Title: A PROCESS FOR PRODUCING 3,4-DIHYDRO NAPHTHYRIDINONE ANALOGS

Abstract: This invention is to provide a process for producing 3,4-dihydro naphthyridinone analogs and salts thereof containing the structure shown by the following structural formula (I). The naphthyridinone analogs with an electrocyclic withdrawing group in 3-position are readily converted to corresponding 3,4-dihydro naphthyridinone analogs in the presence of a reducing agent, e.g. sodium borohydride and lithium borohydride. The reduction can be performed in mild condition, and the intermediate naphthyridinone analogs containing the structure shown by the following structural formula (II) can be prepared easily under mild condition too, so various substituent can be introduced to the 3,4-dihydro naphthyridinone analogs.
A PROCESS FOR PRODUCING 3,4-DIHYDRO NAPHTHYRIDINONE ANALOGS

TECHNICAL FIELD

The present invention relates to novel synthetic method of 3,4-dihydro naphtthyridinone analogs. The compound can be used, e.g. as a pharmaceutical intermediate of pyridine derivatives which inhibit IkB kinase β (IKK-β or IKK-beta) activity, thus inhibit nuclear factor kappa B (NF-κB) activity, and can be used for the prophylaxis and treatment of diseases associated with NF-κB activity, in particular for the treatment of inflammatory diseases.

BACKGROUND ART

The development of a novel compound having effective anti-inflammatory actions based on a specific and selective inhibitory activity to NF-κB has been desired.

The present inventor has found that 3,4-dihydro naphtthyridinone analogs are useful for intermediate of the novel compound. Synthetic method of 3,4-dihydro naphtthyridinone analogs shown by the following Scheme 1 is disclosed in WO 2001027103. But the intermediate bromomethyl compound is prepared under strongly acidic condition, so it is difficult to introduce acid-sensitive groups in 3,4-dihydro naphtthyridinone analogs.
Scheme 1

Moreover, another synthetic method of 3,4-dihydro naphthyridinone analogs such as shown by the following Scheme 2 is disclosed in DE 3423003 and Al 19860102, but the reaction is performed under strongly acidic condition and the derivation of 3,4-dihydro naphthyridinone analogs is very limited too.

DISCLOSURE OF INVENTION

The object of this invention is to provide the synthetic method that can prepare 3,4-dihydro naphthyridinone analogs with various substituents in mild conditions.

The reduction can be performed in mild condition, and the intermediate naphthyridinone analogs can be prepared easily under mild condition
too, so various substituent can be introduced to the 3,4-dihydro naphthyridinone analogs. The present invention has been accomplished based on these findings.

**INDUSTRIAL APPLICABILITY**

The novel synthetic method of 3,4-dihydro naphthyridinone analogs is provided by this invention.

By using naphthyridinone analogs with a electrowithdrawing group in 3-position as the precursor of corresponding 3,4-dihydro naphthyridinone, the 3,4-dihydro naphthyridinone can be prepared easily under mild condition and various substituent can be introduced.

3,4-dihydro naphthyridinone analogs and salts thereof would be useful template for biologically active compounds, e.g. pyridine derivatives which inhibit IκB kinase β (IKK-β or IKK-beta) activity, thus inhibit nuclear factor kappa B (NF-κB) activity, and can be used for the prophylaxis and treatment of diseases associated with NF-κB activity, in particular for the treatment of inflammatory diseases.
