HUMAN TNFRSF25 ANTIBODY

CROSS-REFERENCE TO RELATED APPLICATIONS

This application claims benefit of priority from U.S. Provisional Application No. 62/134,740, filed on March 18, 2015, and U.S. Provisional Application No. 62/080,694, filed on November 17, 2014, both of which are incorporated herein by reference in their entirety.

TECHNICAL FIELD

This document relates to antibodies and antigen binding fragments thereof that bind specifically to TNFRSF25, and to methods for using the antibody and antigen binding fragments to, for example, stimulate proliferation of human T cells (e.g., CD8+ T cells), and to treat cancer patients.

BACKGROUND

Tumor necrosis factor receptor superfamily member 25 (TNFRSF25) is a member of the TNF-receptor superfamily that is preferentially expressed by activated and antigen-experienced T lymphocytes. TNFRSF25 is activated by the TLIA (TNFSF15) ligand, which is rapidly upregulated in antigen presenting cells and in some endothelial cells following Toll-Like Receptor or Fc receptor activation. TNFRSF25 can stimulate NF-kappa B activity, and also can stimulate caspase activation to regulate cell apoptosis (Bodmer et al., Immunity 6(1):79-88, 1997; and Kitson et al, Nature 384(6607):372-375, 1996). Alternative splicing produces multiple distinct isoforms of TNFRSF25, most of which are potentially secreted molecules. Alternative splicing of the TNFRSF25 gene in B and T cells encounters a program change upon T-cell activation, which predominantly produces full-length, membrane bound isoforms, and is thought to be involved in controlling lymphocyte proliferation induced by T-cell activation.

Activation of TNFRSF25 is dependent on previous engagement of the T cell receptor. After binding to TLIA, TNFRSF25 signaling increases the sensitivity of T cells to endogenous IL-2, and enhances T cell proliferation. Since activation of TNFRSF25 is
T cell receptor dependent, the activity of TNFRSF25 in vivo is specific to T cells that are encountering cognate antigen. At rest, and when there is no underlying autoimmunity, the majority of T cells that regularly encounter cognate antigen are FoxP3+ regulatory T cells. Stimulation of TNFRSF25, in the absence of any other exogenous signals, stimulates highly specific proliferation of FoxP3+ regulatory T cells from a baseline of 8-10% of all CD4+ T cells to 35-40% of all CD4+ T cells, within five days (Schreiber et al, J Clin Invest 120(10):3629-3640, 2010). Therapeutic agonists of TNFRSF25 can be used to stimulate Treg expansion, which can reduce inflammation in experimental models of asthma, allogeneic solid organ transplantation, and ocular keratitis (Schreiber et al., supra; Reddy et al, J Virol 86(19): 10606-10620, 2012; and Wolf et al, Transplantation 94(6):569-574, 2012). Similarly, because TNFRSF25 activation is antigen dependent, costimulation of TNFRSF25 together with an autoantigen or with a vaccine antigen can lead to exacerbation of immunopathology or enhanced vaccine-stimulated immunity, respectively (Schreiber et al, J Immunol 189(7):3311-3318, 2010).

SUMMARY

This document provides agonistic human and humanized TNFRSF25 specific monoclonal antibodies, and antigen binding fragments thereof. Also provided herein are methods for, inter alia, using the antibodies and antigen binding fragments to stimulate proliferation of human T cells, as well as methods for using the antibodies and antigen binding fragments in the treatment of human cancer patients (e.g., by administering an amount of an antibody or antigen binding fragment that is effective to stimulate proliferation of CD8+ T cells).

In one aspect, this document features an isolated heavy chain variable region polypeptide that binds specifically to TNFRSF25, where the polypeptide includes heavy chain CDR1, CDR2, and CDR3 sequences, where the CDR1 sequence is GFTFSNHDLN (SEQ ID NO:4), the CDR2 sequence is YISSASGLISYADAVRG (SEQ ID NO:6); and (c) the CDR3 sequence is DPPYSGLYALDF (SEQ ID NO:8). The isolated heavy chain variable region polypeptide can further include variable region heavy chain framework (FW) sequences juxtaposed between the heavy chain CDRs according to the formula
(FW1)-(CDR1)-(FW2)-(CDR2)-(FW3)-(CDR3)-(FW4). The heavy chain framework sequences can be human. In some embodiments, the isolated heavy chain variable region polypeptide can be combination with a light chain variable region polypeptide comprising light chain CDR1, CDR2, and CDR3 sequences, wherein the CDR1 sequence is TLSSELSSYTIV (SEQ ID NO:11), the CDR2 sequence is LKSDGSHSKGD (SEQ ID NO:13), and the CDR3 sequence is GAGYTLAGQYGWV (SEQ ID NO:15). Variable region light chain framework (FW) sequences can be juxtaposed between the light chain CDRs according to the formula (FW1)-(CDR1)-(FW2)-(CDR2)-(FW3)-(CDR3)-(FW4). The light chain framework sequences can be human.

In another aspect, this document features an isolated anti-TNFRSF25 antibody or antigen binding fragment thereof, where the antibody or antibody fragment contains (i) a heavy chain variable region sequence containing the amino acid sequence set forth in SEQ ID NO:1 or the amino acid sequence of SEQ ID NO:1 with no more than 12 total amino acid substitutions, and (ii) a light chain variable region sequence containing the amino acid sequence of SEQ ID NO:2 or the amino acid sequence of SEQ ID NO:2 with no more than 11 total amino acid substitutions. The antibody or antigen binding fragment can further include a human constant region (e.g., a constant region selected from the group consisting of human IgGl, IgG2, IgG3, and IgG4), or a murine constant region (e.g., a constant region selected from the group consisting of murine IgGl, IgG2A, IgG2B, and IgG3). The antibody or antigen binding fragment can have reduced or minimal effector function. The antibody or antigen binding fragment can bind to human TNFRSF25 with an affinity of about 5 nM. The antibody or antigen binding fragment can be capable of increasing proliferation of human, murine, or macaque T cells in vitro or in vivo (e.g., wherein the proliferation of the T cell is increased by at least 20%, as determined by flow cytometry analysis of antigen specific T cells). Administration of the antibody or antigen binding fragment to a subject at a dose of about 0.1 mg/kg to about 50 mg/kg can lead to stimulation of T cell proliferation in the subject, and/or to increased tumor cell apoptosis in the subject.
This document also features a pharmaceutical composition containing a pharmaceutically acceptable carrier and an antibody or antigen binding fragment as described herein.

In addition, this document features an article of manufacture containing a pharmaceutical composition as provided herein and at least one additional agent for treating cancer. The at least one additional agent can include, for example, an agent that targets CTLA-4, PD-1, PD-L1, LAG-3, Tim-3, TNFRSF4, TNFRSF9, TNFRSF18, CD27, CD39, CD47, CD73, or CD278, an A2A receptor antagonist, a TGF-beta antagonist, a B7 family costimulatory molecule, a TNF receptor superfamily costimulatory molecule, a vaccine composition, chimeric antigen receptor-transfected T cells or expanded tumor infiltrating lymphocytes for use in an adoptive T cell therapy (e.g., in vitro or in a subject), or a chemotherapeutic agent. In some embodiments, the at least one additional agent can be used during the in vitro manufacturing process of an autologous T cell therapy.

In another aspect, this document features an isolated monoclonal antibody that specifically binds to TNFRSF25. The antibody can include (a) a heavy chain containing a CDR1 sequence as set forth in SEQ ID NO:4, a CDR2 sequence as set forth in SEQ ID NO:6, and a CDR3 sequence as set forth in SEQ ID NO:8, and (b) a light chain containing a CDR1 sequence as set forth in SEQ ID NO:1, a CDR2 sequence as set forth in SEQ ID NO:13, and a CDR3 sequence as set forth in SEQ ID NO:15. The isolated monoclonal antibody can include a heavy chain containing SEQ ID NO:1, 17, 21, 23, or 25, and a light chain comprising SEQ ID NO:2, 26, or 30.

In another aspect, this document features a pharmaceutical composition containing a pharmaceutically acceptable carrier and a human or humanized monoclonal antibody that specifically binds to TNFRSF25, where the antibody comprises includes (a) a heavy chain containing a CDR1 sequence as set forth in SEQ ID NO:4, a CDR2 sequence as set forth in SEQ ID NO:6, and a CDR3 sequence as set forth in SEQ ID NO:8, and (b) a light chain containing a CDR1 sequence as set forth in SEQ ID NO:1, a CDR2 sequence as set forth in SEQ ID NO:13, and a CDR3 sequence as set forth in SEQ ID NO:15. In some embodiments, the antibody can include a heavy chain comprising the
amino acid sequence set forth in SEQ ID NO:1, 17, 21, 23, or 25, and a light chain comprising the amino acid sequence set forth in SEQ ID NO:2, 26, or 30.

In still another aspect, this document features an isolated monoclonal antibody that binds specifically to TNFRSF25, where the antibody contains a set of six CDRs that includes no more than four total amino acid substitutions in the set of six CDRs having the amino acid sequences set forth in SEQ ID NOS:4, 6, 8, 11, 13, and 15. In some embodiments, the set of six CDRs includes no more than two total amino acid substitutions in the set of six CDRs having the amino acid sequences set forth in SEQ ID NOS:4, 6, 8, 11, 13, and 15.

In another aspect, this document features a pharmaceutical composition containing a pharmaceutically acceptable carrier and a human or humanized monoclonal antibody that binds specifically to TNFRSF25, where the antibody contains a set of six CDRs that includes no more than four total amino acid substitutions in the set of six CDRs having the amino acid sequences set forth in SEQ ID NOS:4, 6, 8, 11, 13, and 15. In some embodiments, the set of six CDRs includes no more than two total amino acid substitutions in the set of six CDRs having the amino acid sequences set forth in SEQ ID NOS:4, 6, 8, 11, 13, and 15.

This document also features a method for treating a tumor in a subject. The method can include administering to the subject an amount of a composition as provided herein that is effective to induce apoptosis of TNFRSF25-expressing tumor cells in the tumor. The composition can include, for example, a pharmaceutically acceptable carrier and a human or humanized monoclonal antibody that binds specifically to TNFRSF25, where the antibody includes a set of six CDRs that comprises no more than four total amino acid substitutions in the set of six CDRs having the amino acid sequences set forth in SEQ ID NOS:4, 6, 8, 11, 13, and 15, or an isolated anti-TNFRSF25 antibody or antigen binding fragment thereof that includes (i) a heavy chain variable region sequence containing the amino acid sequence set forth in SEQ ID NO:1 or the amino acid sequence of SEQ ID NO:1 with no more than 12 total amino acid substitutions, and (ii) a light chain variable region sequence containing the amino acid sequence of SEQ ID NO:2 or
the amino acid sequence of SEQ ID NO:2 with no more than 11 total amino acid 
substitutions.

In addition, this document features a method for stimulating proliferation of 
CD8+ T cells in a subject. The method can include administering to the subject a 
therapeutically effective amount of a composition as provided herein. Proliferation of 
CD8+ T cells can be increased by at least about 20% as compared to the baseline level of 
proliferation prior to the administering, as determined by flow cytometry analysis of 
antigen specific CD8+ T cells.

In yet another aspect, this document features a method for eliciting an immune 
response in a subject. The method can include administering to the subject a 
therapeutically effective amount of a composition as provided herein.

This document also features a method for stimulating proliferation of 
CD4+FoxP3+ regulatory T cells in a subject. The method can include administering to 
the subject a therapeutically effective amount of a composition as provided herein. 

Unless otherwise defined, all technical and scientific terms used herein have the 
same meaning as commonly understood by one of ordinary skill in the art to which this 
invention pertains. Although methods and materials similar or equivalent to those 
described herein can be used to practice the invention, suitable methods and materials are 
described below. All publications, patent applications, patents, and other references 
mentioned herein are incorporated by reference in their entirety. In case of conflict, the 
present specification, including definitions, will control. In addition, the materials, 
methods, and examples are illustrative only and not intended to be limiting.

The details of one or more embodiments of the invention are set forth in the 
accompanying drawings and the description below. Other features, objects, and 
advantages of the invention will be apparent from the description and drawings, and from 
the claims.

**DESCRIPTION OF DRAWINGS**

FIG. 1 is a graph plotting functional activity of a human TNFRSF25-specific 
mAb (PTX-25). P815 cells, or P815 cells expressing human TNFRSF25, were exposed in
This document provides a human TNFRSF25 specific monoclonal antibody ("PTX-25"), as well as humanized versions of the antibody, and antigen binding fragments of the antibody and its humanized versions. Also provided herein are methods
for using PTX-25 to, inter alia, stimulate proliferation of T cells (e.g., human T cells, murine T cells, or macaque T cells), as well as methods for using PTX-25 in the treatment of human cancer patients (e.g., by administering an amount of PTX-25 that is effective to stimulate proliferation of CD8+ T cells).

As used herein, the term "antibody" refers to any immunoglobulin or antibody (e.g., human, hamster, feline, mouse, cartilaginous fish, or camelid antibodies), and any derivative or conjugate thereof, that specifically binds to an antigen. A wide variety of antibodies are known by those skilled in the art. Non-limiting examples of antibodies include monoclonal antibodies, polyclonal antibodies, humanized antibodies, multi-specific antibodies (e.g., bi-specific antibodies), single-chain antibodies (e.g., single-domain antibodies, camelid antibodies, and cartilaginous fish antibodies), chimeric antibodies, feline antibodies, and felinized antibodies. The term antibody also includes antibody derivatives and conjugates (e.g., an antibody conjugated to a stabilizing protein, a detectable moiety, or a therapeutic agent).

By "isolated" or "purified" with respect to a polypeptide (e.g., an antibody or a fragment thereof), it is meant that the polypeptide is separated to some extent from the cellular components with which would normally be found in nature (e.g., other polypeptides, lipids, carbohydrates, and nucleic acids). In some embodiments, an "isolated" polypeptide is one that is expressed and produced in an environment other than the environment in which the polypeptide would naturally expressed and produced. For example, a plant polypeptide is isolated when expressed and produced in bacteria or fungi. Similarly, a plant polypeptide is isolated when its gene coding sequence is operably linked to a chimeric regulatory element and expressed in a tissue where the polypeptide is not naturally expressed.

An isolated polypeptide can yield a single major band on a non-reducing polyacrylamide gel. An isolated polypeptide can be at least about 75% pure (e.g., at least 80%, 85%, 90%, 95%, 97%, 98%, 99%, or 100% pure). Isolated polypeptides can be obtained by, for example, extraction from a natural source, by chemical synthesis, or by recombinant production in a host cell or transgenic plant, and can be purified using, for example, affinity chromatography, immunoprecipitation, size exclusion chromatography,
and ion exchange chromatography. The extent of purification can be measured using any appropriate method, including, without limitation, column chromatography, polyacrylamide gel electrophoresis, or high-performance liquid chromatography.

An "antigen binding fragment" is any portion of a full-length antibody that contains at least one variable domain (e.g., a variable domain of a mammalian (e.g., feline, human, hamster, or mouse) heavy or light chain immunoglobulin, a camelid variable antigen binding domain (VHH), or a cartilaginous fish immunoglobulin new antigen receptor (Ig-NAR) domain) that is capable of specifically binding to an antigen. Non-limiting examples of antibody fragments include Fab, Fab', F(ab')₂, and Fv fragments, diabodies, linear antibodies, and multi-specific antibodies formed from antibody fragments. Additional antibody fragments containing at least one camelid VHH domain or at least one cartilaginous fish Ig-NAR domain include mini-bodies, micro-antibodies, subnano-antibodies, and nano-antibodies, and any of the other forms of antibodies described, for example, in U.S. Publication No. 2010/0092470.

An "Fv fragment" is the minimum antibody fragment that contains a complete antigen recognition and binding site. This region consists of a dimer of one heavy chain variable domain and one light chain variable domain in tight, non-covalent association. It is in this configuration that the three complementary determining regions (CDRs) of each variable domain interact to define an antigen binding site on the surface of the VH-VL dimer. As used herein, the term "complementary determining region" or "CDR" refers to a region within an immunoglobulin (a heavy or light chain immunoglobulin) that forms part of an antigen binding site in an antibody or antigen binding fragment thereof. As is known in the art, heavy chain and light chain immunoglobulins each contain three CDRs, referred to as CDR1, CDR2, and CDR3. In any antibody or antigen binding fragment, the three CDRs from the heavy chain immunoglobulin and the three CDRs from the light chain immunoglobulin together form an antigen binding site in the antibody or antigen binding fragment thereof. The Kabat Database is one system used in the art to number CDR sequences present in a light chain immunoglobulin or a heavy chain immunoglobulin.
Collectively, the six CDR's confer antigen binding specificity to the antibody. However, even a single variable domain (or half of an Fv comprising only three CDR's specific for an antigen) has the ability to recognize and bind the antigen, although usually at a lower affinity than the entire binding site. The "Fab fragment" also contains the constant domain of the light chain and the first constant domain (CHI) of the heavy chain. The "Fab fragment" differs from the "Fab' fragment" by the addition of a few residues at the carboxy terminus of the heavy chain CHI domain, including one or more cysteines from the antibody hinge region. The "F(ab')2 fragment" originally is produced as a pair of "Fab' fragments" which have hinge cysteines between them. Methods of preparing such antibody fragments, such as papain or pepsin digestion, are known to those skilled in the art.

An antibody can be of the IgA-, IgD-, IgE, IgG- or IgM-type, including IgG- or IgM-types such as, without limitation, IgGl-, IgG2-, IgG3-, IgG4-, IgM1- and IgM2-types. For example, in some cases, the antibody is of the IgGl-, IgG2- or IgG4- type.

In some embodiments, antibodies as provided herein can be fully human or humanized antibodies. By "human antibody" is meant an antibody that is encoded by a nucleic acid (e.g., a rearranged human immunoglobulin heavy or light chain locus) present in the genome of a human. In some embodiments, a human antibody can be produced in a human cell culture (e.g., feline hybridoma cells). In some embodiments, a human antibody can be produced in a non-human cell (e.g., a mouse or hamster cell line). In some embodiments, a human antibody can be produced in a bacterial or yeast cell.

Human antibodies can avoid certain problems associated with xenogeneic antibodies, such as antibodies that possess murine or rat variable and/or constant regions. For example, because the effector portion is human, it can interact better with other parts of the human immune system, e.g., to destroy target cells more efficiently by complement-dependent cytotoxicity or antibody-dependent cellular cytotoxicity. In addition, the human immune system should not recognize the antibody as foreign. Further, half-life in human circulation will be similar to naturally occurring human antibodies, allowing smaller and less frequent doses to be given. Methods for preparing human antibodies are known in the art.
As used herein, the term "humanized antibody" refers to a human antibody that contains minimal sequence derived from non-human (e.g., mouse, hamster, rat, rabbit, or goat) immunoglobulin. Humanized antibodies generally are chimeric or mutant monoclonal antibodies from mouse, rat, hamster, rabbit or other species, bearing human constant and/or variable region domains or specific changes. In non-limiting examples, humanized antibodies are human antibodies (recipient antibody) in which hypervariable region (HVR) residues of the recipient antibody are replaced by HVR residues from a non-human species (donor) antibody, such as a mouse, rat, rabbit, or goat antibody having the desired specificity, affinity, and capacity. In some embodiments, Fv framework residues of the human immunoglobulin can be replaced by corresponding non-human residues. In some embodiments, humanized antibodies can contain residues that are not found in the recipient antibody or in the donor antibody. Such modifications can be made to refine antibody performance, for example.

In some embodiments, a humanized antibody can contain substantially all of at least one, and typically two, variable domains, in which all or substantially all of the hypervariable loops (CDRs) correspond to those of a non-human immunoglobulin, while all or substantially all of the framework regions are those of a human immunoglobulin sequence. A humanized antibody also can contain at least a portion of an immunoglobulin constant (Fc) region, typically that of a human immunoglobulin.

In some embodiments, humanized antibody or antigen binding fragment as provided herein can have reduced or minimal effector function (e.g., as compared to corresponding, non-humanized antibody), such that it does not stimulate effector cell action to the same extent that a corresponding non-humanized antibody would.

Techniques for generating humanized antibodies are well known to those of skill in the art. In some embodiments, controlled rearrangement of antibody domains joined through protein disulfide bonds to form new, artificial protein molecules or "chimeric" antibodies can be utilized (Konieczny et al, Haematologica (Budap.) 14:95, 1981). Recombinant DNA technology can be used to construct gene fusions between DNA sequences encoding mouse antibody variable light and heavy chain domains and human antibody light and heavy chain constant domains (Morrison et al., Proc Natl Acad Sci
USA 81:6851, 1984). For example, DNA sequences encoding antigen binding portions or CDRs of murine monoclonal antibodies can be grafted by molecular means into DNA sequences encoding frameworks of human antibody heavy and light chains (Jones et al., Nature 321:522, 1986; and Riechmann et al, Nature 332:323, 1988). Expressed recombinant products are called "reshaped" or humanized antibodies, and contain the framework of a human antibody light or heavy chain and antigen recognition portions, CDRs, of a murine monoclonal antibody.

Other methods for designing heavy and light chains and for producing humanized antibodies are described in, for example, U.S. Patent Nos. 5,530,101; 5,565,332; 5,585,089; 5,639,641; 5,693,761; 5,693,762; and 5,733,743. Yet additional methods for humanizing antibodies are described in U.S. Patent Nos. 4,816,567; 4,935,496; 5,502,167; 5,558,864; 5,693,493; 5,698,417; 5,705,154; 5,750,078; and 5,770,403, for example.

The term "single-chain antibody" refers to a single polypeptide that contains at least one variable binding domain (e.g., a variable domain of a mammalian heavy or light chain immunoglobulin, a camelpid VHH, or a cartilaginous fish (e.g., shark) Ig-NAR domain) that is capable of specifically binding to an antigen. Non-limiting examples of single-chain antibodies include single-domain antibodies.

As used herein, the term "single-domain antibody" refers to a polypeptide that contains one camelpid VHH or at least one cartilaginous fish Ig-NAR domain that is capable of specifically binding to an antigen. Non-limiting examples of single-domain antibodies are described, for example, in U.S. Publication No. 2010/0092470.

An antibody or antigen binding fragment thereof "specifically binds" to a particular antigen, e.g., TNFRFS25, when it binds to that antigen in a sample, and does not recognize and bind, or recognizes and binds to a lesser extent, other molecules in the sample. In some embodiments, an antibody or an antigen binding fragment thereof can selectively bind to an epitope with an affinity (KD) equal to or less than, for example, about 1 x 10^{-6} M (e.g., equal to or less than about 1 x 10^{-9} M, equal to or less than about 1 x 10^{-10} M, equal to or less than about 1 x 10^{-11} M, or equal to or less than about 1 x 10^{-12} M) in phosphate buffered saline. The ability of an antibody or antigen binding fragment
to specifically bind a protein epitope can be determined using any of the methods known in the art or those methods described herein. This can include, for example, binding to TNFRSF25 on live cells as a method to stimulate caspase activation in live transformed cells (FIG. 2 and TABLE 1), binding to an immobilized target substrate including human TNFRSF25 fusion proteins as detected using an ELISA method (FIG. 3), binding to TNFRSF25 on live cells as detected by flow cytometry (FIG. 6 and TABLE 2), or binding to an immobilized substrate by surface plasmon resonance (including ProteOn) (FIG. 7 and TABLE 3).

As described herein, a monoclonal antibody against TNFRSF25 was isolated, and the amino acid sequences of the variable heavy and light chains were determined to contain SEQ ID NOS:1 and 2, respectively. As described in Example 4 below, the antibody was humanized, such that several humanized VH (SEQ ID NOS:17, 21, 23, and 25) and VL (SEQ ID NOS:26 and 30) genes were designed using homologous frameworks of human germ line genes (FIG. 4).

Thus, this document provides heavy chain variable region polypeptides containing the amino acid sequence set forth in SEQ ID NO:1, 17, 21, 23, or 25, or an antigen binding fragment thereof, as well as polypeptides having at least about 90% (e.g., about 91%, about 92%, about 93%, about 94%, about 95%, about 96%, about 97%, about 98%, or about 99%) amino acid sequence identity to SEQ ID NO:1, 17, 21, 23, or 25, or an antigen binding fragment thereof. In some embodiments, a heavy chain variable region polypeptide can contain 12 or less (e.g., 12, 11, ten, nine, eight, seven, six, five, four, three, two, or one) amino acid substitution as compared to SEQ ID NO:1, 17, 21, 23, or 25, or an antigen binding fragment thereof.

In some embodiments, a heavy chain variable region polypeptide can include the CDR1 sequence set forth in SEQ ID NO:4, the CDR2 sequence set forth in SEQ ID NO:6, and the CDR3 sequence set forth in SEQ ID NO:8. The polypeptide also can include variable region heavy chain framework (FW) sequences juxtaposed between the CDRs, according to the formula (FW1)-(CDR1)-(FW2)-(CDR2)-(FW3)-(CDR3)-(FW4), for example. In some embodiments, the FW sequences can be human sequences. In some embodiments, a heavy chain variable region polypeptide can include the FW1
sequence set forth in SEQ ID NO:3, SEQ ID NO: 18, or SEQ ID NO:22, the FW2 sequence set forth in SEQ ID NO:5, SEQ ID NO: 19, or SEQ ID NO:24, the FW3 sequence set forth in SEQ ID NO:7 or SEQ ID NO:20, and the FW4 sequence set forth in SEQ ID NO:9. Particular combinations of heavy chain variable region CDR and FW sequences are set forth in the Examples herein. It is to be noted, however, that this document contemplates other combinations of the disclosed CDR and FW sequences.

This document also provides light chain variable region polypeptides containing the amino acid sequence set forth in SEQ ID NO:2, 26, or 30, or an antigen binding fragment thereof, as well as polypeptides having at least about 90% (e.g., about 91%, about 92%, about 93%, about 94%, about 95%, about 96%, about 97%, about 98%, or about 99%) amino acid sequence identity to SEQ ID NO:2, 26, or 30, or an antigen binding fragment thereof. In some embodiments, a light chain variable region polypeptide can contain 11 or less (e.g., 11, ten, nine, eight, seven, six, five, four, three, two, or one) amino acid substitutions as compared to SEQ ID NO:2, 26, or 30, or an antigen binding fragment thereof.

In some embodiments, a light chain variable region polypeptide can contain the CDR1 sequence set forth in SEQ ID NO: 11, the CDR2 sequence set forth in SEQ ID NO: 13, and the CDR3 sequence set forth in SEQ ID NO: 15. The polypeptide also can include variable region light chain FW juxtaposed between the CDRs, according to the formula (FW1)-(CDR1)-(FW2)-(CDR2)-(FW3)-(CDR3)-(FW4). In some cases, the FW sequences can be human sequences. In some embodiments, a light chain variable region polypeptide can include the FW1 sequence set forth in SEQ ID NO: 10, SEQ ID NO:27, or SEQ ID NO:31, the FW2 sequence set forth in SEQ ID NO:12, SEQ ID NO:28, or SEQ ID NO:32, the FW3 sequence set forth in SEQ ID NO:14, SEQ ID NO:29, or SEQ ID NO:33, and the FW4 sequence set forth in SEQ ID NO:16. Particular combinations of light chain variable region CDR and FW sequences are set forth in the Examples herein. It is to be noted, however, that this document contemplates other combinations of the disclosed CDR and FW sequences.

This document also provides antibodies and antigen binding fragments that contain both a heavy chain variable region polypeptide and a light chain variable region
polypeptide as disclosed herein. In some embodiments, for example, an antibody or antigen binding fragment can contain both a heavy chain variable region sequence comprising the amino acid sequence set forth in SEQ ID NO:1, or the amino acid sequence of SEQ ID NO: 1 with no more than 12 total amino acid substitutions (e.g., no more than ten, no more than eight, no more than six, no more than four, or no more than two total amino acid substitutions), and a light chain variable region sequence comprising the amino acid sequence of SEQ ID NO:2, or the amino acid sequence of SEQ ID NO:2 with no more than 11 total amino acid substitutions (e.g., no more than nine, no more than seven, no more than five, no more than three, or no more than one total amino acid substitution). An amino acid substitution refers to the replacement of one amino acid residue with another in a peptide sequence.

In some embodiments, amino acid substitutions can be made by selecting conservative substitutions that do not differ significantly in their effect on maintaining (a) the structure of the peptide backbone in the area of the substitution, (b) the charge or hydrophobicity of the molecule at the target site, or (c) the bulk of the side chain. For example, naturally occurring residues can be divided into groups based on side-chain properties: (1) hydrophobic amino acids (norleucine, methionine, alanine, valine, leucine, and isoleucine); (2) neutral hydrophilic amino acids (cysteine, serine, and threonine); (3) acidic amino acids (aspartic acid and glutamic acid); (4) basic amino acids (asparagine, glutamine, histidine, lysine, and arginine); (5) amino acids that influence chain orientation (glycine and proline); and (6) aromatic amino acids (tryptophan, tyrosine, and phenylalanine). Substitutions made within these groups can be considered conservative substitutions. Non-limiting examples of conservative substitutions include, without limitation, substitution of valine for alanine, lysine for arginine, glutamine for asparagine, glutamic acid for aspartic acid, serine for cysteine, asparagine for glutamine, aspartic acid for glutamic acid, proline for glycine, arginine for histidine, leucine for isoleucine, isoleucine for leucine, arginine for lysine, leucine for methionine, leucine for phenylalanine, glycine for proline, threonine for serine, serine for threonine, tyrosine for tryptophan, phenylalanine for tyrosine, and/or leucine for valine. In some embodiments,
an amino acid substitution can be non-conservative, such that a member of one of the amino acid classes described above is exchanged for a member of another class.

The percent sequence identity between a particular nucleic acid or amino acid sequence and a sequence referenced by a particular sequence identification number is determined as follows. First, a nucleic acid or amino acid sequence is compared to the sequence set forth in a particular sequence identification number using the BLAST 2 Sequences (B12seq) program from the stand-alone version of BLASTZ containing BLASTN version 2.0.14 and BLASTP version 2.0.14. This stand-alone version of BLASTZ can be obtained online at fr.com/blast or at ncbi.nlm.nih.gov. Instructions explaining how to use the B12seq program can be found in the readme file accompanying BLASTZ. B12seq performs a comparison between two sequences using either the BLASTN or BLASTP algorithm. BLASTN is used to compare nucleic acid sequences, while BLASTP is used to compare amino acid sequences. To compare two nucleic acid sequences, the options are set as follows: -i is set to a file containing the first nucleic acid sequence to be compared (e.g., C:\seq1.txt); -j is set to a file containing the second nucleic acid sequence to be compared (e.g., C:\seq2.txt); -p is set to blastn; -o is set to any desired file name (e.g., C:\output.txt); -q is set to -1; -r is set to 2; and all other options are left at their default setting. For example, the following command can be used to generate an output file containing a comparison between two sequences: C:\B12seq -i c:\seq1.txt -j c:\seq2.txt -p blastn -o c:\output.txt -q -1 -r 2. To compare two amino acid sequences, the options of B12seq are set as follows: -i is set to a file containing the first amino acid sequence to be compared (e.g., C:\seq1.txt); -j is set to a file containing the second amino acid sequence to be compared (e.g., C:\seq2.txt); -p is set to blastp; -o is set to any desired file name (e.g., C:\output.txt); and all other options are left at their default setting. For example, the following command can be used to generate an output file containing a comparison between two amino acid sequences: C:\B12seq -i c:\seq1.txt -j c:\seq2.txt -p blastp -o c:\output.txt. If the two compared sequences share homology, then the designated output file will present those regions of homology as aligned sequences. If the two compared sequences do not share homology, then the designated output file will not present aligned sequences.
Once aligned, the number of matches is determined by counting the number of positions where an identical nucleotide or amino acid residue is presented in both sequences. The percent sequence identity is determined by dividing the number of matches either by the length of the sequence set forth in the identified sequence (e.g., SEQ ID NO: 1), or by an articulated length (e.g., 100 consecutive nucleotides or amino acid residues from a sequence set forth in an identified sequence), followed by multiplying the resulting value by 100. For example, an amino acid sequence that has 110 matches when aligned with the sequence set forth in SEQ ID NO:1 is 90.9 percent identical to the sequence set forth in SEQ ID NO:1 (i.e., 110 ÷ 121 x 100 = 90.9). It is noted that the percent sequence identity value is rounded to the nearest tenth. For example, 75.11, 75.12, 75.13, and 75.14 is rounded down to 75.1, while 75.15, 75.16, 75.17, 75.18, and 75.19 is rounded up to 75.2. It also is noted that the length value will always be an integer.

This document also provides pharmaceutical compositions that contain an antibody or antigen binding fragment as described herein, in combination with a pharmaceutically acceptable carrier. A "pharmaceutically acceptable carrier" (also referred to as an "excipient" or a "carrier") is a pharmaceutically acceptable solvent, suspending agent, stabilizing agent, or any other pharmacologically inert vehicle for delivering one or more therapeutic compounds to a subject (e.g., a mammal, such as a human, non-human primate, dog, cat, sheep, pig, horse, cow, mouse, rat, or rabbit), which is nontoxic to the cell or subject being exposed thereto at the dosages and concentrations employed. Pharmaceutically acceptable carriers can be liquid or solid, and can be selected with the planned manner of administration in mind so as to provide for the desired bulk, consistency, and other pertinent transport and chemical properties, when combined with one or more of therapeutic compounds and any other components of a given pharmaceutical composition. Typical pharmaceutically acceptable carriers that do not deleteriously react with amino acids include, by way of example and not limitation: water, saline solution, binding agents (e.g., polyvinylpyrrolidone or hydroxypropyl methylcellulose), fillers (e.g., lactose and other sugars, gelatin, or calcium sulfate), lubricants (e.g., starch, polyethylene glycol, or sodium acetate), disintegrates (e.g., starch
or sodium starch glycolate), and wetting agents (e.g., sodium lauryl sulfate).
Pharmaceutically acceptable carriers also include aqueous pH buffered solutions or liposomes (small vesicles composed of various types of lipids, phospholipids and/or surfactants which are useful for delivery of a drug to a mammal). Further examples of pharmaceutically acceptable carriers include buffers such as phosphate, citrate, and other organic acids, antioxidants such as ascorbic acid, low molecular weight (less than about 10 residues) polypeptides, proteins such as serum albumin, gelatin, or immunoglobulins, hydrophilic polymers such as polyvinylpyrrolidone, amino acids such as glycine, glutamine, asparagine, arginine or lysine, monosaccharides, disaccharides, and other carbohydrates including glucose, mannose or dextrins, chelating agents such as EDTA, sugar alcohols such as mannitol or sorbitol, salt-forming counterions such as sodium, and/or nonionic surfactants such as TWEEN™, polyethylene glycol (PEG), and PLUPvONICS™.

Pharmaceutical compositions can be formulated by mixing one or more active agents with one or more physiologically acceptable carriers, diluents, and/or adjuvants, and optionally other agents that are usually incorporated into formulations to provide improved transfer, delivery, tolerance, and the like. A pharmaceutical composition can be formulated, e.g., in lyophilized formulations, aqueous solutions, dispersions, or solid preparations, such as tablets, dragees or capsules. A multitude of appropriate formulations can be found in the formulary known to all pharmaceutical chemists:

Remington's Pharmaceutical Sciences (18th ed, Mack Publishing Company, Easton, PA (1990)), particularly Chapter 87 by Block, Lawrence, therein. These formulations include, for example, powders, pastes, ointments, jellies, waxes, oils, lipids, lipid (cationic or anionic) containing vesicles (such as LIPOFECTIN™), DNA conjugates, anhydrous absorption pastes, oil-in-water and water-in-oil emulsions, emulsions carbowax (polyethylene glycols of various molecular weights), semi-solid gels, and semi-solid mixtures containing carbowax. Any of the foregoing mixtures may be appropriate in treatments and therapies as described herein, provided that the active agent in the formulation is not inactivated by the formulation and the formulation is physiologically compatible and tolerable with the route of administration. See, also, Baldrick, Regul
Pharmaceutical compositions include, without limitation, solutions, emulsions, aqueous suspensions, and liposome-containing formulations. These compositions can be generated from a variety of components that include, for example, preformed liquids, self-emulsifying solids and self-emulsifying semisolids. Emulsions are often biphasic systems comprising of two immiscible liquid phases intimately mixed and dispersed with each other; in general, emulsions are either of the water-in-oil (w/o) or oil-in-water (o/w) variety. Emulsion formulations have been widely used for oral delivery of therapeutics due to their ease of formulation and efficacy of solubilization, absorption, and bioavailability.

Compositions and formulations can contain sterile aqueous solutions, which also can contain buffers, diluents and other suitable additives (e.g., penetration enhancers, carrier compounds and other pharmaceutically acceptable carriers). Compositions additionally can contain other adjunct components conventionally found in pharmaceutical compositions. Thus, the compositions also can include compatible, pharmaceutically active materials such as, for example, antipruritics, astringents, local anesthetics or anti-inflammatory agents, or additional materials useful in physically formulating various dosage forms of the compositions provided herein, such as dyes, flavoring agents, preservatives, antioxidants, opacifiers, thickening agents and stabilizers. Furthermore, the composition can be mixed with auxiliary agents, e.g., lubricants, preservatives, stabilizers, wetting agents, emulsifiers, salts for influencing osmotic pressure, buffers, colorings, flavorings, and aromatic substances. When added, however, such materials should not unduly interfere with the biological activities of the polypeptide components within the compositions provided herein. The formulations can be sterilized if desired.

In some embodiments, a composition containing an antibody or antigen binding fragment as provided herein (e.g., PTX-25 or an antigen binding fragment thereof) can be
in the form of a solution or powder with or without a diluent to make an injectable suspension. The composition may contain additional ingredients including, without limitation, pharmaceutically acceptable vehicles, such as saline, water, lactic acid, mannitol, or combinations thereof, for example.

Any appropriate method can be used to administer an antibody or antigen binding fragment as described herein to a mammal. Administration can be, for example, parenteral (e.g., by subcutaneous, intrathecal, intraventricular, intramuscular, or intraperitoneal injection, or by intravenous drip). Administration can be rapid (e.g., by injection) or can occur over a period of time (e.g., by slow infusion or administration of slow release formulations). In some embodiments, administration can be topical (e.g., transdermal, sublingual, ophthalmic, or intranasal), pulmonary (e.g., by inhalation or insufflation of powders or aerosols), or oral. In addition, a composition containing an antibody or antigen binding fragment as described herein can be administered prior to, after, or in lieu of surgical resection of a tumor.

A composition containing an anti-TNFRSF25 antibody or antigen binding fragment can be administered to a mammal in any appropriate amount, at any appropriate frequency, and for any appropriate duration effective to achieve a desired outcome. For example, an anti-TNFRSF25 antibody or antigen binding fragment can be administered to a subject in an amount effective to stimulate proliferation of T cells in vitro or in vivo (e.g., human, murine, hamster, or macaque T cells, including CD8+ T cells and/or CD4+FoxP3+ regulatory T cells), to stimulate apoptosis of tumor cells that express TNFRSF25, to reduce tumor size, or to increase progression-free survival of a cancer patient.

Administration to a subject of an antibody or antigen binding fragment as provided herein can result in increased numbers of T cells (e.g., naturally-occurring tumor-reactive CD8+ T cells or CD4+FoxP3+ regulatory T cells) that can exert anti-cancer effects against cancer cells present within the mammal. Thus, this document also provides methods for stimulating proliferation of T cells in a subject, by administering to the subject an antibody, antigen-binding fragment, or composition as disclosed herein. In some cases, a composition containing an anti-TNFRSF25 antibody or antigen binding
fragment as described herein can be administered to a subject in an amount effective to
increase proliferation of T cells (e.g., by at least about 10 percent, about 20 percent, about
25 percent, about 50 percent, about 60 percent, about 70 percent, about 75 percent, about
80 percent, about 90 percent, about 100 percent, or more than 100 percent), as compared
to the "baseline" level of T cell proliferation in the subject prior to administration of the
composition, or as compared to the level of T cell proliferation in a control subject or
population of subjects to whom the composition was not administered. The T cells can
be, for example, CD8+ T cells, or CD4+FoxP3+ regulatory T cells. Any suitable method
can be used to determine whether or not the level of T cell proliferation is increased in
the subject. Such methods can include, without limitation, flow cytometry analysis of
antigen specific T cells (e.g., flow cytometry analysis of the proportion of antigen
specific CD8+ T cells as a fraction of the total CD8+ T cell pool), analysis of cell
proliferation markers (e.g., expression of Ki67) in CD8+ T cells, increased counts of
CD8+ T cells, or increased proportions of individual TCR sequences of a particular clone
of CD8+ T cells.

This document also provides methods for promoting apoptosis of TNFRSF25-
expressing tumor cells in a subject, by treating the subject with an antibody, antigen-
binding fragment, or composition as described herein. In some cases, a composition
containing an antibody or antigen binding fragment as provided herein can be
administered to a subject (e.g., a cancer patient) in an amount effective to increase
apoptosis of TNFRSF25-expressing tumor cells (e.g., by at least about 10 percent, about
20 percent, about 25 percent, about 50 percent, about 60 percent, about 70 percent, about
75 percent, about 80 percent, about 90 percent, about 100 percent, or more than 100
percent), as compared to the "baseline" level of tumor cell apoptosis in the subject prior
to administration of the composition, or as compared to the level of tumor cell apoptosis
in a control subject or population of subjects to whom the composition was not
administered. Any suitable method can be used to determine whether or not the level of
tumor cell apoptosis is increased in the subject. This can include, for example, radiologic
techniques such as CT or MRI, with or without contrast that indicates the presence of a
necrotic or apoptotic tumor, biopsy of a tumor sample indicating increased tumor cell
death, caspase induction within tumor cells, elimination of detectable tumor lesions by radiologic, or surgical or physical examination.

Methods for treating a subject (e.g., a human patient) with cancer also are provided herein. In some cases, a composition containing an antibody or antigen binding fragment as described herein can be administered to a subject having cancer in an amount effective to reduce the progression rate of the cancer (e.g., by at least about 10 percent, about 20 percent, about 25 percent, about 50 percent, about 60 percent, about 70 percent, about 75 percent, about 80 percent, about 90 percent, or more than 90 percent), as compared to the rate of cancer progression in the subject prior to administration of the composition, or as compared to the rate of cancer progression in a control subject or population of subjects to whom the composition was not administered. In some embodiments, the progression rate can be reduced such that no additional cancer progression is detected. Any appropriate method can be used to determine whether or not the progression rate of cancer is reduced. For skin cancer (e.g., melanoma), for example, the progression rate can be assessed by imaging tissue at different time points and determining the amount of cancer cells present. The amounts of cancer cells determined within tissue at different times can be compared to determine the progression rate. After treatment as described herein, the progression rate can be determined again over another time interval. In some cases, the stage of cancer after treatment can be determined and compared to the stage before treatment to determine whether or not the progression rate has been reduced.

A composition containing an antibody or antigen binding fragment as described herein also can be administered to a subject having cancer under conditions where progression-free survival is increased (e.g., by at least about 10 percent, about 20 percent, about 25 percent, about 50 percent, about 60 percent, about 70 percent, about 75 percent, about 80 percent, about 90 percent, about 100 percent, or more than 100 percent), as compared to the median progression-free survival of corresponding subjects having untreated cancer or the median progression-free survival of corresponding subjects having cancer and treated with other therapies (e.g., chemotherapeutic agents alone).
Progression-free survival can be measured over any length of time (e.g., one month, two months, three months, four months, five months, six months, or longer).

An effective amount of a composition containing a molecule as provided herein can be any amount that has a desired defect (e.g., stimulates proliferation of CD8+ T cells, stimulates apoptosis of TNFRSF25-expressing tumor cells, stimulates or elicits an immune response in a subject, reduces tumor size, reduces the progression rate of cancer, increases progression-free survival of a cancer patient, or increases the median time to progression without producing significant toxicity). Optimum dosages can vary depending on the relative potency of individual polypeptides (e.g., antibodies and antigen binding fragments), and can generally be estimated based on EC50 found to be effective in in vitro and in vivo animal models. Typically, dosage is from 0.01 µg to 100 g per kg of body weight. For example, an effective amount of an antibody or antigen binding fragment can be from about 0.1 mg/kg to about 50 mg/kg (e.g., about 0.4 mg/kg, about 2 mg/kg, about 5 mg/kg, about 10 mg/kg, about 20 mg/kg, about 30 mg/kg, about 40 mg/kg, or about 50 mg/kg), or any range there between, such as about 0.1 mg/kg to about 10 mg/kg, about 0.4 mg/kg to about 20 mg/kg, about 2 mg/kg to about 30 mg/kg, or about 5 mg/kg to about 40 mg/kg. If a particular subject fails to respond to a particular amount, then the amount of the antibody or antigen binding fragment can be increased by, for example, two fold. After receiving this higher concentration, the subject can be monitored for both responsiveness to the treatment and toxicity symptoms, and adjustments made accordingly. The effective amount can remain constant or can be adjusted as a sliding scale or variable dose depending on the subject’s response to treatment. Various factors can influence the actual effective amount used for a particular application. For example, the frequency of administration, duration of treatment, use of multiple treatment agents, route of administration, and severity of the cancer may require an increase or decrease in the actual effective amount administered.

The frequency of administration can be any frequency that, for example, stimulates proliferation of CD8+ T cells, stimulates apoptosis of TNFRSF25-expressing tumor cells, reduces tumor size, reduces the progression rate of cancer, increases progression-free survival of a cancer patient, or increases the median time to progression.
without producing significant toxicity. For example, the frequency of administration can be once or more daily, biweekly, weekly, monthly, or even less. The frequency of administration can remain constant or can be variable during the duration of treatment. A course of treatment can include rest periods. For example, a composition containing an antibody or antigen binding fragment as provided herein can be administered over a two week period followed by a two week rest period, and such a regimen can be repeated multiple times. As with the effective amount, various factors can influence the actual frequency of administration used for a particular application. For example, the effective amount, duration of treatment, use of multiple treatment agents, route of administration, and severity of the cancer may require an increase or decrease in administration frequency.

An effective duration for administering a composition provided herein can be any duration that stimulates proliferation of CD8+ T cells, stimulates apoptosis of TNFRSF25-expressing tumor cells, reduces tumor size, reduces the progression rate of cancer, increases progression-free survival of a cancer patient, or increases the median time to progression without producing significant toxicity. Thus, an effective duration can vary from several days to several weeks, months, or years. In general, the effective duration for the treatment of cancer can range in duration from several weeks to several months. In some cases, an effective duration can be for as long as an individual subject is alive. Multiple factors can influence the actual effective duration used for a particular treatment. For example, an effective duration can vary with the frequency of administration, effective amount, use of multiple treatment agents, route of administration, and severity of the cancer.

After administering a composition as provided herein to a cancer patient, the patient can be monitored to determine whether or not the cancer was treated. For example, a subject can be assessed after treatment to determine whether or not the progression rate of the cancer has been reduced (e.g., stopped). Any method, including those that are standard in the art, can be used to assess progression and survival rates.

A method for using an antibody or antigen binding fragment as provided herein can be combined with known methods of treatment for cancer, for example, either as
combined or additional treatment steps, or as additional components of a therapeutic formulation. For example, enhancing a host’s immune function can be useful to combat tumors. Methods can include, without limitation, APC enhancement, such as by injection into a tumor of DNA encoding foreign MHC antigens (including tumor antigens, mutation derived antigens, or other antigens), or transfecting biopsied tumor cells with genes that increase the probability of immune antigen recognition (e.g., immune stimulatory cytokines, GM-CSF, or co-stimulatory molecules B7.1, B7.2) of the tumor. Other methods can include, for example, solubilization of specific tumor antigens into depot or sustained release preparations, transfection of allogeneic tumor cells with adjuvant proteins or antigen carrier proteins, transfection of allogeneic tumor cells with immune stimulatory proteins such as alpha galactosyleramide, incorporation of specific tumor antigens into virus-derived vaccine regimens, incorporation of specific tumor antigens into *Listeria* derived vaccine regimens, adoptive cellular immunotherapy (including chimeric antigen receptor transfected T cells), or treatment with activated tumor-specific T-cells (including *ex vivo* expanded tumor infiltrating lymphocytes). Adoptive cellular immunotherapy can include isolating tumor-infiltrating host T-lymphocytes and expanding the population *in vitro* (e.g., by stimulation with IL-2). The T-cells then can be re-administered to the host. Other treatments that can be used in combination with an antibody or antigen-binding fragment as provided herein include, for example, radiation therapy, chemotherapy, hormonal therapy, and the use of angiogenesis inhibitors.

Thus, in some embodiments, an anti-TNFRSF25 antibody or antigen binding fragment can be used in combination with one or more additional monoclonal antibodies that inhibit binding of PD-L1 to PD-1, inhibit binding of CTLA-4 to CD80 or CD86, or activate signaling via the TNFRSF4, TNFRSF9, or TNFRSF18 pathways, for example. This also can include administration with another antibody, fusion protein, or small molecule that binds a specific target on a tumor cell (e.g., combinations with monoclonal antibodies that bind targets such as CD20, Her2, EGFRvIII, DR4, DR5, VEGF, CD39, and CD73). An anti-TNFRSF25 antibody or antigen binding fragment also can be used in combination with a cancer vaccine approach to enhance the activation of tumor antigen
specific T cells in a cancer patient. In addition, an anti-TNFRSF25 antibody or antigen binding fragment can be used after administration of autologous or allogeneic T or NK cells engineered to express a chimeric T cell receptor that recognizes a specific tumor antigen. Further, an anti-TNFRSF25 antibody or antigen binding fragment can be used in combination with specific chemotherapy or radiation therapy strategies as a method to expand tumor specific T cells and enhance the activity of either approach as a monotherapy in a cancer patient.

When one or more conventional therapies are combined with treatment using an anti-TNFRSF25 antibody or antigen binding fragment as provided herein for treating cancer, for example, the conventional therapy(ies) can be administered prior to, subsequent to, or simultaneously with administration of the anti-TNFRSF25 antibody or antigen binding fragment. For example, a PD-1 blocking antibody can be administered to a patient prior to administration of a TNFRSF25 agonist antibody. Such a regimen can be cycled over a period of weeks, months, or years, for example. Alternatively, a PD-1 blocking antibody can be administered at the same time or after administration of a TNFRSF25 agonist antibody. Such a regimen also can be cycled over a period of weeks, months, or years. In some embodiments, combination therapies that are repeatedly administered over a period of time can include two or more of the above administration strategies.

In some embodiments, an anti-TNFRSF25 antibody or antigen binding fragment as provided herein can be used during an in vitro assay or manufacturing process as a method for stimulating proliferation of tumor infiltrating lymphocytes isolated from a cancer patient, or to stimulate proliferation of chimeric antigen receptor expressing T cells being expanded in vitro and intended for subsequent infusion for the treatment of a cancer patient.

Also provided herein are articles of manufacture containing an antibody or antigen binding fragment as described herein, or a pharmaceutical composition containing the antibody or antigen binding fragment. The antibody or pharmaceutical composition can be within a container (e.g., a bottle, vial, or syringe). The article of manufacture also can include a label with directions for reconstituting and/or using the
antibody, antigen binding fragment, or composition. In some embodiments, an article of manufacture can include one or more additional items (e.g., one or more buffers, diluents, filters, needles, syringes, and/or package inserts with further instructions for use). An article of manufacture also can include at least one additional agent for treating cancer. For example, an article of manufacture as provided herein can contain an agent that targets CTLA-4, PD-1, PD-L1, LAG-3, Tim-3, TNFRSF4, TNFRSF9, TNFRSF18, CD27, CD39, CD47, CD73, or CD278. In some embodiments, an article of manufacture can contain an A2A receptor antagonist or a TGF-beta antagonist. In some embodiments, an article of manufacture can include a B7 family costimulatory molecule (e.g., CD28 or CD278) or a TNF receptor superfamily costimulatory molecule (e.g., TNFRSF4, TNFRSF9, or TNFRSF18), a chemotherapeutic agent, or an anti-tumor vaccine composition.

The invention will be further described in the following examples, which do not limit the scope of the invention described in the claims.

**EXAMPLES**

**Example 1 - Functional activity of human PTX-25**

P815 cells, or P815 cells expressing human TNFRSF25, were exposed *in vitro* to either control human IgG, human TLIA-Ig or PTX-25. TNFRSF25 contains a death domain, which can lead to apoptosis in cells with active signaling via TNFRSF25. Caspase activation can be used as a marker for cells that are undergoing apoptosis. Thus, functional activity of TNFRSF25 was determined by detection of caspase activation in cells expressing human TNFRSF25 and exposed to a TNFRSF25 agonist (human TL1A-Ig or PTX-25) as compared to control. Human TLIA-Ig and PTX-25, but not human IgG, led to caspase activation in P815 cells expressing human TNFRSF25, but not in P815 cells alone (FIG. 1). This assay also was performed using the various humanized constructs outlined herein. These data demonstrated an inverse relationship between the affinity of binding as determined by surface plasmon resonance and the functional activity as determined by caspase activation for the humanized constructs (FIG. 2 and TABLE 1).
Example 2 - Binding of PTX-25 to human TNFRSF25-Fc

The binding of PTX-25 to human TNFRSF25-Fc was detected and quantified using an enzyme linked immunosorbent assay (FIG. 3).

Example 3 - PTX-25 amino acid sequences

Hybridoma sequencing yielded one hamster VH and one hamster VL (lambda) sequence. Protein sequences, including FW and CDR regions, are shown below. CDR definitions are Kabat with the exception of VH CDR1, which was defined using IMGT definition.

Pre-humanized Parental PTX-25 VH: EVQLVESGGLSSQPGLSCLQSLCLCEAS

CDR3: DPPYSGLYALDF (SEQ ID NO:7)
Example 4 - Humanization of PTX-25

Four humanized VH-genes were designed using homologous frameworks of IGHV3-7*03 and IGHV3-48*03 human germ line genes. The amino acid after the Cys in the FW1 region was wobbled between human and mouse sequences (E and A), to better support CDR1 conformation. Two humanized VL-genes were designed using homologous frameworks of IGLV4-60*03 and IGLV4-69*01 human germ line genes. The scheme for humanization is illustrated in FIG. 4. The humanized V-genes were back-translated, codon optimized, and synthesized by GeneScript Custom Gene Synthesis. Seventeen antibodies, including one chimeric antibody and sixteen humanized antibodies (8 IgGl and 8 IgG4), were expressed in 293F cells. Culture supernatants containing antibodies were harvested and purified using Protein A chromatography. Nucleic acid and encoded amino acid sequences follow.

IGLV4-69*01 Clone (94.6% human)
Example 5 - *In vitro* stimulation of CD4+ and CD8+ T cell proliferation by PTX-25

Human T cells were purified by gradient centrifugation and plated in the presence of plate-bound anti-human CD3 antibody and IL-2. PTX-25 was added, and the proliferation of human CD4+ and CD8+ T cells was detected using flow cytometry following incorporation of Click-Edu reagent *in vitro*. Graphs plotting the *in vitro* stimulation of human CD4+ and CD8+ T cell proliferation by PTX-25 are shown in FIG. 5. Left panel, CD4+ cells; right panel, CD8+ cells.

Example 6 - *In vitro* binding activity of humanized TNFRSF25 antibody constructs to human TNFRSF25

The indicated humanized TNFRSF25 antibodies were incubated with P815 cells expressing human TNFRSF25 at the indicated antibody concentrations. Binding of each antibody to the cells was then detected by flow cytometry. The mean fluorescence intensity of binding is indicated on the y-axis for each concentration of antibody indicated on the x-axis (FIG. 6 and TABLE 2).

Example 7 - Affinity of humanized TNFRSF25 antibodies to human TNFRSF25

Affinity of the indicated humanized TNFRSF25 antibodies was determined by surface plasmon resonance (SPR) using the ProteOn method (FIG. 7 and TABLE 3).
Example 8 - *in vitro* caspase release

Caspase release induced by BMK1, chimeric antibody cAbl.hlgGl (35783), and the most potent humanized antibody hAb2 (35816) was tested. Chimeric cAbl.hlgGl (35783) and humanized hAb2 (35816) induced caspase activities with the ECso of 121.4 and 68.2 ng/ml, respectively, both of which were higher than the ECso of BMK1 (19.2 ng/ml; FIG. 8). The maximal caspase activity induced by the engineered antibodies was significantly lower than by the original 4C12-A5 MAb. The significant difference in *in vitro* potencies of 4C12-A5 and cAbl.hlgGl indicated that antibody constant region plays a role in modulating agonistic activity by these antibodies. The *in vitro* potency of humanized hAb2 was within 3-4 fold of the original hamster MAb. The hTLIA-hFc chimera, which is the ligand for TNFRSF25, induced caspase activity with an ECso of 282.5 ng/ml.

Example 9 - Antibody-dependent cell-mediated cytotoxicity

The antibody-dependent cell-mediated cytotoxicity (ADCC) of chimeric and humanized antibodies was measured by incubating target cells with PBMCs for 6 hours with an effector/target ratio of 50:1, using indicated IgG concentrations ranging from 10 ug/ml to 0.01 ng/ml. The maximal lysis rate reached 40%, and the ECso for antibodies ranged from 47 ng/ml to 240 ng/ml (FIG. 9; TABLE 4). No significant difference was observed between chimeric and humanized antibodies.

OTHER EMBODIMENTS

It is to be understood that while the invention has been described in conjunction with the detailed description thereof, the foregoing description is intended to illustrate and not limit the scope of the invention, which is defined by the scope of the appended claims. Other aspects, advantages, and modifications are within the scope of the following claims.
WHAT IS CLAIMED IS:

1. An isolated heavy chain variable region polypeptide that binds specifically to TNFRSF25, the polypeptide comprising heavy chain CDR1, CDR2, and CDR3 sequences, wherein the CDR1 sequence is GFTFSNHDLN (SEQ ID NO:4), the CDR2 sequence is YISSASGLISYADA (SEQ ID NO:6); and (c) the CDR3 sequence is DPPYSGLYALDF (SEQ ID NO:8).

2. The isolated heavy chain variable region polypeptide of claim 1, further comprising variable region heavy chain framework (FW) sequences juxtaposed between the heavy chain CDRs according to the formula (FW1)-(CDR1)-(FW2)-(CDR2)-(FW3)-(CDR3)-(FW4).

3. The isolated heavy chain variable region polypeptide of claim 2, wherein the heavy chain framework sequences are human.

4. The isolated heavy chain variable region polypeptide of claim 1, in combination with a light chain variable region polypeptide comprising light chain CDR1, CDR2, and CDR3 sequences, wherein the CDR1 sequence is TLSSELSSYTIV (SEQ ID NO:11), the CDR2 sequence is LKSDGSHSKGD (SEQ ID NO:13), and the CDR3 sequence is GAGYTLAGQYGV (SEQ ID NO:15).

5. The isolated heavy chain variable region polypeptide of claim 4, wherein variable region light chain framework (FW) sequences are juxtaposed between the light chain CDRs according to the formula (FW1)-(CDR1)-(FW2)-(CDR2)-(FW3)-(CDR3)-(FW4).

6. The isolated heavy chain variable region polypeptide of claim 5, wherein the light chain framework sequences are human.

7. An isolated anti-TNFRSF25 antibody or antigen binding fragment thereof, wherein the antibody or antibody fragment comprises:
(i) a heavy chain variable region sequence comprising the amino acid sequence
set forth in SEQ ID NO:1 or the amino acid sequence of SEQ ID NO:1 with no more than
12 total amino acid substitutions; and

(ii) a light chain variable region sequence comprising the amino acid sequence of
SEQ ID NO:2 or the amino acid sequence of SEQ ID NO:2 with no more than 11 total
amino acid substitutions.

8. The antibody or antigen binding fragment of claim 7, further comprising a human
constant region.

9. The antibody or antigen binding fragment of claim 8, wherein the constant region
is selected from the group consisting of human IgGl, IgG2, IgG3, and IgG4.

10. The antibody or antigen binding fragment of claim 8, wherein the constant region
is IgGl.

11. The antibody or antigen binding fragment of claim 7, further comprising a murine
constant region.

12. The antibody or antigen binding fragment of claim 11, wherein the constant
region is selected from the group consisting of murine IgGl, IgG2A, IgG2B, and IgG3.

13. The antibody or antigen binding fragment of any one of claims 7-12, wherein the
antibody or antigen binding fragment has reduced or minimal effector function.

14. The antibody or antigen binding fragment of any one of claims 7-12, wherein the
antibody or antigen binding fragment binds to human TNFRSF25 with an affinity of
about 5 nM.

15. The antibody or antigen binding fragment of any one of claims 7-12, wherein the
antibody or antigen binding fragment is capable of increasing proliferation of human T
cells in vitro or in vivo.
16. The antibody or antigen binding fragment of claim 15, wherein the proliferation of human T cell is increased by at least 20%, as determined by flow cytometry analysis of antigen specific T cells.

17. The antibody or antigen binding fragment of any one of claims 7-12, wherein the antibody or antigen binding fragment is capable of increasing proliferation of murine T cells in vitro or in vivo.

18. The antibody or antigen binding fragment of claim 17, wherein the proliferation of murine T cells is increased by at least about 20%, as determined by flow cytometry analysis of antigen specific T cells.

19. The antibody or antigen binding fragment of any one of claims 7-12, wherein the antibody or antigen binding fragment is capable of causing proliferation of macaque T cells in vitro or in vivo.

20. The antibody or antigen binding fragment of claim 19, wherein the proliferation of macaque T cells is increased by at least 20%, as determined by flow cytometry analysis of antigen specific T cells.

21. The antibody or antigen binding fragment of any one of claims 7-12, wherein T cell proliferation in a subject is stimulated following administration of the antibody or antigen binding fragment to the subject at a dose of about 0.1 mg/kg to about 50 mg/kg.

22. The antibody or antigen binding fragment of any one of claims 7-12, wherein tumor cell apoptosis in a subject is increased following administration of the antibody or antigen binding fragment to the subject at a dose of about 0.1 mg/kg to about 50 mg/kg.

23. A pharmaceutical composition comprising a pharmaceutically acceptable carrier and the antibody or antigen binding fragment of any one of claims 7-12.
24. An article of manufacture comprising the pharmaceutical composition of claim 23 and at least one additional agent for treating cancer.

25. The article of manufacture of claim 24, wherein the at least one additional agent is an agent that targets CTLA-4, PD-1, PD-L1, LAG-3, Tim-3, TNFRSF4, TNFRSF9, TNFRSF18, CD27, CD39, CD47, CD73, or CD278, or is an A2A receptor antagonist or a TGF-beta antagonist.

26. The article of manufacture of claim 24, wherein the at least one additional agent is a B7 family costimulatory molecule.

27. The article of manufacture of claim 24, wherein the at least one additional agent is a TNF receptor superfamily costimulatory molecule.

28. The article of manufacture of claim 24, wherein the at least one additional agent is a vaccine composition.

29. The article of manufacture of claim 24, wherein the at least one additional agent comprises chimeric antigen receptor-transfected T cells or expanded tumor infiltrating lymphocytes for use in an adoptive T cell therapy \textit{in vitro} or in a subject.

30. The article of manufacture of claim 24, wherein the at least one additional agent is a chemotherapeutic agent.

31. The article of manufacture of claim 24, wherein the at least one additional agent is used during the \textit{in vitro} manufacturing process of an autologous T cell therapy.

32. An isolated monoclonal antibody that specifically binds to TNFRSF25, wherein the antibody comprises:

(a) a heavy chain comprising a CDR1 sequence as set forth in SEQ ID NO:4, a CDR2 sequence as set forth in SEQ ID NO:6, and a CDR3 sequence as set forth in SEQ ID NO:8; and
(b) a light chain comprising a CDR1 sequence as set forth in SEQ ID NO:11, a CDR2 sequence as set forth in SEQ ID NO:13, and a CDR3 sequence as set forth in SEQ ID NO:15.

33. The isolated monoclonal antibody of claim 32, wherein the heavy chain comprises a CDR1 sequence as set forth in SEQ ID NO:4.

34. The isolated monoclonal antibody of claim 32, wherein the antibody comprises a heavy chain comprising SEQ ID NO:1, 17, 21, 23, or 24, and a light chain comprising SEQ ID NO:2, 26, or 30.

35. A pharmaceutical composition comprising a pharmaceutically acceptable carrier and a human or humanized monoclonal antibody that specifically binds to TNFRSF25, wherein the antibody comprises:

(a) a heavy chain comprising a CDR1 sequence as set forth in SEQ ID NO:4, a CDR2 sequence as set forth in SEQ ID NO:6, and a CDR3 sequence as set forth in SEQ ID NO:8; and

(b) a light chain comprising a CDR1 sequence as set forth in SEQ ID NO:11, a CDR2 sequence as set forth in SEQ ID NO:13, and a CDR3 sequence as set forth in SEQ ID NO:15.

36. The pharmaceutical composition of claim 35, wherein the heavy chain comprises a CDR1 sequence as set forth in SEQ ID NO:4.

37. The pharmaceutical composition of claim 35, wherein the antibody comprises a heavy chain comprising the amino acid sequence set forth in SEQ ID NO:1, 17, 21, 23, or 25, and a light chain comprising the amino acid sequence set forth in SEQ ID NO:2, 26, or 30.

38. An isolated monoclonal antibody that binds specifically to TNFRSF25, wherein the antibody comprises a set of six CDRs that comprises no more than four total amino acid substitutions in the set of six CDRs having the amino acid sequences set forth in SEQ ID NOS:4, 6, 8, 11, 13, and 15.
39. The isolated monoclonal antibody of claim 38, when the set of six CDRs comprises no more than two total amino acid substitutions in the set of six CDRs having the amino acid sequences set forth in SEQ ID NOS:4, 6, 8, 11, 13, and 15.

40. A pharmaceutical composition comprising a pharmaceutically acceptable carrier and a human or humanized monoclonal antibody that binds specifically to TNFRSF25, wherein the antibody comprises a set of six CDRs that comprises no more than four total amino acid substitutions in the set of six CDRs having the amino acid sequences set forth in SEQ ID NOS:4, 6, 8, 11, 13, and 15.

41. The pharmaceutical composition of claim 40, when the set of six CDRs comprises no more than two total amino acid substitutions in the set of six CDRs having the amino acid sequences set forth in SEQ ID NOS:4, 6, 8, 11, 13, and 15.

42. A method for treating a tumor in a subject, comprising administering to the subject an amount of the composition of claim 23 or claim 40 that is effective to induce apoptosis of TNFRSF25-expressing tumor cells in the tumor.

43. A method for stimulating proliferation of CD8+ T cells in a subject, comprising administering to the subject a therapeutically effective amount of the composition of claim 23 or claim 40.

44. The method of claim 43, wherein proliferation of CD8+ T cells is increased by at least about 20% as compared to the baseline level of proliferation prior to the administering, as determined by flow cytometry analysis of antigen specific CD8+ T cells.

45. A method of eliciting an immune response in a subject, comprising administering to the subject a therapeutically effective amount of the composition of claim 23 or claim 40.
A method for stimulating proliferation of CD4+FoxP3+ regulatory T cells in a subject, comprising administering to the subject a therapeutically effective amount of the composition of claim 23 or claim 40.

INTERNATIONAL SEARCH REPORT

International application No.
PCT/US1 5/61 082

A. CLASSIFICATION OF SUBJECT MATTER
IPC(8) - A61K 38/00, 39/395 (2016.01 )
CPC - A61K 38/00, 39/395

According to International Patent Classification (IPC) or to both national classification and IPC

B. MINIMUM DOCUMENTATION SEARCHED

Minimum documentation searched (classification system followed by classification symbols)
IPC(8): A61K 38/00, 39/00, 39/395 (2016.01 )
CPC: A61K 38/00, 39/00, 39/395

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)
PatSeer (US, EP, WO, JP, DE, GB, CN, FR, KR, ES, AU, IN, CA, INPADOC Data); EBSCO Discovery; Google/Google Scholar; Pubmed/NCBI BLAST: isolated, heavy chain variable region, polypeptide, monoclonal antibody, pharmaceutical, TNFRSF25

C. DOCUMENTS CONSIDERED TO BE RELEVANT

</table>

Further documents are listed in the continuation of Box C.

See patent family annex.

* Special categories of cited documents:
"A" document defining the general state of the art which is not considered to be of particular relevance
"E" earlier application or patent but published on or after the international filing date
"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
"O" document referring to an oral disclosure, use, exhibition or other means
"P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art
"Z" document member of the same patent family

Date of the actual completion of the international search
18 February 2016 (18.02.2016)

Date of mailing of the international search report
11 MAR 2016
