UNITED STATES PATENT OFFICE.

ROBERT KENNETH MILKS, OF OTTAWA, ONTARIO, CANADA.

ANTISEPTIC WATERPROOF GARBAGE-RECEPTACLE AND STAND THEREFOR.

1,121,387.

Specification of Letters Patent.

Patented Dec. 15, 1914.

Application filed January 20, 1913. Serial No. 743,022.

To all whom it may concern:

Be it known that I, ROBERT KENNETH MILKS, a subject of the King of Great Britain, and a resident of the city and district of Ottawa, county of Carleton, in the Province of Ontario, Dominion of Canada, have invented certain new and useful Improvements in Antiseptic Waterproof Garbage-Receptacles and Stands Therefor; and I do hereby declare that the following is a full, clear, and exact description of the same.

The invention relates to improvements in antiseptic waterproof garbage receptacles with stands therefor, as described in the present specification and illustrated in the accompanying drawings that form part of the same.

The invention consists essentially in a novel receptacle for garbage and the like which may be impregnated with a disinfectant and waterproofing compound.

The objects of the invention are to devise a cheap and efficient garbage receptacle which will be odorless, impervious to water, and, at the same time, protected against disease germs.

In the drawings Figure 1 is a perspective view of the receptacle which is adapted to be rendered antiseptic, waterproof and odorless. Fig. 2 is a perspective view showing the receptacle in dotted lines, mounted on a preferred form of stand.

Like numerals of reference indicate corresponding parts in each figure.

Referring to the drawings, 1 is the receptacle, here shown in the form of a bag composed of some porous or fibrous material which is adapted to be impregnated with a suitable disinfectant and waterproofing compound.

2 is the base of the stand, having the casing 3 and bracket 4 mounted thereon.

5 is a shelf mounted on the rail 6 sliding in the casing 3 and forming a seat for the bottom of the receptacle.

The casing 3 is provided with a regulating screw 7 which is adapted to hold the rail 6 in any desired position along the length of the base 2, thus allowing for a larger or smaller sized receptacle.

8 is a ring mounted on the bracket 4, being adapted to fit inside the mouth of the receptacle 1 and act as a bearing surface for the semi-circular rings 9 and 10, which are

mounted on hinges 11 and are adapted to swing upwardly and snap together over the stationary ring 8 in any suitable manner, thus holding the mouth of the bag securely in its open position, the stationary ring 8 being on the inside, and the hinged rings 9 and 10 fitting around the outside of the mouth thereof.

12 is a suitable cover which is adapted to form an air tight closure for the mouth of the receptacle.

13 is the hinge on which said cover swings.

14 are staples or hooks in the sides of the base 2 for the purpose of holding a suitable screen 16 in place around the receptacle, adapted for the protection of same.

Throughout the present application this receptacle is illustrated and described as it is used in connection with my improved garbage collecting system, but it must be understood that it may also be used for any other purpose, the salient features of the invention being the saturation of a receptacle with a disinfectant, waterproof and an odorless compound. It may be pointed out as another advantage, when my invention is used in this connection, that, when the garbage has been collected and conveyed to an incinerator in these bags, the refuse will burn the more freely on account of the chemical properties which may be contained in the solution with which the bag has been impregnated.

What I claim is:

A garbage receptacle comprising a support, an inflammable waterproof bag, a bracket secured to the support, a ring supported from the bracket and adapted to extend on the inside of the bag and from which the bag is suspended, clamping arms permanently hinged to the bracket and adapted to be swung apart and away from the bag in a lateral direction, a cover for the receptacle adapted to project over the edge of the bag, pivotal supporting means for the cover, and an adjustable support for the bottom of the bag.

Signed at the city of Ottawa, Ontario, Canada, this sixth day of November, 1912.

ROBERT KENNETH MILKS.
