A coloring or tinting composition containing as a substantive dye at least one hydroxyanthraquinone derivative of formula (I) is provided. Preferred hydroxyanthraquinone derivatives include 1,4-dihydroxy-6-chloro-7-(3'-methylphenoxy) anthraquinone, 1,4-dihydroxy-6-chloro-7-(2'-methyl-3'-hydroxyphenoxy)anthraquinone, 1,4-dihydroxy-6-chloro-7-(4'-methylphenoxy)-anthraquinone, 1,4-dihydroxy-6-chloro-7(3,5'-dimethoxyphenoxy)-anthraquinone, or 1,4-dihydroxy-6-chloro-7-(2',3'-dimethoxyphenoxy)-anthraquinone.
DIRECT HAIR DYES AND USE THEREOF

[0001] This invention relates to preparations containing special substantive dyes for coloring and tinting keratin fibers, more especially human hair, to the use of these preparations and to new dyes.

[0002] Preparations for tinting and coloring hair are an important type of cosmetic product. They may be used to give the natural color of the hair a light or relatively dark shade, to obtain a totally different hair color or to cover unwanted color tones, for example gray tones, according to the wishes of the particular user. Conventional hair colorants are formulated either on the basis of oxidation dyes or on the basis of substantive dyes according to the required color or the permanence thereof. In many cases, combinations of oxidation dyes and substantive dyes are also used to obtain special shades.

[0003] Good dyes are distinguished by high coloring strength. They are also required to show high fastness to perspiration, heat, permanent waving, washing and light. In addition, they are expected to be toxicologically and dermatologically safe. It is also of advantage if the substances are highly soluble in various basic formulations.

[0004] Colorants based on oxidation dyes lead to bright and permanent color tones. However, they do involve the use of powerful oxidizing agents such as, for example, hydrogen peroxide solutions. This can damage the hair to be colored. Such damage then has to be repaired with suitable hair-care products. In addition, contact of the skin with these colorants can produce unwanted reactions in very sensitive people.

[0005] Colorants based on substantive dyes do not require oxidizing agents and can be better formulated at pH values around the neutral point. However, a major disadvantage of colorants based on substantive dyes is the poor fastness to washing of the colors obtained.

[0006] Among the substantive dyes, nitrobenzene derivatives play an important role. Nitroanilines and their derivatives in particular are distinguished by intensive colors with good fastness to light. However, a disadvantage of known nitroaniline dyes is their unsatisfactory fastness to washing, i.e. the colors lose intensity after repeated washing of the hair.

[0007] Accordingly, there is still a need for new substantive dyes distinguished by improved absorption onto the hair and/or by colors with improved fastness to washing.

[0008] In addition, substantive dyes are also used for shading purposes in oxidation hair colors. Accordingly, substantive dyes are expected to be highly compatible with oxidation dye precursors and with the components typically present in oxidation hair colorants. In particular, stability to reducing and oxidizing agents is desirable for an applicationally valuable substantive dye.

[0009] To develop fashionable colors, red color tones have to be obtained. This is frequently achieved by the use of 2-nitro-p-phenylenediamine derivatives. However, these derivatives are often inadequately soluble or dispersible in water. If the dye cannot be solubilized in the coloring medium, uneven colors are the result. There is also a high risk of only weak colors being obtained. In the particular case of colorants containing a high concentration of dyes or colorants containing carriers with only a weak solubilizing effect, the dyes crystallize out, remain in the coloring bath or are not sufficiently absorbed onto the hair.

[0010] It has now surprisingly been found that special hydroxyanthraquinone derivatives satisfy the requirements substantive dyes are expected to meet to a high degree.

[0011] Some hydroxyanthraquinone derivatives are already known to the expert as hair dyes from DE 32 07 036 A1. However, there is nothing in that document which points towards the hair dyes according to the present invention.

[0012] In a first embodiment, therefore, the present invention relates to preparations for coloring and tinting keratin fibers, more particularly human hair, which contain at least one hydroxyanthraquinone derivative corresponding to formula (I):

\[
\begin{align*}
\text{(I)}
\end{align*}
\]

[0013] in which \(R\) stands for a group corresponding to formula (II):

\[
\begin{align*}
\text{(II)}
\end{align*}
\]

[0014] in which \(R^1\) to \(R^4\) independently of one another represent hydrogen, a hydroxy group, a \(C_{1-4}\) alkoxy group, a \(C_{1-4}\) alkyl group, a \(C_{1-4}\) fluoroalkyl group, a carboxy group, a nitro group, a halogen atom, a group with the formula \(-S-R^3\), where \(R^2\) is hydrogen or a \(C_{1-4}\) alkyl group, a group with the formula \(-Ph-CH_2-COOR^5\), where \(R^5\) is hydrogen, a \(C_{1-4}\) alkyl group or a physiologically acceptable cation, or two adjacent substituents \(R^2\) to \(R^3\) form a methylenedioxy ring and \(X\) is a halogen atom, as a substantive dye in a cosmetically acceptable carrier.

[0015] Examples of the \(C_{1-4}\) alkyl groups mentioned as substituents in the compounds according to the invention are the methyl, ethyl, propyl, isopropyl and butyl groups. Ethyl and methyl are preferred alkyl groups. According to the invention, a preferred \(C_{1-4}\) alkoxy group is, for example, a methoxy group or an ethoxy group. According to the invention, examples of a halogen atom are an F, Cl or Br atom, a Cl atom being particularly preferred. According to the invention, a preferred fluorooalkyl group is the trifluoroethyl group. Examples of physiologically acceptable cations are the cations of sodium, potassium and lithium and the ammonium ion. The sodium cation and the ammonium ion...
are particularly preferred. According to the invention, the abbreviation \( -Ph- \) stands for a disubstituted phenyl ring.

According to the invention, compounds of formula (I) in which X is a chlorine atom are preferred.

Other preferred compounds of formula (I) are those in which at least one of the substituents \( R^1 \) to \( R^4 \) is a hydroxy group, a methyl group or a methoxy group.

Particularly preferred compounds of formula (I) are 1,4-dihydroxy-6-chloro-7-phenoxanthraquinone, 1,4-dihydroxy-6-chloro-7-(3-hydroxyphenoxo)-anthraquinone, 1,4-dihydroxy-6-chloro-7-(3′-methoxyphenoxo)-anthraquinone, 1,4-dihydroxy-6-chloro-7-(3′-methoxyphenoxo)-anthraquinone, 1,4-dihydroxy-6-chloro-7-(2′-methylphenoxo)-anthraquinone, 1,4-dihydroxy-6-chloro-7-(2′-methylphenoxo)-anthraquinone, 1,4-dihydroxy-6-chloro-7-(3′,5′-dimethoxyphenoxo)-anthraquinone, 1,4-dihydroxy-6-chloro-7-(3′,5′-dimethoxyphenoxo)-anthraquinone, 1,4-dihydroxy-6-chloro-7-(2′,3′-dimethoxyphenoxo)-anthraquinone, 2-benzo[3,4-d]1,3-dioxolan-5-yloxy-3-chloro-5,8-dihydroxynaphthalene-1,4-dione and 1,4-dihydroxy-6-chloro-7-(2′-methylphenoxo)-anthraquinone.

The preparations according to the invention contain the compound of formula (I) in quantities of typically 0.05 to 5.0% by weight, based on the colorant, in the case of oxidation colorants without the oxidizing preparation. Quantities of 0.1 to 3% by weight are preferred.

In principle, there are no limitations to the usability of the compounds of formula (I) in preparations for coloring and tinting keratin fibers.

In a first preferred embodiment, the preparations according to the invention are preparations intended to produce only temporary coloring of the fibers. Corresponding preparations are commonly known as tinting preparations. This embodiment also encompasses, for example, hair treatment preparations with which the hair is intended to be not only temporarily colored, but also given a certain style. Corresponding preparations are known as tinting lotions.

Since the preparations in question can normally be formulated without the assistance of oxidizing components, especially hydrogen peroxide, the preparations according to the invention in this embodiment may be free from oxidation dye precursors.

Although the compounds corresponding to formula (I) may also be used as sole dye component, the preparations according to this embodiment preferably still contain at least one other dye of the substantive type.

Substantive dyes are normally nitrophenylenediamines, nitroaminophenols, azo dyes, anthraquinones or indophenols. Preferred substantive dyes are the compounds known under the International names or trade names of HC Yellow 2, HC Yellow 4, HC Yellow 5, HC Yellow 6, Basic Yellow 57, Disperse Orange 3, HC Red 3, HC Red BN, Basic Red 76, HC Blue 2, HC Blue 12, Disperse Blue 3, Basic Blue 99, HC Violet 1, Disperse Violet 1, Disperse Violet 4, Disperse Black 9, Basic Brown 16 and Basic Brown 17 and also 1,4-bis(β-hydroxyethyl)-amino-2-nitrobenzene, 4-amino-2-nitrophenylenamine-2-carboxylic acid, 6-nitro-1,2,3,4-tetrahydroquinoxaline, hydroxycarbazole-2-nitrosohydroxide, piperac acid, 2-amino-6-chloro-4-nitrophenol, 4-ethylamino-3-nitrobenzoic acid and 2-chloro-6-ethylamino-1-hydroxy-4-nitrobenzene. The preparations according to the invention in this embodiment preferably contain the substantive dyes in a quantity of 0.01 to 20% by weight, based on the colorant as a whole.

The preparations according to the invention may also contain naturally occurring dyes such as, for example, henna red, henna neutral, henna black, camomile blossom, sandalwood, black tea, black alder bark, sage, logwood, madder root, catechu, sedre and alkanet.

Other dye components present in the colorants according to the invention include indoles and indolines and physiologically compatible salts thereof. Preferred examples are 5,6-dihydroxyindole, N-methyl-5,6-dihydroxyindole, N-ethyl-5,6-dihydroxyindole, N-propyl-5,6-dihydroxyindole, N-butyryl-5,6-dihydroxyindole, 5,6-dihydroxyindole-2-carboxylic acid, 6-hydroxyindole, 6-aminoindole and 4-aminoindole. Other preferred examples are 5,6-dihydroxyindoline, N-methyl-5,6-dihydroxyindoline, N-ethyl-5,6-dihydroxyindoline, N-propyl-5,6-dihydroxyindoline, N-butyryl-5,6-dihydroxyindoline, 5,6-dihydroxyindoline-2-carboxylic acid, 6-hydroxyindoline, 6-aminoindoline and 4-aminoindoline.

In a second preferred embodiment, the claimed preparations are hair colorants for the permanent coloring of hair. These preparations contain at least one oxidation dye precursor of the primary intermediate type. These generally colorless compounds react with one another under the effect of oxidizing agents or atmospheric oxygen, optionally with the aid of special enzymes or metal ions as catalysts, to form the required dyes. However, in order to in particular to form natural hair colors, combinations of several primary intermediates are generally used. In addition, so-called secondary intermediates are generally additionally used. Secondary intermediates react with the primary intermediates under the effect of oxidizing agents which leads to new colors or to a shading of the color. According to the invention, both a single secondary intermediate and several secondary intermediates may be used in combination with one or more primary intermediates.

According to the invention, preferred primary intermediates are p-phenylenediamine, p-toluylenediamine, p-amino phenol, o-aminophenol, 1-(2'-hydroxyethyl)-2,5-diaminobenzene, N,N-bis(2-hydroxyethyl)-p-phenylenediamine, 2-(2,5-diaminophenoxo)-ethanol, 1-phenyl-3-carboxyamido-4-amino-5-pyrazolone, 4-amino-3-methylphenol, 2,4,5,6-tetraaminopyrimidine, 2-hydroxy-4,5,6-triaminopyrimidine, 4-hydroxy-2,5,6-triaminopyrimidine, 2,4-dihydroxy-5,6-diaminopyrimidine, 2-dimethylamino-4,5,6-triaminopyrimidine, 2-hydroxymethylamino-4-amino phenol, bis(4-amino phenyl)-amine, 4-amino-3-fluorophenol, 2-aminoethyl-4-a minophenol, 2-hydroxymethyl-4-amino phenol, 4-amino-2-(dicyclaminomethyl)-phenol, bis(2-hydroxy-5-amino phenyl) methanol, 1,4-bis(4-amino phenyl)-1 diazacyclononane, 1,3-bis-(N-(2-hydroxyethyl)-N-(4-amino phenylaminomethyl))-2-propanol, 4-amino-2-(2-hydroxyethyl)-phenol, 1,10-bis-(2,5-diaminophenyl)-1,4,7,10-tetraoxadecane and 4,5-diaminopyrazole derivatives according to EP 0 740 931 or WO 94/08970 such as, for example, 4,5-diamino-1-(2'-hydroxyethyl)-pyrazole.

According to the invention, particularly preferred primary intermediates are p-phenylenediamine, p-toluylenediamine, p-amino phenol, o-aminophenol, 1-(2'-hydroxyethyl)-2,5-diaminobenzene, N,N-bis(2-hydroxyethyl)-p-phenylenediamine, 2-(2,5-diaminophenoxo)-ethanol, 1-phenyl-3-carboxyamido-4-amino-5-pyrazolone, 4-amino-3-methylphenol, 2,4,5,6-tetraaminopyrimidine, 2-hydroxy-4,5,6-triaminopyrimidine, 4-hydroxy-2,5,6-triaminopyrimidine, 2,4-dihydroxy-5,6-diaminopyrimidine, 2-dimethylamino-4,5,6-triaminopyrimidine, 2-hydroxymethylamino-4-amino phenol, bis(4-amino phenyl)-amine, 4-amino-3-fluorophenol, 2-aminoethyl-4-a minophenol, 2-hydroxymethyl-4-amino phenol, 4-amino-2-(dicyclaminomethyl)-phenol, bis(2-hydroxy-5-amino phenyl) methanol, 1,4-bis(4-amino phenyl)-1 diazacyclononane, 1,3-bis-(N-(2-hydroxyethyl)-N-(4-amino phenylaminomethyl))-2-propanol, 4-amino-2-(2-hydroxyethyl)-phenol, 1,10-bis-(2,5-diaminophenyl)-1,4,7,10-tetraoxadecane and 4,5-diaminopyrazole derivatives according to EP 0 740 931 or WO 94/08970 such as, for example, 4,5-diamino-1-(2'-hydroxyethyl)-pyrazole.
diamine, p-aminophenol, 1-(2'-hydroxyethyl)-2,5-diaminobenzene, 4-amino-3-methylphenol, 2-aminoethyl-4-amino phenol, 2,4,5,6-tetraminopyrimidine, 2-hydroxy-4,5,6-triaminopyrimidine and 4-hydroxy-2,5,6-triaminopyrimidine.

[0030] According to the invention preferred secondary intermediates are

[0031] m-aminophenol and derivatives thereof such as, for example, 5-amino-2-methylphenol, 5-(3-hydroxypropylaminio)-2-methylphenol, 2-hydroxy-4-aminophenoxycetamino-2-chloro-6-methylphenol, 5-amino-4-chloro-2-methylphenol, 5-amino-4-methoxy-2-methylphenol, 5-(2-hydroxyethyl)-amino-2-methylphenol, 3-(diethylamino)-phenol, N-cyclopentyl-3-aminophenol, 1,3-dihydroxy-5-(methylamino)-benzene, 3-(ethylamino)-4-methylphenol and 2,4-dichloro-3-aminophenol,

[0032] o-aminophenol and derivatives thereof,

[0033] m-diaminobenzene and derivatives thereof such as, for example, 2,4-diaminophenoxycetamino, 1,3-bis(2,4-diaminophenoxymethyl)propane, 4-hydroxymethoxy-2-amino-4-(2-hydroxyethylaminio)-benzene, 1,3-bis(2,4-diaminophenyl)methane, 2,6-bis(2-hydroxyethylamino)-1-methylbenzene and 1-amino-3-bis(2-hydroxyethyl)-amino-4-methylbenzene,

[0034] o-diaminobenzene and derivatives thereof such as, for example, 3,4-diaminobenzoic acid and 2,3-diamino-1-methylbenzenes,

[0035] di- and trihydroxybenzenes derivatives such as, for example, resorcinol, resorcinol monomethyl ether, 2-methyl resorcinol, 5-methyl resorcinol, 2,5-dimethyl resorcinol, 2-chlororesorcinol, 4-chlororesorcinol, pyrogallol and 1,2,4-trihydroxybenzene,

[0036] pyridine derivatives such as, for example, 2,6-dihydroxypyridine, 2-amino-3-hydroxypyridine, 2-amino-5-chloro-3-hydroxypyridine, 3-amino-2-methylaminio-6-methoxypyridine, 2,6-dihydrox-3,4-dimethylpyridine, 2,6-dihydrox-4-methylpyridine, 2,6-diaminopyridine, 2,3-diamino-6-methoxypyridine and 3,5-diamino-2,6-dimethoxypyridine,

[0037] naphthalene derivatives such as, for example, 1-naphthol, 2-methyl-1-naphthol, 2-hydroxymethyl-1-naphthol, 2-hydroxyethyl-1-naphthol, 1,5-dihydroxynaphthalene, 1,6-dihydroxynaphthalene, 1,7-dihydroxynaphthalene, 1,8-dihydroxynaphthalene, 2,7-dihydroxynaphthalene and 2,3-dihydroxynaphthalene,

[0038] morpholine derivatives such as, for example, 6-hydroxybenzomorpholine and 6-amino benzomorpholine,

[0039] quinoxaline derivatives such as, for example, 6-methyl-1,2,3,4-tetrahydroquinoxaline,

[0040] pyrazole derivatives such as, for example, 1-phenyl-3-methylpyrazol-5-one,

[0041] indole derivatives such as, for example, 4-hydroxyindole, 6-hydroxyindole and 7-hydroxyindole,

[0042] methylenedioxybenzene derivatives such as, for example, 1-hydroxy-3,4-methylenedioxybenzene, 1-amino-3,4-methylenedioxybenzene and 1-(2-hydroxyethyl)-amino-3,4-methylenedioxybenzene.

[0043] According to the invention, other preferred secondary intermediates are 3-dimethylaminophenol, 2,4-dihydroxyaniline, 8-amino-6-methoxquinoline, 2-amino-5-naphthol-1,7-disulfonic acid, 3-amino-1-phenyl-5-pyrazolone, 75-diaminobenzamide, 3-methylsulfonilamino-2-methylanilines, 5,6-dihydroxybenzimidazole, 2,2'-dihydroxybenzylaminine, 3,3',5'-tetramino-2,2'-dimethoxydiphenyl, 3,5-diamino-3-chlorobenzotri fluoride, 4-methyl-3-aminophenol, 2,4-diamino-3-chlorophenol, 1-amino-3-di-(2-hydroxyethylaminio)-4-ethoxybenzene, 2,4-dimethyloresorcinol, bis-(2,4-dimethoxyphenoxymethylene), 2,6-bis-(hydroxyethyl)pyridine, 2-hydroxy-3-methoxybenzylalcohol, 2-hydroxyquinoline, 4-hydroxy-3-methoxybenzylamine, 4-ethylresorcinol, 2-methyl-4-aminophenol, 5-(3-hydroxypropylamino)-2-methylphenol, 2,6-dimethoxy-3-aminophenol and 2,6-dimino-3-methylthioluene.

[0044] According to the invention, particularly preferred secondary intermediates are 1-naphthol, 1,5,2,7- and 1,7-dihydroxynaphthalene, 3-aminophenol, 5-amino-2-methylphenol, 3-amino-3-hydroxypropyridine, resorcinol, 4-chlororesorcinol, 2-chloro-6-methyl-3-aminophenol, 2-methyl resorcinol, 5-methyl resorcinol, 2,5-dimethyl resorcinol and 2,6-dihydroxy-3,4-dimethylpyridine.

[0045] According to the invention, it may be preferable to use primary and secondary intermediates which do not require any oxidizing agents other than air to form the colors.

[0046] Besides the compounds corresponding to formula (I), the primary intermediate and optionally secondary intermediates, the preparations according to the invention of this embodiment may if desired contain other substantive dyes for shading purposes. Reference is made at this juncture to the above list.

[0047] The hair colorants according to the invention contain both the primary intermediates and the secondary intermediates in a quantity of preferably 0.005 to 20% by weight, based on the colorant without the oxidizing agent preparation. The primary and secondary intermediates are generally used in a substantially equimolar ratio to one another. Although it has proved to be of advantage to use the primary and secondary intermediates in an equimolar ratio, there is no disadvantage in using a certain excess of individual oxidation dye precursors so that primary and secondary intermediates may be present in a molar ratio of 1:0.5 to 1:2.

[0048] The oxidation dye precursors or the substantive dyes do not have to be single compounds. On the contrary, other components may be present in small quantities in the hair colorants according to the invention due to the processes used to produce the individual dyes providing these other components do not adversely affect the coloring result or have to be ruled out for other reasons, for example toxicological reasons.

[0049] So far as the dyes suitable for use in the hair colorants and tinting preparations according to the invention are concerned, reference is also expressly made to the work

[0050] In a preferred embodiment, the preparations according to the invention also contain anionic, nonionic or—more particularly—cationic polymers, especially if they are also intended to have conditioning or setting properties.

[0051] Cationic polymers suitable as conditioning agents contain cationic groups within the polymer chain. These groups may be part of the polymer chain although they may also be positioned in side chains attached to a main chain by intermediate links. Typical cationic groups contain quaternary nitrogen or phosphorus atoms. Groups containing quaternary nitrogen atoms are preferred. The quaternary nitrogen atoms may carry four different substituents or partly identical substituents and may be part of a ring system. Preferred cationic groups are ammonium and imidazolium groups.

[0052] The following are examples of such polymers:

[0053] Quaternized cellulose derivatives commercially available under the names of Celquat® and Polymer JR®. The compounds Celquat® H 100, Celquat L 200 and Polymer JR®400 are preferred quaternized cellulose derivatives.

[0054] Copolymers of vinyl pyrrolidone with quaternized derivatives of dialkylaminoacrylate and methacrylate, such as vinyl pyrrolidone/dimethylamino- benzylmethacrylate copolymers quaternized, for example, with diethyl sulfate and the copolymer of vinyl pyrrolidone and methacrylamidopropyl trimethyl ammonium chloride. Compounds such as these are commercially available under the names of Gafquat®734, Gafquat®755 and Gafquat® HS100.

[0055] Copolymers of vinyl pyrrolidone with vinyl imidazolium methochloride which are commercially available under the name of Luviskol®.

[0056] Polymeric dimethyl diallyl ammonium salts and copolymers thereof with acrylic acid and with esters and amides of acrylic acid and methacrylic acid. The products commercially available under the names of Merquat®100 (poly(dimethyl diallyl ammonium chloride)), Merquat®550 (dimethyl diallyl ammonium chloride/acylamide copolymer) and Merquat® 280 (dimethyl diallyl ammonium chloride/acyrlic acid copolymer) are examples of such cationic polymers.

[0057] Quaternized guar derivatives commercially available under the names of Cosmedia Guar® and Jaguar®. Preferred guar derivatives are, for example, Cosmedia Guar® C-261 and Jaguar® C 13-S.

[0058] Cationically derivatized silicone oils such as, for example, the commercially available products Q2-7224 (manufacturer: Dow Corning; a stabilized trimethyl silyl amodimethicone), Dow Corning 929 Emulsion (containing a hydroxylamino-modified silicone which is also known as amodimethicone), SM-2059 (manufacturer: General Electric), SLM-55067 (manufacturer: Wacker) and Abil® Quat 3270 and 3272 (manufacturer: Th. Goldschmidt; diquaternary polydimethyl siloxanes, Quaternium-80).

[0059] Chitosan and derivatives thereof.

[0060] Quaternized polyvinyl alcohol.

[0061] The polymers with quaternary nitrogen atoms in the main polymer chain known by the names of Polyquaternium 2, Polyquaternium 17, Polyquaternium 18 and Polyquaternium 27.

[0062] Cationic polymers from the first four groups mentioned are particularly preferred, Polyquaternium 2, Polyquaternium 10 and Polyquaternium 22 being most particularly preferred.

[0063] The cationic polymers are preferably present in the preparations according to the invention in quantities of 0.1 to 5% by weight, based on the preparation as a whole.

[0064] The following are examples of suitable nonionic polymers:

[0065] Vinyl pyrrolidone/vinyl ester copolymers of the type marketed for example under the trade mark Luviskol® (BASF), Luviskol® VA 64 and Luviskol® VA, both vinyl pyrrolidone/vinyl acetate copolymers, are preferred nonionic polymers.

[0066] Cellulose ethers, such as the hydroxypropyl cellulose, hydroxyethyl cellulose and methyl hydroxpropyl cellulose marketed under the trade marks Culmin®, and Benecel® (AQUALON).

[0067] Shellac.

[0068] Polyvinyl pyrrolidones of the type marketed under the name Luviskol® (BASF).

[0069] The following are examples of suitable anionic polymers:

[0070] Copolymers of acrylic acid and/or methacrylic acid or esters thereof with C10-30 alkyl acrylates of the type marketed, for example, under the name Permulen®.

[0071] Polymers and copolymers of crotonic acid with esters and amides of acrylic and methacrylic acid, such as vinyl acetate/crotonic acid and vinyl acetate/vinyl propionate/crotonic acid copolymers. Compounds of this type are marketed under the names Resyln® (NATIONAL STARCH), Luviskol® (BASF) and Gafse® (GAF). The products Luviskol® CA-66 and Luviskol® CAP may be preferable.

[0072] Vinyl pyrrolidone/vinyl acrylate copolymers obtainable, for example, under the trade mark Luviflex® (BASF). A preferred polymer is the vinyl pyrrolidone/acrylate terpolymer obtainable under the name Luviflex® VBM-35 (BASF).

[0073] Acrylic acid/ethyl acrylate/N-tert.butyl acrylamide terpolymers marketed, for example, under the name Ultrahold® strong (BASF) and methacrylic
acid/ethyl acrylate/t-butyl acrylate terpolymers marketed under the name Luvimer® 100P (BASF).

It may be of preferred to use anionic, nonionic or cationic polymers in hair colorants that are free from oxidation dye precursors.

To produce the colorants according to the invention, the substantive dyes and the oxidation dye precursors, if any, are incorporated in a suitable water-containing carrier. For coloring hair, such carriers are, for example, creams, emulsions, gels or even surfactant-containing foaming solutions, for example shampoos, foam aerosols or other formulations suitable for application to the hair.

The colorants according to the invention may also contain any of the known active substances, additives and auxiliaries typical of such formulations. In many cases, the colorants contain at least one surfactant, both anionic and zwitterionic, ampholytic, nonionic and cationic surfactants being suitable in principle. In many cases, however, it has been found to be of advantage to select the surfactants from anionic, zwitterionic or nonionic surfactants.

Suitable anionic surfactants for the preparations according to the invention are any anionic surface-active substances suitable for use on the human body. Such substances are characterized by a water-solubilizing anionic group such as, for example, a carboxylate, sulfate, sulfonate or phosphate group and a lipophilic alkyl group containing around 10 to 22 carbon atoms. In addition, glycol or polyglycol ether groups, ester, ether and amide and hydroxyl groups may also be present in the molecule. The following are examples of suitable anionic surfactants—in the form of the sodium, potassium and ammonium salts and the mono-, di- and trialkanol-ammonium salts containing 2 or 3 carbon atoms in the alkanol group:

- Linear fatty acids containing 10 to 22 carbon atoms (soaps),
- Ether carboxylic acids corresponding to the formula R—O-(CH₂-CH₂O)ₓ—CH₃—COOH, in which R is a linear alkyl group containing 10 to 22 carbon atoms and x=0 or 1 to 16,
- Acyl sarcosides containing 10 to 18 carbon atoms in the acyl group,
- Acyl taurides containing 10 to 18 carbon atoms in the acyl group,
- Acyl isethionates containing 10 to 18 carbon atoms in the acyl group,
- Sulfoacetic acid mono- and dialkyl esters containing 8 to 18 carbon atoms in the alkyl group and sulfoacetic acid monoalkyl polylpolyoxyethyl esters containing 8 to 18 carbon atoms in the alkyl group and 1 to 6 oxyethyl groups,
- Linear alkane sulfonates containing 12 to 18 carbon atoms,
- Linear α-olefin sulfonates containing 12 to 18 carbon atoms,
- α-Sulfocalcium acid methyl esters of fatty acids containing 12 to 18 carbon atoms,
- Alkyl sulfates and alkyl polyglycol ether sulfates corresponding to the formula R—O-(CH₂—CH₂O)ₓ—SO₃H, in which R is a preferably linear alkyl group containing 10 to 18 carbon atoms and x=0 or 1 to 12,
- Mixtures of surface-active hydroxyxulfonates according to DE-A-37 25 300,
- Sulfated hydroxyalkyl polyethylene and/or hydroxyalkylene propylene glycol ethers according to DE-A-37 23 354,
- Sulfonates of unsaturated fatty acids containing 12 to 24 carbon atoms and 1 to 6 double bonds according to DE-A-39 26 344,
- Esters of tartaric acid and citric acid with alcohols in the form of addition products of around 2 to 15 molecules of ethylene oxide and/or propylene oxide with fatty alcohols containing 8 to 22 carbon atoms.

Preferred anionic surfactants are alkyl sulfates, alkyl polyglycol ether sulfates and other carboxylic acids containing 10 to 18 carbon atoms in the alkyl group and up to 12 glycol ether groups in the molecule and, in particular, salts of saturated and, more particularly, unsaturated C₉₋₂₂ carboxylic acids, such as oleic acid, stearic acid, isostearic acid and palmitic acid.

In the context of the invention, zwitterionic surfactants are surface-active compounds which contain at least one quaternary ammonium group and at least one —COO⁻ or —SO₃⁻ group in the molecule. Particularly suitable zwitterionic surfactants are the so-called betaines, such as N-alkyl-N,N-dimethyl ammonium glycinites, for example cocoalkyl dimethyl ammonium glycinate, N-acylaminoxyethyl-N,N-dimethyl ammonium glycinites, for example cocoylaminoxyethyl dimethyl ammonium glycinate, and 2-alkyl-3-carboxymethyl-3-hydroxyethyl imidazolines containing 8 to 18 carbon atoms in the alkyl or acyl group and cocoylaminoxyethyl hydroxyethyl carboxymethyl glycinate. A preferred zwitterionic surfactant is the fatty acid amide derivative known by the CTFA name of Cocamidopropyl Betaine.

Ampholytic surfactants are surface-active compounds which, in addition to a C₉₋₁₆ alkyl or acyl group, contain at least one free amino group and at least one —COOH or —SO₃H group in the molecule and which are capable of forming inner salts. Examples of suitable ampholytic surfactants are N-alkyl glycines, N-alkyl proprionic acids, N-alkyl aminoobutyric acids, N-alkyl iminoisopropionic acids, N-hydroxyethyl-N-alkyl amidopropyl glycines, N-alkyl taurines, N-alkyl sarcosines, 2-alkylaminopropionic acids and alkyl aminocarboxylic acids containing around 8 to 18 carbon atoms in the alkyl group. Particularly preferred ampholytic surfactants are N-cocoalkyl aminoisopropionate, cocoacetyl aminoethyl aminoisopropionate and C₁₂₋₁₈ acyl sarcosine.

Nonionic surfactants contain, for example, a polyl group, a polyalkylene glycol ether group or a combination of polyol and polyglycol ether groups as the hydrophilic group. Examples of such compounds are products of the addition of 2 to 30 moles of ethylene oxide and/or 0 to 5 moles of propylene...
oxide onto linear fatty alcohols containing 8 to 22 carbon atoms, onto fatty acids containing 12 to 22 carbon atoms and onto alklyphenols containing 8 to 15 carbon atoms in the alkylation group,

\[ 0097 \] C_{12-22} fatty acid monoesters and diesters of products of the addition of 1 to 30 moles of ethylene oxide onto glycerol,

\[ 0098 \] C_{8-22} alkyl mono- and oligoglycosides and ethoxylated analogs thereof,

\[ 0099 \] products of the addition of 5 to 60 moles of ethylene oxide onto castor oil and hydrogenated castor oil,

\[ 0100 \] products of the addition of ethylene oxide onto sorbitan fatty acid esters and

\[ 0101 \] products of the addition of ethylene oxide onto fatty acid alkanoalaminics.

\[ 0102 \] Examples of cationic surfactants suitable for use in the hair treatment preparations according to the invention are, in particular, quaternary ammonium compounds. Preferred quaternary ammonium compounds are ammonium halides, such as alkyl trimethyl ammonium chlorides, dialkyl dimethyl ammonium chlorides and trialkyl methyl ammonium chlorides, for example cetyl trimethyl ammonium chloride, stearyl trimethyl ammonium chloride, distearyl dimethyl ammonium chloride, lauryl dimethyl ammonium chloride, lauryl dimethyl benzyl ammonium chloride and tridecyl methyl ammonium chloride. Other cationic surfactants suitable for use in accordance with the invention are the quaternized protein hydrolyzates.

\[ 0103 \] Alkyl amidoamines, particularly fatty acid amidoamines, such as the stearyl amidopropyl dimethyl amine obtainable as Tego Amid® S 18, are distinguished not only by their favorable conditioning effect, but also and in particular by their ready biodegradability. Quaternary ester compounds, so-called Aesterquat®, such as the methyl hydroxyalkyl dialkylalkyl ammonium methosulfates marketed under the trade name of Stepanex® and the products marketed under the trade name of Dehyquat®, such as Dehyquat® AU-46, are also readily biodegradable.

\[ 0104 \] One example of a quaternary sugar derivative suitable for use as a cationic surfactant is the commercially available product Glucquat®100 (INCI name: Lauryl Methyl Gluceth-10 Hydroxypropyl Dimonium Chloride).

\[ 0105 \] The compounds containing alkyl groups used as surfactants may be single compounds. In general, however, these compounds are produced from native vegetable or animal raw materials so that mixtures with different alkyl chain lengths dependent upon the particular raw material are obtained.

\[ 0106 \] The surfactants representing addition products of ethylene and/or propylene oxide with fatty alcohols or derivatives of these addition products may be both products with a Anormal homolog distribution and products with a narrow homolog distribution. Products with a Anormal homolog distribution are mixtures of homologs which are obtained in the reaction of fatty alcohol and alkylene oxide using alkali metals, alkali metal hydroxides or alkali metal alkoholates as catalysts. By contrast, narrow homolog distributions are obtained when, for example, hydroxalics, alkaline earth metal salts of either carboxylic acids, alkaline earth metal oxides, hydroxides or alcoholates are used as catalysts. The use of products with a narrow homolog distribution can be of advantage.

\[ 0107 \] The hair treatment preparations according to the invention preferably may also contain a conditioning agent selected from the group consisting of cationic surfactants, cationic polymers, alkyl amidoamines, paraflin oils and synthetic oils.

\[ 0108 \] Cationic polymers can be preferred conditioning agents. Reference is made in this connection to the polymers mentioned in the foregoing.

\[ 0109 \] Other suitable conditioning agents are silicone oils, more particularly dialkyl and alkylaryl siloxanes such as, for example, dimethyl polysilosxane and methylethyl polysilosxane and alkoxylated and quaternized analogs thereof. Examples of such siloxanes are the products marketed by Dow Corning under the names of DC 190, DC 200, DC 344, DC 345 and DC 1401 and the commercial products QZ-7224 (manufacturer: Dow Corning; a stabilized triethyl silyl amodicimethione), Dow Corning® 929 Emulsion (containing a hydroxylamino-modified silicone which is also known as amodicimethicone), SM-2059 (manufacturer: General Electric), SLM-55067 (manufacturer: Wacker) and Abil® Quat 3270 and 3272 (manufacturer: Th. Goldschmidt; diquaternary polydimethylsiloxanes, quaternium-80).

\[ 0110 \] Other suitable conditioning agents are paraffin oils, synthetically produced oligomeric alkenes and vegetable oils, such as jojoba oil, sunflower oil, orange oil, almond oil, wheatgerm oil and peach kernel oil.

\[ 0111 \] Phospholipids, for example soya lecithin, egg lecithin and kephalins, are also suitable hair-conditioning compounds.

\[ 0112 \] Other active substances, auxiliaries and additives are, for example,

\[ 0113 \] thickeners, such as agar, agar gum, alginites, xanthan gum, gum arabic, karaya gum, locust bean gum, linseed gums, dextrins, cellulose derivatives, for example methyl cellulose, hydroxyalkyl cellulose and carboxymethyl cellulose, starch fractions and derivatives, such as amylose, amylopectin and dextrins, clays such as, for example, bentonite or fully synthetic hydrocolloids such as, for example, polyvinyl alcohol,

\[ 0114 \] structurants, such as glucose and malic acid,

\[ 0115 \] protein hydrolyzates, more particularly elastin, collagen, keratin, milk protein, soya protein and wheat protein hydrolyzates, condensation products thereof with fatty acids and quaternized protein hydrolyzates,

\[ 0116 \] perfume oils, dimethyl isosorbide and cyclo-dextrins,

\[ 0117 \] solubilizers, such as ethanol, isopropanol, ethylene glycol, propylene glycol, glycerol and diethylene glycol,

\[ 0118 \] antiandruff agents, such as Piroctone Olamine and Zinc Omadine,
[0119] other substances for adjusting the pH value,
[0120] active substances, such as panthenol, pantethenic acid, allantoin, pyrrolidone carboxylic acids and salts thereof, plant extracts and vitamins,
[0121] cholesterol,
[0122] sun protection factors,
[0123] consistency factors, such as sugar esters, polyol esters or polyol alkyl ethers,
[0124] fats and waxes, such as sperm ace, beeswax, montan wax, paraffins, fatty alcohols and fatty acid esters,
[0125] fatty acid alkanoamides,
[0126] complexing agents, such as EDTA, NTA and phosphonic acids,
[0127] swelling and penetration agents, such as glycercol, propylene glycol monooctyl ether, carbonates, hydrogen carbonates, guanidines, ureas and primary, secondary and tertiary phosphates,
[0128] opacifiers, such as latex,
[0129] pearifiers, such as ethylene glycol mono- and distearate,
[0130] propellants, such as propane/butane mixtures, N₂O₃, dimethyl ether, CO₂ and air,
[0131] antioxidants.

[0132] To produce the colorants according to the invention, the constituents of the water-containing carrier are used in the usual quantities for this purpose. For example, emulsifiers are used in concentrations of 0.5 to 30% by weight while thickeners are used in concentrations of 0.1 to 25% by weight, based on the colorant as a whole.

[0133] In a second embodiment, the present invention also relates to the use of a preparation according to the invention for coloring and tinting keratin fibers, more particularly human hair.

[0134] In principle, the preparations according to the invention may be formulated in such a way that they may either remain on the hair or may be rinsed out.

[0135] In a preferred embodiment, the preparations according to the invention are formulated to remain on the hair. This is the case with so-called tinting preparations in particular, but also with preparations which are additionally intended to have a setting effect.

[0136] Some of the dyes according to the invention are unknown in the literature.

[0137] In a third embodiment, therefore, the present invention relates to 1,4-dihydroxy-6-chloro-7-(3'-methylphenoxyl)-anthraquinone.

[0138] In a fourth embodiment, therefore, the present invention relates to 1,4-dihydroxy-6-chloro-7-(2'-methyl-3-hydroxyphenoxy)-anthraquinone.

[0139] In a fifth embodiment, therefore, the present invention relates to 1,4-dihydroxy-6-chloro-7-(4'-methylphenoxy)-anthraquinone.

[0140] In a sixth embodiment, therefore, the present invention relates to 1,4-dihydroxy-6-chloro-7-(3',5'-dimethoxyphenoxy)-anthraquinone.

[0141] In a seventh embodiment, therefore, the present invention relates to 1,4-dihydroxy-6-chloro-7-(2',3'-dimethoxyphenoxy)-anthraquinone.

[0142] In an eighth embodiment, therefore, the present invention relates to 2-benz0(3,4-d]1,3-dioxolan-5-yloxy-3-chloro-5,8-dihydroxynaphthalene-1,4-dione.

[0143] In a ninth embodiment, therefore, the present invention relates to 1,4-dihydroxy-6-chloro-7-(2'-methylphenoxy)-anthraquinone.

[0144] The following Examples are intended to illustrate the invention.

EXAMPLES

[0145] 1. Hair Coloring Creams Containing Substantive Dye

<table>
<thead>
<tr>
<th>Mixture A</th>

</tr>
<tr>
<td>p-Hydroxybenzoic acid methyl ester</td>
<td>0.15 g</td>
</tr>
<tr>
<td>Water</td>
<td>70.00 g</td>
</tr>
</tbody>
</table>

[0146] ¹ lauryl alcohol containing ca. 4.5 mol ethylene oxide/acetic acid sodium salt (ca. 82% active substance; INCI name: Sodium Laureth-6 Carboxylate) (KAO, Chem-Y)

[0147] The substances were melted at 80° C., mixed with water heated to 80° C. and emulsified with vigorous stirring. The emulsion was then cooled with vigorous stirring.

<table>
<thead>
<tr>
<th>Mixture B</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Ammonium sulfate</td>

<tr>
<td>Ammonia (25% solution)</td>
<td>to pH 9.0</td>
</tr>
<tr>
<td>Water</td>
<td>10.00 g</td>
</tr>
</tbody>
</table>

[0148] The dye was dissolved in water heated to 50° C. to which the ammonium sulfate and ammonia had been added.

[0149] The dye solution (mixture B) was added to the emulsion (mixture A), adjusted to pH 9 with ammonia and made up with water to 100 g. The whole was then stirred until room temperature was reached.

[0150] The coloring cream thus obtained was applied to 5 cm long tresses of standardized 80% gray, but not specially pretreated human hair and left thereon for 30 minutes at 35° C. The hair was then rinsed, washed with a typical hair shampoo and dried.
The results of the coloring tests are set out in Table I:

1-22. (canceled)

23. A hydroxyanthraquinone derivative corresponding to formula (I)

\[
\begin{align*}
\text{OH} & \quad \text{O} \\
\text{X} & \\
\text{OR} & \quad \text{OH} \\
\end{align*}
\]

wherein X is a chlorine atom and R is a 3-methylphenyl group, a 4-methylphenyl group, or a 2-methyl-3-hydroxyphenyl group.

24. The hydroxyanthraquinone derivative of claim 23 wherein R is a 2-methyl-3-hydroxyphenyl group.

25. The hydroxyanthraquinone derivative of claim 23 wherein R is a 3-methylphenyl group, or a 4-methylphenyl group.

26. A hydroxyanthraquinone derivative corresponding to formula (I)

\[
\begin{align*}
\text{OH} & \quad \text{O} \\
\text{X} & \\
\text{OR} & \quad \text{OH} \\
\end{align*}
\]

wherein X is a chlorine atom and R is a 3,5-dimethoxyphenyl group, a 2,3-dimethoxyphenyl group, or 3,4-methylenedioxybenzene.

27. The hydroxyanthraquinone derivative of claim 26 wherein R is a 3,5-dimethoxyphenyl group or a 2,3-dimethoxyphenyl group.

28. The hydroxyanthraquinone derivative of claim 26 wherein R is 3,4-methylenedioxybenzene.
