protective receptor complex, e.g., tissue protective cytokine complex. Both in vitro and in vivo techniques that can be used for assessing the therapeutic indications of, for example, the compounds identified by the inventive assays disclosed above are disclosed in PCT Application No. PCT/US01/49479, U.S. patent application Ser. Nos. 10/188,905 and 10/188,841.

[0507] The aforementioned tissue protective peptides and peptide analogs of the invention may be useful generally for the prevention, therapeutic treatment, or prophylactic treatment of human diseases or disorders of the central nervous system or peripheral nervous system which have primarily neurological or psychiatric symptoms, ophthalmic diseases, cardiovascular diseases, cardiopulmonary diseases, respiratory diseases, kidney, urinary and reproductive diseases, bone diseases, skin diseases, connective tissue diseases, gastrointestinal diseases and endocrine and metabolic abnormalities. Examples of use include, but are not limited to, protection against and repair of injury resulting from trauma and resulting inflammation to the brain (ischemic stroke, blunt trauma, subarachnoid hemorrhage), spinal cord (ischemia, blunt force trauma), peripheral nerves (sciatic nerve injury, diabetic neuropathy, carpal tunnel syndrome), retinal (macular edema, diabetic retinopathy, glaucoma), and heart (myocardial infarct, chronic heart failure). In particular, such diseases, disorders, and conditions include hypoxic conditions, which adversely affect responsive tissues, such as excitable tissues including, but not limited to, those noted above in Section 4.2 (xiii), or those responsive cells tissues or organs, those that express the appropriate Type-1 cytokine receptor, e.g., EPO-R receptor or the tissue protective receptor complex. Therefore, the tissue protective peptides and peptide analogs of the invention can be used to treat or prevent damage to responsive tissue resulting from hypoxic conditions in a variety of conditions and circumstances. Non-limiting examples of such conditions and circumstances are provided in the table herein below.

[0508] The tissue protective peptides and peptide analogs are also of interest in the modulation of stem cell activity. It has been established that cytokines exhibiting tissue protective activity, e.g., EPO, are able to mobilize stem cells, stimulating the migration to regions of injury and aiding the repair process, e.g. in a regenerative role. For example, in experimental stroke, EPO mediates the migration of neuroblasts into a region of ischemic injury to regenerate neurons during the period of recovery (Tsai et al., J. Neurosci 2006 26:1269-74). As another example, EPO and carbamylated EPO (CEPO) mobilize endothelial progenitor cells from the bone marrow into the circulation. These cells then home to distance regions and are involved in the formation of new blood vessels (for effect of EPO, see, Bahlmann et al, 2003, Kidney Int. 64:1648-1652). While not wishing to be bound to any particular theory, the isolated peptides and peptide analogs disclosed herein are believed to have a similar effect on the migration of stem cells.

[0509] In the example of the protection of neuronal tissue pathologies treatable and preventable using tissue protective peptides and peptide analogs of the invention, such pathologies include those which result from reduced oxygenation of neuronal tissues. Any condition which reduces the availability of oxygen to neuronal tissue, resulting in stress, damage, and finally, neuronal cell death, can be treated using tissue protective peptides and peptide analogs of the present invention. Generally referred to as hypoxia and/or ischemia, these conditions arise from or include, but are not limited to,
stroke, vascular occlusion, prenatal or postnatal oxygen deprivation, suffocation, choking, near drowning, carbon monoxide poisoning, smoke inhalation, trauma, including surgery and radiotherapy, asphyxia, epilepsy, hypoglycemia, chronic obstructive pulmonary disease, emphysema, adult respiratory distress syndrome, hypotensive shock, septic shock, anaphylactic shock, insulin shock, sickle cell crisis, cardiac arrest, dysrhythmia, nitrogen narcosis, hypoxemic hypoxia (altitude sickness, high altitude pulmonary edema, high altitude cerebral edema, sleep apnea, hypopnea, respiratory arrest, shrunts), methaemoglobinaemia, histotoxic hypoxia, intrauterine hypoxia, and neurological deficits caused by heart-lung bypass procedures.

[0510] In one embodiment, for example, the tissue protective peptides and peptide analogs of the present invention identified using the above-noted assays could be administered alone or as part of a composition to prevent injury or tissue damage resulting from risk of injury or tissue damage prior to, during, or subsequent to a surgical procedure or a medical procedure. For example, surgical procedures may include tumor resection or aneurysm repair and medical procedures may include labor or delivery. Other pathologies caused by or resulting from hypoglycemia which are treatable using tissue protective peptides and peptide analogs of the present invention include insulin overdose, also referred to as iatrogenic hyperinsulinemia, insulinoma, growth hormone deficiency, hypocortisolism, drug overdose, and certain tumors.

[0511] Other pathologies resulting from excitable neuronal tissue damage include seizure disorders, such as epilepsy, convulsions, or chronic seizure disorders. Other treatable conditions and diseases include, but are not limited to, diseases such as stroke, multiple sclerosis, hypotension, cardiac arrest, chronic heart failure, Alzheimer’s disease, Parkinson’s disease, cerebral palsy, brain or spinal cord trauma, AIDS dementia, age-related loss of cognitive function, memory loss, amyotrophic lateral sclerosis, seizure disorders, alcoholism, retinal ischemia, optic nerve damage resulting from glaucoma, and neuronal loss.

[0512] The specific tissue protective peptides and peptide analogs of the present invention may be used to treat or prevent inflammation resulting from disease conditions or various traumas, such as physically or chemically induced inflammation. The tissue protective peptides and peptide analogs are also contemplated for the treatment and prevention of inflammatory conditions in one or more organs or tissues including, but not limited to, the brain, spinal cord, connective tissue, heart, lung, kidney and urinary tract, pancreas, eyes and prostate. Non-limiting examples of such trauma include, but are not limited to those listed in Section 4.2 (xvi). Further the tissue protective peptides may be used to treat or prevent inflammation resulting from ischemic and non-ischemic conditions including, but not limited to, allergies, allergic diseases, allergic symptoms, rheumatic diseases, sports related injuries, exposure to toxic agents, infections including viral, fungal, and bacterial, further examples of such conditions are disclosed above in Section 4.2 (iv), (v) and (xvi). The inflammation may be acute or chronic. Further applications in the field of inflammation are noted within PCT/US2004/031789 filed Sep. 29, 2004 and published as WO 2005/032467.

[0513] The specific tissue protective peptides and peptide analogs of the present invention may be used to treat central nervous and peripheral nervous system diseases resulting from demyelination or impairment of the myelin sheath. These diseases are defined as mainly involving inflammatory myelin sheath lesions of unknown origin, with the exception of myelinization deficiency diseases, such as leukodystrophy, and diseases due to obvious causes. Multiple sclerosis (MS) is a typical disease among demyelinating diseases, and pathologically, it is characterized by changes, mainly, inflammatory demyelination, and gliosis. Since its etiology is unknown, its diagnosis is made based on its clinical features, i.e., spatial multiplicity and multiplicity over time of central nervous system lesions. Furthermore, acute disseminated encephalomyelitis (ADEM), inflammatory diffuse sclerosis, acute and subacute necrotizing hemorhagic encephalomyelitis, and transverse myelitis are included in demyelinating diseases. Also, peripheral nervous tissues rely upon Schwann cells to maintain the myelin sheath, if these cells are impaired, peripheral demyelinating disease is caused.

[0514] The tissue protective peptides and peptide analogs of the present invention may be used to treat or prevent conditions of, and damage to the heart including any chronic or acute pathological event involving the heart and/or associated tissue (e.g., the pericardium, aorta and other associated blood vessels), including ischemia-reperfusion injury; congestive heart failure; cardiac arrest; myocardial infarction; atherosclerosis, mitral valve leakage, atrial flutter, cardiotoxicity caused by compounds such as drugs (e.g., doxorubicin, herceptin, thioridazine and cisplade); cardiac damage due to parasitic infection (bacteria, fungi, rickettsiae, and viruses, e.g., syphilis, chronic Trypanosoma cruzi infection); fulminant cardiac amyloidosis; heart surgery; heart transplantation; angioplasty, laparoscopic surgery, traumatic cardiac injury (e.g., penetrating or blunt cardiac injury, and aortic valve rupture), surgical repair of a thoracic aortic aneurysm; a suprarenal aortic aneurysm; cardiogenic shock due to myocardial infarction or cardiac failure; neuronal shock and anaphylaxis. The tissue protective peptides and peptide analogs of the current invention may also be used to treat those individuals at risk for heart disease such as cardiac failure (i.e., where the heart is not able to pump blood at a rate required by the metabolizing tissues, or when the heart can do so only with an elevated filling pressure). Such at risk patients would include patients having or being at risk of having cardiac infarction, coronary artery disease, myocarditis, chemotheraphy, cardiomyopathy, hypertension, valvular heart diseases (most often mitral insufficiency and aortic stenosis) and toxin-induced cardiomyopathy (e.g. ethanol, cocaine, etc.) and the like.

[0515] The tissue protective peptides and peptide analogs of the present invention may be used to treat or prevent conditions of, and damage to, the eyes, e.g., retinal tissue. Such disorders include, but are not limited to retinal ischemia, macular degeneration, retinal detachment, retinitis pigmentosa, arteriosclerotic retinopathy, hypertensive retinopathy, retinal artery blockage, retinal vein blockage, retinal edema, hypotension, and diabetic retinopathy.

[0516] In another embodiment, the tissue protective peptides and peptide analogs of the present invention and principles of the invention may be used to prevent or treat injury resulting from exposure to toxic agents, i.e. radiation or chemical damage to responsive tissue. In one embodiment of the invention the above-noted peptides are useful as therapeutics for modulating the mediators of the body’s response to toxic agents, preferably to suppress or inhibit the
activity of such modulators. Additionally, the above-noted peptides are useful as therapeutics for the treatment, prevention, amelioration or management of damage, effects or symptoms of exposure to a toxic agent. The peptides may be used to treat exposure to various toxic agents, including biological, chemical or radiation agents.

These peptides may be used to treat the damages, effects, or symptoms due to biological agents such as of prions, viruses, microorganisms (bacteria and fungi), and some unicellular and multicellular eukaryotes (i.e., parasites), including, but not limited to, those biological toxins listed above in Section 4.2 (viii). Further the peptides of the current invention may be used to prevent, treat, ameliorate, or manage the damage, effects or symptoms due to chemical agents. Such agents include, but are not limited to, blood agents, blister agents, nerve agents, pulmonary agents, and incapacitating agents. Additionally, the peptides of the current invention may be used to prevent, treat, ameliorate or manage damage, effects or symptoms due to toxic exposure to industrial chemicals including but not limited to those listed in Section 4.2 (x). Damage, effects or symptoms due to exposure to a radiation agent are preventable, treatable, or manageable using the peptides of the current invention. The peptides can prevent, treat, ameliorate, or manage the damage, effects or symptoms due to radioactive agents that include alpha, beta or gamma radiation, and more particularly may include, but are not limited to, \(^{137}\)Cs, \(^{60}\)Co, \(^{24}\)Am, \(^{225}\)Ac, \(^{131}\)I, \(^{238}\)Pu, \(^{90}\)Sr, \(^{226}\)Ra, \(^{137}\)Sn, \(^{75}\)Zr, \(^{40}\)Mo, \(^{187}\)Re, \(^{192}\)Ir, \(^{109}\)Cd, \(^{103}\)Ru, \(^{125}\)I, \(^{131}\)Te, \(^{144}\)Ce, \(^{133}\)I, \(^{111}\)In, \(^{235}\)U, \(^{238}\)U, \(^{228}\)Th, \(^{237}\)Pa, \(^{234}\)Pu, \(^{233}\)Pu, \(^{232}\)Th, \(^{231}\)Pa, \(^{230}\)Th, \(^{229}\)Th, \(^{228}\)Th, \(^{227}\)Th, \(^{226}\)Ra, \(^{225}\)Ra, \(^{224}\)Ra, \(^{223}\)Ra, \(^{222}\)Ra, \(^{221}\)Ra, \(^{220}\)Ra, \(^{219}\)Ra, \(^{218}\)Ra, \(^{217}\)Ra, \(^{216}\)Rn, \(^{215}\)Rn, \(^{214}\)Rn, \(^{213}\)Rn.

As mentioned above, the present invention also provides tissue protective peptides and peptide analogs of the present invention for use in enhancing tissue function in responsive cells, tissues and organs in a mammal by peripheral administration of a tissue protective peptide as described above. Various diseases and conditions are amenable to treatment using this method. For example this method is useful for enhancing function in excitable tissues resulting in an increase in cognitive function even in the absence of any condition or disease. Further, the tissue protective cytokines are useful for improving the quality of wound healing, reducing the time required to heal, improving the quality of the healed tissues and reducing the incidence of adhesions resulting from the wound. See PCT/US2004/031789 filed Sep. 29, 2004 and published as WO 2005/032467. Further the tissue protective peptides of the current invention may be useful in treating, preventing or managing the lesions on the skin or along the respiratory pathways induced by chemical agents such as blistering or vesicant agents or industrial chemicals.

These uses of the peptides of the present invention are described in further detail below and include enhancement of learning and training in both human and non-human mammals.

In another embodiment, the tissue protective peptides and peptide analogs of the present invention may be useful generally for the prevention, therapeutic treatment, prophylactic treatment or management of various cancers or neoplastic disorders of the central nervous system, peripheral nervous system, gastrointestinal/digestive system, genitourinary system, adrenal, gynecological, head and neck, hematological/blood, musculoskeletal/soft tissue, respiratory, and breast. Examples of use include, but are not limited to, protection against and repair of injury resulting from cancers or neoplastic disorders listed in section 4.2 (ix) and (xv). Further the peptides of the current invention may be used for the prevention, therapeutic treatment, prophylactic treatment or management of various syndromes associated with neoplasms or cancers, including, but not limited to those listed above in Section 4.2 (xviii). The peptides may be used in accordance with the method of the current invention to address the above-noted syndromes. For example, the peptides may be administered to address hereditary syndromes such as Li Fraumeni, hereditary non-polyposis colorectal cancer, familial adenomatous polyposis, and Von Hippel-Lindau syndrome by either delaying the onset of the neoplastic aspects of the disease, reducing the number of neoplastic growths associated with the syndrome, or in general enhancing the quality of life or the longevity of those patients afflicted with these conditions. The peptides may also be administered prophylactically to address syndromes related to certain treatment, chemotherapy or radiation therapy, of the neoplastic disorder or cancer, such as androgen deprivation syndrome, therapy related myelodysplastic syndrome or somnolence syndrome, in the hopes of preventing the syndromes or reducing the severity of the syndrome.

Further, the peptides may be used to treat or prevent cachexia and diseases related to cachexia. Such diseases include, but are not limited to cancer cachexia, anorexia, asthenia, anemia, tuberculosis, AIDS, congestive heart failure, renal failure, liver failure, chronic obstructive pulmonary disease, emphysema, muscle atrophy, diabetes, and endotoxemia.
Conditions and diseases treatable or preventable using tissue protective peptides and peptide analogs of the present invention provides the central nervous system include but are not limited to mood disorders, anxiety disorders, depression, autism, attention deficit hyperactivity disorder, and cognitive dysfunction. These conditions benefit from enhancement of neuronal function. Other disorders treatable in accordance with the teachings of the present invention include sleep disruption, for example, sleep apnea and travel-related disorders; subarachnoid and aneurismal bleeds, hypotensive shock, concussive injury, septic shock, anaphylactic shock, and sequelae of various encephalitides and meningitides, for example, connective tissue disease-related cerebritides such as lupus. Other uses include prevention of or protection from poisoning by neurotoxins, such as domoic acid shellfish poisoning, neuroathlitis, and Guam disease, amyotrophic lateral sclerosis, Parkinson's disease; postoperative treatment for embolic or ischemic injury; whole brain irradiation; sickle cell crisis; and eclampsia.

A further group of conditions treatable or preventable using tissue protective peptides and peptide analogs of the present invention include mitochondrial dysfunction, of either a hereditary or acquired nature, which are the cause of a variety of neurological diseases typified by neuronal injury and death. For example, Leigh disease (subacute necrotizing encephalopathy) is characterized by progressive visual loss and encephalopathy, due to neuronal drop out, and myopathy. In these cases, defective mitochondrial metabolism fails to supply enough high energy substrates to fuel the metabolism of excitable cells. A tissue protective peptide or peptide analog optimizes failing function in a variety of mitochondrial diseases. As mentioned above, hypoxic conditions adversely affect excitable tissues. The excitable tissues include, but are not limited to, neuronal tissues such as tissue of the peripheral nervous system (ear and retina) and central nervous system (brain and spinal cord); cardiovascular tissue such as the cells of the heart and associated nerves; and glandular tissue such as the pancreas where T-type calcium channels along with cell-to-cell gap junctions participate in secretion of insulin. An exemplary list of excitable tissue includes, but is not limited to, organs and tissues that include nerves, skeletal muscle, smooth muscle, cardiac muscle, uterus, central nervous system, spinal cord, brain, retina, olfactory system, and auditory system. In addition to the conditions described above, the tissue protective peptides and peptide analogs of the present invention are useful in the treatment of inhalation poisoning such as carbon monoxide and smoke inhalation, severe asthma, adult respiratory distress syndrome, and choking and near drowning. Further conditions which create hypoxic conditions or by other means induce responsive tissue, such as excitable tissue damage include hypoglycemia that may occur in inappropriate dosing of insulin, or with insulin-producing neoplasms (insulinoma).

Various neuropsychologic disorders which are described to originate from excitable tissue damage are treatable using tissue protective peptides and peptide analogs of the present invention. Chronic disorders in which neuronal damage is involved and for which treatment or preventable by the present invention include disorders relating to the central nervous system and/or peripheral nervous system including age-related loss of cognitive function and senile dementia, chronic seizure disorders, Alzheimer's disease, Parkinson's disease, dementia, memory loss, amyotrophic lateral sclerosis, multiple sclerosis, tuberous sclerosis, Wilson's disease, cerebral and progressive supranuclear palsy, Guam disease, Lewy body dementia, prion diseases, such as spongiform encephalopathies, e.g., Creutzfeldt-Jakob disease, Huntington’s disease, myotonic dystrophy, Friedreich’s ataxia and other ataxias, as well as Gilles de La Tourette’s syndrome, seizure disorders such as epilepsy and chronic seizure disorder, stroke, brain or spinal cord trauma, AIDS dementia, alcoholism, autism, retinal ischemia, glaucoma, autonomic function disorders such as hypertension and sleep disorders, and neuropsychiatric disorders that include, but are not limited to schizophrenia, schizoaffective disorder, attention deficit disorder, dysthmic disorder, major depressive disorder, mania, obsessive-compulsive disorder, psychoactive substance use disorders, anxiety, panic disorder, as well as unipolar and bipolar affective disorders. Additional neuropsychiatric and neurodegenerative disorders include, for example, those listed in the American Psychiatric Association’s Diagnostic and Statistical Manual of Mental Disorders (DSM).

A further group of conditions treatable or preventable using tissue protective peptides and peptide analogs of the present invention include kidney diseases such as renal failure, acute and chronic. Blood supply to the kidneys can be cut off due to several causes including shock from infections invading the bloodstream (septicemia), internal or external hemorrhaging, loss of fluid from the body as a result of severe diarrhea or burns, reactions to transfusions, cardiac arrest or arythmias, surgical trauma and kidney transplantations. The reduced flow of blood to the kidneys resulting from the above conditions may reduced blood flow to dangerously low levels for a time period great enough to cause the development of acute renal failure. The depressed blood flow also results in necrosis, or tissue death, in the kidney, damaging the renal tubular cells. Renal failure may also result from diseases (interstitial and diabetic) nephrotic syndromes, infections, injury (CPB-induced), toxins (contrast-induced, chemotherapy-induced, cyclosporine), autoimmune inflammation (e.g. Lupus, erythrophytosis, etc.) The tissue protective peptides and peptide analogs of the current invention assist in the repair or prevention of this damage helping to ameliorate acute renal failure. Further, the peptides of the current invention may be used to treat, prevent or ameliorate diseases or disorders of the urinary tract including, but not limited to, urinary tract infections, irritable bladder, and trauma or radiation injury to the bladder.

The following table lists additional exemplary, non-limiting indications as to the various conditions and diseases amenable to treatment by the aforementioned tissue protective peptides and peptide analogs.

TABLE 1-continued
DISEASES AND DISORDERS AMENABLE TO TREATMENT BY TISSUE PROTECTIVE PEPTIDES AND PEPTIDE ANALOGS
As mentioned above, these diseases, disorders or conditions are merely illustrative of the range of benefits provided by the tissue protective peptides and peptide analogs of the present invention. Accordingly, this invention generally provides preventative, therapeutic, or prophylactic treatment of the consequences of mechanical trauma or of human diseases. Prevention or therapeutic or prophylactic treatment for diseases, disorders or conditions of the CNS and/or peripheral nervous system are contemplated. Prevention or therapeutic or prophylactic treatment for diseases, disorders or conditions which have a psychiatric component is provided. Prevention or therapeutic or prophylactic treatment for diseases, disorders or conditions including but not limited to those having an ophthalmic, cardiovascular, cardiopulmonary, respiratory, kidney, urinary, reproductive, gastrointestinal, endocrine, or metabolic component is provided. The peptides may be useful for the prevention, therapeutic treatment, prophylactic treatment or management of diseases or disorders associated with tissue damages as well as the damages, effects or symptoms thereof in one or more organs or tissues, preferably at least two, including, but not limited to, the brain, spinal cord, connective tissue, skin, gastrointestinal tract, reproductive organs, liver, heart, lung, kidney, urinary tract, pancreas, eyes and prostate.

In certain embodiments, the methods of the current invention may exclude peptides of the current invention or particular indications. For example, peptides in accordance with Structural Motif I may be excluded in methods of the current invention in the indications disclosed within WO 2006/119767 and WO 2007/071248 including: post-operative nerve damage; traumatic nerve damage; spinal cord injury; impaired myelination of nerve fibers; postischemic damage; stroke; Parkinson's disease; Alzheimer's disease; Huntington's disease; aschizophrenia, dementia; multiple sclerosis, multifactorial dementia; nerve degeneration associated with diabetes mellitus; neuro-muscular degeneration, disorders affecting the circadian clock or neuro-muscular connections; organ transplantation; genetic or traumatic atrophic muscle disorders; degenerative conditions of the gonads, pancreas, kidney, heart, liver and bowel; diabetes mellitus type I or II; nephrosis; psychoses; neurotic disorders; personality disorders; sexual deviations and disorders; mental retardation; disease in the nervous system and sense organs; cognitive anomalies; inflammatory disease of the central nervous system; cerebral degenerations; stimulation of short or long term memory; extra pyramidal diseases and abnormal movement disorders; motor neuron diseases; diseases of the spinal cord; disorders of the autonomic nervous system, diseases of the peripheral nervous system; neuropathies; disorders affecting multiple structures of the eyes; diseases of the ear and mastoid process; abnormalities of organs and soft tissue in newborns; complications of administration of anesthesia or other sedation in labor and delivery; diseases and injuries of the skin; injury to nerves and spinal cord; poisoning by drugs; medicinal and biological substances; metabolic disorders; disorders of endocrine glands; disorders of purine and pyrimidine metabolism; bone disorders; neoplasms; cancers; viral infections of the brain; Guillain-Barre syndromes; pain syndrome; autism and stimulation of the ability to learn. Also, for example, peptides in accordance with Structural Motif II may be excluded in methods of the current invention in the indications disclosed within U.S. Pat. Nos. 5,571,787, 5,700,909, 5,696,080, 5,714,459, 6,590,074, 6,559,124, 6,271,196, 6,268,347, and 6,849,602 including: neuropathic pain due to neurona (amputation, nerve transaction), nerve compression (entrapment neuropathies, or tumor compression), nerve trauma (crush, stretch, or incomplete transection); diabetes mellitus; irradiation, ischemia, vasculitis, post-polio syndrome, alcohol, amyloid, toxins, HIV, hypothyroidism, uremia, vitamin deficiencies, chemotherapy, dC (Zalcitabine). Fabry's diseases, compression (disk, tumor, scar tissue), root avulsion, inflammation (postherpetic neuralgia), spinal cord contusions, spinal cord tumors, spinal cord hemisection, and infarction, tumors or trauma of the brainstem, thalamus or cortex; and demyelinating diseases including multiple sclerosis, acute disseminated leukoencephalitis, progressive multifocal leukoencephalitis, metachromatic leukodystrophy, and adrenal leukodystrophy. For another example, peptides in accordance with Structural Motif III may be excluded in methods of the current invention in the indications disclosed in U.S. Pat. No. 7,259,146 and US Patent Publication No. 20030130197, including: acute neurodegenerative disorders; cerebellar ischemia or infarction including embolic occlusion and thrombotic occlusion; reperfusion following acute ischemia; perinatal hypoxic-ischemic injury; cardiac arrest; intracranial hemorrhage; intracranial and intravertebral lesions; and whiplash shake infant syndrome; chronic neurodegenerative disorders: Alzheimer’s disease, Pick’s disease, diffuse Lewy body disease, progressive supranuclear palsy, multisystem degeneration, chronic epileptic conditions, motor neuron diseases, prion diseases, neurological and psychiatric manifestations associated with peripheral diseases including EPO deficiency, blood loss, renal failure, endstage renal disease, renal transplant, and other diseases associated with anemia including hematological and non-hematological malignancies/tumors, complications associated with chemotherapy and other drugs, hematological disorders, inflammatory and infectious disorders, chronic systemic autoimmune diseases, Henoch Schonlein Purpura, hemolytic uremic syndrome, chemical, toxic, infectious, and radiation injury of the nervous system, and encephalopathies; pleuropathies; neuropathies; Charcot-Marie-Tooth disease; Friedreich’s ataxia; metachromatic leukodystrophy; Refsum’s disease; adrenomyeloneuropathy; Ataxia-telangiectasia; Djerine-Sottas neuropathy; Lambert-Eaton syndrome; and disorders of the cranial nerves. As a further example, peptides in accordance with Structural Motif IV may be excluded in methods of the current invention in the indications disclosed in WO/2007/052154 including: immune-mediated inflammation; autoimmune diseases including Hashimoto’s thyroiditis, insulin dependent diabetes mellitus, systemic lupus erythmatosus; demyelinating disease including multiple sclerosis, traverse myelitis, Guillain-Barre syndrome, and progressive multifocal leukoencephalopathy and demyelination resulting from organophosphate exposure; arthritis; acute cerebrovascular injury; acute spinal cord injury; acute brain injury; acute cardiovascular injury; stroke; traumatic injury; transplant rejection; and graft rejection.

C. Prevention, Treatment, Amelioration, or Management of the Damage, Effects, or Symptoms of Diseases, Disorders or Conditions.

In a further embodiment of the invention, the method of treatment of the current invention is useful for preventing, treating, ameliorating, or managing the damage, effects, or symptoms of the above noted diseases and disorders. In particular, the current method of treatment can be
used to address symptoms including, but not limited to, cachexia, carcinogenesis, sterilization, cutaneous reformation, radiodermatitis, beta burns, gamma burns, loss of cells (in particular bone marrow, digestive tract cells), damage to the hematopoietic, gastrointestinal, central nervous, cardiovascular, skin, and/or reproductive systems, acute radiation syndrome (feeling ofnausea, vomiting, general illness and fatigue, immune system depression, loss of hair, uncontrollable bleeding (mouth, under the skin, kidneys), massive diarrhea, delirium, coma and death), chronic radiation syndrome, cutaneous radiation syndrome (inflammation, erythema, dry or moist desquamation, hair loss, blistering, reddening, ulceration, damage to sebaceous and sweat glands, atrophy, fibrosis, decreased or increased skin pigmentation, and necrosis), headaches, dizziness, nausea, vomiting, mucosal irritation, dyspnea, impaired consciousness, coma, convulsions, tachy- and bradycardias, hypotension, cardiovascular collapse, anoxia, hyperemia, myositis, excessed salivation, diarrhea, involuntary micturition, muscle fasciculation, initial depolarizing flaccid paralysis, spike discharges and convulsions, intermediate syndrome, neurotoxic esterase inhibition, organophosphate-induced delayed neuropathy, erythema, edema, necrosis and vesicles, melanodermia, tracheobronchitis, bronchospasms, bronchial obstruction, hemorrhagic pulmonary edema, respiratory failure, bacterial pneumonia, eye erythema, lacrimation, discomfort of the eyes, severe pain in the eyes, blepharospasm, irritis, blindness, bone marrow suppression, leukocyte shock, hepatic necrosis, renal failure secondary to hyperperfusion, burning sensations (eyes, nasopharynx, oropharynx), profuse tearing, rhinorrhea, coughing hoarseness, dyspnea, odynophagia, conjunctivitis, corneal injury, naso-oropharyngeal injury/edema, respiratory distress due to inflammation of the glottic structures, secretions, and/or laryngospasms, acute respiratory syndromes, disorientation, behavioral modifications, and reactive airway dysfunction syndrome.

As mentioned above, these diseases or disorders associated with tissue damage or damage, effects, or symptoms resulting therefrom are merely illustrative of the range of disorders that can be addressed by the peptides used in the method of the current invention. Accordingly, this invention generally provides preventative, therapeutic, or prophylactic treatment of a disease or disorder associated with tissue damage or damage, effects or symptoms resulting therefrom.

Diseases or disorders associated with tissue damage or damage, effects or symptoms resulting therefrom can be treated or prevented by administration of an effective amount of a peptide of the invention. In certain embodiments, the present invention provides methods of treating or preventing a disease or disorder described herein comprising the step of administering to a subject having the disease or disorder an amount of a peptide of the invention effective to treat or prevent the disease or disorder. In one embodiment, a composition comprising an effective amount of one or more peptides of the invention, or a pharmaceutically acceptable salt thereof, is administered.

D. Treatment in Conjunction with Other Therapeutics for a Cumulative or Synergistic Effect.

In certain embodiments, the invention encompasses methods for treating, mediating, ameliorating or preventing a disease or disorder associated with tissue damage or damage, effects or symptoms resulting therefrom, comprising administering to a patient in need thereof an effective amount of a peptide and another suitable therapeutic agent, each being administered according to a regime suitable for the medicament. This may be done to achieve additive, synergistic or offsetting (to counteract side effects of the therapeutic) benefits of the effects of the peptide and therapeutic agents. This includes the concurrent, substantially simultaneous, or non-concurrent administration of the peptide and suitable therapeutic agent. The non-concurrent administration of the peptide and a suitable therapeutic agent includes sequential, alternating, and acute vs. chronic administration of the peptides and suitable therapeutic agents. Also, the peptide and the suitable therapeutic agent may be administered in the same or separate pharmaceutical compositions, and if administered separately they may be administered via the same route of administration or different routes. Suitable therapeutic methods and agents may include, but are not limited to, carbamates (pyridostigmine, physostigmine, aminosigmine, neostigmine, synostigmine, Epistigmine, Mobum, decarbolium), anticholinergics (trihexyphenidyl, benactyzine, Biperidene, Scopolamine, aprophen, atropine, hyoscin, adiphene, Carafinphen, pento- methionium, Mecamylamine, Trihexyphenidyl) PANPALS, aminophenols (eseroline), organophosphates (TEPP, Paraxin, Ethyl-nitrophenylphosphate), tacrine, 7-MEO- TA, huperzine A, Cholinesterases (BuChE, AChE, triesterase, paraoxanase), oximes/reactivators (HI-6, PAM, Obidoxime, Trimedoxime, Methoxime, Hiio-7, Bi-6, K048, K033, pralidoxime chloride (2-PAM CL), PS2, TMBH, 2-PAM), Suramone, Benzodiazepines, tubocurarine, Memantin, Procyclidine, Nicodipin, Clonidine, pralidoxime, diazepam, enpéphalins, phenylmethylsulfonyl fluoride, nitrium bicarbonate, vitamin E analogs (α-tocopherol succinate, γ-tocotrienol), superoxide dismutase/catalse mimic (EUK189), selensium, benzylic steryl sulfate, truncated flagellin, statins, genistein, galantamine, hydrotheria, 5-andros- tenden, CPg-oligodeoxynucleotides, antimitobials, stem cell transplants, amifostine, Tempol, isoflavones, benzyal- fone analogs, GM-CSF, G-CSF, potassium iodide, aluminum hydroxide, Prussian blue, chelating agents (diethylenetriaminepentacetaete (Ca-DTPA), zinc diethylenetriaminepentacetaete (Zn-DTPA)), keratinocyte growth factor, intestinal peptide hormones, beta glucan, octreotide, pentoxifylline, angietin converting enzyme inhibitors, angietin 11 receptor blockers, methemoglobin forms (amyl nitrite, sodium nitrite), sodium thiosulfate, cobalt compounds (hydroxyxycobalamin (Vitamin B12a), toxoids, antibiotics, vaccines, passive antibodies, chemotherapeutic agents including, but not limited to, methotrexate, taxol, mercaptopurine, thioguanine, hydroxyurea, cytarabine, cyclophosphamide, ifosfamide, nitrosourea, cisplatin, carboplatin, mitomycin, dacarbazine, procarbazine, etoposide, camphatecinus, bleomycin, doxorubicin, idarubicin, daunorubicin, daunomycin, plicamycin, mitoxantrone, asparaginase, vinblastine, vincristine, vinorelbine, pacli- taxel, and docetoxel; Radiation; γ-radiation; Alkylating agents; Nitrogen mustards: cyclophosphamide, Ifosfamide trofosfamide, Chlorambucil; Nitrosourea: Ciuarmestin (BCNU), Lomustine (CCNU), Alky1 sulphonates busulfan, Treosulfan; Triazenes: Decarbazine; Platinum containing compounds: Cisplatin carboplatin, Plant Alkaloids; Vinca alkaloids: vincristine, vinblastine, Vinbeside, Vinorelbine; Taxoids; paclitaxel, Docetaxel; DNA Topoisomerase Inhibitors: Epipodophyllins: etoposide, Teniposide, Topotecan, 9-aminocampothecin irinotecan (Campto®), crisnatol;
Mytomycins: Mytomycin C, Mytomycin C; Anti-metabolites, Anti-folates: DHFR inhibitors: methotrexate, Trimetrexate; IMP dehydrogenase Inhibitors: mycophenolic acid, Tiazofurin, Ribavirin EICAR; Ribonucleotide reductase Inhibitors: hydroxyurea, deferoxamine; Pyrimidine analogs: Uracil analogs, 5-Fluorouracil, Fluorouridine, Doxifuridine, Raltitrexed; Cytosine analogs: cytarabine (ancam C) Cytosine arabinoside fludarabine; Purine analogs: mercaptopurine, Thioguanine; Hormonal therapies; Receptor antagonists: Anti-estrogens, Tamoxifen, Raloxifene megestrol; LHHR agonists: goserelin, Leuprolide acetate; Anti-androgens: flutamide, bicalutamide; Retinoids/Retinoids Vitamin D3 analogs: EB 1089, CB 1093, KH 1060; Photodynamic therapies: verteporfin (BPDA.MA), Phthalocyanine photosensitizer, Pc4 Demethoxy-hypercillin A (2HA-2-DMHA) Cytokines: Interferon-α, Interferon-γ, Tumor necrosis factor; Interleukin analogs: Lovastatin; Dopaminergic neurotoxins: 1-methyl-4-phenylpyridinium ion; Cell cycle inhibitors: staurosporine; Actinomycins: Actinomycin D, Daunomycin; Bleomycins: bleomycin A2, Bleomycin B2, Plenomycin; Anthracyclines: daunorubicin, Doxorubicin (adriamycin); Idarubicin, Epirubicin, Pirarubicin, Zorubicin, Mitoxantrone; MDR inhibitors: verapamil; Cs-A sup+2 ATPase inhibitors: thapsigargin; TNF-α inhibitors/thalidomide: angiogenesis inhibitors 3-(3,4-dimethoxyphenyl)-3-(1-oxo-1, 3-dihydro-isoinole-2-yl)-propionamide (SelCIDs™) ImiRis™, Revlimid™, Actimid™. In another aspect of the present invention, a pharmaceutical composition according to the present invention may include a peptide in a formulation with at least one small molecule that exhibits tissue protective functionality. Suitable small molecules include, but are not limited to, steroids (e.g., laurazol and glucocorticoids), antioxidants (e.g., coenzyme Q10, alpha lipoic acid, and NADH), anticatabolic enzymes (e.g., glutathione peroxidase, superoxide dismutase, catalase, synthetic catalytic scavengers, as well as mimetics), indole derivatives (e.g., indoleamines, carbazoles, and carbolines), nitric acid neutralizing agents, adenosine/adenosine agonists, phytochemicals (flavanoids), herbal extracts (ginkgo biloba and turmeric), vitamins (vitamins A, E, and C), oxidase electron acceptor inhibitors (e.g., xanthine oxidase electron inhibitors), minerals (e.g., copper, zinc, and magnesium), non-steroidal anti-inflammatory drugs (e.g., aspirin, naproxen, and ibuprofen), and combinations thereof.

Additionally, including but not limited to, anti-inflammatory agents (e.g., corticosteroids, prednisone and hydrocortisone), glucocorticoids, steroids, non-steroidal anti-inflammatory drugs (e.g., aspirin, ibuprofen, diclofenac, and COX-2 inhibitors), beta-agonists, anti-cholinergic agents and methyl xanthines), immunomodulatory agents (e.g., small organic molecules, T cell receptor modulators, cytokine receptor modulators, T-cell depleting agents, cytokine antagonists, monocyte antagonists, lymphocyte inhibitors, or anti-cancer agents), gold injections, sulphasalazine, penicillamine, anti-angiogenic agents (e.g., angiotatin), TNF-α antagonists (e.g., anti-TNFα antibodies, and etodastatin), dapsone, psoralens (e.g., methoxalen and trioxalen), anti-malarial agents (e.g., hydroxychloroquine), anti-viral agents, anti-histimines and antibiotics (e.g., erythromycin and penicillin) may be used in conjunction with the current pharmaceutical compositions.

In other embodiments, the present methods for treating, mediating, ameliorating or preventing a disease or disorder associated with tissue damage or damage, effects or symptoms resulting therfore further comprise administration of the peptides in conjunction with methods of treatment such as chemotherapy, radiation therapy (x-ray radiation, high-energy megavoltage (radiation of greater than 1 MeV energy), electron beam, orthovoltage x-ray radiation, gamma-ray emitting radioisotopes (radioactive isotopes of radium, cobalt and other elements), hyperbaric chambers, heart bypass machine, angioplasty, hyperthermia, surgery, angioplasty, etc. to achieve additive, synergistic or offsetting (to counteract side effects of the therapeutic method) benefits of the effects of the peptide and therapeutic method. As an example, in a specific embodiment, peptide can be administered to a patient that has undergone surgery as treatment for the cancer concurrently with chemotherapy or radiation therapy. In another specific embodiment, a chemotherapeutic agent or radiation therapy is administered prior or subsequent to administration of a peptide, preferably at least an hour, five hours, 12 hours, a day, a week, a month, more preferably several months (e.g., up to three months). Additionally, the invention provides methods of treatment of cancer or neoplastic disease with a peptide as an alternative to chemotherapy or radiation therapy where the chemotherapy or the radiation therapy has proven or may prove too toxic, e.g., results in unacceptable or unbearable side effects, for the patient being treated. Alternatively, the invention provides methods of treatment wherein the peptide is administered prior to, simultaneously with or following treatment with chemotherapy or radiation in an effort to prevent or ameliorate the toxic side effects of the treatment method. As demonstrated in Example 2, the peptides administered in accordance with the current method are able to ameliorate the side-effects of cis-platinum a known chemotherapeutic. Although, the above examples relate to the treatment of cancers, it is understood that the peptides may be administered in conjunction with other methods of treatment in the art for diseases or disorders associated with tissue damage and damage, effects, or symptoms resulting therefrom including inflammation, and exposure to toxic agents to achieve synergistic, additive or offsetting results.

E. Formulation and Administration of Peptides

In one embodiment, the method of the current invention provides that a pharmaceutical composition comprising a peptide can be administered systemically to protect or treat the targeted cells, tissue or organ. Such administration may be parenterally, via inhalation, or transmucosally, e.g., orally, buccally, nasally, rectally, intravaginally, sublingually, ocularly, subcutaneously or transdermally. Preferably, administration is parenteral, e.g., via intravenous or intraperitoneal injection, and also including, but is not limited to, intra-arterial, intramuscular, intradermal and subcutaneous administration.

For other routes of administration, such as by use of a perfusate, injection into an organ, or other local administration, a pharmaceutical composition will be provided which results in similar levels of a peptide as described above. A level of about 15 PM-30 nM is preferred.

The pharmaceutical compositions of the invention may comprise a therapeutically effective amount of a compound, and a pharmaceutically acceptable carrier. In a specific embodiment, the term "pharmaceutically acceptable" means approved by a regulatory agency of the Federal or a state government or listed in the U.S. Pharmacopoeia or other generally recognized foreign pharmacopoeia for use in animals, and more particularly in humans. The term "car-
rier” refers to a diluent, adjuvant, excipient, or vehicle with which the therapeutic is administered. Such pharmaceutical carriers can be sterile liquids, such as saline solutions in water and oils, including those of petroleum, animal, vegetable or synthetic origin, such as peanut oil, soybean oil, mineral oil, sesame oil and the like. A saline solution is a preferred carrier when the pharmaceutical composition is administered intravenously. Saline solutions and aqueous dextrose and glycerol solutions can also be employed as liquid carriers, particularly for injectable solutions. Suitable pharmaceutical excipients include starch, glucose, lactose, sucrose, gelatin, malt, rice, flour, chalk, silica gel, sodium stearate, glycerol monostearate, talc, sodium chloride, dried skim milk, glycerol, propylene glycol, water, ethanol and the like. The composition, if desired, can also contain minor amounts of wetting or emulsifying agents, or pH buffering agents. These compositions can take the form of solutions, suspensions, emulsion, tablets, pills, capsules, powders, sustained-release formulations and the like. The composition can be formulated as a suppository, with traditional binders and carriers such as triglycerides. The compounds of the invention can be formulated as neutral or salt forms. Pharmaceutically acceptable salts include those formed with free amino groups such as those derived from hydrochloric, phosphoric, acetic, oxalic, tartaric acids, etc., and those formed with free carboxyl groups such as those derived from sodium, potassium, ammonium, calcium, ferric hydroxides, isopropylamine, triethylamine, 2-ethylamino ethanol, histidine, procaine, etc. Examples of suitable pharmaceutical carriers are described in “Remington’s Pharmaceutical Sciences” by E. W. Martin, hereby incorporated by reference herein in its entirety. Such compositions will contain a therapeutically effective amount of the compound, preferably in purified form, together with a suitable amount of carrier so as to provide the form for proper administration to the patient. The formulation should suit the mode of administration.

[0540] Formulations for increasing transmucosal adsorption of peptides such as long acting peptides are also contemplated by the current invention. Pharmaceutical compositions adapted for oral administration may be provided as capsules or tablets; as powders or granules; as solutions, syrups or suspensions (in aqueous or non-aqueous liquids); as edible foams or wips; or as emulsions. Tablets or hard gelatine capsules may comprise lactose, starch or derivatives thereof, magnesium stearate, sodium saccharide, cellulose, magnesium carbonate, stearic acid or salts thereof. Soft gelatine capsules may comprise vegetable oils, waxes, fats, semi-solid, or liquid polysols etc. Solutions and syrups may comprise water, polyols and sugars.

[0541] An active agent intended for oral administration may be coated with or admixed with a material that delays disintegration and/or absorption of the active agent in the gastrointestinal tract (e.g., glyceryl monostearate or glyceryl distearate may be used). Thus, the sustained release of an active agent may be achieved over many hours and, if necessary, the active agent can be protected from being degraded within the stomach. Pharmaceutical compositions for oral administration may be formulated to facilitate release of an active agent at a particular gastrointestinal location due to specific pH I or enzymatic conditions.

[0542] Pharmaceutical compositions adapted for transdermal administration may be provided as discrete patches intended to remain in intimate contact with the epidermis of the recipient for a prolonged period of time. Pharmaceutical compositions adapted for topical administration may be provided as ointments, creams, suspensions, lotions, powders, solutions, pastes, gels, sprays, aerosols or oils. For topical administration to the skin, mouth, eye or other external tissues a topical ointment or cream is preferably used. When formulated in an ointment, the active ingredient may be employed with either a paraffinic or a water-miscible ointment base. Alternatively, the active ingredient may be formulated in a cream with an oil-in-water base or a water-in-oil base. Pharmaceutical compositions adapted for topical administration to the eye include eye drops. In these compositions, the active ingredient can be dissolved or suspended in a suitable carrier, e.g., in an aqueous solvent. Pharmaceutical compositions adapted for topical administration in the mouth include lozenges, pastilles and mouthwashes.

[0543] Pharmaceutical compositions adapted for nasal and pulmonary administration may comprise solid carriers such as powders (preferably having a particle size in the range of 20 to 500 microns). Powders can be administered in the manner in which sniff is taken, i.e., by rapid inhalation through the nose from a container of powder held close to the nose. Alternatively, compositions adapted for nasal administration may comprise liquid carriers, e.g., nasal sprays or nasal drops. Alternatively, inhalation of compounds directly into the lungs may be accomplished by inhalation deeply or instillation through a mouthpiece into the oropharynx. These compositions may comprise aqueous or oil solutions of the active ingredient. Compositions for administration by inhalation may be supplied in specially adapted devices including, but not limited to, pressurized aerosols, nebulizers or insufflators, which can be constructed so as to provide predetermined dosages of the active ingredient. In a preferred embodiment, pharmaceutical compositions of the invention are administered into the nasal cavity directly or into the lungs via the nasal cavity or oropharynx.

[0544] Pharmaceutical compositions adapted for rectal administration may be provided as suppositories or enemas. Pharmaceutical compositions adapted for vaginal administration may be provided as pessaries, tampons, creams, gels, pastes, foams or spray formulations.

[0545] Pharmaceutical compositions adapted for parenteral administration include aqueous and non-aqueous sterile injectable solutions or suspensions, which may contain antioxidants, buffers, bacteriostats and solutes that render the compositions substantially isotonic with the blood of an intended recipient. Other components that may be present in such compositions include water, alcohols, polyols, glycérine and vegetable oils, for example. Compositions adapted for parenteral administration may be presented in unit-dose or multi-dose containers, for example sealed ampoules and vials, and may be stored in a freeze-dried (lyophilized) condition requiring only the addition of a sterile liquid carrier, e.g., sterile saline solution for injections, immediately prior to use. Extemporaneous injection solutions and suspensions may be prepared from sterile powders, granules and tablets. In one embodiment, an autoinjector comprising an injectable solution of a peptide may be provided for emergency use by ambulances, emergency rooms, and battlefield situations, and even for self-administration in a domestic setting, particularly where the possibility of traumatic amputation may occur, such as by imprudent use of a lawn mower. The likelihood that cells and tissues in a
severed foot or toe will survive after reattachment may be increased by administering a peptide to multiple sites in the severed part as soon as practicable, even before the arrival of medical personnel on site, or arrival of the afflicted individual with severed toe in tow at the emergency room.

[0546] In a preferred embodiment, the composition is formulated in accordance with routine procedures as a pharmaceutical composition adapted for intravenous administration to human beings. Typically, compositions for intravenous administration are solutions in sterile isotonic aqueous buffer. Where necessary, the composition may also include a solubilizing agent and a local anesthetic such as lidocaine to ease pain at the site of the injection. Generally, the ingredients are supplied either separately or mixed together in unit dosage form, for example, as a dry lyophilized powder or water-free concentrate in a hermetically-sealed container such as an ampule or sachet indicating the quantity of active agent. Where the composition is to be administered by infusion, it can be dispensed with an infusion bottle containing sterile pharmaceutical grade water or saline. Where the composition is administered by injection, an ampule of sterile saline can be provided so that the ingredients may be mixed prior to administration.

[0547] Suppositories generally contain active ingredient in the range of 0.5% to 10% by weight; oral formulations preferably contain 10% to 95% active ingredient.

[0548] A perfusate composition may be provided for use in situ perfusion. Such pharmaceutical compositions may comprise levels of peptides, or a form of peptides not suitable for acute or chronic, local or systemic administration to an individual, but will serve the functions intended herein in as an organ bath, organ perfusate, or in situ perfusate prior to removing or reducing the levels of the peptide contained therein before exposing or returning the treated organ or tissue to regular circulation.

[0549] The invention also provides a pharmaceutical pack or kit comprising one or more containers filled with one or more of the ingredients of the pharmaceutical compositions of the invention. Optionally associated with such container(s) can be a notice in the form prescribed by a governmental agency regulating the manufacture, use or sale of pharmaceuticals or biological products, which notice reflects approval by the agency of manufacture, use or sale for human administration.

[0550] In another embodiment, for example, a peptide can be delivered in a controlled-release system. For example, the peptide may be administered using intravenous infusion, an implantable osmotic pump, a transdermal patch, liposomes, or other modes of administration. In one embodiment, a pump may be used (see Langer, supra; Sefton, 1987, CRC Crit. Rev. Biomed. Eng. 14:201; Buchwald et al., 1980, Surgery 88:507; Sauder et al., 1989, N. Engl. J. Med. 321:574, each of which is incorporated by reference herein in its entirety). In another embodiment, the compound can be delivered in a vesicle, in particular a liposome (see Langer, Science 249:1527-1533 (1990); Treat et al., in Liposomes in the Therapy of Infectious Disease and Cancer, Lopez-Berestein and Fidler (eds.), Liss, New York, pp. 353-365 (1989); WO 91/04014; U.S. Pat. No. 4,704,355; Lopez-Berestein, ibid., pp. 317-327; see generally ibid.). In another embodiment, polymeric materials can be used (see Medical Applications of Controlled Release, Langer and Wise (eds.), CRC Press: Boca Raton, Fl., 1974; Controlled Drug Bioavailability, Drug Product Design and Performance, Smolen and Ball (eds.), Wiley: New York (1984); Ranger and Peppas, J. Macromol. Sci. Rev. Macromol. Chem. 23:61, 1953; see also Levy et al., 1985, Science 228:190; During et al., 1989, Ann. Neurol. 25:351; Howard et al., 1989, J. Neurosurg. 71:105, (each of which is incorporated by reference herein in its entirety).

[0551] In yet another embodiment, a controlled release system can be placed in proximity of the therapeutic target, i.e., the target cells, tissue or organ, thus requiring only a fraction of the systemic dose (see, e.g., Goodson, pp. 115-138 in Medical Applications of Controlled Release, vol. 2, supra, 1984, which is incorporated by reference herein in its entirety). Other controlled release systems are discussed in the review by Langer (1990, Science 249:1527-1533, which is incorporated by reference herein in its entirety).

[0552] In another embodiment, peptide, as properly formulated, can be administered by nasal, buccal, oral, rectal, vaginal, ocular, transdermal, parenteral, inhalation or sublingual administration.

[0553] In a specific embodiment, it may be desirable to administer a peptide of the invention locally to the area in need of treatment; this may be achieved by, for example, and not by way of limitation, local infusion during surgery, topical application, e.g., in conjunction with a wound dressing after surgery, by injection, by means of a catheter, by means of a suppository, or by means of an implant, said implant being of a porous, non-porous, or gelatinous material, including membranes, such as silastic membranes, or fibers. A non-limiting example of such an embodiment would be a stent or other scaffold coated with a peptide of the present invention implanted in a portion of the vasculature, duct, etc.

[0554] Selection of the preferred effective dose will be readily determinable by a skilled artisan based upon considering several factors, which will be known to one of ordinary skill in the art. Such factors include the particular form of peptide, and its pharmacokinetic parameters such as bioavailability, metabolism, half-life, etc., which will have been established during the usual development procedures typically employed in obtaining regulatory approval for a pharmaceutical compound. Further factors in considering the dose to include the condition or disease to be treated or the benefit to be achieved in a normal individual, the body mass of the patient, the route of administration, whether administration is acute or chronic, concomitant medications, and other factors well known to affect the efficacy of administered pharmaceutical agents. Thus the precise dosage should be decided according to the judgment of the practitioner and each patient’s circumstances, e.g., depending upon the condition and the immune status of the individual patient, and according to standard clinical techniques.

[0555] In another aspect of the invention, a perfusate or perfusion solution is provided for perfusion and storage of organs for transplant, the perfusion solution includes an amount of a peptide or peptide analog effective to protect responsive cells and associated cells, tissues or organs. Transplant includes but is not limited to allotransplantation, where an organ (including cells, tissue or other bodily part) is harvested from one donor and transplanted into a different recipient, both being of the same species; autotransplantation, where the organ is taken from one part of a body and replaced at another, including bench surgical procedures, in which an organ may be removed, and while ex vivo, resected, repaired, or otherwise manipulated, such as for
tumor removal, and then returned to the original location or xenotransplantation, where tissues or organs or transplanted between species. In one embodiment, the perfusion solution is the University of Wisconsin (UW) solution (U.S. Pat. No. 4,798,824, hereby incorporated by reference herein in its entirety) which contains 5% hydroxyethyl starch (having a molecular weight of from about 200,000 to about 300,000 and substantially free of ethylene glycol, ethylene chlorohydrin, sodium chloride and acetone): 25 mM KH₂PO₄, 3 mM glutathione; 5 mM adenosine; 10 mM glucose; 10 mM HEPES buffer; 5 mM magnesium gluconate; 1.5 mM CaCl₂; 105 mM sodium gluconate; 200,000 units penicillin; 40 units insulin; 16 mg dexamethasone; 12 mg Phenol Red; and has a pH of 7.4-7.5 and an osmolality of about 320 mOs/m supplemented with an appropriate amount of a peptide of the invention. This particular perfusate is merely illustrative of a number of such solutions that can be adapted for the present use by inclusion of an effective amount of a peptide. In a further embodiment, the perfusate solution contains from about 1 to about 500 ng/mL of a peptide, or from about 40 to about 320 ng/mL peptide. As mentioned above, any form of peptide can be used in this aspect of the invention.

In further aspects of the ex-vivo invention, any peptide such as but not limited to the ones described above may be employed.

In another aspect of the invention, methods and compositions for preventing, treating or managing a disease or disorder associated with tissue damage or damage, effects or symptoms resulting therefrom in cells, tissues or organs which are not isolated from the vasculature by an endothelial cell barrier are provided by exposing the cells, tissue or organs directly to a pharmaceutical composition comprising a peptide, or administering or contacting a pharmaceutical composition containing a peptide to the vasculature of the tissue or organ.

Similar to other tissue protective compounds based on erythropoietin, it is possible that the peptides of the present invention may be transported from the luminal surface to the basement membrane surface of endothelial cells of the capillaries of organs with endothelial cell tight junctions, including, for example, the brain, retina, and testes. Thus, the effects of a disease or disorder associated with tissue damage or damage, effects or symptoms resulting therefrom on cells across the barrier may be treated. While not wishing to be bound by any particular theory, after transcytosis of the peptide may interact with a tissue-protective receptor on a cell, for example, neuronal, eye (e.g., retinal), adipose, connective, hair, tooth, mucosal, pancreatic, endocrine, aural, epithelial, skin, muscle, heart, lung, liver, kidney, small intestine, adrenal (e.g. adrenal cortex, adrenal medulla), capillary, endothelial, testes, ovary, stem or endometrial cell, and receptor binding can initiate a signal transduction cascade resulting in the activation of a gene expression program within the responsive cell or tissue, resulting in the protection of the cell or tissue, or organ, from damage, such as by exposure to a toxic agent, inflammation, hypoxia, etc. In another embodiment, the peptide can be cross-linked to a compound that can cross the barrier, such as CEPO, to be transported across the barrier in accordance with the teaching of PCT Application No. PCT/US01/40479, U.S. patent application Ser. Nos. 10/188,905 and 10/185,841, incorporated herein by reference.

Thus, methods for protecting a tissue from disease or disorder associated with tissue damage or damage, effects or symptoms resulting therefrom are described in detail herein below.

In the practice of one embodiment of the invention, a mammalian patient is undergoing systemic chemotherapy for cancer treatment, including radiation therapy, which commonly has adverse effects such as nerve, lung, heart, ovarian or testicular damage. Administration of a pharmaceutical composition comprising a tissue protective peptide or peptide analog as described above is performed prior to and during chemotherapy and/or radiation therapy, to protect various tissues and organs from damage by the chemotherapeutic agent, such as to protect the testes. Treatment may be continued until circulating levels of the chemotherapeutic agent have fallen below a level of potential danger to the mammalian body.

In the practice of another embodiment of the invention, various organs are planned to be harvested from a victim of an automobile accident for transplant into a number of recipients, some of which required transport for an extended distance and period of time. Prior to organ harvesting, the donor is infused with a pharmaceutical composition comprising tissue protective peptides and peptide analogs as described herein. Harvested organs for shipment are perfused with a perfusate containing tissue protective peptides or peptide analogs as described herein, and stored in a bath comprising tissue protective peptides or peptide analogs. Certain organs are continuously perfused with a pulsatile perfusion device, utilizing a perfusate containing tissue protective peptides and peptide analogs in accordance with the present invention. Minimal deterioration of organ function occurs during the transport and upon implant and reperfusion of the organs in situ.

In another embodiment of the present invention, an participant in a hazardous activity that exposes the individual to toxic agents, one could take a dose of a pharmaceutical composition containing a peptide sufficient to either prevent (i.e. delaying the onset of, inhibiting, or stopping), protect against, or mitigate the effects of exposure to a toxic agent. In particular, this method of treatment may have application in various professions involving contact with toxic agents, such as miners, chemical manufacturers, military personnel (soldiers, paratroopers), emergency personnel (police, fire, EMS, and disaster relief personnel), construction workers, food processors, and employees at power reactors.

In another embodiment of the invention, a surgical procedure to repair a heart valve requires temporary cardioplegia and arterial occlusion. Prior to surgery, the patient is infused with a tissue protective peptide or peptide analog. Such treatment prevents hypoxic ischemic cellular damage, particularly after reperfusion. Additionally, the pharmaceutical compositions of the present invention may be used prophylactically to prepare an individual for surgery in an effort to limit the trauma associated with the surgical procedure or aide in the recovery of the individual from the surgical procedure. Although the present method of treatment using pharmaceutical compositions containing tissue protective peptides and peptide analogs provide a prophyl-
lactic use for surgical procedures, it may be particularly useful in procedures that induce temporary ischemic events including, but not limited to, bypass procedures (coronary bypass), angioplasty procedures, amputations, and transplantations, as well as those performed directly upon responsive cells, tissues, or organs such as brain and spinal cord surgery, and open heart procedures. Such procedures may involve the use of cardiopulmonary (heart lung) bypass.

[0565] In another embodiment of the invention, in any surgical procedure, such as in cardiopulmonary bypass surgery, a tissue protective peptide or peptide analog of the invention can be used. In one embodiment, administration of a pharmaceutical composition comprising tissue protective peptides and peptide analogs as described above is performed prior to, during, and/or following the bypass procedure, to protect the function of brain, heart, and other organs.

[0566] In the foregoing examples in which a peptide is used for ex-vivo applications, or for in vivo applications to treat a disease or disorder associated with tissue damage or damages, effects or symptoms resulting therefrom, the invention provides a pharmaceutical composition in dosage unit form adapted for prevention, treatment or management of the damages and effects of exposure to a toxic agent or symptoms thereof which comprises an amount within the range from about 0.01 pg to 30 mg, 0.5 pg to 25 mg, 1 pg to 20 mg, 50 pg to 10 mg, 1 mg to 10 mg, 50 mg to 10 mg, 1 mg to 10 mg, 500 pg to 10 mg, or 1 mg to 10 mg of a peptide, and a pharmaceutically acceptable carrier. In a preferred embodiment, the amount of peptide is within the range from about 0.5 pg to 1 mg. In a preferred embodiment, the formulation contains peptides that are non-erythropoietic.

[0567] Furthermore, this restorative aspect of the invention is directed to the use of any peptides herein for the preparation of a pharmaceutical composition for the restoration of cellular, tissue or organ dysfunction, wherein treatment is initiated after, and well after, the initial insult responsible for the dysfunction. Moreover, treatment using peptides of the invention can span the course of the disease or condition during the acute phase as well as a chronic phase.

[0568] A peptide of the invention may be administered systemically at a dosage between about 1 ng and about 300 µg/kg body weight, preferably about 5-150 µg/kg body weight, most preferably about 10-100 µg/kg body weight, per administration. For example, administration may be repeated hourly, daily, as long as clinically necessary, or after an appropriate interval, e.g., every 1-12 hours, preferably every 6 to 12 hours; every 2-6 days, preferably every 2-4 days; every 1 to 12 weeks, preferably every 1 to 3 weeks. In one embodiment, the effective amount of peptide and a pharmaceutically acceptable carrier may be packaged in a single dose vial or other container. In another embodiment, the peptides, which are capable of exerting the activities described herein but not causing an increase in hemoglobin concentration or hematocrit, are used. Such peptides are preferred in instances wherein the methods of the present invention are intended to be provided chronically.

EXAMPLES

Example 1: Method of Peptide Synthesis

[0569] A. Synthesis of Peptide A (SEQ ID NO:2, Corresponding to EPO Amino Acid Sequence 38-57) and Peptide B (SEQ ID NO:3, Corresponding to EPO Amino Acid Sequence 58-82)

[0570] Peptide A, SEQ ID NO:2, and Peptide B, SEQ ID NO:3, fragments of EPO, were synthesized using “in situ neutralization” Boc Chemistry stepwise solid-phase peptide synthesis, as described in Band, D., Chopra, N and Kent, S., “Total Synthesis of Crambin,” J. AM CHEM. SOC. 2004, 126, 1377-1383 (incorporated by reference herein in its entirety). Briefly, two fragments corresponding to EPO amino acid sequence 38-57 (peptide A, NITVPDYKVV-FYAWKRMVGEQ SEQ ID NO:2) and EPO amino acid sequence 58-82 (peptide B, QQAVEVWQGLALLSEVNGGQALIV SEQ ID NO:3) were synthesized on —OCH₂—Pam-resins (free “carboxyl” peptides) or on 15SCH₂CH₂CO- Len-OCH₃-Pam-Resin (“thioester” peptides). During synthesis the side chains of various amino acids were protected as follows: Arg(Tos), Asn(Xan), Asp(OcHex), Cys(4-CH₃Bzl) or Cys(ACM), Glu(OcHex), Iys(2-CI—Z), Ser(Bzl), Thr(Bzl), Tyr(Br—Z). After the peptide chain was assembled, the peptides were deprotected and simultaneously cleaved from the resin support by treatment with anhydrous HF containing p-cresol (90:10, v/v) for 1 hr at 0° C. After evaporation of the HF under reduced pressure, crude products were precipitated and triturated with chilled diethyl ether, and the peptides were dissolved in 50% aqueous acetonitrile containing 0.1% TFA and purified by the preparative HPLC system. Peptide compositions were confirmed using LC-MS.

[0571] Peptide ID (UEQLERALNSS, SEQ ID NO:280) is an 11-aminoc acid linear peptide with a protected N-terminus (by the 5-membered ring structure of pyroglutamic acid) and a free carboxyl group at the C-terminus. Its molecular weight is 1257 Daltons. It was synthesized using standard Fmoc solid phase peptide synthesis on Wang resin, purified by preparative HPLC and ion-exchange chromatography, and lyophilized. Acetate and ammonium are bound in ionic form to basic and acidic groups of the peptide molecule forming a mixed salt.

Example 2. Tissue Protective Peptides and Peptide Analogs are Non-Erythropoietic

A. In Vitro Assessment

[0572] UTI-7epo, a human erythropoietin-dependent leukemia cell line, was used for the determination of the erythropoietic potency of the peptides. UTI-7epo cells (Deutsche Sammlung von Mikroorganismen und Zellkulturen [DSMZ], Cat. No. ACC 363) are grown in a complete RPMI-1640 medium with 10% FBS and 5 ng/ml erythropoietin. The proliferation/survival (viability increase) response of the cells exposed to erythropoietin is mediated by the classical erythrocyte-type erythropoietin receptor and is a quantitative measure of the capacity of erythropoietin variants to stimulate the classical erythropoietin receptor.

[0573] UTI-7epo cells were transferred to fresh complete RPMI 1640 medium containing 10% donor calf serum, 4 mM L-glutamine, and supplemented with 5 ng/ml of recombinant human erythropoietin. The cells were maintained in 75 cm² flasks with 20 ml of medium/flask in a humidified incubator with 5% CO₂ at 37° C. for 48 h. On day two of the assay, i.e., at 48 h, the cells were transferred from the flask into a 50-ml conical tube and centrifuged at 1,000 rpm for 5 minutes at room temperature. The supernatant was discarded and the cells were washed two times with 10 ml of starvation media (3% donor calf serum, 4 mM L-glutamine). The cells were then re-suspended in starvation media, using
up and down pipette action to obtain a single cell suspension. The re-suspended cells were diluted with starvation media to obtain a density of \(4 \times 10^6\) cells/ml, and plated at a total culture volume of 10 ml per 25 cm² flask. Following a 4 h incubation, the cells were again transferred to a 50-ml conical tube. Control cells were maintained throughout with 5 ng/ml of rhu-erythropoietin.

[0574] Cells were diluted to 200,000 cells/ml in starvation medium, plated at 100 µl/well in a 96 well plate and exposed to varying concentrations of erythropoietin, and Peptide ID, SEQ ID NO:280. A series of 10 fold dilutions in RPMI 1640 medium containing 3% serum was used to generate concentrations of test compounds from 5 pM to 50 nM. Following a further for 48 h incubation, a solution of 15 ml WST-1 Cell Proliferation Reagent (Roche) was added to each well, and incubated for 1 hour at 37°C in CO₂. After mixing for 1 minute, the plate was read in a plate reader (absorption at 450 nm, subtracted from background absorption at 650 nm). As shown in FIG. 1, Peptide ID had no erythropoietic activity over the range of doses in comparison to the strong erythropoietic effect of EPO. This was well below the expectation that a non-erythropoietic peptide or peptide analog will have no erythropoietic activity for a dose lower than 1 µg/ml, and more preferably for a dose lower than 10 µg/ml.

B. In Vivo Assessment

[0575] To evaluate the erythropoietic activity of tissue protective peptides and peptide analogs, Peptide ID was administered intravenously twice a day to Sprague Dawley rats for 28 days. Nine male and nine female rats were assigned to groups 1-4 receiving 0, 60, 180, and 600 µg/kg per dose (0, 48, 143, and 477 nmol/kg, respectively) of Peptide ID in PBS by bolus intravenous administration from days 1-28. Blood samples to assay for hematological variables were collected on day 29. Hemoglobin concentration was determined by use of an automated analyzer (Keska Corporation). As shown in FIG. 2, there was no difference in any of the groups in hemoglobin concentrations.

[0576] Further the erythropoietic and hematopoietic effects of Peptide ID were evaluated in rabbits. Blood samples were taken of all rabbits prior to the initiation of the study to establish the hematological baseline for the animals. Peptide ID was administered twice daily i.v. to New Zealand White rabbits for 28 days. For this study, six males and females were assigned to groups 1 and 4, and four males and four females were assigned to groups 2 and 3. Group 1 received 0, group 2 received 30 µg (24 nmol/kg bw), group 3 received 90 µg/kg (72 nmol/kg bw); and group 4 received 300 µg/kg (240 nmol/kg bw) per dose Peptide ID in PBS by bolus i.v. administration. Blood samples to assay for hematological variables were collected on day 29. Comparison of baseline vs. day 29 hematomatological parameters showed no difference in hemoglobin concentration, hematocrit, or platelet count (FIG. 3, a, b, and c.).

Example 3. Peptide or Peptide Analog is Tissue Protective in In Vitro Assays

[0577] Peptides and peptide analogs can be readily assessed for tissue protection using any number of in vitro assays. For example, protection from excitotoxicity can be determined using kainite-induced death of mouse motoneurons. Spinal cords were obtained from 15-day old Sprague-Dawley rat embryos as previously described (Siren et al., 2001, Proc. Natl. Acad. Sci. USA, 98:4044, hereby incorporated by reference in its entirety). The ventral horn was trypsinized and centrifuged through a 4% BSA cushion for 10 min at 300xg. Cells (representing mixed neuron-glia culture) were seeded at a density of 2,000 cells/cm² into 24-mm well plates precoated with poly-DL-ornithine and laminin. Motoneurons were further purified by immunopanning and the cells were seeded at low density (20,000 cells/cm²) onto 24-mm well plates precoated with poly-DL-ornithine and laminin, and containing complete culture medium [Neurobasal/B27 (2%): 0.5 mM L-glutamine; 2% horse serum; 25 mM 2-mercaptoethanol; 25 mM glutamate; 1% penicillin and streptomycin; 1 ng/ml BDNF]. The medium (without glutamate) was re-added to cultures on days 4 and 6. Cell death was induced on day 6 in culture by incubation for 48 h with kainic acid (5 mM for mixed neuron-glia cultures; 50 mM for purified cultures). Peptide B (5 ng/ml, 1.8 nM), EPO (3.3 nM) or vehicle was added to the cultures 72 h before induction of cell death, and treatment continued for 48 h. The medium was then discarded and the cells were fixed with 4% (vol/vol) paraformaldehyde in PBS for 40 min, permeabilized with 0.2% Triton X-100, were blocked with 10% (vol/vol) FCS in PBS, were incubated with antibodies against non-phosphorylated neurofilaments (SMI-32; 1:9,000) overnight, and were visualized by using the avidin-biotin method with diaminobenzidine. Viability of motoneurons was assessed morphologically by counting SMI-32 positive cells across four sides of the cover slip and staining for apoptotic bodies was done by using H33258. As shown in FIG. 4, Peptide B protected the cells against the neurotoxic effects of the glutamate receptor agonist kainic acid.

Example 4. Middle Cerebral Artery Occlusion Model

[0578] Sprague Dawley rats (8 per group) are subjected to the following MCAO protocol Surgery was performed in accordance with the teachings of Brines et al, 2000, PNAS USA 97:10526-10531 (hereby incorporated by reference in its entirety). Briefly, the rats are anesthetized with chloral hydrate (400 mg/kg-bw, i.p.), the carotid arteries were visualized, and the right carotid was occluded by two sutures and severed. A burr hole adjacent and rostral to the right orbit allowed visualization of the middle cerebral artery ("MCA"), which was cauterized distal to the rhinal artery. To produce a penumbra (border zone) surrounding this fixed MCA lesion, the contralateral carotid artery was occluded for 1 hour by using traction provided by a fine forceps and then re-opened.

[0579] The rats were administered saline, Peptide ID as a single i.v. dose (2 µg/kg bw), or Peptide IX, SEQ ID NO: 299 a scrambled version of Peptide B, SEQ ID NO: 3, as a single i.v. dose (2 µg/kg bw) upon reperfusion, followed by three additional injections at 2-hour intervals. For assessment of injury, rats are subjected to behavioral testing or the volume of the lesion is determined by tetrazolium staining of brain sections performed 24 hours post surgery in accordance with the previously noted protocol.

[0580] (a) Volume of Lesion.

[0581] The volume of the lesion was then determined by tetrazolium staining of brain sections performed 24 hours post surgery. Peptide ID demonstrated a significant reduc-
tion in infarct volume at 24 hours (225±20 mm³) in comparison to saline treated rats (291±23 mm³).

(b) Behavioral Testing.

Rats were also tested in a foot fault behavioral protocol. Rats were tested on an elevated stainless steel grid floor 30 cm x 30 cm with grid size of 30 mm according to the protocol of Markgraf et al., 1992. Brain Research 575:238-246 (hereby incorporated by reference in its entirety). When placed on the grid, a rat would attempt to move around and occasionally place a foot, rather than on the grid, through a grid opening (“foot fault”). The number of foot faults was measured for a 1 minute period.

The number of foot faults is indicative of the cognitive impairment of the rats due to the MCAO, the fewer the number of foot faults the less cognitive impairment. As shown in FIG. 5, Peptide ID significantly improved the rats performance in the foot fault protocol (11.2±1.1 foot faults) in comparison to the saline treated rats (20.2±8.0 foot faults) and Peptide IX treated rats (20.1±2.1 foot faults).

Example 5: Bilateral Renal Ischemia Assay

Sixty male C57/B16 mice (~25 g; Charles River Laboratories) were anesthetized with ketamine (150 mg/kg) and xylazine (15 mg/kg) i.p. Each animal was placed on a homeothermic blanket set at 37° C., and after a mid-line laparotomy, the renal pedicles were clamped for 30 minutes using nontraumatic vascular clamps. Peptide ID was administered at the indicated dose i.v. Injection at 1 minute, 6 hours, and 12 hours after reperfusion. In a single dose study, the mice received a control (PBS), 1 µg/kg of Peptide ID at 1 minute, 1 µg/kg of Peptide ID at 30 minutes, and 1 µg/kg of Peptide ID at 6 hours, or 10 µg/kg of Peptide ID at 6 hours (12 mice per group). In a multiple dose study, the mice received either multiple doses of a control (PBS), 0.1 µg/kg of Peptide ID, 1 µg/kg of Peptide ID, or 10 µg/kg of Peptide ID at 1 minute, 6 hours, and 12 hours after reperfusion.

Twenty-four hours later, mice were reanesthetized and blood was obtained by cardiac puncture. Plasma urea and creatine were used as indicators of renal dysfunction and aspartate aminotransferase was used as an indicator of renal injury. Data were analyzed using ANOVA followed by Dunnett’s post hoc test comparison.

As shown in FIG. 6 and FIG. 7, as shown in each graph, 1 µg/kg of Peptide ID or 10 µg/kg of Peptide ID resulted in a reduction in these biochemical markers of renal dysfunction.

Example 6: Wound Healing

A full thickness punch biopsy model of wound healing was used to evaluate Peptide ID. In this experiment, 3.5 mm-diameter full-thickness skin wounds were placed at the corners of a 3 cm-wide square on the shaved and depilated scapular region of Sprague-Dawley rats. Peptide ID (24 nmol/kg of bw; 9 rats) or PBS (9 rats) was administered subcutaneously daily for 10 days. The area of open wound, measured in a blinded fashion from serial digital photographs, exhibited faster healing in the animals that received Peptide ID as shown in FIG. 8.

Example 7: Enhancement of Cognition

A novel object recognition paradigm in rats was used to evaluate their recall of previously experienced objects. Specifically, adult Wistar rats were exposed to novel test objects and then reexposed to them 24 hours later. Animals were divided into 5 groups receiving either: (1) vehicle, (2) galantamine (3 mg/kg i.p.) 1 hr before testing as a positive control, (3) Peptide ID (24 nmol/kg bw i.p.) 3 hours after the first exposure to the novel objects, (4) Peptide ID (24 nmol/kg bw i.p.) twice daily for 5 days before training and continued through the day immediately after training, and (5) Peptide ID (24 nmol/kg bw i.p.) 1 hour before first exposure to the novel object.

As shown in FIG. 9, the rats from groups 2-4 exhibited improved recognition of the novel objects in the test in comparison to the rats in groups 1 and 5. These results suggest that Peptide ID may influence the consolidation phase of memory acquisition.

Example 8: Cisplatin Induced Nephropathy

Cancer chemotherapeutic agents such as cisplatin (CDDT) are known to induce renal injury among other toxicities. The ability of Peptide ID to protect rats from cisplatin-induced nephropathy was evaluated by administering 2 mg/kg CDDT intraperitoneally, twice a week for 5 weeks. Peptide IC was simultaneously administered at a dose of 0.4 µg/kg, three times a week for 5 weeks. Renal function was evaluated by measuring the volume of urine production. As shown in FIG. 10, concurrent treatment with Peptide IC protected against renal dysfunction due to CDDT.

Example 9: Cortical Tumor Implant

A cortical tumor implant study was conducted in accordance with the protocol of Lampson et al. Cancer Res. 53:176-82:1993 to determine the effect of Peptide ID on the growth of the tumor.

In accordance with the protocol, male CD fisher rats were anesthetized and their right scalp was shaved and washed with disinfectant. A small incision was then made in the scalp overlying the right temporal cerebral cortex. A 1 mm hole was drilled through the calvarium, without puncturing the dura matter. Under aseptic conditions, living 50,000 9L/LacZ gliosarcoma cells in 5 µl was slowly injected through a 22 gauge needle attached to a precision Hamilton syringe. Bone wax was then applied to the trephination site, the skin was sutured and a prophylactic dose of antibiotic was administered i.p. Control rats were provided with saline injections i.p. daily. The rats treated with Peptide ID received daily injections of 30 µg/kg i.p. daily for a period of 25 days. At 25 days following implantation, the animal was anesthetized and the brain perfused-fixed with 2% paraformaldehyde. The brain was then removed and cut on a brain matrix device into coronal sections 1 mm thick and the extent of tumor mass was determined by planimetric methodology.
FIG. 12 demonstrates that Peptide ID inhibited the further growth of the cortical tumor in this model. Whereas the relative volume of the tumor in the saline treated rats grew to greater than 0.4 cm³, the tumors in the Peptide ID treated rats experienced no growth in the tumor volume.

Example 10: 9L Gliosarcoma Implantation Model

In accordance with the protocol of Lampson et al. Cancer Res. 53:176-82, 1993 described above, CD Fisher rats were implanted with 9L gliosarcoma cells transfected with the LacZ gene by use of a Hamilton syringe. 100,000 cells in 10 microliters were injected into the right caudate.

Two weeks after implantation, animals were divided into three groups for daily intraperitoneal injections: one receiving a Peptide ID with a short plasma half life, another receiving Peptide IW (pegylated form of Peptide IC) and the third group received saline. Peptides were given at a dose of 25 nmol/kg body weight. Three weeks later, the animals were sacrificed and serial 1 mm thick coronal sections cut through the brain and incubated with 5-bromo-4-chloro-3-indolyl-[β-D]-galactopyranoside (Xgal). Tumor cells (containing the LacZ gene) metabolized Xgal into a dark blue stain, localizing the extent of tumor. High resolution digital images were obtained and the areas stained blue determined using planimetric methodology. Data is expressed as total area of tumor infiltration.

Results, as represented in FIG. 13, show a marked reduction in tumor size in the group treated with the peptide with longer half life (Peptide IW) to a total area equal to that obtained when animals were treated daily with the peptide with shorter half life (Peptide ID) began on the day of implantation and continued daily until sacrifice. In contrast, while the mean area of the group that received the shorter acting peptide (Peptide ID) at two weeks after implantation was smaller than the saline group, it was not significantly different.

Further, FIG. 14, presents comparative photos of the brains of the saline, Peptide ID, and Peptide IW treated rats. As can be clearly seen in Fig. 12, the largest tumor (dark area) is present in the saline treated rats. The rats treated with Peptide ID daily had substantially smaller tumors, however the rats treated with Peptide IW after two weeks exhibited the best outcomes.

These findings are consistent with the ability of peptides to cause the regression of the 9L gliosarcoma cell line.

Example 11: (Prophetic) Treatment in Cancer Cachexia

The ability of the peptides to address cachexia symptomatic of cancer may be verified by the following protocol.

Rats weighing about 200 g would be inoculated intraperitoneally with 10⁶ AH-130 Hepatoma cells. Simultaneously, one group of rats would be treated with a peptide of interest such as, Peptide ID or Peptide IW, at a dose that would be in a therapeutically effective range, about 0.10 to 2.0 µg/kg/day. A second group would be treated with a placebo. On day 16, the rats would be sacrificed. The food intake and locomotor activity of the subject rats would be assessed before inoculation and on day 11. The weight and body composition would be evaluated by NMR-scan on day 0 and day 16 after sacrifice.

In comparison to the placebo treated rats, one would expect those treated with a peptide in accordance with the method of the current invention to exhibit less fat and lean mass wasting. In addition, the food intake and locomotor activity of the peptide treated rats would be improved.

Example 12: Histamine Induced Ear Inflammation

The ability of peptides useful in the current therapeutic method to antagonize the pro-inflammatory effects of histamine were evaluated in a mouse model of histamine-induced edema disclosed in Brand et al. “Tea tree oil reduces histamine-induced oedema in mouse ears,” Inflamm. Res. 51 (2002) 283-289. Briefly, 24 Sprague-Dawley rats (male, 250 gm) were used in the study. Prior to the histamine challenge, each rat was anesthetized and the thickness of the rat’s ear was measured using a spring loaded micrometer. 20 µl of 60 mg/ml solution of histamine diphasphate was injected intradermally into an ear of the rat and 30 seconds later the rat received either (1) 30 µg/kg Peptide ID IV (12 rats) or (2) Saline IV (12 rats). Then 20 µl of 60 mg/ml solution of histamine diphasphate was injected intradermally to the rat’s other ear. The thickness of the rats ears was then measured using a caliper at 15, 30, 45 and 60 minutes following the histamine challenge.

As can be seen in FIG. 15, Peptide ID reduced the amount of edema associated with the histamine challenge in comparison to saline.

Example 13: Histamine Induced Wheal Formation

The ability of Peptide ID to reduce plasma extravasation (wheal) induced by intradermal histamine administration was evaluated in rats. Animals were pre-administered Evans Blue dye (which binds tightly to albumin) to provide a visual marker of vascular leak. To determine the persistence of peptide IC activity, at various time periods after Peptide ID administration (30 µg/kg, administered intravenously), an intradermal dose of 0.12 µg histamine was administered, and the extent of dye leak quantitated by planimetry performed on digital photographs obtained 15 minutes following histamine placement, a time at which wheal surface area is greatest. Each animal was tested at only a single time point to avoid influence of histamine administration on subsequent responses. Single-dose Peptide ID administration was found to suppress wheal formation, and the suppressive effect was detectable up to 24 hours following a single dose, as shown in FIG. 16, showing the difference in area of saline versus Peptide ID-treated animals.

Example 14: Histamine Induced Wheal Formation

Under isoflurane anesthesia, 12 Sprague-Dawley rats’ abdomens were shaved and depilated. Each rat was then injected intravenously (via internal jugular) with a dilute solution of Evans Blue (30 mg/ml in saline, 1 ml/kg bw). After 5 minutes, 6 small doses of histamine (Histamine diphasphate, 20 microliters administered intradermally) in a rectangular pattern on each rat’s abdomen. After fifteen minutes, when the wheal reaches its maximum size the wheal was photographed and the blister area was determined by digital planimetry. To test the efficacy of various peptides,
the peptide of interest was administered to the rats intravenously shortly after the histamine injection. The peptides tested and results are noted below.

[0609] Rats received either saline or 10 mg/kg of EPO at time of histamine challenge. FIG. 17 illustrates that the rats that the wheal area (lesion area) of the EPO treated rats (about 0.4 cm²) was half the lesion area of the saline treated animals (about 0.8 cm²).

[0611] Rats received either saline, Peptide IY (30 mg/kg), Peptide ID (30 μg/kg), or Peptide IW (30 μg/kg) at time of histamine challenge. FIG. 18 illustrates that the wheal area (lesion area) of the Peptide ID and Peptide IW treated rats (about 0.35 cm² and 0.3 cm² respectively) was half the lesion area of the saline and Peptide IY treated animals (about 0.6 cm² each). This not only demonstrated the efficacy of Peptides ID and IW in modulating histamine and the inflammatory response associated with histamine but the importance of the above-disclosed motifs to the efficacy of the peptides given that the Peptide ID did not exhibit anti-inflammatory activity.

[0612] C. Peptide IW, Retro Inverso Peptide IC (Peptide IZ, SEQ ID NO: 300, SSNLAAQRELSEQ), Peptide ID, and Scrambled Peptide IZ (Peptide JA (SEQ ID NO: 301) LSEQARNLSEZL).

[0613] Rats received either saline, peptide JA (30 μg/kg), peptide IZ (30 μg/kg), peptide IW (30 μg/kg) or peptide ID (30 μg/kg) at time of histamine challenge. FIG. 19 illustrates that the wheal area (lesion area) of the peptide IW, ID and IZ treated rats (about 0.3 cm², 0.35 cm² and 0.4 cm² respectively) was less than the lesion area of the saline and peptide JA treated animals (about 0.6 cm² each).

Example 15: Decubitus Ulcer Assay

[0614] A decubitus ulcer (pressure sore) assay was performed on 24 adult Sprague-Dawley rats in accordance with the disclosure of Pierce et al., Selective A2A adenosine receptor activation reduces skin pressure ulcer formation and inflammation, *Am J Physiol Heart Circ Physiol* 281:67:74, 2001. Briefly, a ferromagnetic steel plate was implanted under a dorsal region of the rats skin. A rectangular permanent magnet was applied to the area of the skin under which the plate was implanted in order to compress the skin between the plate and the magnet. This compression reduced the flow of blood to the skin causing ischemia. The rats were subjected to a cycle of ischemia-reperfusion (2 hours ischemia with a 0.5 hour reperfusion) for a 72-hour period. The area of the wound on each rat was measured and, subsequently, the rats were treated with either saline, 30 μg/kg Peptide ID administered sc twice; once at the beginning of the first period of ischemia and a second time at 24 hours later, 30 μg/kg Peptide ID administered sc daily, or EPO daily. Daily the area of the wound on each rat was measured for a period of 12 days. FIG. 20 demonstrates that Peptide ID and EPO reduced the size of the wound, and that daily administration of Peptide IG resulted in the smallest wound size.

Example 16 (Prophetic Example): Skin Prick Test

[0615] An initial histamine skin prick test is performed to determine a baseline. The skin prick test is performed on a patient in a semi-recumbent position on the volar aspect of both forearms (more than 5 cm above the distal skin creases of the wrists). The forearm is cleansed with alcohol and allowed to dry. Using a pen, the prospective skin test sites, for histamine and negative control, are marked and label at least 2 cm apart from one another. A drop of histamine dihydrochloride (10 mg/ml) or negative control is placed at the appropriate mark, and then a sterile lancet is introduced through each drop at an 90° angle and withdrawn. The sites are then observed for the presence of erythema and wheal formation at 15 minutes following administration. A photograph is taken of the wheals and then the size of the wheal is determined using digital planimetry.

[0616] The skin prick test is performed again at a time period of at least 3 hours later using the above protocol. One of the above noted peptides may be administered to the patient at a period of 15 minutes to 2 hours prior to administration of the histamine challenge, at the time of administration of the histamine challenge, or to 60 minutes following the histamine challenge to determine the ability of the peptide to prevent, manage/ameliorate or treat histamine induced inflammation, respectively. For example, at the time of the histamine prick the patient may be given a dose of Peptide ID by IV or sc injection. It is expected that the wheal area will be about 50% less after treatment with Peptide ID.

Example 17: Radiomitting Activity in Hematopoietic Screening Assay

[0617] The ability of peptides useful in the current therapeutic method to mitigate the effects of a radioactive agent on the hematopoietic system was evaluated in a murine model of radiation injury. Briefly, 80 C57BL/6 mice (50% female and 50% male, 15-28 gm) were used in the study were divided into two groups.

[0618] In both groups the radiation was administered to the mice as a single uniform total body dose of gamma radiation from a 137Cs radiation source (GammaCell 40; Nordion International, Kanata, Ontario, Canada) at an exposure rate of 65-69 cGy/minute±2.5 cGy.

[0619] Group A received a L7D70/30 dose of radiation (796 cGy) and then 20 of the mice were administrated Peptide ID (30 μg/kg subcutaneously) at 24 hrs after irradiation and then once a day for 29 days. The remaining 20 mice (control group) received PBS (subcutaneously) at 24 hrs after irradiation and then once a day for 29 days.

[0620] Group B received a L7D90/30 dose of radiation (831 cGy) and then 20 of the mice were administrated Peptide ID (30 μg/kg subcutaneously) at 24 hrs after irradiation and then once a day for 29 days. The remaining 20 mice (control group) received PBS (subcutaneously) at 24 hrs after irradiation and then once a day for 29 days.

[0621] The mice were monitored for survival once a day until signs of early euthanasia appeared, then twice/day until day 30.

[0622] As shown in FIG. 21, thirty-day survival and overall survival time of mice receiving Peptide ID administered subcutaneously were significantly increased compared to the mice receiving PBS. In particular, at 796 cGy the treatment mice exhibited a 45% survival rate in comparison to the control group’s 10% survival rate, and at 831 cGy the treatment mice exhibited a 20% survival rate in comparison to the control group’s 5% survival rate.
Example 18: Radiomitigating Activity in a Gastrointestinal Screening Assay

[0623] The ability of peptides useful in the current therapeutic method to mitigate the effects of a radioactive agent on the gastrointestinal system was evaluated in a murine model of radiation injury. Briefly, 30 C57BL/6 mice (male, 20-30 gm) were used in the study.

[0624] The radiation was administered to the mice using a Pantak HF320 X-ray (Agfa NDT Ltd., Reading, UK), operated at 300 kV, 10 mA. The X-ray tube has additional filtration to give a radiation quality of 2.3 mm Cu half-value layer (HVL). Mice had their head, thorax, and forelimbs shielded to protect their bone marrow and select for the GI response. The mice were restrained in a jig and positioned at a distance of 700 mm focus from the focus of the X-ray tube. Irradiation was delivered at a dose rate of 75.5 cGy/min (unshielded) and 70.0 cGy/min (shielded) for a period sufficient to expose the mice to 15 Gy of radiation.

[0625] At 24 hours following radiation, 15 of the mice were administered Peptide ID (30 µg/kg subcutaneously) and then once a day for the duration of the study and remaining 15 mice (control group) received PBS (subcutaneously) and then once a day for the duration of the study.

[0626] The mice were weighed and monitored once a day until signs of diarrhea and early euthanasia appeared, then twice a day.

[0627] As shown in FIG. 22, twenty-day survival of mice receiving Peptide ID administered subcutaneously was significantly greater than the mice receiving PBS (6 mice in treatment group vs. 1 in the control group).

[0628] This invention is not to be limited in scope by the specific embodiments described which are intended as single illustrations of individual aspects of the invention, and functionally equivalent methods and components are within the scope of the invention. Indeed various modifications of the invention, in addition to those shown and described herein will become apparent to those skilled in the art from the foregoing description and accompanying drawings. Such modifications are intended to fall within the scope of the appended claims.

[0629] All references cited herein are incorporated by reference herein in their entireties for all purposes.

<210> SEQ ID NO 291
<211> LENGTH: 11
<212> TYPE: PRT
<213> ORGANISM: Artificial Sequence
<220> FEATURE:
<223> OTHER INFORMATION: Parathyroid hormone derived Peptide IM

<400> SEQUENCE: 291

Val Met Ile Val Met Leu Ala Ile Cys Phe Leu
1  5  10

<210> SEQ ID NO 292
<211> LENGTH: 11
<212> TYPE: PRT
<213> ORGANISM: Artificial Sequence
<220> FEATURE:
<223> OTHER INFORMATION: Pancreatic polypeptide derived Peptide IN
Leu Arg Arg Tyr Ile Asn Met Leu Thr Arg Pro
1 5 10

SEQ ID NO 293
LENGTH: 11
TYPE: PRT
ORGANISM: Artificial Sequence
FEATURE:
OTHER INFORMATION: Calcitonin gene related peptide derived Peptide ID

Leu Ala Leu Ser Ile Leu Val Leu Tyr Gln Ala
1 5 10

SEQ ID NO 294
LENGTH: 23
TYPE: PRT
ORGANISM: Artificial Sequence
FEATURE:
OTHER INFORMATION: Carboxy terminus of the amphipathic helix; sequence TR derived Peptide IQ

Gln Glu Gln Leu Glu Arg Ala Leu Asn Ser Ser Leu Arg Arg Tyr Ile
1 5 10 15
Asn Met Leu Thr Arg Thr Arg
20

SEQ ID NO 295
LENGTH: 7
TYPE: PRT
ORGANISM: Artificial Sequence
FEATURE:
OTHER INFORMATION: Helix-B exterior-presenting amino acids linked to the beta pleated sheet derived Peptide IR

Cys Ser Leu Asn Glu Asn Ile
1 5

SEQ ID NO 296
LENGTH: 16
TYPE: PRT
ORGANISM: Artificial Sequence
FEATURE:
OTHER INFORMATION: Chimeric peptide derived Peptide IS

1. A method for preventing, treating, ameliorating or managing cancer or a neoplastic disorder in a subject in need thereof comprising administering to said subject an effective amount of:

(a) an isolated peptide comprising an amino acid sequence of WHEHVAIQEARRLL (SEQ ID NO: 114), wherein the isolated peptide is no more than 29 amino acids in length; or

(b) an isolated peptide consisting essentially of an amino acid sequence of WHEHVAIQEARRLL (SEQ ID NO: 114), wherein one amino acid residue of the amino acid sequence is replaced with a different amino acid residue or an amino acid equivalent.

62. The method of claim 61, wherein the isolated peptide comprises an amino acid sequence consisting of the amino acid sequence of WHEHVAIQEARRLL (SEQ ID NO: 114).

63. The method of claim 61, wherein the isolated peptide consists essentially of an amino acid sequence of WHEHVAIQEARRLL (SEQ ID NO: 114), wherein one amino acid residue of the amino acid sequence is replaced with a different amino acid residue or an amino acid equivalent.

64. The method of claim 61, wherein the isolated peptide is modified with an addition of polyethylene glycol.

65. The method of claim 61, wherein the cancer or neoplastic disorder is of the central nervous system, peripheral nervous system, gastrointestinal system, digestive system, genitourinary system, gynecological system, head and neck, hematological system, blood, musculoskeletal tissue, soft tissue, respiratory system or breast.

66. The method of claim 65, wherein the cancer or neoplastic disorder is of the digestive system.

67. The method of claim 66, wherein the cancer or neoplastic disorder of the digestive system is selected from the group consisting of appendix cancer, bile duct cancer, colon cancer, gallbladder cancer, gastric cancer, intestinal cancer, colon cancer, liver cancer, pancreatic cancer, rectal cancer, and stomach cancer.

68. The method of claim 65, wherein the cancer or neoplastic disorder is of the respiratory system.

69. The method of claim 68, wherein the cancer or neoplastic disorder of the respiratory system is lung cancer.

70. The method of claim 68, wherein the lung cancer is selected from the group consisting of non-small cell lung cancer, small cell lung cancer, squamous cell lung cancer and mesothelioma.
71. The method of claim 70, wherein the non-small cell lung cancer is adenocarcinoma.
72. A method for preventing or treating cachexia in a subject in need thereof comprising administering to said subject an effective amount of:
   (a) an isolated peptide comprising an amino acid sequence of WEHVNAIQEARRLL (SEQ ID NO: 114), wherein the isolated peptide is no more than 29 amino acids in length; or
   (b) an isolated peptide consisting essentially of an amino acid sequence of WEHVNAIQEARRLL (SEQ ID NO: 114), wherein one amino acid residue of the amino acid sequence is replaced with a different amino acid residue or an amino acid equivalent.
73. The method of claim 72, wherein the isolated peptide comprises an amino acid sequence consisting of the amino acid sequence of WEHVNAIQEARRLL (SEQ ID NO: 114).
74. The method of claim 72, wherein the isolated peptide consists essentially of an amino acid sequence of WEHVNAIQEARRLL (SEQ ID NO: 114), wherein one amino acid residue of the amino acid sequence is replaced with a different amino acid residue or an amino acid equivalent.
75. The method of claim 72, wherein the isolated peptide is modified with an addition of polyethylene glycol.
76. The method of claim 72, wherein the cachexia is caused by or symptomatic of a disease selected from the group consisting of cancer, anorexia, asthenia, anemia, tuberculosis, AIDS, congestive heart failure, renal failure, liver failure, chronic obstructive pulmonary disease, emphysema, muscle atrophy, diabetes, and endotoxinemia.
77. The method of claim 76, wherein the cachexia is caused by or symptomatic of cancer.
78. The method of claim 72, wherein the cachexia is a side-effect of chemotherapy or radiation therapy.
