54 **Window frame with one or more upright-sliding shutters.**

57 This window frame allows the complete closing or opening of the window-space by means of a single upright-sliding shutter (3, 4, 5) disappearing entirely into the wall, when it is completely lifted.

If it contains more shutters, each of them carries on a specific function of its own and by itself, that is the function of a windowpane or a blind or a house-breaking proof closing device.

The shutter 5 can be high thermal insulating.

The shutters can be supplied with a locking device which be inaccessible and off sight in order to prevent them from being lifted from the outside, even when they are partly lifted in an opening position.
