UNITED STATES PATENT OFFICE

PAULINE F. CARTER, OF BROOKLINE, MASSACHUSETTS

CLOTHES DRIER

Application filed August 22, 1932. Serial No. 629,948.

The present invention relates to a hanger for clothes and the like having for its purpose to provide means whereby articles of clothing such as stockings and the like may be hung out to dry.

The object of the invention resides in the provision of a device of this nature which is simple in its construction, light, inexpensive to manufacture, convenient to mount on a door, window or the like, thoroughly efficient and reliable in use and otherwise well adapted to the purpose for which it is designed.

With the above and numerous other objects in view as will appear as the description proceeds, the invention resides in certain novel features of construction, and in the combination and arrangement of parts as will be hereinafter more fully described and claimed.

In the drawing:

Figure 1 is a side elevation of the device embodying the features of my invention.

Figure 2 is a top plan view thereof, and

Figure 3 is a detailed section taken substantially on the line 3—3 of Figure 1.

Referring to the drawing in detail it will be seen that letter F denotes an oblong frame comprising end members 5 and 6, the latter being shorter than the former and sides which include portions 7 merging from the ends of the end member 5 at right angles thereto and merging into outwardly converging intermediate portions 8 which merge into left outwardly converging portions 9 which merge into the end of the end member 6. A plurality of spring clips or clothes pins 10 are mounted on the frame F along the sides thereof at spaced intervals being mounted by means of the pins 11 of the clips 10.

On the center of the end member 5 there is formed a substantially inverted U-shaped hanger bracket denoted generally by the letter B and comprising a relatively short leg 12 merging upwardly from the upper edge of the end member 5 and merging into the cross portion 14 which in turn merges into a relatively long depending leg 15.

This bracket B may be easily engaged over the upper edge of a window sash W, a door, or any other like support and therefore may be conveniently used in a room or the like for drying stockings and the like.

It is thought that the construction, utility and advantages of this invention will now be clearly understood without a more detail description thereof.

It is apparent that changes in the details of construction may be resorted to without departing from the spirit or scope of the invention as hereinafter claimed.

Having thus described my invention, what I claim as new is:

A clothes drying apparatus of the class described comprising a frame, clips mounted on the frame and a hanger bracket mounted on the frame, said hanger bracket being of an inverted U-shaped formation having the end of one leg merging into one end of the frame, said frame being of an oblong formation to include end portions and side portions, the side portions having the parts remote from the bracket converging outwardly therefrom.

In testimony whereof I affix my signature.

PAULINE F. CARTER.
