TOILET KIT

Charles H. Dolan, II, Kansas City, Mo.

Application August 26, 1943, Serial No. 500,117

1 Claim. (Cl. 132-79)

1

The instant invention relates to a toilet kit and more particularly to a men's kit capable of holding tubes, cans and bottles containing toilet preparation as well as toilet accessories such as safety razor, blades, shaving and tooth brushes and comb.

One of the primary objects of the invention is the construction of a toilet kit of the character indicated having means for dispensing the various toilet creams, powder, liquid and the like contained in the tubes, cans and bottles aforementioned.

Yet another aim is the manufacture of a kit in which each bottle, tube and can is equipped with a valve mechanism for selectively dispensing the toilet preparations.

Still another purpose is the fabrication of a kit having the features set out above and which will be a compact portable unit capable of being readily secured to a support such as a wall or ledge; which will be easy to use and economical to manufacture.

The above and other aims and objects will be apparent from the detailed description hereinafter appearing when taken in conjunction with the appended drawing showing preferred embodiments of the invention, and in which:

Figure 1 is a perspective view of a toilet kit showing a front lid portion of the kit in open horizontal position to reveal the manner in which the tubes, bottle and can holding toilet preparations are operatively positioned within the kit; and

Fig. 2 is a fragmentary perspective view of the lower portion of the kit showing the disposition of the various toilet articles or accessories on the inner surface of a lower hinged lid portion or cover, the latter being shown in open position.

In Figs. 1 and 2, the reference character K designates the kit as a whole comprising a substantially rectangular receptacle or container 10 having side walls 11 and 12, a rear wall 13, and an upper lid portion 14 having a curved overhanging extension 15 at its upper edge constituting the top of the container. A lower lid portion 16 having a curved extension 17 at its lower edge constituting the bottom wall of the container, is hinged to the rear wall at 18, while upper lid portion is hinged as indicated at 19.

The upper part of the kit K is equipped with a plurality of spaced vertically extending partitions 20, 21, and 22, forming compartments 23, 24, 25, and 26, the compartment 25 preferably holding in a downwardly directed or inverted dispensing position a tube of shaving cream 28, compartment 26 similarly holding a bottle of after-shave lotion 30, compartment 27 similarly

2

holding a can of talcum powder 31, and compartment 28 similarly holding a tube of toothpaste 32. Each of the tubes, can and bottle has a dispensing valve mechanism 33, 34, 35 or 36. As shown in Fig. 2, in the closed position of lid 14 the operating knobs 37, 38, 39 and 40 of the respective valve mechanisms extend through one of apertures 41, 42, 43 or 44, formed adjacent the lower hinged portion of lid 14, said apertures each being of greater diameter than a knob to permit clearance by lid 14 when swung downwardly.

Figure 2 shows the disposition of a shaving brush 45, comb 46, razor 47, old and new blades 48, 49, and a tooth brush 50 on the inner surface of lower lid 16; said accessories being held in place by spring clips 51 or the like mounted on said surface. For holding the lid portion 16 in horizontal position a two-part folding bracket 52 pivots at 53 to lid portion 16 is provided. Each of lid portions 14 and 16 is snapped closed and frictionally held thus by flanges 54 or the like on the upper edge of the lower lid and curved top 15 on the upper lid portion.

Referring again to the drawing, it will be seen that the kit K is adapted to be attached to a wall or ledge, and when lid 16 carrying various toilet accessories is down, the toilet preparations may be selectively dispensed by operating knobs or push buttons 37, 38, 39 and 40.

It will thus be appreciated that the various aims and objects of the invention have been attained. Various changes in the specific details will occur to those skilled in the art and it is contemplated to cover all such and to be limited in this respect only as may be necessary by the scope of the claim hereto appended.

What I claim and desire to secure by Letters Patent is:

A toilet article unit comprising a container having an upper lid hinged to the walls thereof intermediate the top and bottom of the container and a lower lid hinged to the bottom edge of the container, said lids, in closed position forming the front wall of the container and being vertically aligned, said container having an intermediate horizontal ledge for supporting in the upper portion thereof a plurality of receptacles each containing a toilet preparation with each receptacle in inverted dispensing position, access to said receptacles being had by opening said upper lid and access to a dispensed portion from a receptacle solely by opening said lower lid, said lower lid having means for supporting a plurality of toilet accessories, and means for holding said lower lid in a horizontal position when opened.

CHARLES H. DOLAN, II.
