Acrylamide compounds for combating invertebrate pests

Description

The present invention relates to acrylamide compounds which are useful for combating or controlling invertebrate pests, in particular arthropod pests and nematodes, and to a method for producing them. The invention also relates to a method for controlling invertebrate pests by using these compounds and to plant propagation material and to an agricultural and a veterinary composition comprising said compounds.

Invertebrate pests and in particular arthropods and nematodes destroy growing and harvested crops and attack wooden dwelling and commercial structures, causing large economic loss to the food supply and to property. While a large number of pesticidal agents are known, due to the ability of target pests to develop resistance to said agents, there is an ongoing need for new agents for combating invertebrate pests, in particular insects, arachnids and nematodes.

Related insecticidal acrylamide compounds are described in WO 2011/054436. However, this document does not describe compounds having the characteristic substituents as claimed in the present invention.

It is an object of the present invention to provide compounds that have a good pesticidal activity, in particular insecticidal activity, and show a broad activity spectrum against a large number of different invertebrate pests, especially against difficult to control arthropod pests and/or nematodes.

It has been found that these objectives can be achieved by acrylamide compounds of the formula I below, by their stereoisomers and by their salts, in particular their agriculturally or veterinarily acceptable salts.

Therefore, in a first aspect, the invention relates to acrylamide compounds of formula I

The present invention includes both amorphous and crystalline compounds of the formula I, mixtures of different crystalline states of the respective compound I, as well as amorphous or crystalline salts thereof.

Salts of the compounds of the formula I are preferably agriculturally and veterinarily acceptable salts. They can be formed in a customary method, e.g. by reacting the compound with an acid of the anion in question if the compound of formula I has a basic functionality or by reacting an acidic compound of formula I with a suitable base.
Suitable agriculturally acceptable salts are especially the salts of those cations or the acid addition salts of those acids whose cations and anions, respectively, do not have any adverse effect on the action of the compounds according to the present invention. Suitable cations are in particular the ions of the alkali metals, preferably lithium, sodium and potassium, of the alkaline earth metals, preferably calcium, magnesium and barium, and of the transition metals, preferably manganese, copper, zinc and iron, and also ammonium (NH₄⁺) and substituted ammonium in which one to four of the hydrogen atoms are replaced by CI-C₄-alkyl, CI-C₄-hydroxyalkyl, CI-C₄-alkoxy, CI-C₄-alkoxy-Cl-C₄-alkyl, hydroxy -CI-C₄-alkoxy -CI-C₄-alkyl, phenyl or benzyl. The term "plant propagation material" is to be understood to denote all the generative parts of the plant such as seeds and vegetative plant material such as cuttings and tubers (e.g. potatoes), which can be used for the multiplication of the plant. This includes seeds, roots, fruits, tubers, bulbs, rhizomes, shoots, sprouts and other parts of plants, including seedlings and young plants, which are to be transplanted after germination or after emergence from soil. Said young plants may also be protected before transplantation by a total or partial treatment by immersion or pouring.

The term "plants" comprises any types of plants including "non-cultivated plants" and in particular "cultivated plants".

The term "non-cultivated plants" refers to any wild type species or related species or related genera of a cultivated plant.

The term "cultivated plants" is to be understood as including plants which have been modified by breeding, mutagenesis or genetic engineering including but not limiting to agricultural biotech products on the market or in development (cf. http://www.bio.org/speeches/pubs/er/agri_products.asp). Genetically modified plants are plants, which genetic material has been so modified by the use of recombinant DNA techniques that under natural circumstances cannot readily be obtained by cross breeding, mutations or natural recombination. Typically, one or more genes have been integrated into the genetic material of a genetically modified plant in order to improve certain properties of the plant. Such genetic modifications also include but are not limited to targeted post-translational modification of protein(s), oligo- or polypeptides e.g. by glycosylation or polymer additions such as prenylated, acetylated or farnesylated moieties or PEG moieties.

Plants that have been modified by breeding, mutagenesis or genetic engineering, e.g. have been rendered tolerant to applications of specific classes of herbicides, such as auxin herbicides such as dicamba or 2,4-D; bleacher herbicides such as hydroxylphenylpyruvate dioxygenase (HPPD) inhibitors or phytoene desaturase (PDS) inhibitors; acetolactate synthase (ALS) inhibitors such as sulfonyl ureas or imidazolinones; enolpyruvylshikimate-3-phosphate synthase (EPSPS) inhibitors, such as glyphosate; glutamine synthetase (GS) inhibitors such as glufosinate; protoporphyrinogen-IX oxidase inhibitors; lipid biosynthesis inhibitors such as acetyl CoA carboxylase (ACCase) inhibitors; or oxynil (i.e. bromoxynil or ioxynil) herbicides as a result of conventional methods of breeding or genetic engineering. Furthermore, plants have been made re-
sistant to multiple classes of herbicides through multiple genetic modifications, such as resistance to both glyphosate and glufosinate or to both glyphosate and a herbicide from another class such as ALS inhibitors, HPPD inhibitors, auxin herbicides, or AC-Case inhibitors. These herbicide resistance technologies are e.g. described in Pest Manage. Sci. 61, 2005, 246; 61, 2005, 258; 61, 2005, 277; 61, 2005, 269; 61, 2005, 286; 64, 2008, 326; 64, 2008, 332; Weed Sci. 57, 2009, 108; Austral. J. Agricult. Res. 58, 2007, 708; Science 316, 2007, 1185; and references quoted therein. Several cultivated plants have been rendered tolerant to herbicides by conventional methods of breeding (mutagenesis), e.g. Clearfield® summer rape (Canola, BASF SE, Germany) being tolerant to imidazolinones, e.g. imazamox, or ExpressSun® sunflowers (DuPont, USA) being tolerant to sulfonyl ureas, e.g. tribenuron. Genetic engineering methods have been used to render cultivated plants such as soybean, cotton, corn, beets and rape, tolerant to herbicides such as glyphosate and glufosinate, some of which are commercially available under the trade names RoundupReady® (glyphosate-tolerant, Monsanto, U.S.A.), Cultivance® (imidazolinone tolerant, BASF SE, Germany) and LibertyLink® (glufosinate-tolerant, Bayer CropScience, Germany).

Furthermore, plants are also covered that are by the use of recombinant DNA techniques capable to synthesize one or more insecticidal proteins, especially those known from the bacterial genus Bacillus, particularly from Bacillus thuringiensis, such as δ-endotoxins, e.g. CryIA(b), CryIA(c), CryIF, CryIF(a2), CrylA(b), CrylIA, CrylIB(bl) or Cry9c; vegetative insecticidal proteins (VIP), e.g. VIP1, VIP2, VIP3 or VIP3A; insecticidal proteins of bacteria colonizing nematodes, e.g. Photobacterium spp. or Xenorhabdus spp.; toxins produced by animals, such as scorpion toxins, arachnid toxins, wasp toxins, or other insect-specific neurotoxins; toxins produced by fungi, such Streptomy-
cetes toxins, plant lectins, such as pea or barley lectins; agglutinins; proteinase inhibitors, such as trypsin inhibitors, serine protease inhibitors, patatin, cystatin or papain inhibitors; ribosome-inactivating proteins (RIP), such as ricin, maize-RIP, abrin, luffin, saporin or bryodin; steroid metabolism enzymes, such as 3-hydroxysteroid oxidase, ecdysteroid-IDP-glycosyl-transferase, cholesterol oxidases, ecdysone inhibitors or HMG-CoA-reductase; ion channel blockers, such as blockers of sodium or calcium channels; juvenile hormone esterase; diuretic hormone receptors (helicokinin receptors); stilben synthase, bibenzyl synthase, chitinases or glucanases. In the context of the present invention these insecticidal proteins or toxins are to be understood expressly also as pre-toxins, hybrid proteins, truncated or otherwise modified proteins. Hybrid proteins are characterized by a new combination of protein domains, (see, e.g. WO 02/015701). Further examples of such toxins or genetically modified plants capable of synthesizing such toxins are disclosed, e.g., in EP-A 374 753, WO 93/007278, WO 95/34656, EP-A 427 529, EP-A 451 878, WO 03/18810 und WO 03/52073. The
methods for producing such genetically modified plants are generally known to the person skilled in the art and are described, e.g. in the publications mentioned above. These insecticidal proteins contained in the genetically modified plants impart to the plants producing these proteins tolerance to harmful pests from all taxonomic groups of 5  
arthropods, especially to beetles (Coleoptera), two-winged insects (Diptera), and moths (Lepidoptera) and to nematodes (Nematoda). Genetically modified plants capable to synthesize one or more insecticidal proteins are, e.g., described in the publications mentioned above, and some of which are commercially available such as YieldGard® (corn cultivars producing the Cry1Ab toxin), YieldGard® Plus (corn cultivars producing Cry1Ab and Cry3Bb1 toxins), Starlink® (corn cultivars producing the Cry9c toxin), Hercules® RW (corn cultivars producing Cry34Ab1, Cry35Ab1 and the enzyme Phosphinothricin-N-Acetyltransferase [PAT]); NuCOTN® 33B (cotton cultivars producing the Cry1Ac toxin), Bollgard® I (cotton cultivars producing the Cry1Ac toxin), Bollgard® II (cotton cultivars producing Cry1Ac and Cry2Ab2 toxins); VIPCOT® (cotton cultivars producing a VIP-toxin); NewLeaf® (potato cultivars producing the Cry3A toxin); Bt-Xtra®, NatureGard®, KnockOut®, BiteGard®, Protecta®, Bt1 1 (e.g. Agrisure® CB) and Bt176 from Syngenta Seeds SAS, France, (corn cultivars producing the CryAb toxin and PAT enzyme), MIR604 from Syngenta Seeds SAS, France (corn cultivars producing a modified version of the Cry3A toxin, c.f. Furthermore, plants are also covered that are by the use of recombinant DNA techniques capable to synthesize one or more proteins to increase the resistance or tolerance of those plants to bacterial, viral or fungal pathogens. Examples of such proteins are the so-called "pathogenesis-related proteins" (PR proteins, see, e.g. EP-A 392 225), plant disease resistance genes (e.g. potato cultivars, which express resistance genes acting against Phytophthora infestans derived from the mexican wild potato Solanum bulbocastanum) or T4-lysozyme (e.g. potato cultivars capable of synthesizing these proteins with increased resistance against bacteria such as Erwinia amylovora). The methods for producing such genetically modified plants are generally known to the person skilled in the art and are described, e.g. in the publications mentioned above.

Furthermore, plants are also covered that are by the use of recombinant DNA techniques capable to synthesize one or more proteins to increase the productivity (e.g. bio mass production, grain yield, starch content, oil content or protein content), toler-
ance to drought, salinity or other growth-limiting environmental factors or tolerance to pests and fungal, bacterial or viral pathogens of those plants.

Furthermore, plants are also covered that contain by the use of recombinant DNA techniques a modified amount of substances of content or new substances of content, specifically to improve human or animal nutrition, e.g. oil crops that produce health-promoting long-chain omega-3 fatty acids or unsaturated omega-9 fatty acids (e.g. Nexera® rape, DOW Agro Sciences, Canada).

Furthermore, plants are also covered that contain by the use of recombinant DNA techniques a modified amount of substances of content or new substances of content, specifically to improve raw material production, e.g. potatoes that produce increased amounts of amylopectin (e.g. Amflora® potato, BASF SE, Germany).

In the present invention, the "heterobicyclic rings" contain two rings which have at least one ring atom in common. At least one of the two rings contains a heteroatom or heteroatom group selected from N, O, S, NO, SO and SO2 as ring member. The term comprises condensed (fused) ring systems, in which the two rings have two neighboring ring atoms in common, as well as spiro systems, in which the rings have only one ring atom in common, and bridged systems with at least three ring atoms in common.

In the above structures # denotes the attachment point to the remainder of the molecule. The attachment point is not restricted to the ring on which is shown, but can be on either of the fused rings, and may be on a carbon or on a nitrogen ring atom. Among the above compounds, preference is given to compounds la.1 and la.5 to la.33. More preference is given to compounds la.1 and la.5 and especially to la.5.

The compounds of the formula (I) can be prepared by novel methods as described below or and in the synthesis descriptions of the working examples, or by standard methods of organic chemistry, e.g. by the methods described hereinafter or in the synthesis descriptions of the working examples. The substituents, variables and indices are as defined above for formula (I), if not otherwise specified.

The compounds (I) can be prepared by coupling a compound 2 with a heterocyclic compound 3, wherein A is A or a precursor of A and LG is a C-bound halide ion, preferably a chloride, bromide or iodide ion, for instance under the conditions of a Heck reaction via Pd-catalyzed cross coupling, generally in the presence of a base, as shown in scheme 1. A typical catalyst is tetrakis(triphenylphosphine)palladium(0). Sol-
vents such as tetrahydrofuran, acetonitrile, diethyl ether and dioxane are suitable. Other methods for introduction of the heteroaromatic group Q-A are the Suzuki, Stille and Kumada coupling procedures; see for example Tetrahedron, 2004, 60, 8991-9016. If A is a precursor of A, this can be then converted into the final group A.

Scheme 1

The compound 2 wherein Z is O can for example be prepared by an amidation reaction of the acrylic acid (derivative) 5 with the benzylic amine 4 as shown in scheme 2. LG is OH, Cl, Br, an anhydride residue (-O-C(O)-R) or an active ester residue (-OR'). -O-C(O)-R is a group which can be displaced easily by the amino group of 4. Suitable acid derivatives with which the carboxylic acid 5 (LG = OH) can form suitable mixed anhydrides are, for example, the esters of chloroformic acid, for example isopropyl chloroformate and isobutyl chloroformate, or of chloroacetic acid. If 5 with LG = OR' forms a so-called active ester, this is obtained in a formal sense by the reaction of the acid 5 (LG = OH) with an active ester-forming alcohol, such as p-nitrophenol, N-hydroxybenzotriazole (HOBT), N-hydroxysuccinimide or OPfp (pentafluorophenol). In case that LG is OH, amidation is preferably carried out by first activating the carboxylic acid with oxalylchloride [(COCl)2] or thionylchloride (SOCl2) to the respective acid chlorides, followed by reaction with amine 4. Alternatively, amidation is carried out in the presence of a coupling reagent. Suitable coupling reagents (activators) are well known and are for instance selected from carbodiimides, such as DCC (dicyclohexylcarbodiimide) and DIPC (diisopropylcarbodiimide), benzotriazol derivatives, such as HATU (O-(7-azabenzotriazol-1-yl)-N,N,N',N'-tetramethyluronium hexafluorophosphate), HBTU ((0-benzotriazol-1-yl)-N,N,N',N'-tetramethyluronium hexafluorophosphate) and HCTU (1H-benzotriazolum-1-[[bis(dimethylamino)methylene]-5-chloro tetrafluoroborate) and phosphonium-derived activators, such as BOP ((benzotriazol-1-ylxy)-tris(dimethylamino)phosphonium hexafluorophosphate), Py-BOP ((benzotriazol-1-ylxy)-tripyrrrolidinophosphonium hexafluorophosphate) and Py-BrOP (bromotripyrrrolidinophosphonium hexafluorophosphate). Generally, the activator is used in excess. The benzotriazol and phosphonium coupling reagents are generally used in a basic medium.
The benzylic amine 4a, wherein L is H, can be prepared by reaction the aldehyde or ketone 7 with hydroxylamine to the oxime 6, as shown in scheme 3. Subsequent reduction and, in case that R3 is not hydrogen, reaction with a group X-R3, wherein X is a leaving group, such as a halogen atom, and R3 is not H, yields compound 4a.

Scheme 3

Alternatively, the benzylic amine 4 can be prepared by reaction the aldehyde or ketone 7 with an amine NH2R3 to the imine 8, as shown in scheme 4. Standard reduction (hydrogenation) conditions give a compound 4a, wherein L1 is H. For obtaining compounds 4 wherein L1 is a C-bound radical, such as alkyl, cycloalkyl, alkenyl, alkynyl, phenyl or a C-bound heterocycl, the imine 8 is reacted with a Grignard reagent L1-MgX, wherein X is Cl or Br, or with a lithium organic compound L1-Li.

Scheme 4

The benzylic amine 4b, wherein L1 is OH, can be prepared as shown in scheme 5 by reacting the imine 8 with a carbonic dichloride COCl2 in the presence of a base, such as Hunig’s base (N,N-diisopropylethylamine) and subsequent quenching with an aqueous solution, as described in WO 2004/0131 10. Reaction of 4b with SOCl2 in the presence of a base, such as triethylamine, yields an amine 4c wherein L1 is Cl.

Scheme 5
The benzylic amine 4, wherein \( L \) is alkoxy, can be prepared as shown in scheme 6 in analogy to the reactions described in J. Org. Chem. 1988, 53(4), 3358-3361, Zhurnal Organicheskoi Kimii 1981, 17(7), 1420-1429, 1263-1271, J. Org. Chem. USSR (English Translation) 1992, 28(19.1), 1635-1643 or Zhurnal Organicheskoi Kimii 1992, 28(10), 2042-2053 by reacting the acyl chloride 9 (\( R = \) alkyl) with sodium azide to 10. Curtius rearrangement yields the isocyanate 11. This is reacted with an alcohol \( R'\text{OH} \) (\( R' = \text{C}1-\text{C}4-\text{alkyl or benzyl} \)) to the carbamate 12, which is then hydrolysed to 4. Alternatively, isocyanate 11 can be reacted with water and thereby directly converted into the amine 4.

Amines 4, wherein \( L \) is \( \text{CN} \), can be prepared in analogy to the reaction described in Tetrahedron 1993, 49(8), 1541-1546 by reacting the amide 13 with phosphorus pentachloride to the nitrile 14. Grignard reaction with 15 yields the imine 16, which is then reacted with HCN to 4, as shown in scheme 7.
Amines 4', wherein L is NH2, can be prepared in analogy to the reaction described in Chemistry of heterocyclic compounds 2004, 40(3), 370-376 by reacting the imine 17 with and amine NH2R3 to 18, as shown in scheme 8. Hydrolysis of the carbamate group yields 4'.

Compounds 49, wherein L1 and R2 form a ring, can be prepared in analogy to the synthesis described in EP-A-2042480 by reacting 19 with a Grignard or lithium organyl M-R1, wherein M is Li or MgCl, to 20. Reaction with sodium azide in the presence of an acid, such as trifluoroacetic acid, yields 21, which is then reduced to 49, as shown in scheme 9.

Compounds of formula I wherein Z is O can alternatively be prepared in an amidation reaction of the acrylic acid (derivative) 22 with the benzylic amine 4, as shown in scheme 10. LG is like above OH, Cl, Br, an anhydride residue (-O-C(O)-R) or an active ester residue (-OR'). Suitable amidation conditions correspond to those described above for scheme 2.

The acrylic acid (derivative) 22 can be prepared by reacting the acrylic acid (derivative) 5 with a heterocyclic compound 3, as shown in scheme 11, under the conditions of a Heck coupling reaction, as described above for scheme 1.
Compounds wherein \( Z \) is \( S \) can be prepared by reacting a compound \( I, I' \) or \( 2 \) with Lawesson's reagent or \( \text{P}2\text{S}5 \).

Compounds wherein \( E \) and \( R^4 \) or \( E \) and \( R'^4 \) or two radicals \( R^4 \) and \( R'^4 \) or \( R^4 \) and \( R^5 \) or \( R'^4 \) and \( R^5 \), together with the atoms to which they are bound, form a ring, can be prepared by using respective starting material. This is either commercially available or can be prepared in analogy to known methods, such as described, for example, in WO 02/36583, WO 02/59099, WO 2005/034880, WO 2007/146758 or WO 201 1/012538.

A' as a precursor of A is typically a halogen atom, CN, carboxy, tert-butoxycarbonyl, an acetale group, a protected aldehyde group or \( -\text{OS}02\text{-R}^\text{z}1 \), where \( R^\text{z}1 \) is \( \text{Ci-C}4\text{-alkyl}, \text{Ci-C}4\text{-haloalkyl} \) or phenyl which may be substituted by 1, 2 or 3 radicals selected from \( \text{Ci-C}4\text{-alkyl}, \text{Ci-C}4\text{-haloalkyl} \) \( \text{Ci-C}4\text{-alkoxy} \) or \( \text{Ci-C}4\text{-haloalkoxy} \). A' as a precursor of A is preferably a halogen atom or \( -\text{OS}02\text{-R}^\text{z}1 \), where \( R^\text{z}1 \) is as defined above, and is more preferably a halogen atom or O triflate.

Compounds \( I' \), in which A is a precursor of A, can be converted as shown below into the different groups A1 to A4.

Compounds \( I' \), in which A is Cl, Br, I or \( -\text{OS}02\text{-R}^\text{z}1 \), where \( R^\text{z}1 \) is as defined above, can be converted to compounds I wherein A is a group A1, wherein A1 is an imino group \(-\text{C}(=\text{O})\text{R}^\text{8} \), by reaction with carbon monoxide and a hydride source, such as triethylsilane, in the presence of a transition metal complex catalyst, preferably a palladium catalyst, to a carbonyl compound II. This reaction converts the starting group A' into a carbonyl group \(-\text{C}(=\text{O})\text{H} \).

The aldehyde II can also be obtained by reducing the methyl ester V (see below; \( R = \) methyl) with diisobutylaluminium hydride (DIBAL-H) either directly to the aldehyde II or via the corresponding alcohol, which is then oxidized to the aldehyde.
For obtaining compounds in which R⁸ in the imino group is H, such carbonyl compounds II are then reacted with an amine (derivative) NH₂R⁶. Alternatively, the compound I', in which A' is Cl, Br, I or -OS0₂-R², where R² is as defined above, can be reacted in a one pot reaction with carbon monoxide and hydrogen in the presence of a transition metal complex catalyst and the amine NH₂R⁶.

For obtaining compounds in which R⁸ in the imino group is not H, the carbonyl compounds are reacted with a Grignard reagent R⁶-MgHal, where Hal is Cl, Br or I, or an organolithium compound R⁸-Li to obtain an alcohol of formula III

![Chemical structure](image)

which is then oxidized to a carbonyl compound of the formula IV

![Chemical structure](image)

This is then reacted with an amine NH₂R⁶ to the respective imine compound.

Compounds I wherein A is a group A¹, wherein A¹ is -S(0)ₙR⁹ or -N(R⁹)R⁶, can for example be prepared by reacting a compound I' wherein A' is Cl, Br or I in a Ullmann-type reaction with an amine NH₆R⁶ or a thiol SHR⁹ in the presence of a Cu(I) catalyst. To obtain a compound wherein A¹ is -S(0)ₙR⁹ wherein n is not 0 the thiol can then be oxidized, e.g. with hydrogen peroxide. Amine groups can further be introduced in a Buchwald-Hartwig reaction by reacting a compound I' wherein A' is Cl, Br or I with an amine NH₆R⁶ in the presence of a palladium catalyst, such as PdCb(dppe) in the presence of a base, such as cesium carbonate.

Thioethers (A¹ = -SR⁹) can further be introduced by reacting a compound I' wherein A is F in an SNAr reaction (nucleophilic aromatic substitution reaction) with a thiol HSR⁹ in
the presence of a base, such as potassium carbonate (K2CO3), or with a thiolate (e.g. NaSR9).

Compounds I wherein A is a group A2, wherein W is O and Y is OR9 can be prepared by reacting a compound I' wherein A is Cl, Br, I or Otriflate with carbon monoxide in the presence of a palladium catalyst and an alcohol R9OH. Compounds I wherein A is a group A2, wherein W is O and Y is NR6R6 can be prepared by reacting a compound I' wherein A' is Cl, Br, I or Otriflate with carbon monoxide in the presence of a palladium catalyst and an alcohol ROH, wherein R is Cl-C4-alkyl, to a compound of formula V.

Suitable palladium catalysts are for example those described in PCT/EP 201 1/060388.

This ester is then hydrolyzed to the respective carboxylic acid, which is the reacted under standard amidation conditions with an amine NHR6R6. Hydrolyzation can be carried out under standard conditions, e.g. under acidic conditions using for example hydrochloric acid, sulfuric acid or trifluoroacetic acid, or under basic conditions using for example an alkali metal hydroxide, such as LiOH, NaOH or KOH. Amidation is preferably carried out by activation of the carboxylic acids with oxalyl chloride [(COCI)2] or thionylchloride (SOCl2) to the respective acid chlorides, followed by reaction with an amine NHR6R6. Alternatively, amidation is carried out in the presence of a coupling reagent.

Suitable coupling reagent (activators) are well known and are for instance selected from carbodiimides, such as DCC (dicyclohexylcarbodiimide) and DIPC (diisopropylcarbodiimide), benzotriazol derivatives, such as HATU (0-(7-azabenzotriazol-1-yl)-N,N,N',N'-tetramethyluronium hexafluorophosphate), HBTU ((O-benzotriazol-1-yl)-N,N,N',N'-tetramethyluronium hexafluorophosphate) and HCTU (1H-benzotriazolium-1-[bis(dimethylamino)methylene]-5-chloro tetrafluoroborate) and phosphonium-derived activators, such as BOP ((benzotriazol-1-yloxy)-tris(dimethylamino)phosphonium hexafluorophosphate), Py-BOP ((benzotriazol-1-yl)-tricyprenylidinphosphonium hexafluorophosphate) and Py-BrOP (bromotripyrenylidinphosphonium hexafluorophosphate). Generally, the activator is used in excess. The benzotriazol and phosphonium coupling reagents are generally used in a basic medium.

Compounds I wherein A is a group A2, wherein W is S and Y is NR6R6 or OR9, can be prepared by reacting the corresponding oxo-compound (W is O) with Lawesson’s reagent (CAS 19172-47-5), see for example Jesberger et al., Synthesis, 2003, 1929-1958 and references therein. For compounds wherein Y is NR6R6, solvents such as HMPA or THF at an elevated temperature such as 60°C to 100°C can be used. Preferred re-
action conditions are THF at 65°C. For compounds wherein Y is OR\textsuperscript{9}, solvent free conditions or solvents such as toluene at temperatures such as 100°C to 200°C, preferably 140°C, are suitable reaction conditions.

Compounds I wherein A is a group A\textsuperscript{3}, wherein R\textsuperscript{7a} and R\textsuperscript{7b} are hydrogen, can be prepared by reducing a compound V or II for example with LAH (lithium aluminium hydride) or DIBAL-H (diisobutyl aluminium hydride) to a compound VI.

This is then reacted in an SN reaction with an amine NHR\textsuperscript{5}R\textsuperscript{6}. For this purpose, the OH group can first be converted into a better leaving group, e.g. into a sulfonate (for example mesylate, tosylate or a triflate group). If R\textsuperscript{6} is a group -C(0)R\textsuperscript{8}, it is alternatively possible to react compound VI with an amine \textsubscript{N}H\textsubscript{2}R\textsuperscript{5} and react then the resulting benzylic amine with an acid R\textsubscript{8}-COOH or a derivative thereof, such as its acid chloride R\textsubscript{8}-COCl, in an amidation reaction.

Compounds I wherein A is a group A\textsuperscript{3}, wherein R\textsuperscript{7a} is optionally substituted alkyl or optionally substituted cycloalkyl and R\textsuperscript{7b} is hydrogen, can be prepared by subjecting a ketone IV, in which R\textsuperscript{8} corresponds to R\textsuperscript{7a} which is optionally substituted Ci-C6 -alkyl or optionally substituted Cs-Cs -cycloalkyl, to a reductive amination to furnish compounds VII. Typical conditions for the reductive amination are: Reacting ketone IV with an amine H\textsubscript{2}N\textsuperscript{R}\textsuperscript{5} to yield the corresponding imine which is reduced to amine VII with a reducing agent reagent such as Na(CN)BH\textsubscript{3}. The reaction from ketone IV to amine VII may also be carried out as a one pot procedure.

For obtaining compounds in which R\textsuperscript{7a} and R\textsuperscript{7b} are optionally substituted alkyl, optionally substituted cycloalkyl, optionally substituted alkenyl or optionally substituted alkynyl, carbonyl compounds such as IV, in which R\textsuperscript{8} corresponds to R\textsuperscript{7a} which is optionally substituted Ci-C6 -alkyl, optionally substituted Cs-Cs -cycloalkyl, optionally substituted C2-C6 -alkenyl or optionally substituted C2-C6 -alkynyl, is reacted with a Grignard reagent R\textsuperscript{7b}-MgHal, where Hal is Cl, Br or I, or an organolithium compound R\textsuperscript{7b}-Li, where R\textsuperscript{7b} is optionally substituted Ci-C6 -alkyl, optionally substituted Cs-Cs -cycloalkyl, optionally...
substituted C2-C6-alkenyl or optionally substituted C2-C6-alkynyl, to obtain an alcohol of formula VIII.

![Chemical structure diagram](VIII)

Alcohol VIII can then be converted into amine IX via the corresponding azide, as described, for example, in Organic Letters, 2001, 3(20), 3145-3148.

![Chemical structure diagram](IX)

If desired, this can be converted into compounds I wherein R⁵ and R⁶ are different from hydrogen, for example by standard alkylation reactions.

Compounds I wherein A is a group A⁢³, wherein R⁷a is optionally substituted alkyl, alkenyl, alkynyl, cycloalkyl or CN and R⁷b is hydrogen, can be prepared by converting an aldehyde II into an imine X by reaction with an amine derivative NH₂R⁶, wherein R⁶ is tert-butyl sulfinyl, or, for preparing a compound with R⁷a = CN, tosylate.

![Chemical structure diagram](X)

This imine is then reacted with a compound H-R⁷a in an addition reaction under conditions as described for example in J. Am. Chem. Soc. 2009, 3850-3851 and the references cited therein, or, for introducing CN as a group R⁷a, Chemistry - A European Journal 2009, 15, 11642-1 1659.

Compounds I wherein A is a group A⁢³, wherein both R⁷a and R⁷b are optionally substituted alkyl, alkenyl, alkynyl, cycloalkyl or CN, can be prepared analogously by converting a ketone IV, wherein R⁸ is has the meaning desired for R⁷b and is optionally substituted alkyl, alkenyl, alkynyl, cycloalkyl or CN, into an imine by reaction with an amine derivative NH₂R⁶, wherein R⁶ is tert-butyl sulfinyl, or, for preparing a compound with XI R⁷a = CN, tosylate.

![Chemical structure diagram](XI)
This imine is then reacted with a compound H-R<sub>7a</sub> in an addition reaction under conditions as described for example in J. Org. Chem 2002, 67, 7819-7832 and the references cited therein, or, for introducing CN as a group R<sub>7a</sub>, Chemistry - A European Journal 2009, 15, 11642-1 1659.

If desired, R<sup>8</sup> can then be removed to yield an amino group NH<sub>2</sub>.

Compounds I wherein A is A<sup>4</sup> can be prepared by standard ring coupling reactions. For example, compounds wherein A<sup>4</sup> is an N-bound heterocyclic ring can be prepared by reacting a compound I' wherein A' is Cl, Br or I with the respective ring A<sup>4</sup>-H (H being on the nitrogen ring atom to be coupled) under Ullmann coupling conditions, such as described, for example, in WO 2007/075459. Typically, copper(I) iodide or copper(I) oxide and a ligand such as 1,2-cyclohexyldiamine is used, see for example Kanemasa et al., European Journal of Organic Chemistry, 2004, 695-709. If A' is F, the reaction is typically run in a polar aprotic solvent such as N,N-dimethylformamide, N,N-dimethylacetamide or N-methylpyrrolidone, and in the presence of an inorganic base such as sodium, potassium or cesium carbonate.

Compounds, wherein A<sup>4</sup> is a C-bound heterocyclic ring can be prepared by reacting a compound I' wherein A' is Br or I with the boronic acid of the respective ring A<sup>4</sup>-B(OH)2 or the boronate ester of the respective ring A<sup>4</sup>-B(OR2) under Suzuki reaction conditions via Pd-catalyzed cross coupling, such as described, for example, in WO 2007/075459. A typical catalyst is tetakis(triphenylphosphine)palladium(0). Solvents such as tetrahydrofuran, acetonitrile, diethyl ether and dioxane are suitable. The boronic acids A<sup>4</sup>-B(OH)2 are either commercially available or can be prepared by known methods. Other methods for introduction of the heterocyclic groups A<sup>4</sup> are the Heck, Stille, Kumada and Buchwald-Hartwig coupling procedures; see for example Tetrahedron, 2004, 60, 8991-9016.

As a rule, the compounds of formula (I) including their stereoisomers, salts, and N-oxides, and their precursors in the synthesis process, can be prepared by the methods described above. If individual compounds can not be prepared via the above-described routes, they can be prepared by derivatization of other compounds (I) or the respective precursor or by customary modifications of the synthesis routes described. For example, in individual cases, certain compounds of formula (I) can advantageously be prepared from other compounds of formula (I) by derivatization, e.g. by ester hydrolysis, amidation, esterification, ether cleavage, olefination, reduction, oxidation and the like, or by customary modifications of the synthesis routes described.
The reaction mixtures are worked up in the customary manner, for example by mixing with water, separating the phases, and, if appropriate, purifying the crude products by chromatography, for example on alumina or on silica gel. Some of the intermediates and end products may be obtained in the form of colorless or pale brown viscous oils which are freed or purified from volatile components under reduced pressure and at moderately elevated temperature. If the intermediates and end products are obtained as solids, they may be purified by recrystallization or trituration.

The invention also relates to agrochemical compositions comprising an auxiliary and at least one compound I according to the invention.
An agrochemical composition comprises a pesticidally effective amount of a compound 1. The term "effective amount" denotes an amount of the composition or of the compounds 1, which is sufficient for controlling harmful fungi on cultivated plants or in the protection of materials and which does not result in a substantial damage to the treated plants. Such an amount can vary in a broad range and is dependent on various factors, such as the species to be controlled, the treated cultivated plant or material, the climatic conditions and the specific compound 1 used.

The compounds 1, their N-oxides and salts can be converted into customary types of agrochemical compositions, e.g. solutions, emulsions, suspensions, dusts, powders, pastes, granules, pressings, capsules, and mixtures thereof. Examples for composition types are suspensions (e.g. SC, OD, FS), emulsifiable concentrates (e.g. EC), emulsions (e.g. EW, EO, ES, ME), capsules (e.g. CS, ZC), pastes, pastilles, wettable powders or dusts (e.g. WP, SP, WS, DP, DS), pressings (e.g. BR, TB, DT), granules (e.g. WG, SG, GR, FG, GG, MG), insecticidal articles (e.g. LN), as well as gel formulations for the treatment of plant propagation materials such as seeds (e.g. GF). to 1000 g, more preferably from 1 to 100 g and most preferably from 5 to 100 g, per
100 kilogram of plant propagation material (preferably seeds) are generally required.
When used in the protection of materials or stored products, the amount of active sub-
stance applied depends on the kind of application area and on the desired effect.
Amounts customarily applied in the protection of materials are 0.001 g to 2 kg, prefera-
ibly 0.005 g to 1 kg, of active substance per cubic meter of treated material.

device, a knapsack sprayer, a spray tank, a spray plane, or an irrigation system. Usual-
ly, the agrochemical composition is made up with water, buffer, and/or further auxilia-
ries to the desired application concentration and the ready-to-use spray liquor or the
agrochemical composition according to the invention is thus obtained. Usually, 20 to
2000 liters, preferably 50 to 400 liters, of the ready-to-use spray liquor are applied per
hectare of agricultural useful area.

According to one embodiment, individual components of the composition according to
the invention such as parts of a kit or parts of a binary or ternary mixture may be mixed
by the user himself in a spray tank and further auxiliaries may be added, if appropriate.

pounds I and/or active substances from the groups M) or F) (see below), may be mixed
by the user in a spray tank and further auxiliaries and additives may be added, if ap-
propriate.

the invention or partially premixed components, e.g. components comprising com-
pounds I and/or active substances from the groups M) or F) (see below), can be ap-
p lied jointly (e.g. after tank mix) or consecutively.

The invertebrate pest (also referred to as "animal pest"), i.e. the insects, arachnids and nematodes, the plant, soil or water in which the plant is growing or may grow can be contacted with the compounds of the present invention or composition(s) comprising them by any application method known in the art. As such, "contacting" includes both direct contact (applying the compounds/compositions directly on the invertebrate pest or plant - typically to the foliage, stem or roots of the plant) and indirect contact (applying the compounds/compositions to the locus of the invertebrate pest or plant). The compounds of the present invention or the pesticidal compositions comprising them may be used to protect growing plants and crops from attack or infestation by animal pests, especially insects, acaridae or arachnids by contacting the plant/crop with a pesticidally effective amount of compounds of the present invention. The term "crop" refers both to growing and harvested crops.
The compounds of the present invention and the compositions comprising them are particularly important in the control of a multitude of insects on various cultivated plants, such as cereal, root crops, oil crops, vegetables, spices, ornamentals, for example seed of durum and other wheat, barley, oats, rye, maize (fodder maize and sugar maize / sweet and field corn), soybeans, oil crops, crucifers, cotton, sunflowers, bananas, rice, oilseed rape, turnip rape, sugarbeet, fodder beet, eggplants, potatoes, grass, lawn, turf, fodder grass, tomatoes, leeks, pumpkin/squash, cabbage, iceberg lettuce, pepper, cucumbers, melons, Brassica species, melons, beans, peas, garlic, onions, carrots, tuberous plants such as potatoes, sugar cane, tobacco, grapes, petunias, geranium/pelargoniums, pansies and impatiens.

The compounds of the present invention are employed as such or in form of compositions by treating the insects or the plants, plant propagation materials, such as seeds, soil, surfaces, materials or rooms to be protected from insecticidal attack with an insecticidally effective amount of the active compounds. The application can be carried out both before and after the infection of the plants, plant propagation materials, such as seeds, soil, surfaces, materials or rooms by the insects.

Moreover, invertebrate pests may be controlled by contacting the target pest, its food supply, habitat, breeding ground or its locus with a pesticidally effective amount of compounds of the present invention. As such, the application may be carried out before or after the infection of the locus, growing crops, or harvested crops by the pest.

The compounds of the present invention can also be applied preventively to places at which occurrence of the pests is expected.

The compounds of the present invention may be also used to protect growing plants from attack or infestation by pests by contacting the plant with a pesticidally effective amount of compounds of the present invention. As such, "contacting" includes both direct contact (applying the compounds/compositions directly on the pest and/or plant - typically to the foliage, stem or roots of the plant) and indirect contact (applying the compounds/compositions to the locus of the pest and/or plant).

"Locus" means a habitat, breeding ground, plant, seed, soil, area, material or environment in which a pest or parasite is growing or may grow.

In general, "pesticidally effective amount" means the amount of active ingredient needed to achieve an observable effect on growth, including the effects of necrosis, death, retardation, prevention, and removal, destruction, or otherwise diminishing the occurrence and activity of the target organism. The pesticidally effective amount can vary for the various compounds/compositions used in the invention. A pesticidally effective amount of the compositions will also vary according to the prevailing conditions such as desired pesticidal effect and duration, weather, target species, locus, mode of application, and the like.
In the case of soil treatment or of application to the pests dwelling place or nest, the quantity of active ingredient ranges from 0.0001 to 500 g per 100 m², preferably from 0.001 to 20 g per 100 m². Customary application rates in the protection of materials are, for example, from 0.01 g to 1000 g of active compound per m² treated material, desirably from 0.1 g to 50 g per m².

Insecticidal compositions for use in the impregnation of materials typically contain from 0.001 to 95 weight %, preferably from 0.1 to 45 weight %, and more preferably from 1 to 25 weight % of at least one repellent and/or insecticide. For use in treating crop plants, the rate of application of the active ingredients of this invention may be in the range of 0.1 g to 4000 g per hectare, desirably from 5 g to 500 g per hectare, more desirably from 5 g to 200 g per hectare. The compounds of the present invention are effective through both contact (via soil, glass, wall, bed net, carpet, plant parts or animal parts), and ingestion (bait, or plant part).

The compounds of the present invention may also be applied against non-crop insect pests, such as ants, termites, wasps, flies, mosquitos, crickets, or cockroaches. For use against said non-crop pests, compounds of the present invention are preferably used in a bait composition. The bait can be a liquid, a solid or a semisolid preparation (e.g. a gel). Solid baits can be formed into various shapes and forms suitable to the respective application e.g. granules, blocks, sticks, disks. Liquid baits can be filled into various devices to ensure proper application, e.g. open containers, spray devices, droplet sources, or evaporation sources. Gels can be based on aqueous or oily matrices and can be formulated to particular necessities in terms of stickyness, moisture retention or aging characteristics. The bait employed in the composition is a product, which is sufficiently attractive to incite insects such as ants, termites, wasps, flies, mosquitos, crickets etc. or cockroaches to eat it. The attractiveness can be manipulated by using feeding stimulants or sex pheromones. Food stimulants are chosen, for example, but not exclusively, from animal and/or plant proteins (meat-, fish- or blood meal, insect parts, egg yolk), from fats and oils of animal and/or plant origin, or mono-, oligo- or polyorganosaccharides, especially from sucrose, lactose, fructose, dextrose, glucose, starch, pectin or even molasses or honey. Fresh or decaying parts of fruits, crops, plants, animals, insects or specific parts thereof can also serve as a feeding stimulant. Sex pheromones are known to be more insect specific. Specific pheromones are described in the literature and are known to those skilled in the art. For use in bait compositions, the typical content of active ingredient is from 0.001 weight % to 15 weight %, desirably from 0.001 weight % to 5% weight % of active ingredient.
Formulations of compounds of the present invention as aerosols (e.g. in spray cans), oil sprays or pump sprays are highly suitable for the non-professional user for controlling pests such as flies, fleas, ticks, mosquitoes or cockroaches. Aerosol recipes are preferably composed of the active compound, solvents such as lower alcohols (e.g. methanol, ethanol, propanol, butanol), ketones (e.g. acetone, methyl ethyl ketone), paraffin hydrocarbons (e.g. kerosenes) having boiling ranges of approximately 50 to 250 °C, dimethylformamide, N-methylpyrrolidone, dimethyl sulfoxide, aromatic hydrocarbons such as toluene, xylene, water, furthermore auxiliaries such as emulsifiers such as sorbitol monooleate, oleyl ethoxylate having 3-7 mol of ethylene oxide, fatty alcohol ethoxylate, perfume oils such as ethereal oils, esters of medium fatty acids with lower alcohols, aromatic carbonyl compounds, if appropriate stabilizers such as sodium benzoate, amphoteric surfactants, lower epoxides, triethyl orthoformate and, if required, propellants such as propane, butane, nitrogen, compressed air, dimethyl ether, carbon dioxide, nitrous oxide, or mixtures of these gases.

The oil spray formulations differ from the aerosol recipes in that no propellants are used. For use in spray compositions, the content of active ingredient is from 0.001 to 80 weights %, preferably from 0.01 to 50 weight % and most preferably from 0.01 to 15 weight %.

The compounds of the present invention and its respective compositions can also be used in mosquito and fumigating coils, smoke cartridges, vaporizer plates or long-term vaporizers and also in moth papers, moth pads or other heat-independent vaporizer systems.

Methods to control infectious diseases transmitted by insects (e.g. malaria, dengue and yellow fever, lymphatic filariasis, and leishmaniasis) with compounds of the present invention and its respective compositions also comprise treating surfaces of huts and houses, air spraying and impregnation of curtains, tents, clothing items, bed nets, tsetse-fly trap or the like. Insecticidal compositions for application to fibers, fabric, knitted goods, nonwovens, netting material or foils and tarps preferably comprise a mixture including the insecticide, optionally a repellent and at least one binder. Suitable repellents for example are N,N-Diethyl-meta-toluamide (DEET), N,N-diethylphenylacetamide (DEPA), 1-(3-cyclohexan-1-yl-carbonyl)-2-methylpiperine, (2-hydroxymethylcyclohexyl) acetic acid lactone, 2-ethyl-1,3-hexandiol, indalone, Methylneodecanamide (MNDA), a pyrethroid not used for insect control such as [(+/-)-3-allyl-2-methyl-4-oxocyclopent-2-(+)-enyl-(+)-trans-chrysanthemate] (Esbiothrin), a repellent derived from or identical with plant extracts like limonene, eugenol, (+)-Eucamalol (1), (-)-l-epi-eucamalol or crude plant extracts from plants like Eucalyptus maculata, Vitex rotundifolia, Cymbopogon martini, Cymbopogon citratus (lemon grass), Cymbopogon nartus (citronella). Suitable binders are selected for example from polymers and co-
polymers of vinyl esters of aliphatic acids (such as vinyl acetate and vinyl
versatate), acrylic and methacrylic esters of alcohols, such as butyl acrylate, 2-
ethylhexylacrylate, and methyl acrylate, mono- and di-ethylenically unsaturated hydro-
carbons, such as styrene, and aliphatic diens, such as butadiene.

The impregnation of curtains and bednets is done in general by dipping the textile ma-
terial into emulsions or dispersions of the insecticide or spraying them onto the nets. The compounds of the present invention and their compositions can be used for pro-
tecting wooden materials such as trees, board fences, sleepers, etc. and buildings
such as houses, outhouses, factories, but also construction materials, furniture, leathers, fibers, vinyl articles, electric wires and cables etc. from ants and/or termites, and
for controlling ants and termites from doing harm to crops or human being (e.g. when
the pests invade into houses and public facilities). The compounds of the present in-
vention are applied not only to the surrounding soil surface or into the under-floor soil in
order to protect wooden materials but it can also be applied to lumbered articles such
as surfaces of the under-floor concrete, alcove posts, beams,plywoods, furniture, etc.,
wooden articles such as particle boards, half boards, etc. and vinyl articles such as
coated electric wires, vinyl sheets, heat insulating material such as styrene foams, etc.
In case of application against ants doing harm to crops or human beings, the ant con-
troller of the present invention is applied to the crops or the surrounding soil, or is di-
rectly applied to the nest of ants or the like.

The compounds of the present invention are also suitable for the treatment of plant
propagation material, especially seeds, in order to protect them from insect pest, in
particular from soil-living insect pests and the resulting plant’s roots and shoots
against soil pests and foliar insects.

The compounds of the present invention are particularly useful for the protection of the
seed from soil pests and the resulting plant’s roots and shoots against soil pests and
foliar insects. The protection of the resulting plant’s roots and shoots is preferred.
More preferred is the protection of resulting plant’s shoots from piercing and sucking
insects, wherein the protection from aphids is most preferred.

The present invention therefore comprises a method for the protection of seeds from
insects, in particular from soil insects and of the seedlings’ roots and shoots from
insects, in particular from soil and foliar insects, said method comprising contacting the
seeds before sowing and/or after pregermination with a compound of the present in-
vention, including a salt thereof. Particularly preferred is a method, wherein the
plant’s roots and shoots are protected, more preferably a method, wherein the plants
shoots are protected form piercing and sucking insects, most preferably a method,
wherein the plants shoots are protected from aphids.
The term seed embraces seeds and plant propagules of all kinds including but not limited to true seeds, seed pieces, suckers, corms, bulbs, fruit, tubers, grains, cuttings, cut shoots and the like and means in a preferred embodiment true seeds.

The term seed treatment comprises all suitable seed treatment techniques known in the art, such as seed dressing, seed coating, seed dusting, seed soaking and seed pelleting.

The present invention also comprises seeds coated with or containing the active compound.

The term "coated with and/or containing" generally signifies that the active ingredient is for the most part on the surface of the propagation product at the time of application, although a greater or lesser part of the ingredient may penetrate into the propagation product, depending on the method of application. When the said propagation product is (re)planted, it may absorb the active ingredient.

Suitable seed is seed of cereals, root crops, oil crops, vegetables, spices, ornamentals, for example seed of durum and other wheat, barley, oats, rye, maize (fodder maize and sugar maize / sweet and field corn), soybeans, oil crops, crucifers, cotton, sunflowers, bananas, rice, oilseed rape, turnip rape, sugarbeet, fodder beet, eggplants, potatoes, grass, lawn, turf, fodder grass, tomatoes, leeks, pumpkin/squash, cabbage, iceberg lettuce, pepper, cucumbers, melons, Brassica species, melons, beans, peas, garlic, onions, carrots, tuberous plants such as potatoes, sugar cane, tobacco, grapes, petunias, geranium/pelargoniums, pansies and impatien.

In addition, the active compound may also be used for the treatment of seeds from plants, which tolerate the action of herbicides or fungicides or insecticides owing to breeding, including genetic engineering methods.

For example, the active compound can be employed in treatment of seeds from plants, which are resistant to herbicides from the group consisting of the sulfonylureas, imidazolinones, glufosinate-ammonium or glyphosate-isopropylammonium and analogous active substances (see for example, EP-A 242 236, EP-A 242 246) (WO 92/00377) (EP-A 257 993, U.S. 5,013,659) or in transgenic crop plants, for example cotton, with the capability of producing Bacillus thuringiensis toxins (Bt toxins) which make the plants resistant to certain pests (EP-A 142 924, EP-A 193 259).

Furthermore, the active compound can be used also for the treatment of seeds from plants, which have modified characteristics in comparison with existing plants consist, which can be generated for example by traditional breeding methods and/or the generation of mutants, or by recombinant procedures. For example, a number of cases have been described of recombinant modifications of crop plants for the purpose of modifying the starch synthesized in the plants (e.g. WO 92/1 1376, WO 92/14827, WO 91/19806) or of transgenic crop plants having a modified fatty acid composition (WO 91/13972).
The seed treatment application of the active compound is carried out by spraying or by dusting the seeds before sowing of the plants and before emergence of the plants.

Compositions which are especially useful for seed treatment are e.g.:

- A Soluble concentrates (SL, LS)
- D Emulsions (EW, EO, ES)
- E Suspensions (SC, OD, FS)

These formulations can be applied to the seed diluted or undiluted. Application to the seeds is carried out before sowing, either directly on the seeds or after having pregerminated the latter.

In a preferred embodiment a FS formulation is used for seed treatment. Typically, a FS formulation may comprise 1-800 g/l of active ingredient, 1-200 g/l Surfactant, 0 to 200 g/l antifreezing agent, 0 to 400 g/l of binder, 0 to 200 g/l of a pigment and up to 1 liter of a solvent, preferably water.

Seed Treatment formulations may additionally also comprise binders and optionally colorants.

Binders can be added to improve the adhesion of the active materials on the seeds after treatment. Examples of a gelling agent is carrageen (Satiagel®)

In the treatment of seed, the application rates of the compounds of the present invention are generally from 0.01 g to 10 kg per 100 kg of seed, preferably from 0.05 g to 5 kg per 100 kg of seed, more preferably from 0.1 g to 1000 g per 100 kg of seed and in particular from 0.1 g to 200 g per 100 kg of seed.

The invention therefore also relates to seed comprising a compound of the present invention, including an agriculturally useful salt of it, as defined herein. The amount of the compound of the present invention, including an agriculturally useful salt thereof will in general vary from 0.01 g to 10 kg per 100 kg of seed, preferably from 0.05 g to 5 kg per 100 kg of seed, in particular from 0.1 g to 1000 g per 100 kg of seed. For specific crops such as lettuce the rate can be higher.

Methods which can be employed for treating the seed are, in principle, all suitable seed treatment and especially seed dressing techniques known in the art, such as seed coating (e.g. seed pelleting), seed dusting and seed imbibition (e.g. seed soaking).

Here, "seed treatment" refers to all methods that bring seeds and the compounds of the present invention into contact with each other, and "seed dressing" to methods of seed treatment which provide the seeds with an amount of the compounds of the present invention, i.e. which generate a seed comprising a compound of the present invention. In principle, the treatment can be applied to the seed at any time from the harvest of the seed to the sowing of the seed. The seed can be treated immediately before, or during, the planting of the seed, for example using the "planter's box" method. However, the treatment may also be carried out several weeks or months, for example up to 12 months, before planting the seed, for example in the form of a seed dressing treatment, without a substantially reduced efficacy being observed.

Expediently, the treatment is applied to unsown seed. As used herein, the term "unsown seed" is meant to include seed at any period from the harvest of the seed to the
sowing of the seed in the ground for the purpose of germination and growth of the plant.

Specifically, a procedure is followed in the treatment in which the seed is mixed, in a suitable device, for example a mixing device for solid or solid/liquid mixing partners, with the desired amount of seed treatment formulations, either as such or after previous dilution with water, until the composition is distributed uniformly on the seed. If appropriate, this is followed by a drying step.

The compounds of the present invention, including their stereoisomers, veterinarily acceptable salts or N-oxides, are in particular also suitable for being used for combating parasites in and on animals.

An object of the present invention is therefore also to provide new methods to control parasites in and on animals. Another object of the invention is to provide safer pesticides for animals. Another object of the invention is further to provide pesticides for animals that may be used in lower doses than existing pesticides. And another object of the invention is to provide pesticides for animals, which provide a long residual control of the parasites.

The invention also relates to compositions comprising a parasiticidally effective amount of compounds of the present invention, including their stereoisomers, veterinarily acceptable salts or N-oxides, and an acceptable carrier, for combating parasites in and on animals.

The invention also provides a process for the preparation of a composition for treating, controlling, preventing or protecting animals against infestation or infection by parasites which comprises a parasiticidally effective amount of a compound of the present invention, including its stereoisomers, veterinarily acceptable salts or N-oxides, or a composition comprising it.

Activity of compounds against agricultural pests does not suggest their suitability for control of endo- and ectoparasites in and on animals which requires, for example, low, non-emetic dosages in the case of oral application, metabolic compatibility with the animal, low toxicity, and a safe handling.

Surprisingly it has now been found that compounds of formula (I) and their stereoisomers, veterinarily acceptable salts, tautomers and N-oxides, are suitable for combating endo- and ectoparasites in and on animals.
The compounds of the present invention, especially compounds of formula (I) and their stereoisomers, veterinarily acceptable salts, tautomers and N-oxides, and compositions comprising them are preferably used for controlling and preventing infestations of and infections in animals including warm-blooded animals (including humans) and fish. They are for example suitable for controlling and preventing infestations and infections in mammals such as cattle, sheep, swine, camels, deer, horses, pigs, poultry, rabbits, goats, dogs and cats, water buffalo, donkeys, fallow deer and reindeer, and also in fur-bearing animals such as mink, chinchilla and raccoon, birds such as hens, geese, turkeys and ducks and fish such as fresh- and salt-water fish such as trout, carp and eels.

The present invention relates to the therapeutic and the non-therapeutic use of compounds of the present invention and compositions comprising them for controlling and/or combating parasites in and/or on animals. The compounds of the present invention and compositions comprising them may be used to protect the animals from attack or infestation by parasites by contacting them with a parasitically effective amount of compounds of the present invention and compositions containing them.

The compounds of the present invention and compositions comprising them can be effective through both contact (via soil, glass, wall, bed net, carpet, blankets or animal parts) and ingestion (e.g. baits). As such, "contacting" includes both direct contact (applying the pesticidal mixtures/compositions containing the compounds of the present invention directly on the parasite, which may include an indirect contact at its locus-P, and optionally also administrating the pesticidal mixtures/composition directly on the animal to be protected) and indirect contact (applying the compounds/compositions to the locus of the parasite). The contact of the parasite through application to its locus is an example of a non-therapeutic use of compounds of the present invention. "Locus-P" as used above means the habitat, food supply, breeding ground, area, material or environment in which a parasite is growing or may grow outside of the animal.

In general, "parasitically effective amount" means the amount of active ingredient needed to achieve an observable effect on growth, including the effects of necrosis, death, retardation, prevention, and removal, destruction, or otherwise diminishing the occurrence and activity of the target organism. The parasitically effective amount can vary for the various compounds/compositions of the present invention. A parasitically effective amount of the compositions will also vary according to the prevailing conditions such as desired parasitical effect and duration, target species, mode of application, and the like.
The compounds of the present invention can also be applied preventively to places at which occurrence of the pests or parasites are expected. Administration can be carried out both prophylactically and therapeutically. Administration of the active compounds is carried out directly or in the form of suitable preparations, orally, topically/dermally or parenterally.

Different concentrations of formulated compounds were pipetted into the aphid diet, using a custom built pipetter, at two replications. After application, 5 - 8 adult aphids were placed on the artificial membrane inside the microtiter plate wells. The aphids were then allowed to suck on the treated aphid diet and incubated at about 23 ± 1°C and about 50 ± 5 % relative humidity for 3 days. Aphid mortality and fecundity was then visually assessed.

*Dichromothrips corbetti* adults used for bioassay were obtained from a colony maintained continuously under laboratory conditions. For testing purposes, the test compound was diluted to a concentration of 500 ppm (wt compound: vol diluent) in a 1:1 mixture of acetone:water (vohvol), plus 0.01 % vol/vol Kinetic® surfactant. Thrips potency of each compound was evaluated by using a floral-immersion technique. Plastic petri dishes were used as test arenas. All petals of individual, intact orchid flowers were dipped into treatment solution and allowed to dry. Treated flowers were placed into individual petri dishes along with 10 - 15 adult thrips. The petri dishes were then covered with lids. All test arenas were held under continuous light and a temperature of about 28°C for duration of the assay. After 4 days, the numbers of live thrips were counted on each flower, and along inner walls of each petri dish. The level of thrips mortality was extrapolated from pre-treatment thrips numbers.

A nonionic surfactant (Kinetic®) was included in the solution at a volume of 0.01% (v/v).

Cotton plants at the cotyledon stage (one plant per pot) were sprayed by an automated electrostatic plant sprayer equipped with an atomizing spray nozzle. The plants were dried in the sprayer fume hood and then removed from the sprayer. Each pot was placed into a plastic cup and about 10 to 12 whitefly adults (approximately 3-5 days old) were introduced. The insects were collected using an aspirator and a nontoxic Tygon® tubing connected to a barrier pipette tip. The tip, containing the collected insects, was then gently inserted into the soil containing the treated plant, allowing insects to crawl out of the tip to reach the foliage for feeding. Cups were covered with a reusable screened lid. Test plants were maintained in a growth room at about 25°C and about 20-40% relative humidity for 3 days, avoiding direct exposure to fluorescent light (24 hour photoperiod) to prevent trapping of heat inside the cup. Mortality was assessed 3 days after treatment, compared to untreated control plants.
