N-((2Z)-2-((4-HYDROXYPHENYL)IMINO)-1,2-DIHYDRO-3-PYRIDINYL)-4-
METHOXYBENZENESULFONAMIDE CRYSTALLINE FORM 2

FIELD OF THE INVENTION

This invention pertains to N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-
pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2, ways to make it, compositions
containing it and methods of treatment of diseases using it.

BACKGROUND OF THE INVENTION

Crystallinity of compounds may effect, among other physical and mechanical
properties, their solubility, dissolution rate, hardness, compressibility and melting point.
There is therefore an existing need in the chemical and therapeutic arts for identification of
novel crystalline forms of salts of drugs and ways of reproducibly making them.

SUMMARY OF THE INVENTION
One embodiment of this invention pertains to N-((2Z)-2-((4-Hydroxyphenyl)iminoo)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 characterized, when measured at about 25°C with Cu-Kα radiation, by a powder diffraction pattern with at least three peaks having respective 2θ values of about 8.6°, 10.1°, 11.7°, 11.9°, 13.4°, 18.3°, 20.0°, 20.2°, 21.5°, 25.2°, or 26.5°.

Another embodiment pertains to N-((2Z)-2-((4-Hydroxyphenyl)iminoo)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 characterized in the monoclinic crystal system, when measured at about 25°C with Mo-Kα radiation, by respective lattice parameters a, b and c of about 14.1153 Å ± 0.0003 Å, 11.6272 Å ± 0.0003 Å and 21.5959 Å ± 0.0001 Å and β of 107.692°.

Still another embodiment pertains to N-((2Z)-2-((4-Hydroxyphenyl)iminoo)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 characterized in the monoclinic crystal system, when measured at about 25°C with Mo-Kα radiation, by respective lattice parameters a, b and c of about 14.1153 Å ± 0.0003 Å, 11.6272 Å ± 0.0003 Å and 21.5959 Å ± 0.0001 Å and β of 107.692°, and by a powder diffraction pattern, when measured at about 25°C with Cu-Kα radiation, with at least three peaks having respective 2θ values of about 8.6°, 10.1°, 11.7°, 11.9°, 13.4°, 18.3°, 20.0°, 20.2°, 21.5°, 25.2°, or 26.5°.

Still another embodiment pertains to N-((2Z)-2-((4-Hydroxyphenyl)iminoo)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 having substantial crystalline purity and characterized, when measured at about 25°C with Cu-Kα radiation, by a powder diffraction pattern with at least three peaks having respective 2θ values of about 8.6°, 10.1°, 11.7°, 11.9°, 13.4°, 18.3°, 20.0°, 20.2°, 21.5°, 25.2°, or 26.5°.

Still another embodiment pertains to N-((2Z)-2-((4-Hydroxyphenyl)iminoo)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 having substantial crystalline purity and characterized in the monoclinic crystal system, when measured at about 25°C with Mo-Kα radiation, by respective lattice parameters a, b and c of about 14.1153 Å ± 0.0003 Å, 11.6272 Å ± 0.0003 Å and 21.5959 Å ± 0.0001 Å and β of 107.692°.

Still another embodiment pertains to N-((2Z)-2-((4-Hydroxyphenyl)iminoo)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 characterized in the monoclinic crystal system, when measured at about 25°C with Mo-Kα radiation, by respective lattice parameters a, b and c of about 14.1153 Å ± 0.0003 Å, 11.6272 Å ± 0.0003 Å and 21.5959 Å ± 0.0001 Å and β of 107.692°, and by a powder diffraction pattern, when measured at about 25°C with Cu-Kα radiation, with at least three peaks having respective 2θ values of about 8.6°, 10.1°, 11.7°, 11.9°, 13.4°, 18.3°, 20.0°, 20.2°, 21.5°, 25.2°, or 26.5°.
Still another embodiment pertains to N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 having substantial crystalline purity and substantial chemical purity and characterized, when measured at about 25°C with Cu-Kα radiation, by a powder diffraction pattern with at least three peaks having respective 2θ values of about 8.6°, 10.1°, 11.7°, 11.9°, 13.4°, 18.3°, 20.0°, 20.2°, 21.5°, 25.2°, or 26.5°.

Still another embodiment pertains to N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 having substantial crystalline purity and substantial chemical purity and characterized in the monoclinic crystal system, when measured at about 25°C with Mo-Kα radiation, by respective lattice parameters a, b and c of about 14.1153 Å ± 0.0003 Å, 11.6272 Å ± 0.0003 Å and 21.5959 Å ± 0.0001 Å and β of 107.692°.

Still another embodiment pertains to N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 having substantial crystalline purity and substantial chemical purity and characterized in the monoclinic crystal system, when measured at about 25°C with Mo-Kα radiation, by respective lattice parameters a, b and c of about 14.1153 Å ± 0.0003 Å, 11.6272 Å ± 0.0003 Å and 21.5959 Å ± 0.0001 Å and β of 107.692°, and by a powder diffraction pattern, when measured at about 25°C with Cu-Kα radiation, with at least three peaks having respective 2θ values of about 8.6°, 10.1°, 11.7°, 11.9°, 13.4°, 18.3°, 20.0°, 20.2°, 21.5°, 25.2°, or 26.5°.

Still another embodiment pertains to N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 having substantial crystalline purity, substantial chemical purity, and substantial geometric purity and characterized, when measured at about 25°C with Cu-Kα radiation, by a powder diffraction pattern with at least three peaks having respective 2θ values of about 8.6°, 10.1°, 11.7°, 11.9°, 13.4°, 18.3°, 20.0°, 20.2°, 21.5°, 25.2°, or 26.5°.

Still another embodiment pertains to N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 having substantial crystalline purity, substantial chemical purity, and substantial geometric purity and characterized in the monoclinic crystal system, when measured at about 25°C with Mo-Kα radiation, by respective lattice parameters a, b and c of about 14.1153 Å ± 0.0003 Å, 11.6272 Å ± 0.0003 Å and 21.5959 Å ± 0.0001 Å and β of 107.692°.

Still another embodiment pertains to N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 having substantial crystalline purity, substantial chemical purity, and substantial geometric purity and characterized in the monoclinic crystal system, when measured at about 25°C with Mo-Kα radiation, by respective lattice parameters a, b and c of about 14.1153 Å ± 0.0003 Å,
11.6272 Å ± 0.0003 Å and 21.5959 Å ± 0.0001 Å and β of 107.692°, and by a powder diffraction pattern, when measured at about 25°C with Cu-Kα radiation, with at least three peaks having respective 2θ values of about 8.6°, 10.1°, 11.7°, 11.9°, 13.4°, 18.3°, 20.0°, 20.2°, 21.5°, 25.2°, or 26.5°.

Still another embodiment pertains to compositions made with or comprising an excipient and a therapeutically acceptable amount of N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2, said N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 characterized, when measured at about 25°C with Cu-Kα radiation, by a powder diffraction pattern with at least three peaks having respective 2θ values of about 8.6°, 10.1°, 11.7°, 11.9°, 13.4°, 18.3°, 20.0°, 20.2°, 21.5°, 25.2°, or 26.5°.

Still another embodiment pertains to compositions made with or comprising an excipient and a therapeutically acceptable amount of N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2, said N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 characterized in the monoclinic crystal system, when measured at about 25°C with Mo-Kα radiation, by respective lattice parameters a, b and c of about 14.1153 Å ± 0.0003 Å, 11.6272 Å ± 0.0003 Å and 21.5959 Å ± 0.0001 Å and β of 107.692°.

Still another embodiment pertains to compositions made with or comprising an excipient and a therapeutically acceptable amount of N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2, said N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 characterized in the monoclinic crystal system, when measured at about 25°C with Mo-Kα radiation, by respective lattice parameters a, b and c of about 14.1153 Å ± 0.0003 Å, 11.6272 Å ± 0.0003 Å and 21.5959 Å ± 0.0001 Å and β of 107.692°, and by a powder diffraction pattern, when measured at about 25°C with Cu-Kα radiation, with at least three peaks having respective 2θ values of about 8.6°, 10.1°, 11.7°, 11.9°, 13.4°, 18.3°, 20.0°, 20.2°, 21.5°, 25.2°, or 26.5°.

Still another embodiment pertains to methods for treating cancer in a mammal comprising administering a therapeutically effective amount of N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2, said N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 characterized, when measured at about 25°C with Cu-Kα radiation, by a powder diffraction pattern with at least three peaks having respective 2θ values of about 8.6°, 10.1°, 11.7°, 11.9°, 13.4°, 18.3°, 20.0°, 20.2°, 21.5°, 25.2°, or 26.5°.
Still another embodiment pertains to methods for treating cancer in a mammal comprising administering a therapeutically effective amount of N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2, said N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 characterized in the monoclinic crystal system, when measured at about 25°C with Mo-Kα radiation, by respective lattice parameters a, b and c of about 14.1153 Å ± 0.0003 Å, 11.6272 Å ± 0.0003 Å and 21.5959 Å ± 0.0001 Å and β of 107.692°.

Still another embodiment pertains to methods for treating cancer in a mammal comprising administering a therapeutically effective amount of N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2, said N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 characterized in the monoclinic crystal system, when measured at about 25°C with Mo-Kα radiation, by respective lattice parameters a, b and c of about 14.1153 Å ± 0.0003 Å, 11.6272 Å ± 0.0003 Å and 21.5959 Å ± 0.0001 Å and β of 107.692°, and by a powder diffraction pattern, when measured at about 25°C with Cu-Kα radiation, with at least three peaks having respective 2θ values of about 8.6°, 10.1°, 11.7°, 11.9°, 13.4°, 18.3°, 20.0°, 20.2°, 21.5°, 25.2°, or 26.5°.

Still another embodiment pertains to processes for making N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2, said processes comprising:

providing a mixture comprising N-((2Z)-2-((4-hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide and solvent, wherein said N-((2Z)-2-((4-hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide is completely soluble in said solvent;

cauing N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 to exist in said mixture, said N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2, when isolated and measured at about 25°C with Cu-Kα radiation, characterized by a powder diffraction pattern with at least three peaks having respective 2θ values of about 8.6°, 10.1°, 11.7°, 11.9°, 13.4°, 18.3°, 20.0°, 20.2°, 21.5°, 25.2° or 26.5°; and

isolating said N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2.

Still another embodiment pertains to N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 prepared as set forth in the preceding embodiment.
Still another embodiment pertains to processes for making N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2, said processes comprising:

providing a mixture comprising N-((2Z)-2-((4-hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide and solvent, wherein said N-((2Z)-2-((4-hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide is completely soluble in said solvent;

cauising N-((2Z)-2-((4-hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 to exist in said mixture, said N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2, when isolated and measured at about 25° with Mo-Kα radiation, characterized in the monoclinic crystal system by respective lattice parameters a, b and c of about 14.1153 Å ± 0.0003 Å, 11.6272 Å ± 0.0003 Å and 21.5959 Å ± 0.0001 Å and β of 107.692°; and

isolating said N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2.

Still another embodiment pertains to N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 prepared as set forth in the preceding embodiment.

Still another embodiment pertains to processes for making N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2, said processes comprising:

providing a mixture comprising N-((2Z)-2-((4-hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide and solvent, wherein said N-((2Z)-2-((4-hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide is completely soluble in said solvent;

cauising N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 to exist in said mixture, said N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2, when isolated and measured at about 25° with Mo-Kα radiation, characterized in the monoclinic crystal system by respective lattice parameters a, b and c of about 14.1153 Å ± 0.0003 Å, 11.6272 Å ± 0.0003 Å and 21.5959 Å ± 0.0001 Å and β of 107.692°, and by a powder diffraction pattern, when measured at about 25°C with Cu-Kα radiation, with at least three peaks having respective 2θ values of about 8.6°, 10.1°, 11.7°, 11.9°, 13.4°, 18.3°, 20.0°, 20.2°, 21.5°, 25.2° or 26.5°; and

isolating said N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2.
Still another embodiment pertains to N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 prepared as set forth in the preceding embodiment.

Still another embodiment pertains to processes for making N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 having substantial crystalline purity, said processes comprising:

providing a mixture comprising N-((2Z)-2-((4-hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide and solvent, wherein said N-((2Z)-2-((4-hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 is partially soluble in said solvent;

allowing N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 having substantial crystalline purity to develop in said mixture, said N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2, when isolated and measured at about 25°C with Cu-Kα radiation, characterized by a powder diffraction pattern with at least three peaks having respective 2θ values of about 8.6°, 10.1°, 11.7°, 11.9°, 13.4°, 18.3°, 20.0°, 20.2°, 21.5°, 25.2° or 26.5°; and

isolating said N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2.

Still another embodiment pertains to N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 prepared as set forth in the preceding embodiment.

Still another embodiment pertains to processes for making N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 having substantial crystalline purity, said processes comprising:

providing a mixture comprising N-((2Z)-2-((4-hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide and solvent, wherein said N-((2Z)-2-((4-hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide is partially soluble in said solvent;

allowing N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 having substantial crystalline purity to develop in said mixture, said crystalline N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2, when isolated and measured at about 25°C with Mo-Kα radiation, characterized in the monoclinic crystal system by respective lattice parameters a, b and c of about 14.1153 Å ± 0.0003 Å, 11.6272 Å ± 0.0003 Å and 21.5959 Å ± 0.0001 Å and β of 107.692°; and
isolating said N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2.

Still another embodiment pertains to N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 prepared as set forth in the preceding embodiment.

Still another embodiment pertains to processes for making N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 having substantial crystalline purity, said processes comprising:

providing a mixture comprising N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide and solvent, wherein said N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide is partially soluble in said solvent;

allowing N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 having substantial crystalline purity to develop in said mixture, said N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2, when isolated and measured at about 25°C with Mo-Kα radiation, characterized in the monoclinic crystal system by respective lattice parameters a, b and c of about 14.1153 Å ± 0.0003 Å, 11.6272 Å ± 0.0003 Å and 21.5959 Å ± 0.0001 Å and β of 107.692°, and by a powder diffraction pattern, when measured at about 25°C with Cu-Kα radiation, with at least three peaks having respective 2θ values of about 8.6°, 10.1°, 11.7°, 11.9°, 13.4°, 18.3°, 20.0°, 20.2°, 21.5°, 25.2° or 26.5°; and

isolating said N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2.

Still another embodiment pertains to N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 prepared as set forth in the preceding embodiment.

Still another embodiment pertains to processes for making N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 having substantial crystalline purity, said processes comprising:

providing a mixture comprising N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide and solvent in which said N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide is partially soluble in said solvent;

allowing said mixture to exist at about 25°C until N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 develops, said N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-
methoxybenzenesulfonamide Crystalline Form 2, when isolated, having substantial crystalline purity; and

isolating said N-((2Z)-2-((4-Hydroxyphenyl)iminoo)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2.

Still another embodiment pertains to N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 prepared as set forth in the preceding embodiment.

Still another embodiment pertains to N-(2-((4-Hydroxyphenyl)amino)pyridin-3-yl)-4-methoxybenzenesulfonamide Crystalline Form 1 for use in preparing N-(2-((4-Hydroxyphenyl)amino)pyridin-3-yl)-4-methoxybenzenesulfonamide Crystalline Form 2.

Still another embodiment pertains to amorphous N-(2-((4-hydroxyphenyl)amino)pyridin-3-yl)-4-methoxybenzenesulfonamide for use in preparing N-(2-((4-Hydroxyphenyl)amino)pyridin-3-yl)-4-methoxybenzenesulfonamide Crystalline Form 2.

Still another embodiment pertains to amorphous or crystalline N-(2-((4-hydroxyphenyl)amino)pyridin-3-yl)-4-methoxybenzenesulfonamide hydrochloride for use in preparing N-(2-((4-Hydroxyphenyl)amino)pyridin-3-yl)-4-methoxybenzenesulfonamide Crystalline Form 2.

Still another embodiment pertains to crystalline or non crystalline N-(2-((4-hydroxyphenyl)amino)pyridin-3-yl)-4-methoxybenzenesulfonamide methanolate for use in preparing N-(2-((4-Hydroxyphenyl)amino)pyridin-3-yl)-4-methoxybenzenesulfonamide Crystalline Form 2.

Still another embodiment pertains to crystalline or non crystalline N-(2-((4-hydroxyphenyl)amino)pyridin-3-yl)-4-methoxybenzenesulfonamide ethanolate for use in preparing N-(2-((4-Hydroxyphenyl)amino)pyridin-3-yl)-4-methoxybenzenesulfonamide Crystalline Form 2.

DETAILED DESCRIPTION OF THE INVENTION

This invention pertains to discovery of a new crystalline form of N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2, ways to make it having substantial crystalline, chemical and geometric purity, ways to characterize it, compositions containing it, and methods of treating diseases using it.

The term “crystalline,” as used herein, means having a regularly repeating arrangement of molecules or external face planes.

N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 is thermodynamically stable crystalline at about 25°C.
The term "thermodynamically stable," as used herein, means other than a metastable stable crystalline form at a particular temperature.

4-Methoxyphenyl and (2Z)-((4-hydroxyphenyl)imino)-1,2-dihydropyridin-3-yl may be represented herein by $R^1$ and $R^2$, respectively.

The term "substantial crystalline purity," as used herein, means at least about 95% crystalline purity, preferably about 97% crystalline purity, more preferably about 99% crystalline purity, and most preferably about 100% crystalline purity.

The term "crystalline purity," as used herein, means percentage of N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 in a sample which may contain another crystalline form of the same compound or a tautomer thereof.

The term "substantial chemical purity," as used herein, means about 95% chemical purity, preferably about 97% chemical purity, more preferably about 98% chemical purity, and most preferably about 100% chemical purity.

The term "chemical purity," as used herein, means percentage of N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide in a sample.

A sample of N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide, may contain, for example, acetic acid, ethanol, ethyl acetate, isopropyl acetate, isopropyl ether, methanol, n-propanol, pyridine, pyridine hydrochloride, water, 4-aminophenol, 3,4-bis(4-hydroxyanilino)-6-((4-hydroxyphenyl)imino)-2,4-cyclohexadien-1-one of varying geometric purity, 2-chloro-3-nitropyridine or a regioisomer thereof, 2,6-di-tert-butylphenol, 4-((3-nitro-2-pyridinyl)oxy)aniline, p-methoxybenzenesulfonyl chloride, 4-((3-((4-methoxyphenyl)sulfonyl)amino)pyridin-2-yl)amino)phenyl 4-methoxybenzenesulfonate or a mixture thereof.

The term "substantial geometric purity," as used herein, means geometric isomeric excess greater than about 95%, preferably greater than about 97%, more preferably greater than about 99%, and most preferably about 100%, wherein impurity is $R^1$SO$_2$NHR$_2$, wherein $R^1$ is 4-methoxyphenyl and $R^2$ is (2E)-((4-hydroxyphenyl)imino)-1,2-dihydropyridin-3-yl.

The term "geometric isomeric excess," as used herein, means amount of one geometric isomer of a compound in a mixture which may have another geometric isomer of the same compound in the mixture.

N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 may exist as geometric isomers in which the carbon-nitrogen double bond is in the Z configuration, the E configuration, or a mixture of Z and E configurations, wherein the term "Z" means the larger two substituents on the
same side of a carbon-nitrogen double bond and the term "E" means the larger two substituents on opposite sides of the carbon-nitrogen double bond.

Unless stated otherwise, percentages herein are weight/weight (w/w) percentages.

The term "amorphous," as used herein, means a supercooled liquid or a viscous liquid which looks like a solid but does not have a regularly repeating arrangement of molecules that is maintained over a long range and does not have a melting point but rather softens or flows above its glass transition temperature.

The term "mixture," as used herein, means a combination of two or more than two substances. For mixtures comprising N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 and solvent, the N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 may be completely soluble, partially soluble, or essentially insoluble in the solvent.

It is meant to be understood that solvent molecules from solvated N-((2Z)-2-((4-hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide may be used as solvent for preparation of N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2.

The term "solvate," as used herein, means including a solvent such as acetic acid, acetone, acetonitrile, benzene, chloroform, carbon tetrachloride, dichloromethane, dimethylsulfoxide, 1,4-dioxane, ethanol, ethyl acetate, butanol, tert-butanol, N,N-dimethylacetamide, N,N-dimethylformamide, formamide, formic acid, heptane, hexane, isopropanol, methanol, 1-methyl-2-pyrroldinone, mesitylene, nitromethane, polyethylene glycol, propanol, 2-propanone, pyridine, tetrahydrofuran, toluene, water, xylene, or a mixture thereof.

Causing N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 to exist in a mixture comprising N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 and solvent, wherein the N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 is completely soluble in the solvent, is known as nucleation.

Nucleation may be made to occur by means such as solvent removal, temperature change, solvent-miscible anti-solvent addition, solvent-immiscible anti-solvent addition, seed crystal addition of N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2, chafing or scratching the interior of the container, preferably a glass container, in which nucleation is meant to occur with an implement such as a glass rod or a glass bead or beads, or a combination of the foregoing.
For the practice of this invention, nucleation may be followed by crystal growth, accompanied by crystal growth, or followed and accompanied by crystal growth during which the percentage of N-(2(Z))-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 increases.

The term “solvent,” as used herein, means a substance, preferably a liquid or a miscible, partially miscible or essentially immiscible mixture of two or more than two liquids, which is capable of completely dissolving, partially dissolving, dispersing or partially dispersing another substance, preferably a solid or a mixture of solids.

N-(2-((4-Hydroxyphenyl)amino)pyridin-3-yl)-4-methoxybenzenesulfonamide Crystalline Form 1 is described in commonly-owned United States Patent Application Ser. No. ___.

Amorphous N-(2-((4-hydroxyphenyl)amino)pyridin-3-yl)-4-methoxybenzenesulfonamide N-(2-((4-Hydroxyphenyl)amino)pyridin-3-yl)-4-methoxybenzenesulfonamide is described in commonly-owned United States Patent Application Ser. No. ___.

Amorphous N-(2-((4-Hydroxyphenyl)amino)pyridin-3-yl)-4-methoxybenzenesulfonamide hydrochloride is described in commonly-owned United States Patent Application Ser. No. ___.

Crystalline N-(2-((4-Hydroxyphenyl)amino)pyridin-3-yl)-4-methoxybenzenesulfonamide hydrochloride is described in commonly-owned United States Patent Application Ser. No. ___.

N-(2-((4-Hydroxyphenyl)amino)pyridin-3-yl)-4-methoxybenzenesulfonamide ethanolate is described in commonly-owned United States Patent Application Ser. No. ___.

N-(2-((4-Hydroxyphenyl)amino)pyridin-3-yl)-4-methoxybenzenesulfonamide methanolate is described in commonly-owned United States Patent Application Ser. No. ___.

The term “miscible,” as used herein, means capable of combining without separation of phases.

The term “anti-solvent,” as used herein, means a solvent in which N-(2(Z))-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 is essentially insoluble.

It is meant to be understood that, because many solvents and anti-solvents contain impurities, the level of impurities in solvents and anti-solvents for the practice of this invention, if present, are at a low enough percentage that they do not interfere with the intended use of the solvent in which they are present.

It is also meant to be understood that airborne seed crystals of N-(2(Z))-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline
Form 2 may also cause nucleation in a mixture of N-((2Z)-2-((4-hydroxyphenyl)iminol-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide and solvent.

The term “seed crystal,” as used herein, means N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 having mass. It is meant to be understood that such a crystal may be small enough to be airborne or invisible to the eye.

The term “isolating” or “isolation,” as used herein, means separating N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 and impurity, wherein the impurity may be solvent, anti-solvent, a solid or a mixture thereof. Isolation of N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 is typically accomplished by means such as centrifugation, filtration with or without vacuum, filtration under positive pressure, distillation, evaporation or a combination thereof.

N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 was made by providing a mixture of N-((2Z)-2-((4-hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide and 1:1 acetone/water, wherein the N-((2Z)-2-((4-hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crywas completely soluble in the solvent, causing the N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 to exist in the mixture by treating the mixture with water anti-solvent over 2.5 days with a syringe pump so that the solvent part of the mixture changed from 50% acetone to 10% acetone, stirring the mixture for 24 hours, filtering, and drying.

Substantially chemically and geometrically pure N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 may also be made by the procedures described hereinbelow.

**EXAMPLE 1**

A mixture of 2-chloro-3-nitropyridine (2C3NP, 138.1Kg), 4-aminophenol (2.5-3 equivalents) and N,N-dimethylformamide (DMF, 4.8 mL/g 2C3NP) was stirred until homogeneous, heated at 50°C during which an exotherm raised the solution temperature to 70°C, warmed to 80-85°C, stirred until no 2-chloro-3-nitropyridine remained, cooled to 30°C, treated with water (10.6 mL/g 2C3NP) to precipitate product, then with acetic acid (1.2mL/g 2C3NP), then with ethyl acetate (0.5mL/g 2C3NP), cooled to 5°C, stirred for 2 hours and filtered. The filtrant was washed sequentially with distilled water (1.6mL/g 2C3NP), cold ethanol (1.2mL/g 2C3NP) and cold isopropyl ether (1.2mL/g 2C3NP), and dried under vacuum.
In a preferred embodiment of this process, 4-aminophenol (1 equivalent) was used with 4-methylmorpholine (1.5 equivalents) in either methanol or DMF, and precipitation was accomplished with 10% aqueous acetic acid.

EXAMPLE 2

A mixture of EXAMPLE 1 (41.05 Kg) and ammonium formate (5 equivalents), with or without 2,6-di-tert-butylphenol antioxidant, was treated with a mixture of 50% wet 5% palladium hydroxide on carbon (7% by weight per weight of EXAMPLE 1), in DMF (6 mL/g catalyst) then DMF (total DMF volume: 5 mL/g EXAMPLE 1) first with moderate agitation to control an exotherm (typically peaking at 85°C) then with increased agitation for 1 hour (incomplete reactions were treated with additional catalyst/DMF mixture), cooled to 10°C, and filtered. The filtrant was washed with DMF (0.4mL/g EXAMPLE 1), and the filtrate was added to water (29.4 mL/g EXAMPLE 1) at 10°C to precipitate a solid which was filtered, washed with water (7.5mL/g EXAMPLE 1), partially dried under a nitrogen stream, and further dried under vacuum at 50°C to about 0.5% moisture.

EXAMPLE 3

A mixture of EXAMPLE 2 in pyridine (9 mL/g) at 0°C was treated with a mixture of para-methoxybenzenesulfonyl chloride (1.05 equivalents) in THF (1.4 mL/g) at 0°C at a rate which kept the reaction temperature below 5°C, warmed to 25°C, stirred for 15 minutes, and concentrated. The concentrate was treated with n-propanol to provide a composition having 9% pyridine in the solvent mixture and to precipitate a solid. The mixture was cooled to 0°C and filtered. The filtrant and washed with ethyl acetate (5-7 mL/g starting material) and dried at 45°C.

EXAMPLE 4

A mixture of EXAMPLE 3 and saturated aqueous sodium bicarbonate (2 equivalents) was extracted with ethyl acetate (6 mL/g EXAMPLE 3). The extract was washed with brine (4 mL/g EXAMPLE 3), treated with n-propanol (2 mL/g EXAMPLE 4), and concentrated until the ethyl acetate was present in less than 1%. The concentrate was adjusted to 70:30 n-propanol:water (150-180 mg EXAMPLE 4/g solution), and the hot solution was filtered through a 0.2 micrometer filter. The filtrate was adjusted to solvent composition of 60:40 n-propanol:water and a concentration of approximately 130 mg product/g solution, cooled slowly to 60°C, treated with 4% seed crystals of N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 in 60:40 n-propanol:water, cooled to 0°C using a parabolic cooling curve over approximately 12 hours,
and filtered. The filtrant was washed with 40:60 n-propanol:water (1.8Kg/Kg product) and
dried at 45°C.

A sample of N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-
methoxybenzenesulfonamide Crystalline Form 2 for powder diffraction analysis was applied
as a thin layer, with no prior grinding, to the analysis well of a Scintag XDS 2000
Diffractometer having the following parameters: x-ray source: Cu-Kα; range: 2.00°-40.00°
2θ; scan rate: 1.00 degree per minute; step size: 0.02°; temperature: about 25°C; wavelength:
1.54178 Å.

Representative characteristic peak positions in the powder diffraction pattern of N-
((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide
Crystalline Form 2, expressed as degrees relative to 2θ, are, when measured at about 25°C
with Cu-Kα radiation, about 8.6°(0,0,2), 10.1°(1,1,-1), 11.7°(1,1,1), 11.9°(1,1,-2),
13.4°(2,0,-2), 18.3°, 20.0°(0,2,3), 20.2°(2,2,0), 20.3°(2,2,-2), 21.5°(2,2,1),
25.2°(4,0,-2) and 26.5°(0,2,5). Each peak position is shown with its accompanying Miller
index (h,k,l) values.

The term “about” preceding a series of peak positions is meant to include all of the
peak positions of the group which the term precedes.

It is meant to be understood that peak heights may vary and will be dependent on
variables such as the temperature, size of crystal size or morphology, sample preparation, or
sample height in the analysis well of the diffractometer.

It is also meant to be understood that peak positions may vary when measured with
different radiation sources. For example, Cu-Kα1, Mo-Kα, Co-Kα and Fe-Kα radiation,
having wavelengths of 1.54060 Å, 0.7107 Å, 1.7902 Å and 1.9373 Å, respectively, may
provide peak positions which differ from those measured with Cu-Kα radiation.

While digital outputs from powder x-ray diffractometers may be set to express peak
positions to the one-hundredth and one-thousandth of a degree past the decimal,
diffractometers are incapable of accurate experimental determination beyond one-tenth of a
degree. Accordingly, peak positions reported herein are rounded to one-tenth of a degree past
the decimal.

Peak positions may also be expressed with a variability which accounts for differences
between powder x-ray diffractometers, and variability between Cu-Kα radiation sources,
variability from sample to sample on the same diffractometer, and differences in sample
heights in the analysis well. This variability is preferably expressed as about ±0.2°, about ±
0.1°, or a combination thereof.

Therapeutic utility of N-((2Z)-2-((4-hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-
4-methoxybenzenesulfonamide is demonstrated in commonly-owned United States
60/575,577, May 28, 2004, the specifications of which are hereby incorporated by reference into this application.

The term “mammal,” as used herein, means a particular class of vertebrate, preferably a human.

Compositions made with or comprising N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 may be administered, for example, buccally, ophthalmically, orally, osmotically, parenterally (intramuscularly, intraperitoneally, intrasternally, intravenously, subcutaneously), rectally, topically, transdermally, or vaginally. Ophthalmically administered dosage forms may be administered as, for example, elixirs, emulsions, microemulsions, ointments, solutions, suspensions, or syrups. Orally administered solid dosage forms may be administered as, for example, capsules, dragees, emulsions, granules, pills, powders, solutions, suspensions, tablets, microemulsions, elixirs, syrups, or powders for reconstitution. Osmotically and topically administered dosage forms may be administered as, for example, creams, gels, inhalants, lotions, ointments, pastes, or powders. Parenterally administered dosage forms may be administered as, for example, aqueous or oleaginous solutions or suspensions. Rectally and vaginally dosage forms may be administered as, for example, creams, gels, lotions, ointments, or pastes.

A preferred formulation for the practice of this invention is shown in TABLE 1.

The therapeutically acceptable amount of N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 depends on recipient of treatment, the disease and severity thereof, the composition containing it, time of administration, route of administration, duration of treatment, its potency, its rate of clearance and whether or not another drug is co-administered. The amount of N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 used to make a composition to be administered daily to a patient in a single dose or in divided doses is from about 0.03 to about 200 mg/kg body weight. Single dose compositions contain these amounts or a combination of submultiples thereof.

N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 may be administered with or without an excipient. Excipients include, but are not limited to, encapsulating materials and additives such as absorption accelerators, antioxidants, binders, buffers, coating agents, coloring agents, diluents, disintegrating agents, emulsifiers, extenders, fillers, flavoring agents, humectants, lubricants, perfumes, preservatives, propellants, releasing agents, sterilizing agents, sweeteners, solubilizers, wetting agents, and mixtures thereof.

Excipients for preparation of compositions comprising N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 to be administered orally in solid dosage forms include, for example, agar, alginic acid, aluminum hydroxide, benzyl alcohol, benzyl benzoate, 1,3-butyleneglycol, caromers, castor oil, cellulose, cellulose acetate, cocoa butter, corn starch, corn oil, cottonseed oil, cross-povidone, diglycerides, ethanol, ethyl cellulose, ethyl laurate, ethyl oleate, fatty acid esters, gelatin, germ oil, glucose, glycerol, groundnut oil, hydroxypropylmethylcellulose, isopropanol, isotonic saline, lactose, magnesium hydroxide, magnesium stearate, malt, mannitol, monoglycerides, olive oil, peanut oil, potassium phosphate salts, potato starch, povidone, propylene glycol, Ringer's solution, safflower oil, sesame oil, sodium carboxymethyl cellulose, sodium phosphate salts, sodium lauryl sulfate, sodium sorbitol, soybean oil, stearic acids, stearyl fumarate, sucrose, surfactants, talc, tragacanth, tetrahydrofurfuryl alcohol, triglycerides, water, and mixtures thereof. Excipients for preparation of compositions made with N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 to be administered ophthalmically or orally in liquid dosage forms include, for example, 1,3-butyleneglycol, castor oil, corn oil, cottonseed oil, ethanol, fatty acid esters of sorbitan, germ oil, groundnut oil, glycerol, isopropanol, olive oil, polyethylene glycols, propylene glycol, sesame oil, water, and mixtures thereof. Excipients for preparation of compositions made with N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 to be administered osmotically include, for example, chlorofluorohydrocarbons,
ethanol, water, and mixtures thereof. Excipients for preparation of compositions made with N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 to be administered parenterally include, for example, 1,3-butanediol, castor oil, corn oil, cottonseed oil, dextrose, germ oil, groundnut oil, liposomes, oleic acid, olive oil, peanut oil, Ringer's solution, safflower oil, sesame oil, soybean oil, U.S.P. or isotonic sodium chloride solution, water, and mixtures thereof. Excipients for preparation of compositions made with or comprising N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 to be administered rectally or vaginally include, for example, cocoa butter, polyethylene glycol, wax, and mixtures thereof.

The foregoing is meant to be illustrative of the invention and not intended to limit it to the embodiments disclosed herein. Variations and changes obvious to one skilled in the art are intended to be within the scope and nature of the invention as defined in the claims.
WHAT IS CLAIMED IS:

1. N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 characterized, when measured at about 25°C with Cu-Kα radiation, by a powder diffraction pattern with at least three peaks having respective 2θ values of about 8.6°, 10.1°, 11.7°, 11.9°, 13.4°, 18.3°, 20.0°, 20.2°, 21.5°, 25.2°, or 26.5°.

2. N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 characterized in the monoclinic crystal system, when measured at about 25°C with Mo-Kα radiation, by respective lattice parameters a, b and c of about 14.1153 Å ± 0.0003 Å, 11.6272 Å ± 0.0003 Å and 21.5959 Å ± 0.0001 Å and β of 107.692°.

3. A composition made with or comprising an excipient and a therapeutically acceptable amount of N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2, said N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 characterized, when measured at about 25°C with Cu-Kα radiation, by a powder diffraction pattern with at least three peaks having respective 2θ values of about 8.6°, 10.1°, 11.7°, 11.9°, 13.4°, 18.3°, 20.0°, 20.2°, 21.5°, 25.2°, or 26.5°.

4. A method for treating cancer in a mammal comprising administering a therapeutically effective amount of N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2, said N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 characterized, when measured at about 25°C with Cu-Kα radiation, by a powder diffraction pattern with at least three peaks having respective 2θ values of about 8.6°, 10.1°, 11.7°, 11.9°, 13.4°, 18.3°, 20.0°, 20.2°, 21.5°, 25.2°, or 26.5°.

5. A process for making N-((2Z)-2-((4-Hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide Crystalline Form 2, said processes comprising:

   providing a mixture comprising N-((2Z)-2-((4-hydroxyphenyl)imino)-1,2-dihydro-3-pyridinyl)-4-methoxybenzenesulfonamide and solvent, wherein said N-((2Z)-2-((4-
hydroxyphenylimino)-1,2-dihydro-3-pyrindinyl)-4-methoxybenzenesulfonamide is completely soluble in said solvent;

causing N-((2Z)-2-((4-Hydroxyphenylimino)-1,2-dihydro-3-pyrindinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 to exist in said mixture, said N-((2Z)-2-((4-Hydroxyphenylimino)-1,2-dihydro-3-pyrindinyl)-4-methoxybenzenesulfonamide Crystalline Form 2, when isolated and measured at about 25°C with Cu-Kα radiation, characterized by a powder diffraction pattern with at least three peaks having respective 2θ values of about 8.6°, 10.1°, 11.7°, 11.9°, 13.4°, 18.3°, 20.0°, 20.2°, 21.5°, 25.2° or 26.5°; and

isolating said N-((2Z)-2-((4-Hydroxyphenylimino)-1,2-dihydro-3-pyrindinyl)-4-methoxybenzenesulfonamide Crystalline Form 2.

6. N-((2Z)-2-((4-Hydroxyphenylimino)-1,2-dihydro-3-pyrindinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 prepared as set forth in claim 5.

7. A process for making N-((2Z)-2-((4-Hydroxyphenylimino)-1,2-dihydro-3-pyrindinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 having substantial crystalline purity, said processes comprising:

providing a mixture comprising N-((2Z)-2-((4-hydroxyphenylimino)-1,2-dihydro-3-pyrindinyl)-4-methoxybenzenesulfonamide and solvent, wherein said N-((2Z)-2-((4-hydroxyphenylimino)-1,2-dihydro-3-pyrindinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 is partially soluble in said solvent;

allowing N-((2Z)-2-((4-Hydroxyphenylimino)-1,2-dihydro-3-pyrindinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 having substantial crystalline purity to develop in said mixture, said N-((2Z)-2-((4-Hydroxyphenylimino)-1,2-dihydro-3-pyrindinyl)-4-methoxybenzenesulfonamide Crystalline Form 2, when isolated and measured at about 25°C with Cu-Kα radiation, characterized by a powder diffraction pattern with at least three peaks having respective 2θ values of about 8.6°, 10.1°, 11.7°, 11.9°, 13.4°, 18.3°, 20.0°, 20.2°, 21.5°, 25.2° or 26.5°; and

isolating said N-((2Z)-2-((4-Hydroxyphenylimino)-1,2-dihydro-3-pyrindinyl)-4-methoxybenzenesulfonamide Crystalline Form 2.

8. N-((2Z)-2-((4-Hydroxyphenylimino)-1,2-dihydro-3-pyrindinyl)-4-methoxybenzenesulfonamide Crystalline Form 2 prepared as set forth in claim 7.
