United States Patent Office.

FRANK WHALEN, OF BALLSTON SPA, NEW YORK,

Letters Patent No. 105,748, dated July 26, 1870.

STOVE-LEG.

The Schedule referred to in these Letters Patent and making part of the same.

To all whom it may concern:

Be it known that I, FRANK WHALEN, of Ballston Spa, in the county of Saratoga and State of New York, have invented and made a new and useful Improvement in Legs for Stoves, &c.; and the following is hereby declared to be a full and correct description of the same.

This invention relates to combining caster-legs with the main or supporting-legs of a stove, or other article, in such a manner that said main legs can be removed from the stove, and the stove supported by the caster-legs, so that the same can be rolled from place to place, and the necessity of lifting and carrying the stove avoided.

The upper part of the leg is made as a wedge-shaped plate, to enter a correspondingly-shaped recess in the bottom of the stove, and the said plate is locked to place by means of a swinging arm, that is clamped against the side of the recess, and acts as a stop to prevent the plate and leg being accidentally disconnected from the stove.

The main leg is connected to the caster-leg by means of tongues or flanges entering recesses in the sides and top of said leg.

In the drawing—

Figure 1 is a vertical section of my combined caster and stove-leg.

Figure 2 is an inverted plan of the same.

Figure 3 is an elevation of the caster-leg, and

Figure 4 a similar view of the main or supporting-leg.

The caster-leg *a* is formed with a socket at its lower end, to receive the pintle *b* of the caster-wheel *c*, and said pintle is retained in place by means of the screw *d* taking the circular groove formed in said pintle, or otherwise.

The upper part of the leg *a* is formed as a wedge-shaped plate, *h*, and the edges of said plate, at *e*, are beveled to hold the plate *h* in place, by passing between the under-cut lugs or blocks *f*, which are cast upon or form part of the under or lower plate of the stove.

To prevent the plate *h* being accidentally disconnected from the recess-between the lugs *f*, I make use

of the locking-arm *i*, attached, by the center *l*, to the plate *h*. By moving this arm until one edge takes against the side of the recess *f*, and then clamping the same by the thumb-screw *m*, (as seen in fig. 2,) said arm will act as a stop to effectually prevent the plate *h* slipping, or being withdrawn from its recess.

The main or supporting-leg *n* is longer than the caster-leg *a*, so that, when said leg is in place, the caster-wheel *c* will be lifted off the ground, as seen in fig. 1, and I connect said main leg *n* to the caster-leg *a* by means of the tongues or flanges *t t* and *v*, the tongues *t t* passing on the two sides of the leg *a*, where there may be recesses, *u*, and the plate *v* entering a recess in the upper end of the leg *a*.

The main leg *n* being the longest, as aforesaid, the weight of the stove will be transferred from the caster-leg *a* to said leg *n*, when the parts are in a normal position, and, when the leg *n* is withdrawn, the stove is supported by the caster-leg, and can be rolled about.

By employing the locking-arm to retain the leg to place, danger of said leg falling from the stove is prevented. This locking-device might be employed with an ordinary stove-leg, and the caster-leg and main leg may be applied to the ordinary recess made between the dovetailed ribs on a stove.

I claim as my invention—

1. The locking-arm *i* and clamp-screw *m*, applied to and combined with the plate *h* of the leg, to retain the same between the dovetail lugs or recess of the stove, as specified.

2. The movable caster-leg *a*, receiving the caster-wheel *c* and pintle *b*, and being made with a plate, *h*, to pass into the dovetail recess on a stove, as and for the purposes set forth.

3. The removable leg *n*, provided with tongues or plates *t v*, in combination with the caster-leg, substantially as set forth, so that the caster will be relieved when the leg *n* is inserted, as shown.

Dated May 26, A. D. 1870.

FRANK WHALEN.
