(54) Title: TYK2 INHIBITORS AND USES THEREOF

(57) Abstract: The present invention provides compounds, compositions thereof, and methods of using the same for the inhibition of TYK2, and the treatment of TYK2-mediated disorders.

## TYK2 INHIBITORS AND USES THEREOF

### CROSS-REFERENCE TO RELATED APPLICATIONS

[0001] The present application claims priority to United States provisional patent application serial number 62/773,620, filed November 30, 2018, the entirety of which is incorporated herein by reference.

### TECHNICAL FIELD OF THE INVENTION

[0002] The present invention relates to compounds and methods useful for inhibiting non-receptor tyrosine-protein kinase 2 (“TYK2”), also known as Tyrosine kinase 2. The invention also provides pharmaceutically acceptable compositions comprising compounds of the present invention and methods of using said compositions in the treatment of various disorders.

### BACKGROUND OF THE INVENTION

[0003] The search for new therapeutic agents has been greatly aided in recent years by a better understanding of the structure of enzymes and other biomolecules associated with diseases. One important class of enzymes that has been the subject of extensive study is the protein kinase family.

[0004] Protein kinases constitute a large family of structurally related enzymes that are responsible for the control of a variety of signal transduction processes within the cell. Protein kinases are thought to have evolved from a common ancestral gene due to the conservation of their structure and catalytic function. Almost all kinases contain a similar 250-300 amino acid catalytic domain. The kinases may be categorized into families by the substrates they phosphorylate (e.g., protein-tyrosine, protein-serine/threonine, lipids, etc.).

[0005] In general, protein kinases mediate intracellular signaling by effecting a phosphoryl transfer from a nucleoside triphosphate to a protein acceptor that is involved in a signaling pathway. These phosphorylation events act as molecular on/off switches that can modulate or regulate the target protein biological function. These phosphorylation events are ultimately triggered in response to a variety of extracellular and other stimuli. Examples of such stimuli include environmental and chemical stress signals (e.g., osmotic shock, heat shock, ultraviolet radiation, bacterial endotoxins, and H<sub>2</sub>O<sub>2</sub>), cytokines (e.g., interleukin-1 (IL-1), interleukin-8 (IL-

8), and tumor necrosis factor  $\alpha$  (TNF- $\alpha$ )), and growth factors (e.g., granulocyte macrophage-colony-stimulating factor (GM-CSF), and fibroblast growth factor (FGF)). An extracellular stimulus may affect one or more cellular responses related to cell growth, migration, differentiation, secretion of hormones, activation of transcription factors, muscle contraction, glucose metabolism, control of protein synthesis, and regulation of the cell cycle.

**[0006]** Many diseases are associated with abnormal cellular responses triggered by kinase-mediated events. These diseases include, but are not limited to, autoimmune diseases, inflammatory diseases, bone diseases, metabolic diseases, neurological and neurodegenerative diseases, cancer, cardiovascular diseases, allergies and asthma, Alzheimer's disease, and hormone-related diseases. Accordingly, there remains a need to find protein kinase inhibitors useful as therapeutic agents.

## **SUMMARY OF THE INVENTION**

**[0007]** It has now been found that compounds of this invention, and pharmaceutically acceptable compositions thereof, are effective as inhibitors of TYK2 kinase.

**[0008]** Compounds of the present invention, and pharmaceutically acceptable compositions thereof, are useful for treating a variety of diseases, disorders or conditions, associated with regulation of signaling pathways implicating TYK2 kinases. Such diseases, disorders, or conditions include those described herein.

**[0009]** Compounds provided by this invention are also useful for the study of TYK2 enzymes in biological and pathological phenomena; the study of intracellular signal transduction pathways occurring in bodily tissues; and the comparative evaluation of new TYK2 inhibitors or other regulators of kinases, signaling pathways, and cytokine levels *in vitro* or *in vivo*.

## **DETAILED DESCRIPTION OF CERTAIN EMBODIMENTS**

### ***1. General Description of Certain Embodiments of the Invention:***

**[0010]** Compounds of the present invention, and compositions thereof, are useful as inhibitors of TYK2 protein kinase.

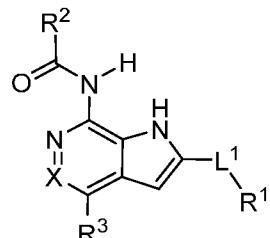

**[0011]** The pseudokinase binding pocket of TYK2 contains a plurality of hydration sites, each of which is occupied by a single molecule of water. Each of these water molecules has a stability rating associated with it. As used herein, the term “stability rating” refers to a numerical calculation which incorporates the enthalpy, entropy, and free energy values associated with each water molecule. This stability rating allows for a measurable determination of the relative stability of water molecules that occupy hydration sites in the binding pocket of TYK2.

**[0012]** Water molecules occupying hydration sites in the binding pocket of TYK2 having a stability rating of >2.5 kcal/mol are referred to as “unstable waters.”

**[0013]** Without wishing to be bound by any particular theory, it is believed that displacement or disruption of an unstable water molecule (i.e., a water molecule having a stability rating of >2.5 kcal/mol), or replacement of a stable water (i.e., a water molecule having a stability rating of <1 kcal/mol), by an inhibitor results in tighter binding of that inhibitor. Accordingly, inhibitors designed to displace one or more unstable water molecules (i.e., those unstable water molecules not displaced by any known inhibitor) will be a tighter binder and, therefore, more potent inhibitor as compared to an inhibitor that does not displace unstable water molecules.

**[0014]** It was surprisingly found that provided compounds displace or disrupt one or more unstable water molecules. In some embodiments, a provided compound displaces or disrupts at least two unstable water molecules.

**[0015]** In certain embodiments, the present invention provides a compound of formula **I**:

**I**

or a pharmaceutically acceptable salt thereof, wherein each of X, L<sup>1</sup>, R<sup>1</sup>, R<sup>2</sup>, and R<sup>3</sup> is as defined below and described in embodiments herein, both singly and in combination.

**[0016]** In some embodiments, the present invention provides a pharmaceutical composition comprising a compound of formula **I**, and a pharmaceutically acceptable carrier, adjuvant, or diluent.

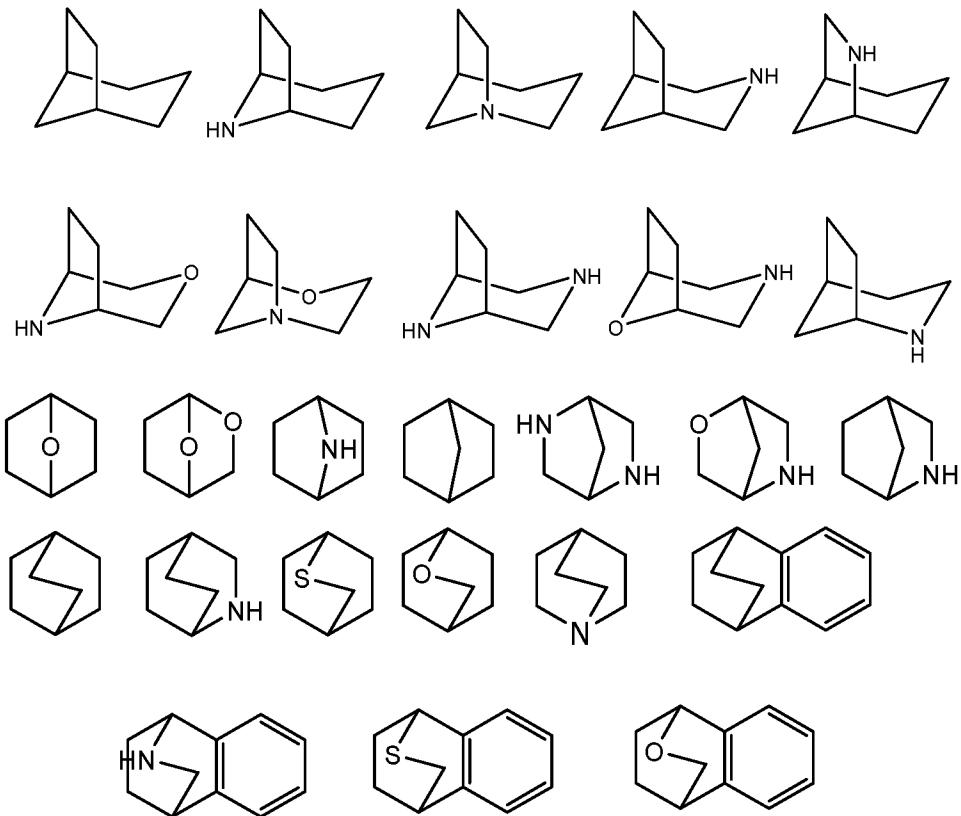

[0017] In some embodiments, the present invention provides a method of treating a TYK2-mediated disease, disorder, or condition comprising administering to a patient in need thereof, a compound of formula I or a pharmaceutically acceptable salt thereof.

**2. Compounds and Definitions:**

As used herein, the following definitions shall apply unless otherwise indicated. For purposes of this invention, the chemical elements are identified in accordance with the Periodic Table of the Elements, CAS version, Handbook of Chemistry and Physics, 75<sup>th</sup> Ed. **[0041]** As used herein, the term "pharmaceutically acceptable salt" refers to those salts which are, within the scope of sound medical judgment, suitable for use in contact with the tissues of humans and lower animals without undue toxicity, irritation, allergic response and the like, and are commensurate with a reasonable benefit/risk ratio. Pharmaceutically acceptable salts are well known in the art. For example, S. M. Berge et al., describe pharmaceutically acceptable salts in detail in *J. Pharmaceutical Sciences*, 1977, 66, 1–19, incorporated herein by reference. Pharmaceutically acceptable salts of the compounds of this invention include those derived from suitable inorganic and organic acids and bases. Examples of pharmaceutically acceptable, nontoxic acid addition salts are salts of an amino group formed with inorganic acids such as hydrochloric acid, hydrobromic acid, phosphoric acid, sulfuric acid and perchloric acid or with organic acids such as acetic acid, oxalic acid, maleic acid, tartaric acid, citric acid, succinic acid or malonic acid or by using other methods used in the art such as ion exchange. Other pharmaceutically acceptable salts include adipate, alginate, ascorbate, aspartate, benzenesulfonate, benzoate, bisulfate, borate, butyrate, camphorate, camphorsulfonate, citrate, cyclopentanepropionate, digluconate, dodecylsulfate, ethanesulfonate, formate, fumarate, glucoheptonate, glycerophosphate, gluconate, hemisulfate, heptanoate, hexanoate, hydroiodide, 2–hydroxy–ethanesulfonate, lactobionate, lactate, laurate, lauryl sulfate, malate, maleate, malonate, methanesulfonate, 2–naphthalenesulfonate, nicotinate, nitrate, oleate, oxalate, palmitate, pamoate, pectinate, persulfate, 3–phenylpropionate, phosphate, pivalate, propionate, stearate, succinate, sulfate, tartrate, thiocyanate, p–toluenesulfonate, undecanoate, valerate salts, and the like.

Representative alkali or alkaline earth metal salts include sodium, lithium, potassium, calcium, magnesium, and the like. Further pharmaceutically acceptable salts include, when appropriate, nontoxic ammonium, quaternary ammonium, and amine cations formed using counterions such as halide, hydroxide, carboxylate, sulfate, phosphate, nitrate, loweralkyl sulfonate and aryl sulfonate.

**[0043]** Unless otherwise stated, structures depicted herein are also meant to include all isomeric (e.g., enantiomeric, diastereomeric, and geometric (or conformational)) forms of the

structure; for example, the R and S configurations for each asymmetric center, Z and E double bond isomers, and Z and E conformational isomers. Therefore, single stereochemical isomers as well as enantiomeric, diastereomeric, and geometric (or conformational) mixtures of the present compounds are within the scope of the invention. Unless otherwise stated, all tautomeric forms of the compounds of the invention are within the scope of the invention. Additionally, unless otherwise stated, structures depicted herein are also meant to include compounds that differ only in the presence of one or more isotopically enriched atoms. For example, compounds having the present structures including the replacement of hydrogen by deuterium or tritium, or the replacement of a carbon by a <sup>13</sup>C- or <sup>14</sup>C-enriched carbon are within the scope of this invention. Such compounds are useful, for example, as analytical tools, as probes in biological assays, or as therapeutic agents in accordance with the present invention. In certain embodiments, a warhead moiety, R<sup>1</sup>, of a provided compound comprises one or more deuterium atoms. In certain embodiments, Ring B of a provided compound may be substituted with one or more deuterium atoms.

**[0044]** As used herein, the term “inhibitor” is defined as a compound that binds to and /or inhibits TYK2 with measurable affinity. In certain embodiments, an inhibitor has an IC<sub>50</sub> and/or binding constant of less than about 50  $\mu$ M, less than about 1  $\mu$ M, less than about 500 nM, less than about 100 nM, less than about 10 nM, or less than about 1 nM.

**[0045]** A compound of the present invention may be tethered to a detectable moiety. It will be appreciated that such compounds are useful as imaging agents. One of ordinary skill in the art will recognize that a detectable moiety may be attached to a provided compound *via* a suitable substituent. As used herein, the term “suitable substituent” refers to a moiety that is capable of covalent attachment to a detectable moiety. Such moieties are well known to one of ordinary skill in the art and include groups containing, e.g., a carboxylate moiety, an amino moiety, a thiol moiety, or a hydroxyl moiety, to name but a few. It will be appreciated that such moieties may be directly attached to a provided compound or *via* a tethering group, such as a bivalent saturated or unsaturated hydrocarbon chain. In some embodiments, such moieties may be attached via click chemistry. In some embodiments, such moieties may be attached via a 1,3-cycloaddition of an azide with an alkyne, optionally in the presence of a copper catalyst. Methods of using click

chemistry are known in the art and include those described by Rostovtsev *et al.*, *Angew. Chem. Int. Ed.* 2002, 41, 2596-99 and Sun *et al.*, *Bioconjugate Chem.*, 2006, 17, 52-57.

**[0046]** As used herein, the term “detectable moiety” is used interchangeably with the term “label” and relates to any moiety capable of being detected, e.g., primary labels and secondary labels. Primary labels, such as radioisotopes (e.g., tritium,  $^{32}\text{P}$ ,  $^{33}\text{P}$ ,  $^{35}\text{S}$ , or  $^{14}\text{C}$ ), mass-tags, and fluorescent labels are signal generating reporter groups which can be detected without further modifications. Detectable moieties also include luminescent and phosphorescent groups.

**[0047]** The term “secondary label” as used herein refers to moieties such as biotin and various protein antigens that require the presence of a second intermediate for production of a detectable signal. For biotin, the secondary intermediate may include streptavidin-enzyme conjugates. For antigen labels, secondary intermediates may include antibody-enzyme conjugates. Some fluorescent groups act as secondary labels because they transfer energy to another group in the process of nonradiative fluorescent resonance energy transfer (FRET), and the second group produces the detected signal.

**[0048]** The terms “fluorescent label”, “fluorescent dye”, and “fluorophore” as used herein refer to moieties that absorb light energy at a defined excitation wavelength and emit light energy at a different wavelength. Examples of fluorescent labels include, but are not limited to: Alexa Fluor dyes (Alexa Fluor 350, Alexa Fluor 488, Alexa Fluor 532, Alexa Fluor 546, Alexa Fluor 568, Alexa Fluor 594, Alexa Fluor 633, Alexa Fluor 660 and Alexa Fluor 680), AMCA, AMCA-S, BODIPY dyes (BODIPY FL, BODIPY R6G, BODIPY TMR, BODIPY TR, BODIPY 530/550, BODIPY 558/568, BODIPY 564/570, BODIPY 576/589, BODIPY 581/591, BODIPY 630/650, BODIPY 650/665), Carboxyrhodamine 6G, carboxy-X-rhodamine (ROX), Cascade Blue, Cascade Yellow, Coumarin 343, Cyanine dyes (Cy3, Cy5, Cy3.5, Cy5.5), Dansyl, Dapoxyl, Dialkylaminocoumarin, 4',5'-Dichloro-2',7'-dimethoxy-fluorescein, DM-NERF, Eosin, Erythrosin, Fluorescein, FAM, Hydroxycoumarin, IRDyes (IRD40, IRD 700, IRD 800), JOE, Lissamine rhodamine B, Marina Blue, Methoxycoumarin, Naphthofluorescein, Oregon Green 488, Oregon Green 500, Oregon Green 514, Pacific Blue, PyMPO, Pyrene, Rhodamine B, Rhodamine 6G, Rhodamine Green, Rhodamine Red, Rhodol Green, 2',4',5',7'-Tetra-bromosulfone-fluorescein, Tetramethyl-rhodamine (TMR), Carboxytetramethylrhodamine (TAMRA), Texas Red, Texas Red-X.

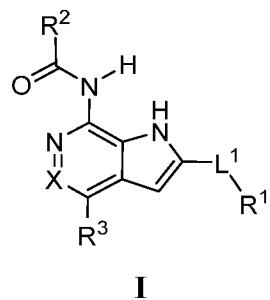

]

**[0049]** The term “mass-tag” as used herein refers to any moiety that is capable of being uniquely detected by virtue of its mass using mass spectrometry (MS) detection techniques. Examples of mass-tags include electrophore release tags such as N-[3-[4’-[(p-Methoxytetrafluorobenzyl)oxy]phenyl]-3-methylglyceronyl]isonipecotic Acid, 4’-[2,3,5,6-Tetrafluoro-4-(pentafluorophenoxy)]methyl acetophenone, and their derivatives. The synthesis and utility of these mass-tags is described in United States Patents 4,650,750, 4,709,016, 5,360,8191, 5,516,931, 5,602,273, 5,604,104, 5,610,020, and 5,650,270. Other examples of mass-tags include, but are not limited to, nucleotides, dideoxynucleotides, oligonucleotides of varying length and base composition, oligopeptides, oligosaccharides, and other synthetic polymers of varying length and monomer composition. A large variety of organic molecules, both neutral and charged (biomolecules or synthetic compounds) of an appropriate mass range (100-2000 Daltons) may also be used as mass-tags.

**[0050]** The terms “measurable affinity” and “measurably inhibit,” as used herein, means a measurable change in a TYK2 protein kinase activity between a sample comprising a compound of the present invention, or composition thereof, and a TYK2 protein kinase, and an equivalent sample comprising an TYK2 protein kinase, in the absence of said compound, or composition thereof.

**[00197]** The amount of compounds of the present invention that may be combined with the carrier materials to produce a composition in a single dosage form will vary depending upon the host treated, the particular mode of administration. Preferably, provided compositions should be formulated so that a dosage of between 0.01 - 100 mg/kg body weight/day of the inhibitor can be administered to a patient receiving these compositions.

**[00198]** It should also be understood that a specific dosage and treatment regimen for any particular patient will depend upon a variety of factors, including the activity of the specific compound employed, the age, body weight, general health, sex, diet, time of administration, rate of excretion, drug combination, and the judgment of the treating physician and the severity of the particular disease being treated. The amount of a compound of the present invention in the composition will also depend upon the particular compound in the composition.

#### *Uses of Compounds and Pharmaceutically Acceptable Compositions*

**[00199]** Compounds and compositions described herein are generally useful for the inhibition of kinase activity of one or more enzymes. In some embodiments the kinase inhibited by the compounds and methods of the invention is TYK2

**[00200]** TYK2 is a non-receptor tyrosine kinase member of the Janus kinase (JAKs) family of protein kinases. The mammalian JAK family consists of four members, TYK2, JAK1, JAK2, and JAK3. JAK proteins, including TYK2, are integral to cytokine signaling. TYK2 associates with the cytoplasmic domain of type I and type II cytokine receptors, as well as interferon types I and III receptors, and is activated by those receptors upon cytokine binding. Cytokines implicated in TYK2 activation include interferons (e.g. IFN- $\alpha$ , IFN- $\beta$ , IFN- $\kappa$ , IFN- $\delta$ , IFN- $\epsilon$ , IFN- $\tau$ , IFN- $\omega$ , and IFN- $\zeta$  (also known as limitin), and interleukins (e.g. IL-4, IL-6, IL-10, IL-11, IL-12, IL-13, IL-22, IL-23, IL-27, IL-31, oncostatin M, ciliary neurotrophic factor, cardiotrophin 1, cardiotrophin-like cytokine, and LIF). Velasquez et al., “A protein kinase in the interferon  $\alpha/\beta$  signaling pathway,” Cell (1992) 70:313; Stahl et al., “Association and activation of Jak-Tyk kinases by CNTF-LIF-OSM-IL-6 $\beta$  receptor components,” Science (1994) 263:92; Finbloom et al., “IL-10 induces the tyrosine phosphorylation of Tyk2 and Jak1 and the differential assembly of Stat1 and Stat3 complexes in human T cells and monocytes,” J. Immunol. (1995) 155:1079; Bacon et al., “Interleukin 12 (IL-12) induces tyrosine phosphorylation of Jak2 and Tyk2: differential use of Janus family kinases by IL-2 and IL-12,” J. Exp. Med. (1995) 181:399; Welham et al.,

]

“Interleukin-13 signal transduction in lymphohemopoietic cells: similarities and differences in signal transduction with interleukin-4 and insulin,” *J. Biol. Chem.* (1995) 270:12286; Parham et al., “A receptor for the heterodimeric cytokine IL-23 is composed of IL-12R $\beta$ 1 and a novel cytokine receptor subunit, IL-23R,” *J. Immunol.* (2002) 168:5699. The activated TYK2 then goes on to phosphorylate further signaling proteins such as members of the STAT family, including STAT1, STAT2, STAT4, and STAT6.

**[00201]** TYK2 activation by IL-23, has been linked to inflammatory bowel disease (IBD), Crohn’s disease, and ulcerative colitis. Duerr et al., “A Genome-Wide Association Study Identifies IL23R as an Inflammatory Bowel Disease Gene,” *Science* (2006) 314:1461-1463. As the downstream effector of IL-23, TYK2 also plays a role in psoriasis, ankylosing spondylitis, and Behçet’s disease. Cho et al., “Genomics and the multifactorial nature of human auto-immune disease,” *N. Engl. J. Med.* (2011) 365:1612-1623; Cortes et al., “Identification of multiple risk variants for ankylosing spondylitis through high-density genotyping of immune-related loci,” *Nat. Genet.* (2013) 45(7):730-738; Remmers et al., “Genome-wide association study identifies variants in the MHC class I, IL10, and IL23R-IL12RB2 regions associated with Behçet’s disease,” *Nat. Genet.* (2010) 42:698-702. A genome-wide association study of 2,622 individuals with psoriasis identified associations between disease susceptibility and TYK2. Strange et al., “A genome-wide association study identifies new psoriasis susceptibility loci and an interaction between HLA-C and ERAP1,” *Nat. Genet.* (2010) 42:985-992. Knockout or tyrphostin inhibition of TYK2 significantly reduces both IL-23 and IL-22-induced dermatitis. Ishizaki et al., “Tyk2 is a therapeutic target for psoriasis-like skin inflammation,” *Intl. Immunol.* (2013), doi: 10.1093/intimm/dxt062.

**[00202]** TYK2 also plays a role in respiratory diseases such as asthma, chronic obstructive pulmonary disease (COPD), lung cancer, and cystic fibrosis. Goblet cell hyperplasia (GCH) and mucous hypersecretion is mediated by IL-13-induced activation of TYK2, which in turn activates STAT6. Zhang et al., “Docking protein Gab2 regulates mucin expression and goblet cell hyperplasia through TYK2/STAT6 pathway,” *FASEB J.* (2012) 26:1-11.

**[00203]** Decreased TYK2 activity leads to protection of joints from collagen antibody-induced arthritis, a model of human rheumatoid arthritis. Mechanistically, decreased Tyk2 activity reduced the production of Th1/Th17-related cytokines and matrix metalloproteases, and other key markers

of inflammation. Ishizaki et al., “Tyk2 deficiency protects joints against destruction in anti-type II collagen antibody-induced arthritis in mice,” *Intl. Immunol.* (2011) 23(9):575-582.

**[00204]** TYK2 knockout mice showed complete resistance in experimental autoimmune encephalomyelitis (EAE, an animal model of multiple sclerosis (MS)), with no infiltration of CD4 T cells in the spinal cord, as compared to controls, suggesting that TYK2 is essential to pathogenic CD4-mediated disease development in MS. Oyamada et al., “Tyrosine Kinase 2 Plays Critical Roles in the Pathogenic CD4 T Cell Responses for the Development of Experimental Autoimmune Encephalomyelitis,” *J. Immunol.* (2009) 183:7539-7546. This corroborates earlier studies linking increased TYK2 expression with MS susceptibility. Ban et al., “Replication analysis identifies TYK2 as a multiple sclerosis susceptibility factor,” *Eur J. Hum. Genet.* (2009) 17:1309-1313. Loss of function mutation in TYK2, leads to decreased demyelination and increased remyelination of neurons, further suggesting a role for TYK2 inhibitors in the treatment of MS and other CNS demyelination disorders.

**[00205]** TYK2 is the sole signaling messenger common to both IL-12 and IL-23. TYK2 knockout reduced methylated BSA injection-induced footpad thickness, imiquimod-induced psoriasis-like skin inflammation, and dextran sulfate sodium or 2,4,6-trinitrobenzene sulfonic acid-induced colitis in mice.

**[00206]** Joint linkage and association studies of various type I IFN signaling genes with systemic lupus erythematosus (SLE, an autoimmune disorder), showed a strong, and significant correlation between loss of function mutations to TYK2 and decreased prevalence of SLE in families with affected members. Sigurdsson et al., “Polymorphisms in the Tyrosine Kinase 2 and Interferon Regulatory Factor 5 Genes Are Associated with Systemic Lupus Erythematosus,” *Am. J. Hum. Genet.* (2005) 76:528-537. Genome-wide association studies of individuals with SLE versus an unaffected cohort showed highly significant correlation between the TYK2 locus and SLE. Graham et al., “Association of NCF2, IKZF1, IRF8, IFIH1, and TYK2 with Systemic Lupus Erythematosus,” *PLoS Genetics* (2011) 7(10):e1002341.

**[00207]** TYK2 has been shown to play an important role in maintaining tumor surveillance and TYK2 knockout mice showed compromised cytotoxic T cell response, and accelerated tumor development. However, these effects were linked to the efficient suppression of natural killer (NK) and cytotoxic T lymphocytes, suggesting that TYK2 inhibitors would be highly suitable for

the treatment of autoimmune disorders or transplant rejection. Although other JAK family members such as JAK3 have similar roles in the immune system, TYK2 has been suggested as a superior target because of its involvement in fewer and more closely related signaling pathways, leading to fewer off-target effects. Simma et al. "Identification of an Indispensable Role for Tyrosine Kinase 2 in CTL-Mediated Tumor Surveillance," *Cancer Res.* (2009) 69:203-211.

**[00208]** However, paradoxically to the decreased tumor surveillance observed by Simma et al., studies in T-cell acute lymphoblastic leukemia (T-ALL) indicate that T-ALL is highly dependent on IL-10 via TYK2 via STAT1-mediated signal transduction to maintain cancer cell survival through upregulation of anti-apoptotic protein BCL2. Knockdown of TYK2, but not other JAK family members, reduced cell growth. Specific activating mutations to TYK2 that promote cancer cell survival include those to the FERM domain (G36D, S47N, and R425H), the JH2 domain (V731I), and the kinase domain (E957D and R1027H). However, it was also identified that the kinase function of TYK2 is required for increased cancer cell survival, as TYK2 enzymes featuring kinase-dead mutations (M978Y or M978F) in addition to an activating mutation (E957D) resulted in failure to transform. Sanda et al. "TYK2-STAT1-BCL2 Pathway Dependence in T-Cell Acute Lymphoblastic Leukemia," *Cancer Disc.* (2013) 3(5):564-577.

**[00209]** Thus, selective inhibition of TYK2 has been suggested as a suitable target for patients with IL-10 and/or BCL2-addicted tumors, such as 70% of adult T-cell leukemia cases. Fontan et al. "Discovering What Makes STAT Signaling TYK in T-ALL," *Cancer Disc.* (2013) 3:494-496.

**[00210]** TYK2 mediated STAT3 signaling has also been shown to mediate neuronal cell death caused by amyloid- $\beta$  (A $\beta$ ) peptide. Decreased TYK2 phosphorylation of STAT3 following A $\beta$  administration lead to decreased neuronal cell death, and increased phosphorylation of STAT3 has been observed in postmortem brains of Alzheimer's patients. Wan et al. "Tyk/STAT3 Signaling Mediates  $\beta$ -Amyloid-Induced Neuronal Cell Death: Implications in Alzheimer's Disease," *J. Neurosci.* (2010) 30(20):6873-6881.

**[00211]** Inhibition of JAK-STAT signaling pathways is also implicated in hair growth, and the reversal of the hair loss associated with alopecia areata. Xing et al., "Alopecia areata is driven by cytotoxic T lymphocytes and is reversed by JAK inhibition," *Nat. Med.* (2014) 20: 1043-1049; Harel et al., "Pharmacologic inhibition of JAK-STAT signaling promotes hair growth," *Sci. Adv.* (2015) 1(9):e1500973.

**[00212]** Accordingly, compounds that inhibit the activity of TYK2 are beneficial, especially those with selectivity over JAK2. Such compounds should deliver a pharmacological response that favorably treats one or more of the conditions described herein without the side-effects associated with the inhibition of JAK2.

**[00213]** Even though TYK2 inhibitors are known in the art, there is a continuing need to provide novel inhibitors having more effective or advantageous pharmaceutically relevant properties. For example, compounds with increased activity, selectivity over other JAK kinases (especially JAK2), and ADMET (absorption, distribution, metabolism, excretion, and/or toxicity) properties. Thus, in some embodiments, the present invention provides inhibitors of TYK2 which show selectivity over JAK2.

**[00214]** The activity of a compound utilized in this invention as an inhibitor of TYK2, or a mutant thereof, may be assayed *in vitro*, *in vivo* or in a cell line. *In vitro* assays include assays that determine inhibition of either the phosphorylation activity and/or the subsequent functional consequences, or ATPase activity of activated TYK2, or a mutant thereof. Alternate *in vitro* assays quantitate the ability of the inhibitor to bind to TYK2. Inhibitor binding may be measured by radiolabeling the inhibitor prior to binding, isolating the inhibitor/TYK2 complex and determining the amount of radiolabel bound. Alternatively, inhibitor binding may be determined by running a competition experiment where new inhibitors are incubated with TYK2 bound to known radioligands. Representative *in vitro* and *in vivo* assays useful in assaying a TYK2 inhibitor include those described and disclosed in, *e.g.*, each of which is herein incorporated by reference in its entirety. Detailed conditions for assaying a compound utilized in this invention as an inhibitor of TYK2, or a mutant thereof, are set forth in the Examples below.

**[00215]** As used herein, the terms “treatment,” “treat,” and “treating” refer to reversing, alleviating, delaying the onset of, or inhibiting the progress of a disease or disorder, or one or more symptoms thereof, as described herein. In some embodiments, treatment may be administered after one or more symptoms have developed. In other embodiments, treatment may be administered in the absence of symptoms. For example, treatment may be administered to a susceptible individual prior to the onset of symptoms (*e.g.*, in light of a history of symptoms and/or in light of genetic or other susceptibility factors). Treatment may also be continued after symptoms have resolved, for example to prevent or delay their recurrence.

**[00258]** The compounds and compositions, according to the method of the present invention, may be administered using any amount and any route of administration effective for treating or lessening the severity of an autoimmune disorder, an inflammatory disorder, a proliferative disorder, an endocrine disorder, a neurological disorder, or a disorder associated with transplantation. The exact amount required will vary from subject to subject, depending on the species, age, and general condition of the subject, the severity of the infection, the particular agent, its mode of administration, and the like. Compounds of the invention are preferably formulated in dosage unit form for ease of administration and uniformity of dosage. The expression "dosage unit form" as used herein refers to a physically discrete unit of agent appropriate for the patient to be treated. It will be understood, however, that the total daily usage of the compounds and compositions of the present invention will be decided by the attending physician within the scope of sound medical judgment. The specific effective dose level for any particular patient or organism will depend upon a variety of factors including the disorder being treated and the severity of the disorder; the activity of the specific compound employed; the specific composition employed; the age, body weight, general health, sex and diet of the patient; the time of administration, route of administration, and rate of excretion of the specific compound employed; the duration of the treatment; drugs used in combination or coincidental with the specific compound employed, and like factors well known in the medical arts. The term "patient", as used herein, means an animal, preferably a mammal, and most preferably a human.

**[00259]** Pharmaceutically acceptable compositions of this invention can be administered to humans and other animals orally, rectally, parenterally, intracisternally, intravaginally, intraperitoneally, topically (as by powders, ointments, or drops), buccally, as an oral or nasal spray, or the like, depending on the severity of the infection being treated. In certain embodiments, the compounds of the invention may be administered orally or parenterally at dosage levels of about 0.01 mg/kg to about 50 mg/kg and preferably from about 1 mg/kg to about 25 mg/kg, of subject body weight per day, one or more times a day, to obtain the desired therapeutic effect.

**[00260]** Liquid dosage forms for oral administration include, but are not limited to, pharmaceutically acceptable emulsions, microemulsions, solutions, suspensions, syrups and elixirs. In addition to the active compounds, the liquid dosage forms may contain inert diluents commonly used in the art such as, for example, water or other solvents, solubilizing agents and

emulsifiers such as ethyl alcohol, isopropyl alcohol, ethyl carbonate, ethyl acetate, benzyl alcohol, benzyl benzoate, propylene glycol, 1,3-butylene glycol, dimethylformamide, oils (in particular, cottonseed, groundnut, corn, germ, olive, castor, and sesame oils), glycerol, tetrahydrofurfuryl alcohol, polyethylene glycols and fatty acid esters of sorbitan, and mixtures thereof. Besides inert diluents, the oral compositions can also include adjuvants such as wetting agents, emulsifying and suspending agents, sweetening, flavoring, and perfuming agents.

**[00261]** Injectable preparations, for example, sterile injectable aqueous or oleaginous suspensions may be formulated according to the known art using suitable dispersing or wetting agents and suspending agents. The sterile injectable preparation may also be a sterile injectable solution, suspension or emulsion in a nontoxic parenterally acceptable diluent or solvent, for example, as a solution in 1,3-butanediol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution, U.S.P. and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose any bland fixed oil can be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid are used in the preparation of injectables.

**[00262]** Injectable formulations can be sterilized, for example, by filtration through a bacterial-retaining filter, or by incorporating sterilizing agents in the form of sterile solid compositions which can be dissolved or dispersed in sterile water or other sterile injectable medium prior to use.

**[00263]** In order to prolong the effect of a compound of the present invention, it is often desirable to slow the absorption of the compound from subcutaneous or intramuscular injection. This may be accomplished by the use of a liquid suspension of crystalline or amorphous material with poor water solubility. The rate of absorption of the compound then depends upon its rate of dissolution that, in turn, may depend upon crystal size and crystalline form. Alternatively, delayed absorption of a parenterally administered compound form is accomplished by dissolving or suspending the compound in an oil vehicle. Injectable depot forms are made by forming microencapsule matrices of the compound in biodegradable polymers such as polylactide-polyglycolide. Depending upon the ratio of compound to polymer and the nature of the particular polymer employed, the rate of compound release can be controlled. Examples of other biodegradable polymers include poly(orthoesters) and poly(anhydrides). Depot injectable

formulations are also prepared by entrapping the compound in liposomes or microemulsions that are compatible with body tissues.

**[00265]** Solid dosage forms for oral administration include capsules, tablets, pills, powders, and granules. In such solid dosage forms, the active compound is mixed with at least one inert, pharmaceutically acceptable excipient or carrier such as sodium citrate or dicalcium phosphate and/or a) fillers or extenders such as starches, lactose, sucrose, glucose, mannitol, and silicic acid, b) binders such as, for example, carboxymethylcellulose, alginates, gelatin, polyvinylpyrrolidinone, sucrose, and acacia, c) humectants such as glycerol, d) disintegrating agents such as agar--agar, calcium carbonate, potato or tapioca starch, alginic acid, certain silicates, and sodium carbonate, e) solution retarding agents such as paraffin, f) absorption accelerators such as quaternary ammonium compounds, g) wetting agents such as, for example, cetyl alcohol and glycerol monostearate, h) absorbents such as kaolin and bentonite clay, and i) lubricants such as talc, calcium stearate, magnesium stearate, solid polyethylene glycols, sodium lauryl sulfate, and mixtures thereof. In the case of capsules, tablets and pills, the dosage form may also comprise buffering agents.

**[00266]** Solid compositions of a similar type may also be employed as fillers in soft and hard-filled gelatin capsules using such excipients as lactose or milk sugar as well as high molecular weight polyethylene glycols and the like. The solid dosage forms of tablets, dragees, capsules, pills, and granules can be prepared with coatings and shells such as enteric coatings and other coatings well known in the pharmaceutical formulating art. They may optionally contain opacifying agents and can also be of a composition that they release the active ingredient(s) only, or preferentially, in a certain part of the intestinal tract, optionally, in a delayed manner. Examples of embedding compositions that can be used include polymeric substances and waxes. Solid compositions of a similar type may also be employed as fillers in soft and hard-filled gelatin

The active component is admixed under sterile conditions with a pharmaceutically acceptable carrier and any needed preservatives or buffers as may be required. Ophthalmic formulation, ear drops, and eye drops are also contemplated as being within the scope of this invention. Additionally, the present invention contemplates the use of transdermal patches, which have the added advantage of providing controlled delivery of a compound to the body. Such dosage forms can be made by dissolving or dispersing the compound in the proper medium. Absorption enhancers can also be used to increase the flux of the compound across the skin. The rate can be controlled by either providing a rate controlling membrane or by dispersing the compound in a polymer matrix or gel.

### Example 98. TYK2 JH2 Domain Binding Assay

**[00992]** Binding constants for compounds of the present invention against the JH2 domain were determined by the following protocol for a KINOMEscan<sup>®</sup> assay (DiscoveRx). A fusion protein of a partial length construct of human TYK2 (JH2domain-pseudokinase) (amino acids

G556 to D888 based on reference sequence NP\_003322.3) and the DNA binding domain of NFkB was expressed in transiently transfected HEK293 cells. From these HEK 293 cells, extracts were prepared in M-PER extraction buffer (Pierce) in the presence of Protease Inhibitor Cocktail Complete (Roche) and Phosphatase Inhibitor Cocktail Set II (Merck) per manufacturers' instructions. The TYK2(JH2domain-pseudokinase) fusion protein was labeled with a chimeric double-stranded DNA tag containing the NFkB binding site (5'-GGGAATTCCC-3') fused to an amplicon for qPCR readout, which was added directly to the expression extract (the final concentration of DNA-tag in the binding reaction is 0.1 nM).

**[00993]** Streptavidin-coated magnetic beads (Dynal M280) were treated with a biotinylated small molecule ligand for 30 minutes at room temperature to generate affinity resins for the binding assays. The liganded beads were blocked with excess biotin and washed with blocking buffer (SeaBlock (Pierce), 1% BSA, 0.05% Tween 20, 1 mM DTT) to remove unbound ligand and to reduce nonspecific binding.

**[00994]** The binding reaction was assembled by combining 16  $\mu$ l of DNA-tagged kinase extract, 3.8  $\mu$ l liganded affinity beads, and 0.18  $\mu$ l test compound (PBS/0.05% Tween 20/10 mM DTT/0.1% BSA/2  $\mu$ g/ml sonicated salmon sperm DNA). Extracts were used directly in binding assays without any enzyme purification steps at a  $\geq$ 10,000-fold overall stock dilution (final DNA-tagged enzyme concentration <0.1 nM). Extracts were loaded with DNA-tag and diluted into the binding reaction in a two step process. First extracts were diluted 1:100 in 1x binding buffer (PBS/0.05% Tween 20/10 mM DTT/0.1% BSA/2  $\mu$ g/ml sonicated salmon sperm DNA) containing 10 nM DNA-tag. This dilution was allowed to equilibrate at room temperature for 15 minutes and then subsequently diluted 1:100 in 1x binding buffer. All reactions were performed in polypropylene 384-well plates. Each was a final volume of 0.02 mL. Assays were incubated with shaking for 1 hour at room temperature. Then the beads were pelleted and washed with wash buffer (1x PBS, 0.05% Tween 20) to remove displaced kinase and test compound. The washed based were re-suspended in elution buffer (1x PBS, 0.05% Tween 20, 0.5  $\mu$ M non-biotinylated affinity ligand) and incubated at room temperature with shaking for 30 minutes. The kinase concentration in the eluates was measured by qPCR. qPCR reactions were assembled by adding 2.5  $\mu$ L of kinase eluate to 7.5  $\mu$ L of qPCR master mix containing 0.15  $\mu$ M amplicon

primers and 0.15  $\mu$ M amplicon probe. The qPCR protocol consisted of a 10 minute hot start at 95 °C, followed by 35 cycles of 95 °C for 15 seconds, 60 °C for 1 minute.

**[00995]** Test compounds were prepared as 111x stocks in 100% DMSO.  $K_d$  values were determined using an 11-point 3-fold compound dilution series with three DMSO control points. All compounds for  $K_d$  measurements are distributed by acoustic transfer (non-contact dispensing) in 100% DMSO. The compounds were then diluted directly into the assays such that the final concentration of DMSO was 0.9%. The  $K_d$  values were determined using a compound top concentration of 30,000 nM.  $K_d$  measurements were performed in duplicate.

**[00996]** Binding constants ( $K_{ds}$ ) were calculated with a standard dose-response curve using the Hill equation:  $Response = Background + \frac{(Signal-Background)}{(1+(\frac{K_d}{Dose})^{Hill\ Slope})}$

**[00997]** The Hill Slope was set to -1. Curves were fitted using a non-linear least square fit with the Levenberg-Marquardt algorithm (Levenberg, K., A method for the solution of certain non-linear problems in least squares, *Q. Appl. Math.* **2**, 164-168 (1944)).

**[00998]** Results of the TYK2 JH2 Domain Binding Assay are presented in **Table 2**. **Example 99. TYK2 & JAK2 Radioactive Kinase Assay**

**[00999]** Peptide substrate, [KKSRGDYM**T**MQIG], (20  $\mu$ M) was prepared in reaction buffer (20 mM Hepes pH 7.5, 10 mM MgCl<sub>2</sub>, 1 mM EGTA, 0.02% Brij35, 0.02 mg/mL BSA, 0.1 mM Na<sub>3</sub>PO<sub>4</sub>, 2 mM DTT, 1% DMSO). TYK2 (Invitrogen) kinase was added, followed by compounds in DMSO. <sup>33</sup>PATP was added to initiate the reaction in ATP at 10  $\mu$ M. The kinase reaction was incubated for 120 min at room temp and reactions were spotted onto P81 ion exchange paper (Whatman # 3698-915), and then washed extensively in 0.75% phosphoric acid, prior to reading the radioactivity counts. For JAK2 (Invitrogen) kinase assay the peptide substrate poly[Glu:Tyr] (4:1), 0.2 mg/ml was used, in the reaction carried out the same as for TYK2.

### Example 100. TYK2 & JAK2 Caliper Assay

[001002] The caliper machine employs an off chip mobility shift assay to detect phosphorylated peptide substrates from kinase assays, using microfluidics technology. The assays were carried out at ATP concentration equivalent to the ATP Km, and at 1 mM ATP. Compounds were serially diluted in DMSO then further diluted in assay buffer (25 mM HEPES, pH 7.5, 0.01% Brij-35, 0.01% Triton, 0.5 mM EGTA). 5ul of diluted compound was added into wells first, then 10 ul of enzyme mix was added into wells, followed by 10 uL of substrate mix (peptide and ATP in 10 mM MgCl<sub>2</sub>) to start reaction. Reaction was incubated at 28 °C for 25 min and then added 25 ul stop buffer (100 mM HEPES, 0.015% Brij-35, 50 mM EDTA), followed by reading with Caliper. JAK2 at 1 nM final concentration and TYK2 at 9.75 nM are from Carna, and substrates used are ATP at 20 and 16 uM, respectively. JAK2 assay uses peptide 22 and TYK2 uses peptide 30 (Caliper), each at 3 uM.

### Example 101. IL-12 Induced pSTAT4 in human PBMC

[001003] Human PBMC were isolated from buffy coat and were stored frozen for assays as needed. Cells for assay were thawed and resuspended in complete media containing serum, then cells were diluted to 1.67 E6 cells/mL so that 120  $\mu$ l per well is 200,000 cells. 15  $\mu$ l of compound or DMSO was added to the well at the desired concentrations and incubated at 1 hr at 37 C. 15  $\mu$ l of stimulus (final concentration of 1.7 ng/mL IL-12) was added for 30 minutes prior to pSTAT4 and total STAT4 analysis using cell lysates prepared and analyzed by MSD reagents as per manufacturer protocol. The final DMSO concentration of compound in the assay was 0.1%.

[001004] The IL-12 Induced pSTAT4 assay evaluates the inhibition of IL-12 induced STAT4 phosphorylation mediated by TYK2/JAK2 (heterodimeric complex).

[001005] Results of the IL-12 Induced pSTAT4 in human PBMC are presented in **Table 4**. Compounds denoted as “A” had an IC<sub>50</sub> lower than 0.1  $\mu$ M; compounds denoted as “B” had an IC<sub>50</sub> between 0.1 and 0.5  $\mu$ M; compounds denoted as “C” had an IC<sub>50</sub> between 0.5 and 1.0  $\mu$ M; and compounds denoted as “D” had an IC<sub>50</sub> greater than 1.0  $\mu$ M.

The final DMSO concentration of compound in the assay was 0.1%.

**[001007]** The GM-CSF Induced pSTAT5 assay is a JAK2 cellular selectivity assay which evaluates inhibition of GM-CSF induced STAT5 phosphorylation mediated by the JAK2/JAK2 homodimeric complex.

**[001008]** Results of the GM-CSF Induced pSTAT5 assay are presented in **Table 5**. **Example 103. Ex vivo Mouse IL-12 induced IFN $\gamma$  Studies**

**[001009]** C57/BL6 mice are given a single oral dose of either vehicle or different doses of compound at a volume of 10 mL/kg. 30 minutes to 1 hour after dosing, animals are euthanized and blood was collected via vena cava into sodium heparin blood collection tubes and inverted several times. Blood is then plated on anti-CD3 coated plates and stimulated with 2 ng/ml of mouse IL-12 in RPMI media for 24 hours at 37°C in humidified incubator with 5% CO<sub>2</sub>. At the end of the incubation, blood is centrifuged at 260g for 5 minutes to collect supernatant. IFN $\gamma$  concentration in the supernatant is determined with mouse IFN $\gamma$  MSD kit per manufacturer's instruction (Meso Scale Discovery). At the time of the blood collection, plasma is collected for drug level analysis by LC-MS/MS.

#### **Example 104. T-ALL Cell Proliferation Assay**

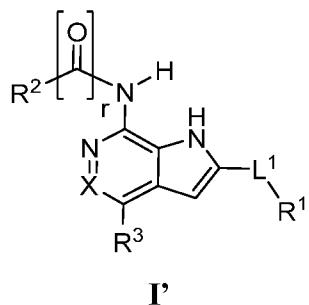

**[001010]** T-ALL cell lines KOPT-K1, HPB-ALL, DND-41, PEER, and CCRF-CEM are cultured in RPMI-1640 medium with 10% fetal bovine serum and penicillin/streptomycin. Cells are plated in triplicate at 1 x 10<sup>4</sup> cells per well in 96-well plates. T-ALL cell lines DU.528, LOUCY, and SUP-T13 are cultured in the same medium and plated at a density of 1.5 x 10<sup>4</sup> cells per well. The cells are treated with DMSO or different concentrations of each compound of the invention. Cell viability at 72 hour exposure to the drug is assessed by CellTiter-Glo Luminescent Cell Viability Assay (Promega). CellTiter-Glo Reagent is added into the well and incubated for 10 minutes. Luminescence is measured subsequently using a 96-well plate luminescence reader. Cell viability is calculated by using the DMSO treated samples as 100%. IC<sub>50</sub> value is calculated by nonlinear regression using GraphPad Prism software.

**Box No. II Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)**

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1.  Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:
  
2.  Claims Nos.: because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
  
3.  Claims Nos.: 11-40 because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

**Box No. III Observations where unity of invention is lacking (Continuation of item 3 of first sheet)**

This International Searching Authority found multiple inventions in this international application, as follows:

-\*\*\*Continued Within the Next Supplemental Box-\*\*\*-

1.  As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2.  As all searchable claims could be searched without effort justifying additional fees, this Authority did not invite payment of additional fees.
3.  As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
  
4.  No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:  
1, 5-6, 9/1, 9/5, 10/1, 10/5

**Remark on Protest**

## INTERNATIONAL SEARCH REPORT

International application No.

PCT/US19/63510

-\*\*\*-Continued from Box No. III Observations where unity of invention is lacking -\*\*\*-

This application contains the following inventions or groups of inventions which are not so linked as to form a single general inventive concept under PCT Rule 13.1. In order for all inventions to be examined, the appropriate additional examination fees must be paid. Groups I+, Claims 1-10; and a compound of Formula I' wherein X is N; L1 a covalent bond; R1 is Cy1 wherein Cy1 is phenyl; R2 is C1-6 aliphatic; and R3 is -C(O)NH2 (compound structure) are directed toward compounds.

The compound will be searched to the extent they encompass a compound of Formula I' wherein X is N; L1 a covalent bond; R1 is Cy1 wherein Cy1 is phenyl; R2 is C1-6 aliphatic; and R3 is -C(O)NH2 (first exemplary compound structure). Applicant is invited to elect additional compound(s), with fully specified structure(s) thereof (e.g. no optional or variable atoms, bonds, or substituents) for each, where available as an option within at least one searchable claim, to be searched. Additional compound(s) will be searched upon the payment of additional fees. It is believed that claims 1 (in-part), 5-6 (in-part), and 9-10 (in-part) encompass this first named invention and thus these claims will be searched without fee to the extent that they encompass a compound of Formula I' wherein X is N; L1 a covalent bond; R1 is Cy1 wherein Cy1 is phenyl; R2 is C1-6 aliphatic; and R3 is -C(O)NH2 (compound structure). Applicants must specify the searchable claims that encompass any additionally elected compound structure(s). Applicants must further indicate, if applicable, the claims which encompass the first named invention, if different than what was indicated above for this group. Failure to clearly identify how any paid additional invention fees are to be applied to the "+" group(s) will result in only the first claimed invention to be searched/examined. An exemplary election would be a compound of Formula I' wherein X is CH; L1 a covalent bond; R1 is Cy1 wherein Cy1 is phenyl; R2 is C1-6 aliphatic; and R3 is -C(O)NH2 (compound structure).

Groups I+ share the technical features including: a compound of formula I', as shown, wherein X is N or CH; L1 is a covalent bond or a C1-4 bivalent saturated or unsaturated, straight or branched hydrocarbon chain wherein one or two methylene units of the chain are optionally and independently replaced by -C(R4)2-, -N(R)-, -N(R)C(O)-, -C(O)NR-, -N(R)S(O)2-, -S(O)2N(R)-, -O-, -C(O)-, -OC(O)-, -C(O)O-, -S-, -S(O)- or -S(O)2-; -\*\*\*-Continued from Previous Supplemental Box-\*\*\*-

Dynavax discloses a compound similar to a compound of formula I': as shown, wherein X is N; L1 a covalent bond; and R1 is Cy1 wherein Cy1 is phenyl (compound of formula A-1 wherein A1 is C, A2 is CR2 wherein R2 is hydrogen, A3 is NR3a wherein R3a is hydrogen, A5 is N, A4 is N (X is N), R1 is phenyl (L1 is a covalent bond and R1 is Cy1 wherein Cy1 is phenyl); paragraphs [0030], [0063]), but Dynavax does not disclose wherein R2 is C1-6 aliphatic; R3 is -C(O)NH2; and r is 0. However, Merck discloses wherein R2 is C1-6 aliphatic; R3 is -C(O)NH2; and r is 0 (compound of formula I wherein A is heteroaryl, Ring B is heteroaryl, p is 2 and one R3 is -N(R)2 wherein one R is hydrogen and one R is C1-6 aliphatic (R2 is C1-6 aliphatic and r is 0) and the other R3 is CON(R)2 wherein each R is hydrogen (R3 is CONH2); paragraphs [0065]-[0067], [0070], [0079]). It would have been obvious to a person of ordinary skill in the art, at the time of the invention, to have modified the compound, as previously disclosed by Dynavax, in order to have provided wherein R2 is C1-6 aliphatic; R3 is -C(O)NH2; and r is 0, as previously disclosed by Merck, for providing bicyclic heteroaryl compounds useful as toll-like receptor antagonists in the treatment of immune disorders (Dynavax; abstract; Merck; paragraphs [0002], [0006]). Since none of the special technical features of the Groups I+ inventions is found in more than one of the inventions, and since all of the shared technical features are previously disclosed by the Dynavax and Merck references, unity of invention is lacking.
