NOVEL AMIDOHETEROARYL AROYL HYDRAZIDE ETHYNES

RELATED APPLICATIONS

- 5 This application claims the benefit of Indian Patent Application no. 1953/MUM/2015 filed on May 18, 2015 which is hereby incorporated by reference.

FIELD OF INVENTION

- 10 The present invention relates to novel amidoheteroaryl aroyl hydrazide ethynes as tyrosine kinase inhibitors, process of preparation thereof, and use of the compounds for preparation of pharmaceutical compositions in the therapeutic treatment of disorders related to tyrosine kinases in humans.

15 BACKGROUND OF THE INVENTION

- Protein tyrosine kinases are currently recognized as important molecular targets for drug development in the treatment of several disorders, particularly in the treatment of proliferative disorders. Dysregulation of tyrosine kinase activity has emerged as a major
20 mechanism by which cancer cells evade normal physiological constraints on growth, proliferation and survival. One of the key focus areas in anti-TK drug discovery is the design and development of small molecules that can directly inhibit catalytic activity of the kinase by interfering with the binding of ATP or substrates. An important advantage of TK-directed therapy is the possibility to perform pharmacodynamic studies that correlate inhibition of the
25 targeted TK in cancer cells with clinical responses to the drug.

Classical tyrosine kinase inhibitors, which are predominantly the Bcr-Abl kinase inhibitors that are currently in clinical use, are described in the following patent literature:

- **United States Patent No. 5,521,184** (the '184 patent): Exemplifies 4-[(Methyl-1-piperaziny)methyl]-*N*-[4-methyl-3-[[4-(3-pyridinyl)-2-pyrimidinyl]amino]-phenyl]benzamide methanesulfonate (Imatinib mesylate, Gleevec[®])
- 30

- **United States Patent No. 7,169,791** (the '791 patent): Exemplifies 4-Methyl-*N*-[3-(4-methyl-imidazol-1-yl)-5-trifluoromethyl-phenyl]-3-(4-pyridin-3-yl-pyrimidin-2-ylamino)-benzamide (Nilotinib, Tassigna[®])
- **United States Patent No 6,596,746** (the '746 patent): Exemplifies *N*-(2-chloro-6-methylphenyl)-2-(6-(4-(2-hydroxyethyl)piperazin-1-yl)-2-methylpyrimidin-4-ylamino)thiazole-5-carboxamide (Dasatinib, Sprycel[®])

While the second generation TK inhibitors in clinic viz. nilotinib and dasatinib have provided additional treatment option to patients who have developed resistance to imatinib, there are certain shortcomings with regard to their side effects. Particularly in the case of dasatinib, the increased potency may be associated with untoward off-target toxicities, which probably relate to their inhibitory activity against a broader range of protein kinases such as Kit, PDGFR and ephrin receptor (EphA2) tyrosine kinases which are directly implicated in haematopoiesis, control of tissue interstitial-fluid pressure and angiogenesis. These effects may provide the physiological explanation for some of the toxicities associated with dasatinib therapy such as myelosuppression and pleural effusion. Besides, treatment with highly potent Abl kinase inhibition has potential for the development of cardiotoxicity in patients with CML.

Studies have shown that patients taking imatinib develop resistance to the drug during the course of therapy. Recent research has provided a better understanding of the mechanism of resistance which led to the development of second generation TK inhibitors. Although the second generation TK inhibitors in clinic provide treatment alternatives for patients who develop resistance to imatinib therapy, the prognosis for the patients having T315I mutation is not good since none of these currently marketed therapies are effective. There is thus an unmet medical need with regard to treatment of patients having the T315I mutation. Omacetaxine (homoharringtonine) is approved by the FDA for CML patients with T315I. However, it is an intravenous drug with a non-specific mechanism of action. Ariad Compound Ponatinib (AP24534, US 8114874) is also approved by US FDA but has a boxed warning for risk-threatening blood clots and severe narrowing of blood vessels.. Other drug candidates in clinical phase include the Deciphera compound DCC-2036 (PCT Publication No. WO 2008/046003). The present applicant previously reported novel diarylacetylene hydrazides as tyrosine kinase inhibitors published as WO 2012/098416 A1.

The current invention describes novel amidoheteroaryl aroyl hydrazide ethynes containing compounds which are not only potent inhibitors of Abl tyrosine kinase but also on its mutant versions.

In one embodiment of the process for preparing compounds of the present invention, the compounds of Formula I can be prepared as per following general scheme 1

The process involves condensation of the hydrazide of Formula III with the diarylacetylenic compound of Formula II, wherein R_1 , R_2 & R_3 are as previously defined for compound of Formula I, and L is a leaving group. Preferably the condensation reaction is carried out in the presence of an inert base and/or a suitable catalyst in an inert solvent.

- 5 The compound of the Formula II in activated form (i.e. $-C(O)-L$) is especially an acid halide, an ester an anhydride or a cyclic imide.

The esters of Formula II can be selected from, for example vinyl esters obtainable, for example, by transesterification of a corresponding ester with vinyl acetate, carbamoylvinyl
10 esters or by treatment with a C_{2-5} alkoxyacetylene. Other active esters are of the amidino type, such as N,N' -disubstituted amidino esters (obtainable, for example, by treatment of the corresponding acid with a suitable N,N' -disubstituted carbodiimide, for example, N,N' -dicyclohexylcarbodiimide), or N,N' -disubstituted amidino esters (obtainable, for example, treatment of the corresponding acid with N,N -disubstituted cyanamide), suitable aryl esters,
15 especially phenyl esters suitably substituted by electron-attracting substituents (obtainable, for example, by treatment of the corresponding acid with a suitably substituted phenol, for example, 4-nitrophenol, 2,4,5-trichlorophenol, or 2,3,4,5,6-pentachloro-phenol in the presence of a condensation agent, such as N,N' -dicyclohexylcarbodiimide). Other suitable active esters include cyanomethyl esters (obtainable, for example, by treatment of the
20 corresponding acid with chloroacetonitrile in the presence of a base), thio esters, especially unsubstituted or substituted, for example nitro-substituted, phenylthio esters (obtainable, for example, by treatment of the corresponding acid with unsubstituted or substituted, for example nitro-substituted, thiophenols, *inter alia* by the anhydride or carbodiimide method), amino or amido esters (obtainable, for example, by treatment of the corresponding acid with
25 an N -hydroxyamino or N -hydroxyamido compound, for example, N -hydroxysuccinimide, N -hydroxypiperidine, N -hydroxyphthalimide or 1-hydroxybenzotriazole, for example by the anhydride or carbodiimide method).

The anhydrides of the compound of Formula II may be formed with carbonic acid
30 semiderivatives, such as corresponding esters, for example carbonic acid alkyl semiesters (obtainable, for example, by treatment of the corresponding acid with haloformic, such as chloroformic, acid); alkyl esters or with a 1-alkoxycarbonyl-2-alkoxy-1,2-dihydroquinoline, for example 1-alkoxycarbonyl-2-ethoxy-1,2-dihydroquinoline; anhydrides with dihalogenated, especially dichlorinated phosphoric acid (obtainable, for example, by

treatment of the corresponding acid with phosphorus oxychloride), or anhydrides with organic acids, such as mixed anhydrides with organic carboxylic acids (obtainable, for example, by treatment of the corresponding acid with an unsubstituted or substituted acyl halide, for example, pivaloyl chloride or trifluoroacetyl chloride). Anhydrides may also be
5 with organic sulfonic acids (obtainable, for example, by treatment of a salt, such as an alkali metal salt, of the corresponding acid, with a suitable organic sulfonic acid halide, such as alkane- or aryl-, for example methane- or *p*-toluenesulfonyl chloride), or with organic phosphonic acids (obtainable, for example, by treatment of the corresponding acid with a suitable organic phosphonic anhydride or phosphonic cyanide).

10

Suitable cyclic amides are especially amides with five-membered diazacycles of aromatic character, such as with imidazoles (obtainable, for example, by treatment of the corresponding acid with *N,N'*-carbonyldiimidazole; imidazolidine method), or pyrazoles, for example 3,5-dimethylpyrazole.

15

Formula II in activated form is preferably generated *in situ* from the corresponding acid (i.e. when L = OH). For example, *N,N'*-disubstituted amidino esters can be formed *in situ* by reacting a mixture of the acid of Formula II (i.e. when L = OH) and the compound of Formula III in the presence of a suitable condensating agent for example *N,N'*-
20 dicyclohexylcarbodiimide. Reactive mixed anhydrides of the acid may also be generated with an organic phosphonic acid *in situ* by reaction with propylphosphonic anhydride or diethylcyanophosphonate in the presence of suitable base for e.g. triethylamine or 4-(*N,N*-dimethylamino)pyridine. The reaction may be carried out in a manner known *per se*, the reaction conditions being dependent especially on how the acid group of Formula II has been
25 activated, usually in the presence of a suitable solvent or diluent or of a mixture thereof and, if necessary, in the presence of a condensation agent. Customary condensation agents are, for example, carbodiimides such as *N,N'*-diethyl-, *N,N'*-diisopropyl, *N,N'*-dicyclohexyl- or *N*-ethyl-*N'*-(3-diethylaminopropyl)-carbodiimide; suitable carbonyl compounds, for example carbonyldiimidazole, or 1,2-oxazolium compounds, for example 2-ethyl-5-phenyl-1,2-
30 oxazolium 3'-sulfonate and 2-*tert*-butyl-5-methyl-isoxazolium perchlorate, or a suitable acylamino compound, for example, 2-ethoxy-1-ethoxycarbonyl-1,2-dihydroquinoline. The bases normally used for aiding the condensation are either inorganic bases such as sodium or potassium carbonate, or organic bases, such as pyridine, triethylamine, *N,N*-diisopropylethylamine or 4-(dimethylamino)pyridine.

Alternatively, the preparation of compounds of Formula I in the present invention can be performed by reacting compounds of Formula IV with the compounds of Formula V, Scheme 2, using similar condensation methods as described above (for Scheme 1); wherein R₁, R₂, R₃ and L are as previously defined.

Scheme 2

Compounds of Formula IV can be prepared from compounds of Formula II and hydrazine of Formula IIIa, Scheme 3, utilizing the coupling procedures as described for Scheme 1, *vide supra*.

Scheme 3

In a similar manner the compounds of Formula III can be prepared by the reaction of compounds of hydrazine hydrate and Formula V, Scheme 4.

Scheme 4

The compounds of Formula II can be prepared by methods known in the literature. Suitable approaches for the preparation of the compounds for Formula II are provided in Scheme 5.

**Scheme 5**

As illustrated in Scheme 5, the ethynyl moiety of pyridine of Formula VIII is coupled with phenyl ring of Formula IX, or the ethynyl moiety of phenyl ring of Formula VII is coupled with pyridine ring of Formula VI; wherein 'W' represents a leaving group like OTf, Cl, Br or I, preferably Br or I; L represent OH or O-alkyl. The coupling reaction can be performed using well known prior art methods, such as metal catalyzed coupling reactions, for example a palladium catalyzed Sonogashira coupling reaction (refer Malleron, J-L., Fiaud, J-C., Legros, J-Y. Handbook of Palladium Catalyzed Organic Reactions, San Diego: Academic Press, 1997). Alternatively, the compound of Formula II is prepared from the vicinal dihalo compound of Formula IIa (where Z represents halo) by tandem dehydrohalogenations.

A strategy similar to the above can be utilized for the synthesis of compounds of Formula I as shown in Scheme 6, i.e. coupling the ethynyl moiety of pyridine ring of Formula VIII to the phenyl ring in Formula XI, or the ethynyl moiety of phenyl ring of Formula X to the pyridine ring in Formula VI; wherein W, R₁, R₂ and R₃ are as previously defined.

**Scheme 6**

The compounds of Formula X & Formula XI can be conveniently prepared by acylation of the hydrazide of Formula III with compounds of Formula VII & Formula IX, respectively, as shown in Scheme 7; wherein L, W, X, R₁, R₂ and R₃ are as previously defined.

Scheme 7

The compounds of Formula I can also be prepared by acylation of the amine of Formula XII as shown in Scheme 8.

5

Scheme 8

Where the above starting compounds VI, VII, VIII and IX contain functional groups that may interfere with the coupling reaction, are protected using suitable protecting groups that can be conveniently removed later.

Characterization data for some of the representative compounds of Formula I are provided in the Table-1.

PHARMACOLOGICAL ACTIVITY

In-vitro Cell Proliferation Assay

K562/U937 cells (2x10⁴ per well) were incubated with the test compounds/vehicle in a total volume of 200μL of media at 37°C with 5% CO₂. On day 4, 20μL MTT 5mg/ml was added and the cells were incubated for 4-5hours followed by addition of 100μL of 10% SDS prepared in 0.06N HCl. The cells were incubated overnight at 37°C with 5% CO₂. On Day 5 the optical density was measured at 570nm with 630nm as reference wavelength. The

optical density in the vehicle treated wells was compared with that of the test compound treated wells.

Results for the representative compounds of Formula I are provided in Table-2.

Mutated Abl (T315I) (human) Kinase

In a final reaction volume of 25 μ L, mutated Abl (T315I) (human) (5-10 mU) is incubated with 8 mM MOPS pH7.0, 0.2 mM EDTA, 50 μ M EAIYAAPFAKKK, 10mM Mg(OAc)₂ and [γ -³³P-ATP] [specific activity approx. 500 cpm/pmol, concentration as required). The reaction is initiated by the addition of the MgATP mix. After incubation for 40 minutes at room temperature, the reaction is stopped by the addition of 5 μ L of a 3% phosphoric acid solution. 10 μ L of the reaction is then spotted onto a P30 filtermat and washed three times for 5 minutes in 75 mM phosphoric acid and once in methanol prior to drying and scintillation counting.

15 The compounds of Formula I showed good inhibitory action on the mutated Abl T315I cell line. Activity data on the mutated Abl T315I cell line for some representative compound is provided in Table-3.
