**Title:** MODULAR DISPLAY SYSTEM OF INTERLOCKING COMPONENTS

**Abstract**

A modular display system of interlocking components, and more particularly, a modular cubic display frame, comprising two sets of four mitered frame members, the two sets defining opposing rectangular end planes, and a set of longitudinal frame members extending perpendicularly between the corners of the two end planes. The end and the longitudinal frame members are interconnected at each corner utilizing a threaded bolt or screw having a lipped head. The lip projecting from the head engages a corresponding groove formed in the outer surfaces of the mitered corners of the end frame members, while the externally-threaded shaft of the screw engages an internally-threaded bore in the end of the longitudinal frame member. All of the frame members have longitudinal channels formed along each side and one corner, for attaching two modular display frames to each other, or for attaching a variety of auxiliary devices to a display frame. The channels are identical in size and configuration, having a T-shaped cross section. The display frames are joined to each other by connecting strips configured to be matingly received in the channels; that is, the strips have I-shaped cross sections.

MODULAR DISPLAY SYSTEM OF INTERLOCKING COMPONENTS

BACKGROUND OF THE INVENTION

1. Field of the Invention

The present invention relates to modular display systems. More specifically, the invention relates to modular display systems, the basic modules of which are interlocking cubes adapted to received ancillary devices.

2. Related Art

Corner connection systems are disclosed in U.S. patents Nos. 3,912,410; 4,501,512; 4,021,128; and 3,835,354. The concept of providing longitudinal channels along frame members, for attaching various accessories, is disclosed in U.S. patents Nos. 3,399,856; 3,613,897; 5,255,803; and 5,477,594. Various interconnection systems using a member of I-shaped cross-section are disclosed in U.S. patents Nos. 3,425,721; 5,090,835; and 5,149,236.

SUMMARY OF THE INVENTION

The present invention is directed to a modular display system of interlocking components, and more particularly, a modular cubic display frame, comprising two sets of four mitered frame members, the two sets defining opposing rectangular end planes, and a set of longitudinal frame members extending perpendicularly between the corners of the two end planes. The end and the longitudinal frame members are interconnected at each corner utilizing a threaded bolt or screw having a lipped head. The lip projecting from the head engages a corresponding groove formed in the outer surfaces of the mitered corners of the end frame members, while the externally-threaded shaft of the screw engages an internally-threaded bore in the end of the longitudinal frame member.

All of the frame members have longitudinal channels formed along each side and one corner, for attaching two modular display frames to each other, or for attaching a variety of auxiliary devices to a display frame. The channels are identical in size and configuration, having a T-shaped cross-section. The display frames are joined to each other by connecting strips configured to be matingly received in the channels; that is, the strips have I-shaped cross-sections.

Auxiliary devices such as crossbars, hang rods, legs, shelves, panels, doors, and drawers
can be attached to a display frame using specially configured connectors which are selectively lockable into the channels.

**BRIEF DESCRIPTION OF THE DRAWINGS**

The invention is better understood by reading the following Detailed Description of the Preferred Embodiments with reference to the accompanying drawing figures, in which like reference numerals refer to like elements throughout, and in which:

Figure 1 is a perspective view of a cube module of the modular display system in accordance with the present invention.

Figure 2 is a cross-sectional view of a frame member of the cube module of Figure 1, taken along line 2-2 of Figure 1.

Figure 3A is an elevational view, partially in cross-section, of a connector for connecting frame members of the type shown in Figure 2 to form the cube module of Figure 1.

Figure 3B is a top plan view of the connector of Figure 3A.

Figure 4A is an exploded plan view of three frame members of the type shown in Figure 2 arranged to form a corner of a cube module, and the connector of Figure 3A.

Figure 4B is a cross-sectional view of Figure 4A, taken along line 4B-4B.

Figure 5A is an assembled view of the three frame members and the connector shown in Figure 4A.

Figure 5B is a cross-sectional view of Figure 5A, taken along line 5B-5B.

Figure 6A is a cross-sectional view of a connecting strip for connecting two cube modules of the type shown in Figure 1.

Figure 6B is a cross-sectional view similar to Figure 6A, interlocked with the frame members of two cube modules, the frame members being shown in dashed lines.

Figure 7A is an end elevational view of a clip for attaching wiring to the module of Figure 1, in the uncompressed state.

Figure 7B is a side elevational view of the clip of Figure 7A.

Figure 7C is a side elevational view of the clip of Figure 7A, in the compressed state.

Figure 8A is a front elevational view of a panel assembly for insertion into a side of the module of Figure 1.

Figure 8B is a side elevational view of a panel holder of the panel assembly of Figure 8A.

Figure 8C is a front elevational view of the panel holder of Figure 8B.
Figure 8D is a cross-sectional view of the panel holder, taken along line 8D-8D of Figure 8B.

Figure 8E is a cross-sectional view of the panel holder, taken along line 8E-8E of Figure 8C.

Figure 9A is an end plan view of a door hinge attached to a frame member of the type shown in Figure 2, with the hinge in the closed position, the door being shown in dashed lines.

Figure 9B is an end plan view of the door hinge and frame member of Figure 9A, with the hinge in the open position, and the door being shown in dashed lines.

Figure 10A is an elevational view, partially in cross-section of a crossbar for attachment between two frame members of the module of Figure 1.

Figure 10B is a partial cross-sectional view of the crossbar of Figure 10A shown connected to a frame member.

Figure 10C is a side elevational view of a screw for locking the crossbar of Figure 10B into the channel of a frame member as shown in Figure 10B.

Figure 10D is a top plan view of the screw of Figure 10C.

Figure 10E is an end elevational view showing the screw of Figure 10C inserted into a channel.

Figure 10F is an end elevational view of a threaded disk to be screwed onto the shaft of the screw of Figure 10C, as shown in Figure 10B.

Figure 10G is a cross-sectional view of the disk of Figure 10F, taken along line 10G-10G of Figure 10F.

Figure 10H is a cross-sectional view of the disk of Figure 10F, taken along line 10H-10H of Figure 10F.

Figure 10I is a locking ring for locking the disk of Figure 10F onto the crossbar of Figure 10A, as shown in Figure 10B.

Figure 10J is a cross-sectional view of the locking ring of Figure 10I, taken along line 10J-10J of Figure 10I.

Figure 10K is a cross-sectional view of a screw for holding the locking ring of Figure 10I onto the end of the crossbar of Figure 10A, as shown in Figure 10B.

Figure 11A is an elevational view, partially in cross-section of a U-shaped hanging rod for attachment between two frame members of the module of Figure 1.

Figure 11B is a partial cross-sectional view of the hanging rod of Figure 11A shown
connected to a frame member.

Figure 12 is an elevational view, partially in cross-section of a faceout rod for attachment to a frame member of the module of Figure 1.

Figure 13A is a side elevational view, partially in cross-section of a shelf assembly for mounting on the faceout rod of Figure 12.

Figure 13B is a top plan view of the shelf assembly of Figure 13A.

Figure 13C is a top plan view of the mounting bracket of the shelf assembly of Figure 13A.

Figure 13D is a cross-sectional view of the mounting bracket, taken along line 13D-13D of Figure 13C.

Figure 13E is a cross-sectional view of the mounting bracket, taken along line 13E-13E of Figure 13C.

Figure 13F is a top plan view of a module having the faceout rod of Figure 12 attached thereto and the shelf assembly of Figure 13B mounted on the faceout rod.

Figure 14A is a top plan view of a shelf support pin for attachment to a frame member of the module of Figure 1.

Figure 14B is a cross-sectional view of the shelf support pin of Figure 14A, taken along line 14B-14B of Figure 14A.

Figure 14C is an enlargement of the circled area 14C of Figure 14A.

Figure 15A is a side elevational view of a pair of modules of the type shown in Figure 1, with legs attached to the bottom of the bottommost module.

Figure 15B is a side elevational view of one of the legs shown in Figure 15A.

Figure 15C is a side elevational view of a single module as shown in Figure 1, with legs attached to the bottom of the module.

Figure 15D is a side elevational view of one of the legs shown in Figure 15C.

Figure 16A is an elevational view of an attachment rod for attaching a centered crossbar to the exterior of the module of Figure 1.

Figure 16B is an elevational view, partially in cross-section, of the attachment rod of Figure 16A, rotated 90°.

Figure 16C is a partial elevational view of the attachment rod of Figure 16A attached to the exterior of a module.

Figure 16D is a top plan view of a screw for attaching the attachment rod to a frame
member of the module.

Figure 16E is a cross-sectional view of the screw of Figure 16D, taken along line 16E-16E of Figure 16D.

Figure 16F is an end elevational view showing the screw of Figure 16D inserted into a channel.

Figure 16G is an top plan view of a threaded ring for holding the screw of Figure 16D in place in the attachment rod of Figure 16A.

Figure 16H is a cross-sectional view of the threaded ring of Figure 16G, taken along line 16H-16H of Figure 16G.

Figure 17A is an elevational view of a crossbar for attachment between two attachment rods of the type shown in Figure 16A, with the attachment rods being shown in dashed lines.

Figure 17B is an elevational view, partially in cross-section, of the attachment rod of Figure 16A, rotated 90°, with the attachment rods being shown in dashed lines.

Figure 18A is a front elevational view of the module of Figure 1 with a set of drawers therein.

Figure 18B is a front elevational view of one of the drawers shown in Figure 18A.

Figure 18C is a side elevational view of the drawer of Figure 18B.

Figure 19A is a front elevational view, partially-exploled, of the module of Figure 1 with a pair of panel holders.

Figure 19B is a top plan view of one of the panel holders of Figure 19A.

Figure 20A is a side elevational view, partially in cross-section, of a connector for connecting various devices to a frame member.

Figure 20B is an end plan view of the male fitting of the connector of Figure 20A.

Figure 20C is a side elevational view, partially in cross-section, of the male fitting of Figure 20B.

Figure 20D is an end plan view of the adjusting ring for the male fitting of the connector of Figure 20A.

Figure 20E is a side elevational view, partially in cross-section, of the adjusting ring of Figure 20D.

Figure 20F is a top plan view of the screw for attaching the connector to a frame member of the module.

Figure 20G is a cross-sectional view of the screw of Figure 20F, taken along line 20G-20G
Figure 20F.

Figure 20H is an end elevational view showing the screw of Figure 20F inserted into a channel.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

In describing preferred embodiments of the present invention illustrated in the drawings, specific terminology is employed for the sake of clarity. However, the invention is not intended to be limited to the specific terminology so selected, and it is to be understood that each specific element includes all technical equivalents which operate in a similar manner to accomplish a similar purpose.

Referring now to Figure 1, there is shown a cube module 10 of the modular display system in accordance with the present invention. The cube module 10 comprises two end frames 12 of four end frame members 14a, and four side frame members 14b joining the two end frames 12. The twelve frame members 14a and 14b thus define the edges of the cube. Although the module 10 is referred to as a cube, it will be appreciated that by elongating any four parallel frame members 12 relative to the remaining parallel members 12, the module 10 can be configured as a rectangular prism, rather than a cube, without substantially affecting the function of the invention.

As can further be seen from Figure 1, and as will be discussed in greater detail hereafter, the ends of the end frame members 14a are mitered at their joints with each other, while the ends of the side frame members 14b are squared off at their joints with the corners of the end frames 12. Otherwise, end frame members 14a and side frame members 14b are essentially identical frame members 14 having a unique cross-section, shown in Figure 2, which enables individual modules 10 to be joined together, as will also be discussed in greater detail hereafter.

Referring now to Figure 2, it can be seen that each frame member 14 has a cross-section which is a soft square (that is, a square with rounded edges), interrupted by five channels 20 of T-shaped cross-section and identical dimensions. The edges of all of the channels 20 are radiused.

Two channels 20a are formed in adjacent first and second sides S1 and S2 of the frame member 14 centered between the first and second edges E1 and E2 and between the second and third edges E2 and E3 of the adjacent first and second sides S1 and S2 of the frame member 14; two channels 20b are adjacent the first and third edges E1 and E3 between the first and fourth
sides and between the second and third sides, respectively; and a fifth channel 20c is formed on
the fourth edge E4 between the third and fourth sides S3 and S4, thus effectively cutting off the
fourth edge E4. One side edge of each second channel 20b aligns with the center line of the first
channel 20a on the opposite side of frame member 14. Each frame member 14 is symmetric about
a diagonal plane through the second edge E2 and center C. When the frame members 14 are
assembled to form a module 10, the third channel 20c is oriented toward the interior of the
module 10.

Referring now to Figures 3A, 3B, 4A, 4B, 5A, and 5B, there is shown a connector 30 for
connecting the end frame members 14a and side frame members 14b together to form a module
10 in accordance with the invention. As shown in Figures 3A and 3B, connector 30 is a screw
having a head 32 and a shaft 34. Head 32 has an axial recess 32a in its upper surface for
receiving the mating head of a wrench, and an annular tapered lip 32b projecting from its lower
surface; while the shaft 34 is conventionally provided with external threads.

As shown in Figures 4A, 4B, 5A, and 5B, at each corner of the module 10, the mitered
ends of end frame members 14a are bored to matingly receive the screw 30, the bores having an
inner portion 40a with a smaller radius corresponding to that of the screw shaft 34 and an outer
portion 40b with a larger radius corresponding to that of the screw head 32. The outer portion
40b is provided with a tapered circumferential groove 40c for matingly receiving the tapered lip
32b of the screw 30. Further, the squared off end of the side frame member 14b is provided with
an internally-threaded axial bore 42 for matingly receiving the externally-threaded shaft 34 of the
screw 30.

Preferably, frame members 14 and screws 30 are made of aluminum. However, it will be
appreciated by those of skill in the art that other metals, as well as plastics, can also be used.

Referring now to Figures 6A and 6B, there is shown a connecting strip 50 for connecting
two modules 10. Connecting strip 50 preferably is made of a plastic material such as PVC,
although other materials having similar characteristics of flexibility, resilience, and durability can
also be used.

The connecting strip 50 has an I-shaped cross-section with radiused edges, dimensioned
to be matingly received in the channels 20 of the frame members 14, as shown in Figure 6B.
Although the frame members 14 in Figure 6B are shown joined along two sides, it will be
appreciated by those of skill in the art that as all of the channels 20 are of the same dimension, any
two frame members 14 can also be joined corner to corner or side to corner, as well. Thus, the
modules 10 can be jointed together in a variety of configurations simply by connecting their adjacent frame members 14 using the connecting strips 50.

In addition to providing a means for connecting adjacent modules 10 together, channels 20 can also be used for attaching a variety of ancillary or auxiliary devices to the frame members 14. Some of these devices are shown in the remaining Figures.

Figures 7A and 7B show a clip 102 designed to secure wiring to the frame members 14. The clip is formed of a flexible and resilient material, such as a soft steel, so that its legs 102a can be pressed together, enabling the feet 102b extending outwardly from the legs 102a to be inserted into a channel 20.

Figures 8A, 8B, and 8C show a panel assembly 104 and the components thereof intended for insertion into the sides or ends of a module 10. As shown in Figure 8A, the panel assembly 104 comprises a panel 104a and four panel holders 104b secured along two sides of the panel 104a. The panel holders 104b can be made of a soft steel.

Each panel holder 104b has a slot 104c at one end for receiving an edge of the panel 104a and a spring-loaded bearing 104d at the other end for insertion into a channel 20. The slot 104c can be provided with pads 104e, to prevent scratching of the panel 104a and a screw 104f for tightening against the panel 104a to hold it in place in the slot 104c. The tension of the spring-loaded bearings 104d is adjusted so that they can be retracted easily to permit insertion or removal of the assembly 104 with respect to a side of the module 10, with the bearings 104d extending into the channels 20 when the assembly is in place. The panel 104a can be in the form of a mirror, a transparent or semi-transparent window, or opaque.

Figures 9A and 9B show a door hinge 110a for attaching a door 110b to one of the frame members 14 of a module 10. The door hinge 110a comprises a pin portion 110c and a barrel portion 110d, both preferably made of aluminum. The pin portion 110c in turn includes a cylindrical pin 110e and a connector 110f of T-shaped cross-section projecting outwardly from the pin 110e and dimensioned to be matingly received in one of the channels 20 of a frame member 14, while the barrel portion 110d includes at one end a channel 110g of generally C-shaped cross-section for pivoting engagement with the pin 110e, and at the other end a groove 110h of generally U-shaped cross-section for receiving an edge of the door 110b.

Referring now to Figures 10A-10K, there is shown a crossbar 120 for positioning between two frame members 14 of a module 10, and a locking assembly 122 for locking the crossbar 120 in place in the channels 20 of the two frame members 14.
As shown in Figures 10A, 10B, and 10K, the crossbar 120 has two axial end bores 120a, for a purpose to be discussed hereinafter. Crossbar 120 preferably is made of aluminum, but can also be made of other materials of suitable strength to serve as a crossbar.

A screw 122a is provided for locking the crossbar 120 into the channel 20. As shown in Figures 10C-10D, the screw 122a has a trapezoidal head 122b and a threaded shaft 122c, the head 122b being dimensioned to be insertable into and removable from the channel 20 when oriented in one direction and locked into the channel 20 when rotated 90° from that direction.

Figures 10F-10H show a threaded disk 122d, which can be made of brass, to be screwed onto the shaft of the screw of Figure 10C, as shown in Figure 10B. Figure 10I in turn shows a locking ring 122e for locking the disk 122d onto the crossbar 120, as shown in Figure 10B; and the locking ring 122e is held in place against the end of the crossbar 120 by a flat head screw 122f screwed into the bore 120a, as shown in Figures 10B and 10K. Locking ring 122e can be made of aluminum.

As will be appreciated by those of skill in the art, the locking assembly 122 can also be used to position the crossbar 120 between the frame members 14 of two spaced modules 10, in the same way as between two parallel frame members 14 of a module 10.

Referring now to Figures 11A and 11B, there is shown a U-shaped hanging rod 130 and a locking assembly 122 for locking the hanging rod 130 in place in the channels 20 of the frame members 14 of a module 10, the locking assembly 122 being the same as that described with reference to Figures 10B-10K. Like crossbar 120, hanging rod 130 has axial end bores 130a, each of which receives a screw 122f which locks the locking assembly 122 in place, and can be made of the same materials as the crossbar 120. Also as with the crossbar 120, the locking assembly 122 can be used to position the hanging rod 130 between the frame members 14 of two spaced modules 10, in the same way as between two parallel frame members 14 of a module 10.

Figure 12 shows a faceout rod 140 for attachment to a frame member 14 of the module 10 using the locking assembly 122 described with reference to Figures 10B-10K. Faceout rod 140 has an axial end bore 140a at one end, which receives a screw 122f which locks the locking assembly 122 in place. At its other end, faceout rod 140 has a knob 140b, which is connected to the body of the rod by a necked-in area 140c. Faceout rod 140 can also be made of the same materials as the crossbar 120.

As will be appreciated by those of skill in the art, the faceout rod 140 can be positioned in a channel 20 either facing the interior or the exterior of the module 10.
Referring now to Figures 13A-13E, there is shown a shelf assembly 150 for mounting on the faceout rod 140. The shelf assembly 150 comprises a shelf 152 and a mounting bracket 154 which holds the shelf 152. Both the shelf 152 and the mounting bracket can be made of aluminum, although it will be appreciated by those of skill in the art that other materials can be used.

The shelf 152 can be configured and dimensioned to fit within the interior of the module 10. The mounting bracket 154 is in the shape of an inverted, truncated cone, and has both an axial bore 154a and a transverse bore 154b at a right angle to the axial bore 154a. The transverse bore 154b is dimensioned to receive the faceout rod 140. The shelf 152 has a central, counterbored aperture 152a, enabling a flat head screw (not shown) to be inserted through the shelf and the axial bore 154a to secure the shelf 152 to the mounting bracket 154. The faceout rod 140 can also be provided with a transverse bore (not shown) in registration with the axial bore 154a of the mounting bracket 154, to enable the flat head screw to pass through; or the screw can be dimensioned to be tightened against the surface of the faceout rod 140.

Figure 13F shows a module 10 having the faceout rod 140 inserted into a corner channel 20c of a side frame member 14b, and the shelf assembly 150 mounted on the faceout rod 140.

Figures 14A-14C show a shelf support pin 160 for attachment to a frame member 14 of the module 10 using the locking assembly 122 described with reference to Figures 10B-10K. Shelf support pin 160 has an axial end bore 160a at one end, which receives a screw 122f which locks the locking assembly 122 in place. At its other end, shelf support pin 160 is provided with a radiused circumferential groove 160b. Four of these shelf support pins 160 can be inserted into the interior channels 20 of the side frame members 12b at the same level to provide support for a shelf in a conventional manner. The shelf support pin 160 can be made of aluminum or other suitable materials.

A module 10 can be mounted on legs 170 to raise it above floor level, as shown in Figures 15A and 15C. The height of the legs 170 used with a module 10 or a stack of modules will, as is conventional, depend upon the height to which it is desired to raise the module or stack of modules. Legs 170 of two different heights are shown in Figures 15A and 15B, and in Figures 15C and 15D, the legs 170 of Figure 15A and 15B having a height equal to that of one module 10, and the legs 170 of Figures 15C and 15D having a height equal to that of two modules 10.

Other than their heights, the legs 170 are identical. Each leg 170 has a shaft portion 170a,
a foot 170b at the bottom of the shaft portion 170a, and an integral screw 170c at the top of the shaft portion 170a. The screw 170c has substantially the same configuration as the screw 30 described in connection with Figures 3A and 3B, enabling the legs 170 to replace the screws 30 at the bottom of the module 10. Thus, the upper surface of the shaft portion 170a has an annular tapered lip 170c projecting from its upper surface for mating engagement with the tapered circumferential groove 40c provided in the bottom surfaces of the end frame members 14a; and an externally-threaded shaft portion 170d dimensioned for engagement with the internally-threaded bore 42 of the side frame members 14b.

Referring now to Figures 16A-16H, there is shown a cylindrical attachment rod 180 for attaching a centered crossbar 190 (to be described hereafter) to the exterior of a module 10. Attachment rod 180 has two end transverse bores and a center transverse bore 180b. The longitudinal axes of transverse bores 180a and 180b are parallel. Transverse bores 180a have constant diameters throughout their lengths; whereas transverse bore 180b has a first end having a first diameter and a second end having a second diameter greater than the first diameter, for a purpose to be described hereafter. Attachment rod 180 can be made from aluminum or other suitable materials.

Attachment rod 180 is attached to a frame member using a pair of screws 182, shown in Figures 16D-16F, inserted through end bores 180a and into a channel 20 in the manner shown in Figure 16C. As shown in Figures 16D-16F, each screw 182 has a trapezoidal head 182a and a threaded shaft 182b, the head 182a being dimensioned to be insertable into and removable from the channel 20 when oriented in one direction and locked into the channel 20 when rotated 90° from that direction.

A ring 184 having a knurled circumference 184a and an internally-threaded bore 184b engages the exposed end of the threaded shaft 182b, is provided for securing the attachment rod 180 in place on screws 182 and against the frame member 14 of the module 10. The ring 184 can also be made of aluminum.

A pair of attachment rods 180 can be attached to a respective pair of spaced modules 10 to receive a centered cylindrical crossbar 190 between them, as shown in Figures 17A and 17B. The crossbar 190 has semi-cylindrical channels 190a formed at either end, dimensioned to engage the side surfaces of the two attachment rods 180; and internally-threaded axial bores 190b extending inwardly from the channels 190a. The crossbar 190 is held in place between the two attachment rods 180 by two screws 192 inserted into the center bores 180b of the attachment rods.
180 and the axial bores 190b of the crossbar 190, the larger diameter portion of each center bore 180b being dimensioned to receive the head of a screw 192, and the smaller diameter portion of each center bore being the same diameter as its corresponding axial bore 180b and being dimensioned to receive the shaft of a screw 192. The crossbar 190 can also be made of aluminum or other suitable materials.

As shown in Figure 18A, a set of drawers 200 can be installed in a module 10. In one embodiment, shown in Figures 18B-18C, each drawer 200 has a cutout 200a at its front top for use as a drawer pull, and at its sides, conventional ball bearing and wheel type drawer slides 200b. Conventional mating slides (not shown) for engaging the slides 200b can be mounted between the side frame members 14b using an attachment rod similar to that shown in Figures 16A-16B, but having the mating slides attached to the sides.

As shown in Figures 19A-19B, a pair of panel holders 210 can be installed on the top of a module 10, to hold a display panel P. Each panel holder 210 has a C-shaped cross-section, one edge of the panel P fitting into the channel 210a defined by the “C.”

Each panel holder 210 also has an integral screw 210b at its bottom end. The screw 210b has substantially the same configuration as the screw 30 described in connection with Figures 3A and 3B, enabling the panel holders 210 to replace the screws 30 at the top of the module 10. Thus, the lower surface of the panel holder 210 has a circumferential tapered lip 210c projecting from its lower surface for mating engagement with the tapered circumferential groove 40c provided in the upper surfaces of the end frame members 14a; and an externally-threaded shaft portion 210d dimensioned for engagement with the internally-threaded bore 42 of the side frame members 14b.

As will be appreciated by those of skill in the art, it may be desirable to attach numerous other ancillary accessories and articles to a module 10. A universal connector 220 therefore is provided, as shown in Figure 20A. Referring to Figures 20A-20C, the connector 220 includes a bushing 220a for receiving the end of the article to be to a frame member 14. The bushing 220a has an axial bore at one end dimensioned to receive an end of the article, and another axial bore at the other end dimensioned to receive a male fitting 220b, shown in Figures 20B and 20C. The bore which receives the end of the article can be threaded or unthreaded, depending upon the application. The bore which receives the male fitting 220b is internally threaded.

The male fitting 220b has a head 220c which is knurled around its circumference and a shaft 220d which is externally threaded. Further, an internally-threaded axial bore extends
through the head 220c and the shaft 220d for receiving a screw 220e for attaching the connector 220 to a frame member 14 of the module 10. As shown in Figures 20F-20H, the screw 220e has a trapezoidal head 220f and a threaded shaft 220g, the head 220f being dimensioned to be insertable into and removable from the channel 20 when oriented in one direction and locked into the channel 20 when rotated 90° from that direction.

The position of the male connector 220b relative to the bushing 220a is conventionally adjusted using an adjusting ring 220h, shown in Figures 20D and 20E. Adjusting ring 220h is also knurled on its circumference, and has an internally-threaded axial bore dimensioned to receive the shaft 220g of the screw 220e.

Both the male fitting 220b and the adjusting ring 220h can be made of aluminum or other suitable materials.

Modifications and variations of the above-described embodiments of the present invention are possible, as appreciated by those skilled in the art in light of the above teachings. It is therefore to be understood that, within the scope of the appended claims and their equivalents, the invention may be practiced otherwise than as specifically described.
WHAT IS CLAIMED IS:

1. A display module comprising at least one modular display frame, said at least one modular display frame comprising:
   first and second sets rectangular frames defining opposing first and second rectangular end planes, each of said end planes having opposing first, second, third, and fourth corners, each of said corners having an outer surface having a circular groove formed therein;
   first, second, third, and fourth longitudinal frame members extending perpendicularly between said opposing first, second, third, and fourth corners, respectively, of said first and second end planes, each of said frame members having opposed ends and an internally-threaded bore extending inwardly from each of said ends;
   a fastener fastening each of said corners to a respective one of said longitudinal frame members, each said fastener having a head and an externally-threaded shaft, said head having a projecting lip corresponding to and engaging said groove formed in said outer surfaces of one of said corners, and said externally-threaded shaft engaging said internally-threaded bores in said end of said longitudinal frame member extending from said corner.

2. The display module of claim 1, wherein said frames and said frame members have longitudinal channels formed along each side and one corner, said channels being identical in size and configuration and having a T-shaped cross-section.

3. The display module of claim 2, further comprising connecting strips having I-shaped cross-sections sized and configured to be matingly received in said channels for connecting at least two display frames together.

4. The display module of claim 3, wherein said connecting strips are made of a flexible and resilient material.
5. The display module of claim 2, wherein said display module comprises at least two of said display frames adjacent each other, and further comprises connecting strips having I-shaped cross-sections sized complementary in configuration to a pair of opposed channels, said connecting strips being matingly received in said channels for connecting said at least two display frames together.

6. The display module of claim 5, wherein said connecting strips are made of a flexible and resilient material.

7. The display module of claim 2, further comprising:
   a connector configured to be selectively lockable into said channels; and
   an auxiliary device attached to said display frame by said connector.

8. The display module of claim 7, wherein said auxiliary device is selected from the group consisting of crossbars, hang rods, legs, shelves, panels, doors, and drawers.

9. The display module of claim 7, wherein said auxiliary device has an attachment end having an axial bore formed therein; and
   wherein said connector comprises a screw having a trapezoidal head and a threaded shaft, said threaded shaft being insertable into said axial bore with said trapezoidal head projecting outwardly of said attachment end, and said head being dimensioned to be insertable into and removable from one of said channels when oriented in one direction and locked into said channel when rotated 90° from said one direction.
10. The display module of claim 9, wherein said auxiliary device comprises a rod, and wherein said display module further comprises a shelf assembly for mounting on said rod, said shelf assembly comprising:

a shelf having an aperture therethrough;

a mounting bracket for mounting said shelf to said rod, said mounting bracket being in the shape of an inverted, truncated cone, and having an axial bore and a transverse bore at a right angle to said axial bore, said transverse bore being dimensioned to receive said rod; and

a fastener for insertion through said aperture in said shelf and into said axial bore of said mounting bracket for fastening said shelf to said mounting bracket.

11. The display module of claim 2, further comprising a panel assembly for insertion into said display frame, said panel assembly comprising:

a panel; and

at least two panel holders, each said panel holder having a slot at a first end thereof for receiving an edge of said panel and a spring-loaded bearing at a second end thereof, said spring-loaded bearing being insertable into one of said channels and having an adjustable tension permitting said panel holder to be retracted easily for insertion and removal from said channel.

12. The display module of claim 2, further comprising a door assembly for insertion into said display frame, said door assembly comprising:

a door; and

a door hinge including a pin portion and a barrel portion, said pin portion including a cylindrical pin and a connector of T-shaped cross-section projecting outwardly from said pin and dimensioned to be matingly received in one of said channels, and said barrel portion including at a first end a channel of generally C-shaped cross-section for pivoting engagement with said pin, and at a second end a groove of generally U-shaped cross-section for receiving an edge of said door.
13. The display module of claim 1, further comprising a plurality of legs raising said display module above the level of a support surface, each of said legs comprising a shaft portion having an upper surface, an annular tapered lip projecting from said upper surface for mating engagement with one of said circular grooves, and an externally-threaded shaft projecting from said upper surface radially inward of said annular tapered lip, said externally-threaded shaft being dimensioned for engagement with said internally-threaded bore in one of said longitudinal frame members, said annular tapered lip and said externally-threaded shaft forming one of said fasteners fastening a corner of one of said rectangular frames to one of said longitudinal frame members.

14. The display module of claim 1, wherein each of said rectangular end frames comprises first, second, third, and fourth end frame members, each of said end frame members having two opposed mitered ends, each adjacent pair of mitered ends having a bore therein configured to matingly receive one of said fasteners, each said bore having an inner portion with a smaller radius corresponding to that of said fastener shaft and an outer portion with a larger radius corresponding to that of said fastener head, said circular groove being formed in said outer portion.

15. The display module of claim 14, wherein each of said end frame members and said longitudinal frame members has a substantially square cross-section, first, second, third, and fourth sides and an interior-facing corner, and first, second, third, fourth, and fifth channels of T-shaped cross-section respectively interrupting said first, second, third, and fourth sides and said corner, all of said channels having identical dimensions.
16. The display module of claim 15, wherein said first side is adjacent said second and fourth sides and opposite said third side, and said interior corner is between said third and fourth sides; and

wherein each said frame member has a center, a first edge between said first and fourth sides, a second edge between said first and second sides, and a third edge between said second and third sides, said first and second channels being formed in said first and second sides centered between said first and second edges and between said second and third edges, and said third and fourth channels being adjacent said first and third edges and between said second and third sides, respectively, and said fifth channel being formed at said corner between said third and fourth sides, one side edge of said second channel aligning with the center line of said first channel, and each frame member being symmetric about a diagonal plane through said second edge and said center.

17. The display module of claim 16, further comprising connecting strips having I-shaped cross-sections sized and configured to be matingly received in said channels for connecting at least two display frames together.

18. The display module of claim 17, wherein said connecting strips are made of a flexible and resilient material.

19. The display module of claim 16, wherein said display module comprises at least two of said display frames adjacent each other, and further comprises connecting strips having I-shaped cross-sections sized complementary in configuration to a pair of opposed channels, said connecting strips being matingly received in said channels for connecting said at least two display frames together.

20. The display module of claim 19, wherein said connecting strips are made of a flexible and resilient material.
21. A display module comprising at least one modular display frame, said at least one modular display frame comprising:

first and second sets of polygonal frames defining opposing first and second end planes, each of said frames having opposing first, second, and third, longitudinal frame members defining first, second, and third, corners, each of said frame members having an outer surface having a curvilinear groove formed therein;

each of said frame members extending towards another frame member from said first, second, and third corners, respectively, of said first and second end planes, each of said frame members having opposed ends and a threaded end surface extending longitudinally at each of said ends;

a fastener fastening each of said frame members to a respective adjacent one of said frame members, each said fastener having a head and a complementarily threaded joining surface, mated with the threaded end surface on the adjacent frame member, said head having a projecting lip complementary to and engaging said groove formed in said outer surfaces of the adjacent frame member, and said threaded joining surface engaging said complementarily threaded end surface in said end of the adjacent frame member.
