UNITED STATES PATENT OFFICE.

GEORGE W. MCGILL, OF NEW YORK, N. Y.

IMPROVEMENT IN CARD-SUSPENDING RINGS.

Specification forming part of Letters Patent No. **175,723**, dated April 4, 1876; application filed May 6, 1875.

To all whom it may concern :

Be it known that I, GEORGE W. MCGILL, of the city and county of New York, in the State of New York, have invented a new and useful Suspending Device; and I do hereby declare the following to be a full and exact description thereof, reference being had to the accompanying drawing, making part of this specification, and to the figures and letters of reference marked thereon.

The device is struck up and shaped from a single piece of metal; and consists in a ring resting in a long horizontal base having fastening-lugs cut and swaged from between its raised borders, in a plane parallel with the sides thereof; and has for its object the hanging of cards, pictures, and other articles, and the bracing of them, while hung, in a manner to prevent the buckling of their center.

Figure 1 in the accompanying drawing represents a front view of my suspending device complete.

A is the ring or garter. B is the horizontal base; and *b b* are the fastening-lugs. The base B is provided with the ribs or raised borders *c c* to give it strength, and these may be figured, to serve an ornamental purpose as well.

The manner in which the device is used is

as follows: The lugs *b b* are forced through the article to be suspended from its front side, and near enough to its upper edge to admit of the ring A extending above the top of the same. The lugs *b b* are then bent down on the other side of the article, so as to clamp it between them and the base B, as shown in Fig. 2, which represents a back view of the device, D representing the suspended article. The device, when attached in this manner to a card or other article, not only enables the card to be suspended thereby, but holds it open, and braces it in a manner which will prevent it buckling in its center.

What I claim as my invention, and desire to secure by Letters Patent, is—

As an improved article of manufacture, my above-described suspending device, stamped from a single piece of sheet metal, having its fastening-lugs *b b* cut and swaged from between its raised borders or ribs in a plane parallel with the sides thereof, and constructed in other respects substantially as herein set forth and described, for the purposes specified.

GEORGE W. MCGILL.
