Title: REMITTANCE METHOD AND SYSTEM FOR SERVICES

Abstract: Tokens containing a unique identification code that allow admission or access to entertainment or personal services are sold and distributed. A seller-distributor node on a global computer network affects transactions that exchange tokens for payment. A base ticket value is determined based on a price range for a subject service. A ticket manager engine translates the price range into a ticket level. End users/ticket holders present the leveled ticket for redemption of the particular service from a participant's service provider. Tickets are thus redeemed at variable rates for equivalent services. An online distributor or portal in the primary and/or secondary market may employ the ticket manager engine and ticket leveling. As a result, the distributor offers/sells leveled tickets. The token may be in the form of an electronic ticket, a bar code, an email message, an electronic message, a code number or machine readable data/code.

REMITTANCE METHOD AND SYSTEM FOR SERVICES

RELATED APPLICATIONS

BACKGROUND

In today's market, there are a variety of ways to make payment for goods and services. Payment can be tendered using cash currency, funds transfer between accounts, debit cards, credit cards, barter, frequent flyer miles, and prepaid cards, to name just a few methods. In the dynamic marketplace, customers might obtain vastly different goods or services for their payment.

There are many different prepaid business models in the marketplace. Conventional prepaid cards include a wide variety of financial products, including gift cards, phone cards, travel cards, flexible spending account cards, government benefit cards, subway system cards, employee incentive cards and payroll cards. These prepaid cards generally are in the form of a plastic card with a magnetic strip,
bar code or embedded chip that permit the cardholders to access funds for the purchase of goods or services, much like a credit or debit card. Although prepaid cards have the appearance of credit cards and debit cards and they provide a form of cash, usually they neither involve credit nor are they tied to a cardholder's demand deposit account. Such cards are typically tied to a specified brand product or merchant service provider and have a set dollar amount or line of credit up to which the end user can spend in one or multiple uses. This form, therefore, presents the end user with concerns over price differentials between participating merchants (service provider) and increases in prices for the same goods or services. Because the card is designed for multiple-use bounded by a predefined dollar limit, the end user more often than not pays out of pocket for purchases over the dollar limit of the card, or is subject to what is commonly called a split tender transaction forcing the end user to apply multiple payment methods to complete a single transaction.

Further, not all consumer transactions are classic exercises of supply and demand wherein the customer has the utmost control and choice among differing alternatives with incrementally different costs and/or different pricing and payment arrangements. One example is a vendor's prepaid gift indicia, which can take various forms ranging from an authorized numbered slip bearing the vendor's name and a dollar amount to plastic cards bearing the vendor's logo and having a magnetically readable strip with a predetermined dollar value, each redeemable at the vendor's sales outlets. A prepaid gift indicia is generally issued by a particular retailer and can only be redeemed at that retailer's facilities. In this situation, the person who purchases the gift indicia may exercise a degree of choice, but the person who redeems it (typically the recipient of the gift) has no choice except to use the issuing retailer as the provider. Inasmuch as the issuer and the provider are the same entity, the issuer/provider has full control of the extent to which the selling price of the gift card corresponds to the offering price of the goods or services that are delivered. It is conceivable that the issuer/provider may include a premium or discount to encourage patronage and/or purchase of gift indicia, but within the control of the issuer/provider, the goods or services are provided in exchange for an amount that is related to the issuer/provider's pricing schedules.
It is known that providers of personal entertainment and sporting services, can issue a gift ticket that represents an incremental cash value or an incremental quantity of their services. This is possible because pricing and terms upon the sale of the gift ticket are controlled by the same party that controls the nature, quality and delivery terms of the services. As a result, the issuer/provider can issue a gift ticket for a given cash value or for a given increment of services. Thus a gift ticket or coupon might be granted for one pass to a matinee show or one Saturday afternoon bowling game, presumably with the ticket priced at an amount related to the pricing of the associated service. If the gift ticket is not defined as equal to a given service and/or if the issuer offers different services at different prices, then the gift ticket is denominated as a cash value and the user is entitled to deduct from the value on the ticket when paying for services, until the value associated with the ticket is exhausted.

It would be advantageous if a convenient arrangement could be organized whereby different potentially-competing suppliers of services can all honor a coupon or gift ticket or similar indicia of value that is denominated not in a monetary value but as a particular service. It is not possible for the purchaser of a gift ticket for a given increment of services from one establishment to redeem the gift ticket at another establishment for comparable services, because the services are not likely to be of the same value to consumers, or offered at the same price by suppliers. If such a system were envisioned, it would necessarily involve exchanges of case value and not transactions for a given increment of services regardless of where it is obtained.

A gift ticket system might be envisioned where one can buy a gift ticket for an incremental entertainment service (a single movie showing, for example), but if that gift ticket was to be redeemable at any of a plurality of competing different movie theaters, some provision would be needed to account for the fact that some theaters are more comfortable, have larger screens and better sound systems and consequently have higher ticket prices than others. Such an arrangement would not likely be practical, or at least would be less practical than using cash currency, and would require a network of behind-the-scenes fund transfers in varying amounts per transaction, between establishments at which the gift tickets are sold to customers and establishments at which the customer redeems the tickets for more or less
expensive entertainment services. On the other hand, one could issue gift tickets for an incremental amount of money, leaving it to the consumer to decide where to expend the gift ticket, either wholly or in some successive number of transactions that each represent less than the full initial cost of the gift ticket.

Gift tickets can resemble debit cards and be presented by customers for deduction of an incremental monetary value in exchange for goods or services of that cost. It is known to have the representation of value carried on the card itself (e.g., in the case of a "smartcard" having security aspects). Alternatively, it is known to have the card carry a serial number or address associated with a record stored in a database in communication with points of sale. These arrangements also require behind-the-scenes transfer of funds among the entities selling the cards, perhaps the customer, and the entities at which the card is redeemed for goods or services.

It is known that credit cards can be issued that may be selectively limited to certain vendors, either by the users (to limit purchases by their children or others to whom the cards are lent) or by corporations (for example to employees' limit meal and entertainment expenses to certain establishments). See Cohen, US Patent No. 6,422,462 "Apparatus and Methods for Improved Credit Cards and Credit Card Transactions." Such cards are still redeemable, however, for the cash value of purchases made and the users are still responsible for paying for transactions on an as-used basis.

An arrangement that requires such a network of funds transfers is actually already in place. Credit card systems including Visa, MasterCard, Discover, American Express, etc., deal with goods/services providers across the board. They are available for the most part to any customer and to any supplier. However, existing credit card systems work because there is a medium of exchange, namely dollars and cents (or other currencies), that is the same as to all suppliers and all possible goods and services. There is no practical way in which to supply a given service, such as a round of golf or a theater ticket, that is free of association with a particular supplier and might be redeemed by the customer at any of a plurality of possible suppliers, even though their pricing may differ, without relying on a backup funds transfer network associated with the point of sale.
SUMMARY

The present invention relates generally to marketing and distributing services, such as participatory sports or entertainment services, where a customer is issued a ticket or similar indicia, such as a token, electronic ticket, etc., which can be redeemed for a particular service or experience. Preferably, the service is one that can be obtained at the customer's option from any of a plurality of distinct providers or venues, including providers that normally charge more or less than others for the particular experiential service involved. Tickets, for example, can be redeemable for a particular service or experience, such as concerts, sports events, theatrical shows, broadway shows, family events, golf courses, movie theaters, spas, etc., each at different respective levels.

Systems and methods are provided for creating a redeem-for-experiential program (electronic data or code, magnetic strip card, bar code card, etc.) for a ticket card-holder to participate or gain access or admittance for such experiential services. The certain and other experiential services are provided by one or more providers. Variable rate redemption of the leveled ticket for the service (e.g. event, experience, etc.) provided by the providers is enabled. A threshold price range for the leveled ticket can be determined. An access level for the leveled ticket can be determined based on the threshold price range. The access level indicates which of the experiential services of the different providers the ticket provides access to. The venue providers offer similar experiential services relative to each other. The experiences can be, for example, golf services, spa services, movie theatre services, sports arena services, concert or other entertainment hall services, and the like, each of different levels. For example, movie theatre services may include matinee showings, weeknight showings and weekend showings.

On each occasion of use, a ticket user selects one of the particular providers of which to use the leveled ticket to obtain access to the certain service. The user may also decide to select other services of the provider. Using a communications network, the provider processes the leveled ticket. First the leveled ticket is processed to determine whether the leveled ticket is valid. If the leveled ticket is
valid, it is redeemable by the provider. In response to redeeming the leveled ticket, the ticket user is allowed access to the certain services by the selected provider.

In the case of the ticket user wishing to access other services instead of or in addition to the certain services by the provider, the leveled ticket is further processed to determine whether the access level of the ticket is commensurate with or otherwise matches the access level of the desired (other) services. If the access level of the leveled ticket does not match the access level of the desired (other) services, the ticket user is allowed to upgrade the leveled ticket to increase the access level. The leveled ticket can be upgraded by allowing the ticket user to purchase an additional incremental value above a base ticket value on the leveled ticket. The leveled ticket is presented by the ticket user to the selected provider in exchange for access to the selected/desired service(s). The redemption amount debited by the selected provider can be higher than the base ticket value.

In determining whether the leveled ticket matches the access level of the selected/user desired services, the communications network can be used to determine whether the access level of the leveled ticket matches the access level of the selected services. The communications network can be a credit card network, debit card network, or private label network for example. The providers can be authorized merchants that are part of the communications network. Processing the ticket to determine whether the ticket is valid can exclude reporting of any monetary value associated with the ticket, but can include reporting incremental credit information.

When using the leveled ticket to enable the ticket user to obtain access to the selected services, the leveled ticket can be redeemed at a variable rate. In response to the variable rate redemption of the leveled ticket, the provider allows the ticket user access to the selected services. The variable rate can be within the determined threshold price range for such tickets. In redeeming the leveled ticket, the price set by the selected provider for the selected services is paid to the provider. The price debited for the services by some of the providers can be different from price debited by other providers for the same services (e.g. event, experience, etc.). In this way, the leveled ticket can be redeemed at a variable rate among the providers for the same services. Payment can be effected at the price debited for the selected
services. Any differences in prices debited by the providers for the same service can be absorbed by the invention system.

The leveled ticket can be accepted for a single use of the certain and/or selected services or for multiple uses of the certain and/or selected services. The leveled ticket can be redeemable for the selected services from the selected provider, as opposed to a cash value. The leveled ticket can be implemented using a plastic card, which is similar to a credit card or debit card. The ticket can be implemented using an electronic ticket with an access code or pin number. The ticket user can obtain the leveled ticket by making an online reservation. The online reservation can enable the ticket user to reserve access (e.g. specific time slot/date for a round of golf, specific seats at a certain showing/event, and the like) at a selected provider.

The leveled ticket can have a unique identifier. Upon purchase of the leveled ticket by a customer, who could be the ticket user, the leveled ticket can be activated by a seller. The leveled ticket can be activated by validating the unique product identifier of the ticket.

A system for providing access to services is disclosed. A leveled ticket, which may be electronic, is processed using a communications network. An engine in communication with the communications network processes leveled tickets at a variable rate for same or equivalent services by participating providers. The range of rates of the service providers is within a threshold price range. The threshold price range defines an access level for the leveled ticket. The access level qualifies different participating providers (e.g. events, venues, etc.) for the ticket such that the leveled ticket is usable as a provision of access to qualified services offered by qualified providers.

A ticket reseller can facilitate the re-distribution of tickets as leveled tickets. Tickets from a network of various distributors can be aggregated to create leveled tickets. An aggregation engine in communication with the network of various distributors facilitates the creation and distribution of leveled tickets. The network of distributors can include independent ticket distributors who are distributing tickets in the secondary ticket distribution market. The distributors in the network can be ticket brokers, agents online, or fans selling their tickets. The ticket reseller can provide, for example, a ticket auction site where tickets from independent ticket
distributors, e.g. service providers, artists, promoters, fans or venues, are auctioned to ticket purchasers according to ticket levels.

According to another aspect, an inventive system and method arrange is provided for remittance for services as represented by a token, or in other words, prepayment by a customer of a predetermined sum for indicia such as a one-time-use gift ticket. The ticket/token is redeemable for a particular incremental quantity of services, as opposed to a cash value. The ticket/token is redeemable at any of a plurality of different providers that offer services that might be more or less similar but that qualify as the stated sort of services. The system and method are particularly applicable to personal services, entertainment services and similar quantifiable services, e.g., a movie pass (at any participating theater), a round of golf (at any participating golf course), a spa treatment (at any participating spa), etc.

The providers are independent entities that determine the nature of their own offerings and set their own prices. The gift ticket issuer enlists a number of suppliers of services to be obtained by redemption of the ticket for services, each having offerings that have character, terms and pricing arrangements that are approximately equal but may differ up to some threshold. Enlisted service providers agree to participate in the program and agree to accept the prepaid gift ticket as a payment method.

According to an inventive aspect, the enlisted service providers are not required to accept some standard or negotiated amount that is less than their regular price for services of the type that are delivered. Instead, the service providers accept for payment one time use tickets and process the transaction over an existing credit card network or as some other financial transaction (including such instant payment systems as Pay Pal, which allows secured payment directly out of an existing bank account) in which the account that is debited is the account of the entity that issued the one-time-use ticket.

Gift tickets are sold through sales outlets, through the Internet, by telephone or in large blocks to institutional purchasers. Participating merchants whose services may be redeemed through the gift ticket system can also be empowered to sell the tickets. The tickets can be retail items of purchase that are activated at the point where the tickets are sold to customers.
The customers can use the gift tickets to redeem a stated increment of services for themselves or can present the ticket as a gift. The system is particularly applicable for use in giving gifts or employee awards or incentives, because the emphasis is wholly on redemption for the services and not on redemption of a given cash value.

Gift tickets each contain a unique identification code and are loaded with a predetermined value identified as a one-time use at any customer-chosen one of the service providers who have agreed to participate and who provide the pertinent goods or services that are identified when the ticket is sold.

When a ticket is sold, it is activated by the seller, for example by scanning a bar code associated with a uniform product code or by swiping a magnetic strip on the ticket itself, and notifying a ticket information manager of its sale. At that time, the unique identification code of the ticket is noted in a memory file by the ticket information manager. A predetermined portion of the sale price (i.e. less any service fee to the vendor) can be transferred by the vendor to the ticketing program manager at the time of ticket activation. Another alternative is that the entire purchase price is credited to an account maintained by or for the ticketing program manager who then regularly compensates the vendor for its participation, either on a flat-fee basis or as some function of the number of tickets sold, including perhaps added incentives at various sales level thresholds.

Gift tickets sold over the Internet or by telephone can be mailed in an activated state or can employ security features requiring the purchaser to activate the ticket (by Internet or telephone) upon receipt, for example, by repeating a code that was given to the purchaser at the time of the sale or by repeating a password determined by the purchaser at the time of the sale.

The ticket can be purchased by the ultimate user or advantageously is given by the purchaser to the end user, for example as a gift, an employee or sales incentive award, a premium item or the like. The gift ticket holder presents the ticket for redemption of the particular service from one of a plurality of agreed service providers. The identities of the agreed service providers can be stored in an inclusion table that is employed by a ticket information manager. The service provider verifies the ticket's validity by checking with the ticket information
manager that the ticket's unique identification code is valid and that the ticket has been activated, in a transaction that is much the same as a credit card authorization, which can use the same point of sale network communications as a credit card transaction.

According to another aspect, although the gift ticket is issued as a one-time-use item, purchasers can choose to add incremental value to upgrade the ticket at the time of purchase or prior to redemption. This feature has two main applications. With the capability of adding an incremental value, it is possible to apply the invention to services of a given kind (such as a round of golf, for example) that have more than some predetermined threshold difference in value that prevents them from being peers. Thus, the invention can be applied to an arrangement in which 18 holes at an international golf course such as Pebble Beach of the Masters' course in Augusta, for example, can be regarded as distinct services from less prestigious local golf courses that represent the norm. The customer can purchase an upgrade (or several incremental upgrades if more than one is needed for a particular provider) if desired, to the higher quality level in the same category of "a round of golf," which can be redeemed at any of the venues that fall into the higher classification.

Alternatively or in addition to providing upgrades for moving upwardly between two or more classes of a given service that might render two alternatives as peers, the holder of a ticket can be permitted to obtain an upgrade that arranges a ticket issued for one person for a given class of services to be redeemable for more than one person, within the same class of services.

Upgrades as described can be purchased in a manner similar to the initial transaction at which the ticket was originally offered and sold. Alternatively, sales of upgrades can be made in various other ways, such as through an Internet web site with the use of a credit card or by touch tone telephone through an Interactive Voice Response system connected to the ticket information manager's data storage system.

It is an aspect of the system and method that the purchase price of the gift ticket is fixed, but the ticket holder can redeem the ticket at any of a plurality of providers of a given service, even though the service providers may normally assess different prices. The service providers are credited in the redemption process with their agreed payment price from the ticketing program manager, so that the provider
is paid in a normal manner when a ticket user redeems a ticket for a service. In this way, ticket holders are fully as welcome at the provider's establishment as a customer that might remit cash currency when obtaining the same service. In one embodiment of the system, the ticket is recognized by an existing credit card system such as American Express, Visa, Master Charge, Discover, etc. (particularly, Discover, which currently has the capability to distinguish among vendors in an inclusion list), and can be swiped in existing point of sale terminals, thus allowing for familiar use by the service provider and instant payment to the service provider's account. The service provider is credited for the price of its services in the usual manner of a credit card network, but unlike the usual credit card transaction, a charge is not levied against the user's account, but is debited against an account held by the ticketing program manager.

A system is also disclosed to implement the marketing, sale, redemption and account management of a one-time-use gift ticket for prepaid entertainment or personal services.

The above aspects and features of the invention will be better understood from and are disclosed in further detail by following detailed description of certain preferred embodiments of the invention, provided in connection with the accompanying drawings, forming a part of this written description.

BRIEF DESCRIPTION OF THE DRAWINGS

The foregoing will be apparent from the following more particular description of example embodiments of the invention, as illustrated in the accompanying drawings in which like reference characters refer to the same parts throughout the different views. The drawings are not necessarily to scale, emphasis instead being placed upon illustrating embodiments of the present invention.

FIG. 1 is a block diagram illustrating an example overview of a redeem-for-services system according to an embodiment of the present invention.

FIG. 2 is a flow diagram illustrating steps of an exemplary embodiment and method of administering a services system of the present invention.

FIG. 3 is a flow diagram illustrating an overview of the steps for creating leveled tickets according to an embodiment of the present invention.
FIG. 4 is a flow diagram illustrating an overview of the steps for using the ticket and ticket redemption according to an embodiment of the present invention.

FIG. 5A is a block diagram of a redeem-for-services system with merchants associated with levels according to an embodiment of the present invention.

FIG. 5B is a block diagram of an example online environment for processing an electronic ticket according to an embodiment of the invention.

FIG. 5C is a block diagram of a price leveling method and system using an aggregate ticket-distribution channel according to an embodiment of the invention.

FIG. 6 is a schematic view illustrating a computer network or similar digital processing environment in which embodiments of the present invention may be implemented.

FIG. 7 is a block diagram illustrating the internal structure of a computer node or processor device of the network of FIG. 6.

15 DETAILED DESCRIPTION OF THE INVENTION

A description of example embodiments of the invention follows.

Redeem-for-Services System

Unlike a traditional gift card with a specific monetary value, the present invention generally provides a redeem-for-services system using a card or a ticket, which is not limited to a single dollar amount or store chain. The recipient of one of these inventive tickets has the flexibility to enjoy a particular type of goods or personal services, such as a concert, sports, arts, theater, broadway show, family event, golf, ski, spa, or movie experience, regardless of price variances, at the location and time of their choosing. The inventive ticket can be processed, for example, by simply swiping it through a standard credit card reader/network, or by simply entering in a pin number or access code.

FIG. 1 is a block diagram of an example overview of a redeem-for-services system 10 according to an embodiment of the present invention. In this example, the redeem-for-services system 10 includes the following parties: a seller 20, purchaser 30, end user/ticket user 35 and service provider 80. A ticket information
manager 70, financial network 90 and ticketing program manager 95 support the apparatus and affect the transactions among the parties of system 10.

For the end user 35, the present invention provides unique access to goods or services (e.g. experiential services, events, etc.). The unique access code, for example, can be a 16-digit identification number, which can be booked online. Preferably, a ticket 40 (i.e. a leveled ticket) that includes the unique access code is provided. The ticket 40 is for a specified service that is acceptable at multiple participating service providers 80. The service providers 80 provide similar services. The ticket 40 is for one or more uses at any one of the multiple participating service providers 80 of the end user's choosing. Because the participating service providers 80 may have different prices for the subject service, the inventive ticket 40 is redeemable at a variable rate. Through the ticketing program manager 95, the present invention provides a price leveling scheme associated with threshold price ranges and the variable rate redemption, which is discussed in more detail below.

Any of the service providers 80 can increase the price of the subject service between the time the ticket 40 is originally issued and the time the ticket 40 is used, and the variable rate redemption will cover the increased price. To the end user 35, the ticket 40 provides full payment for the subject service no matter what the cost differential from one service provider to the next or the increase in price by an individual service provider 80 over time. That is, to the end user, the experience in using the inventive ticket 40 does not differ depending on the service provider 80 selected by the end user 35 (even if the end user selects the service provider with the highest price for the subject service or a service provider who has increased the price of that service). The end user 35 does not need to pay out of pocket for the cost differential. The cost differential is absorbed by the ticket information manager 70. As a result, the inventive ticket 40 represents to the end user 35 the subject service paid in full and serves as a one-time access to the service.

By way of contrast, traditional gift cards and credit cards provide a form of cash. Such cards have a set dollar amount or line of credit up to which the end user can spend in one or multiple uses. With conventional gift or debit cards, the user typically faces concerns over price differentials between participating merchants
(service providers) and increases in prices for the same goods or services. The user has a different experience in using the gift or debit card depending on merchant selected. Because conventional gift/debit cards are designed for multiple uses, bounded by a predefined dollar limit, the user more often than not pays out of pocket for purchases over the dollar limit of the card.

While traditional credit/debit or gift cards effectively represent a dollar for dollar cash equivalent, usable multiple times for goods/services of the end user's choosing, the variable rate redemption of the present invention provides a ticket 40 for a prespecified service.

Referring to FIGS. 1 and 2, at step 100, a ticketing program manager 95 desiring to implement the redeem-for-services system 10, preferably for a particular type of entertainment or personal service, enlists a plurality of service providers (merchants) 80 of one or more substantially comparable services. In at least one embodiment, providers 80 are under contract to honor the inventive ticket 40 according to the procedures described herein, namely to accept the ticket 40 in exchange for provision of the provider's 80 regular services and to seek remuneration for such services from the system maintained by the ticketing program manager 95.

The ticketing program manager 95 enlists the service providers 80 as members of a network of similar service providers (e.g. a common group enterprise or industry). The provider's membership in the common group enterprise helps advertise the provider's services. Likewise, membership in the enterprise can further benefit individual providers, through additional advertising, access to new clientele and association with a product (the ticket 40) that may be promoted as having a certain desirable cachet in and of itself. In addition, it can be desirable that the service providers accept the ticket 40 at all times they are open, so that a "no-blackouts" feature of the ticket 40 will enhance its acceptance in the marketplace and add to the desirability of receiving such a pass as a gift. However, it is not strictly necessary for the provider 80 to undertake any particular responsibilities other than to provide the same services to ticket user 35 as the provider 80 provides to regular cash customers.
The service providers 80 can provide at least one same stated service or article of goods, for example, a round of golf, a day's worth of skiing, a sports event, a concert, or treatment at a health spa or the like. A broad network of providers of like services who accept the ticket 40 improves the marketability of the ticket 40, since the ability for the user to select among a variety of convenient providers is a desirable feature and one which can differentiate the ticket 40 from ordinary gift cards or other indicia redeemable only at the retailers from whom it was purchased. Various providers 80 can provide somewhat different services and may assess different charges, up to a threshold of difference within which the providers are considered to provide the "same" service as authorized and redeemable by presenting the one time use ticket 40. As used herein, a "same" service contemplates like services, equivalent services and similar.

Therefore, while the particular service for which a ticket 40 is to be used is nominally the same service for that series of ticket (e.g., for tickets sold for redemption for a uniquely named or described service), the service providers 80 need not all agree to provide identical services or to charge a dictated price for their services. Within the threshold of comparable pricing, differences in services can be accommodated owing to such factors as specific service component differences, location, prestige and quality, or other differences, as well as arbitrary consumer preferences. It is an inventive aspect of the subject system and method that service providers are not required to each accept identical payment value for their services, despite the fact that the gift ticket 40 is sold for a given price and is redeemable for such services at any of the service providers 80, the service providers 80 do not need to each accept identical payment value for their services.

Setting the Price of the Ticket

The ticketing program manager 95 sets the price charged by seller 20 for sale and activation of the ticket 40, so as to accommodate variations in actual service provider prices. Preferably, the inventive tickets are priced according to leveled access (levels of access to services afforded by the ticket). A standard ticket can be pre-loaded at least with level one access, while tickets for services that are in mid-to upper level price ranges, can be pre-loaded with level two or level three access.
Each participating golf course location, for example, can be associated with a specific level. An online directory can be provided to distribute information about each golf location and its associated level(s). These levels can be applied to each golf ticket as an indication of the golfing experience, for instance, to allow for seasonal and resort style play.

FIG. 3 is a flow diagram depicting the steps for creating leveled tickets according to an embodiment of the present invention. The prices set by the participating service providers are analyzed at step 302. Based on the analyzed prices, a respective price range for a "same service" is determined at step 304 and different price ranges for different sets of services are similarly determined. For each determined price range, invention method (e.g. processor routine) 300 defines a threshold price range of the corresponding service at step 304. It is within this threshold the range that system 10 provides variable rate redemption for same service (the corresponding service). Next, the method/processor routine 300 (step 304) assigns a respective access or ticket level to each threshold price range. Different access levels have different threshold price ranges.

At step 306, the participating service providers' services are assigned to access or ticket levels according to respective threshold price ranges that their service prices fall into. For example, services that are in the mid price ranges can be assigned to a level two threshold pricing category. Services that are in the upper price ranges can be assigned to a level three threshold pricing category. The service provider is free to set and/or change his service prices without regard to system levels or threshold price ranges. The variable rate redemption in cooperation with the threshold price ranges allow for such.

At step 308, tickets are generated based on access level. A golf ticket, for example, for a round of golf at 18 hole, 3 par courses is preloaded with level one access. Other golf tickets are preloaded with level two access for redemption at par 5 golf courses, and so forth. The levels applied to each ticket can be used (step 310) by the ticket user as an indication of the ranking of the quality of the experience afforded by the ticket. By preloading the tickets with leveled access, the system 10, 300 enables the tickets to be used in exchange for services at an experience/quality level that matches the respective access level associated with the ticket. An online
directory, for instance, can be provided to enable the ticket holder to find information about each service location (or participating service provider) and the associated levels of services at each service location.

Similarly, a printed directory may be provided with each ticket, such that there are different directories for the different levels of tickets.

Preferably, the threshold price range corresponding to a ticket 40 level is set and/or periodically adjusted so that the use of the tickets integrated over all the users and providers, has a sufficient surplus selling price over the average cost of the service (which may or may not be the same as the average provider price, given that users may frequent certain providers more than others), to provide at least a modest return on investment to the ticketing program manager 95. The ticket 40 selling price is determined so that any overage that accumulates when a ticket 40 is redeemed for ticket level services from providers whose services are priced at less than the ticket 40 selling price is balanced against the shortfall that arises when a ticket 40 is redeemed for services from providers whose services are priced higher than the ticket 40 selling price. This calculation advantageously takes into account (1) the extent to which users may prefer to patronize certain providers over others (e.g., providers that are perhaps more prestigious, that advertise more, that have been in business longer or that have locations that are convenient to a larger number of users), and (2) the extent to which tickets are never redeemed (based on statistical data or heuristics). The calculation also provides for a return to the ticketing program manager 95 over a break-even number.

At any rate, ticket 40 levels and service provider 80 relationships are established (100). Ticket Information Manager 70 stores ticket level information, service provider 80 information (identification of entity and services offered, and correspondence of services to respective ticket levels), and the like.

Establishing Relationships with Sales Outlets

Referring back to FIGS. 1 and 2, after the service provider relationships have been established (step 100) or while that is occurring, the ticketing program manager 95 establishes relationships with existing sales outlets or ticket distributors (step 110) who will sell the tickets 40. The sellers can be any kind of distributor, such as
a vendor, store, retailer, wholesaler, etc. The sellers 20 can directly distribute the tickets or they can be resellers who sell and distribute the tickets in the secondary market.

In one embodiment, the sellers 20 have point of sale terminals 50 connected to an existing network 60, such as a credit/debit card network or private label network, that allows fast, efficient communication with the ticket information manager 70. This communication is desirable for the transfer of the information required to initialize a ticket 40 once it has been purchased. If the existing network is connected to a financial network 90, such as that maintained by a credit card company, this can also facilitate the automatic transfer of funds between the sellers 20 and the ticketing program manager 95 and between the ticketing program manager 95 and service providers 80. For example, the credit card company or issuing bank can require an escrow account for the ticketing program manager 95, into which funds are transferred from the sellers and from which funds are withdrawn to pay service providers. By using an existing credit card network as the financial "settlement" for the system, funds transfers can be managed with minimal day-to-day involvement from the ticketing program manager 95. While the use of an existing credit card network as the communication network carries certain advantages, it is also possible for the communications to take place over an Internet connection (for example to a secure web page hosted by the account manager) or a telephone connection to either "live" operators or an Interactive Voice Response system connected to the ticket 40 information manager's (70) data storage equipment.

In one exemplary embodiment, the ticket information manager 70 has a communications link or other access to a financial network 90 which is a credit card provider's network. When a ticket 40 is swiped on a point of sale terminal 50 at either the seller's end or the service provider's end, the credit card network will communicate (at 60) with or otherwise access the ticket 40 information manager's processor of financial transaction 70 equipment. The ticket 40 verification or validation and approval of service providers are handled directly by the ticket information manager 70. The ticket information manager 70 simply returns an
accept or reject message to the credit card (financial) network 90, which then either causes the transaction to process at the point of sale terminal 50 or cease.

In an alternative embodiment, the ticket issuer can be a commercial organization other than a seller 20, with communications equipment or the like to activate the ticket 40 through communications with the ticketing program manager 95.

In another embodiment, the sellers can be independent third parties (e.g. resellers), and the system 300 can facilitate the aggregation of tickets from a network of distributors/service providers for sale and distribution as leveled tickets.

FIG. 5C is a block diagram of the invention price leveling as applied to or employed by an aggregate ticket-distribution channel 565 according to an embodiment of the invention. A central aggregation website/portal 585, for example, can be provided to distribute tickets according to leveled access 575, 580. The portal 585 can be a ticket auction site where potential purchasers can bid on the leveled tickets. The portal 585 provides an online marketplace for buyers and sellers of tickets for sports, concerts, theater and other entertainment and services. The tickets are auctioned or sold using the portal 585 even for events that have been sold out. Using the portal 585, a potential ticket purchaser may select, bid and/or purchase tickets for an experiential service.

An aggregation engine 570 aggregates tickets from the network of distributors/service providers (e.g. ticket brokers, agents online, fans selling their tickets, etc) to facilitate the distribution of the tickets as leveled tickets. Standard tickets (e.g. tickets purchased for $1-100) can be pre-loaded at least with level one access 575, while tickets for services that are in mid-to upper level price ranges (e.g. tickets purchased for $101-$200), can be pre-loaded with level two 580, etc. The tickets, for example, can be obtained from the ticket holders desiring to resell them and then auctioned at the site 585. In this way, the site/portal 585 provides a ticket marketplace that assists ticket holders in reselling their respective tickets, for example, when unable to attend an event. By creating a marketplace for buyers and sellers, the site/portal 585 provides a highly needed service in the secondary ticket distribution market. The aggregation engine 570 is used to aggregate tickets from
the various sources and provide leveled tickets at a central place 585 for sale and
distribution to ticket buyers according to ticket levels.

Distributing and Configuring the Tickets

Once relationships with the sellers 20 and service providers 80 are
established, the ticketing program manager 95 distributes the tickets (step 120).
Preferably the tickets are distributed at first in a un-activated state, namely
functional but not yet activated for use. An activation process includes placing
suitable codes or notations on the tickets or storing codes in the tickets or elsewhere
in a data storage medium that is accessible over a communication network. These
codes can be checked or authorized by the payment when determining whether to
permit use of the tickets to redeem-for-services by a venue provider.

In one embodiment, the tickets have a preprinted unique identification code
and a magnetic strip or other means of recording information. The strip or other
means can be prerecorded with a unique or at least substantially unique
identification code for each ticket. The unique identification code may be an
alphabetic code, a numeric code, an alpha numeric code, or other appropriate
identification code capable of uniquely identifying an individual ticket, and perhaps
also identifying the related type of service (e.g., golf, spa, etc.). In an alternate
embodiment, the tickets do not have a preprinted or prerecorded identification code,
but do contain a recordable medium such as a magnetic strip or an electronic storage
device, which may be loaded with a unique code preliminarily or may have an area
in which such a code is inserted as a part of the activation procedure.

The issued ticket 40 can be configured and formatted with certain indicia
characteristic of a standard credit card. This can include printed or embossed
account identification numbers, a magnetic strip or on board integrated circuit
memory, a one or two dimensional optical bar code, etc. The information can be
prerecorded or at least partly recordable. Two or more redundant means for storing
the same information, such as an account number, which identifies the level
associated with the ticket, can be provided for data entry in different optional ways,
or the different storage techniques can be used for information that is otherwise
cross referenced. Advantageously, the ticket 40 has sufficient information carried
thereon to permit use of the ticket 40 substantially in the same physical manner as a standard credit card, namely using equipment conventionally provided at a point-of-sale terminal 50 (scanners, magnetic strip swipe readers, keyboards, etc.).

Instead of preloading a card with the ticket information, an e-ticket (electronic ticket) can be provided. FIG. 5B is a block diagram of an example online environment for processing an electronic ticket according to an embodiment of the invention. An application server 556 can host the ticket account information 554. End users at client systems 558 can access their ticket information 554 and download an electronic copy of their leveled e-ticket 552. An e-ticket can be a paperless electronic document or qualifying data. When an end user, for example, reserves a golf T-time or movie seat by telephone or using global computer network communications, the details of the reservation can be stored electronically at the application server 556. The end user can download a copy of the electronic ticket locally to their hard drive 558, or print a hardcopy of the reservation, but preferably, in this implementation, the hard copy would not be required for admission to the desired service/service provider 80. A confirmation number can be assigned to the end user's reservation, along with the date(s), and location(s). For admittance, the end user can simply present positive identification or a confirmation code, access code or PIN number.

Referring back to FIGS. 1 and 2, the ticketing program manager 95 reserves for itself a series of digits or numbers or number combinations in a standard credit card format that are unique to the account manager and identify one or more accounts associated with the ticketing program manager 95. Initialization and validation steps, which are processed by a ticket information manager 70 can be undertaken over an existing communication network 60, which preferably is a network that processes conventional credit/debit cards, or can be another public or private data communication network. Other types of communication devices may be used instead of or in addition to a standard point-of-sale terminal 50 programmed to handle credit cards, so long as the device is capable of communicating sufficient ticket information over an operable communications network. For example, in another example implementation, the ticket information can be transmitted between the seller 20 and the ticket information manager 70 by telephone either by voice in
association with a live operator or through a telephone keypad to an Interactive Voice Response system.

The ticket 40 proceeds through several steps associated with initial issue, sale (preferably with validation concurrently upon sale), and later presentation as an identification of value used to present remittance for a service. At step 130 (FIG. 2), the purchaser 30 selects a ticket 40 for purchase and pays the seller 20 some agreed purchase price 31. This transaction can be a conventional retail, wholesale or other transaction in which one or more tickets are exchanged for cash or credit or other remuneration.

At step 131, the seller 20 activates the ticket, preferably, including transmitting an identification code that is or becomes associated with the ticket 40 (e.g., is at least partly read from or written onto or otherwise associated with the ticket). The identification code is at least substantially unique to the ticket 40 and is transmitted over the existing communications network 60 to the ticket information manager 70 or to a data store associated with the ticket information manager 70. If the system is such that the ticket 40 already has a preprinted or recorded identification number, the ticket information manager 70 compares this number with the numbers of tickets that it has previously distributed to sellers as one step in determining validity. If the ticket 40 has a valid number is active, and that has not already been processed, the ticket 40 information manager records the ticket's number, noting for example in a data memory that the ticket 40 has now been purchased and should be authorized for use. Other information is also preferably recorded, including at least the purchase price and the date of the sale transaction (step 132). The ticket information manager 70 preferably acknowledges by communication back to the seller that the ticket 40 is valid and now has been initialized (step 133), although the acknowledgement can be deferred or accomplished off line.

The seller 20 then accepts payment 31 from the purchaser 30 (who might or might not be the ultimate ticket user). At step 134, the seller 20 transfers payment 21 to the ticketing program manager 95, preferably, through a financial network 90 such as a credit card network. If a credit card network is used, funds can be automatically transferred to an escrow account maintained with the credit card
company for the ticketing program manager 95. Although the seller could have previously paid the ticketing program manager 95 in full for the tickets and then resells them to customers, it is preferable that payment to the ticketing program manager's escrow account is made from funds received from the purchaser 30.

Therefore, payment 31, 21 is transferred to or for the benefit of the ticketing program manager 95 when payment is tendered by the purchaser 30. The payment 21 to the ticketing program manager 95 (or its escrow account) is the payment tendered, less a portion of the sale price that is due to the seller (step 134) in consideration of making the sale.

If the communication network 60 is an existing credit card network, credit can be transferred immediately to the ticketing program manager's 95 account. In another embodiment, the initialization process can take place over a global computer network (the Internet), e.g., via a secure web page hosted by the ticketing program manager 95 or another party providing account transfer services. For example, payment to the ticketing program manager's escrow account can be effected through available Internet payment mechanisms such as Pay Pal, which provides for value transfer to end user's accounts. Otherwise, the seller 20 can remit funds owed to the ticketing program manager 95 on an invoiced or other basis. Because the initialization of the ticket 40 (steps 131-133) is preferably performed through the ticket information manager 70, an exact, up-to-date record is maintained of how many tickets each seller has sold, and at what price. This facilitates accountability and correct payment to the ticketing program manager 95 or into its escrow account.

Using the Ticket

Once purchased, a ticket 40, may be used by the purchaser 30 or by someone to whom the purchaser has conveyed the ticket, for example as a premium or as a gift for redemption, etc. The ticket 40 is used as a representation of value used as remittance at any of the service providers' services that match the ticket level. Inasmuch as the end user 35 might or might not be the same party as the purchaser 30, for the purpose of this description, the term "user" or "end user" should be construed to encompass an initial purchaser or anyone to whom the purchaser has conveyed the ticket 40.
A ticket user 35 presents the ticket 40 to a service provider 80 at step 150 in order to redeem the indicated service. At step 151, the service provider, preferably, verifies the validity of the ticket 40, including its associated ticket level, by data transfer to the ticket information manager 70 over the communications network 60.

If the communications network is one that is maintained by a credit card provider, the credit card provider's equipment would recognize the unique identification code as being not an ordinary credit card but a onetime-use ticket 40 and would contact the ticket information manager 70 to perform verification of both the service provider's inclusion in the program and the validity of the individual ticket. As a first check, the ticket information manager 70 will verify that the service provider 80 is among those who have agreed to accept the tickets. (Step 152). This may be accomplished by the storage of an inclusion table listing those participatory providers by the ticket information manager 70. If the communications network is a credit card network, the initial screening for whether a service provider 80 is listed in an inclusion table can also be made by the credit card service provider. The unique identification code associated with the ticket 40 is read at the point of sale terminal 50 of the service provider 80 and then transmitted to the ticket information manager 70. At step 153, the ticket code is compared with a list of codes stored in a data base maintained by (or for) the ticket information manager 70, namely, a list of valid ticket codes for initialized but as-yet-unused tickets. If the ticket code is valid and the ticket 40 has not yet been used, the ticket information manager 70 returns a message to the service provider (via the credit card network if employed as part of the system) that the ticket 40 is valid. This indicates to the service provider 80 point of sale that the user may redeem a single use of the service provider's services, such as the aforementioned round of golf, day of skiing, baseball game, a concert, or treatment at a health spa or the like. The ticket information manager 70 then records data referenced to the ticket code to represent that the ticket 40 has been used, so that the ticket 40 may not be used validly again (step 154).

By communicating to the service provider 80 that the ticket 40 is valid, the ticket information manager 70 basically indicates that the ticketing program manager 95 will remit payment 81 to the service provider 80 in the amount of the going (current) purchase price of the service for which the ticket user 35 has
presented the ticket 40. If a credit card provider is serving as the financial network and the communications network 60, the ticket information manager 70 can signal the credit card provider to release funds from an escrow account maintained for the ticketing program manager 95 directly to the service provider's account. To facilitate validation, it is possible for a service provider that offers various services to report to the ticket information manager 70 that a particular service is being redeemed, whereby the ticketing program manager 95 can account for the amount to be remitted. Finally, the ticket information manager 70 sends a notification to the financial network 90 that a ticket 40 has been redeemed, at which point the financial network provider transfers payment 81 from the ticketing program manager's account to the service provider's 95 account. (Step 155).

When the communications network 60 is (or links with) an existing credit card network, credit for the funds may be transferred from the ticketing program manager 95 (or its escrow account maintained by the credit card network) to the service provider's account immediately in the same way as a credit card transaction, but, preferably, the purchaser 30 and end user 35 are not privy to the accounting details of service price and the like. Preferably, it is not necessary for the end user 35 to present identification or sign receipts or the like, because the monetary transaction is between the ticketing program manager 95 and the service provider 80.

Although a credit card network can be used, the communications network can be another public or private data communications network, such as an Internet connection to a web page hosted by (or for) the ticket information manager 70 or alternatively by the ticketing program manager 95. The ticketing program manager 95 can transfer funds to the service provider using a variety of Internet-based services, such as Pay Pal, Bill Point, etc. Otherwise, the ticketing program manager 95 can make payment by check or other means to service providers 80 on a periodic basis to account for the number of users that have used that service provider's services since last payment. It will be recognized that the separate functional blocks depicted in FIG. 1 as ticket information manager 70 and ticketing program manager 95 may be performed by the same entity. Further ticket information manager 70 and ticketing program manager 95 may be implemented as one or more processing
engines (e.g. a redeem-for-services ticket engine) or other processor-like units. It should be recognized that an escrow account can be maintained either by the ticketing program manager 95 as depicted in FIG. 1 or by the financial network 90 on behalf of the ticketing program manager 95. Other configurations and arrangements are suitable.

If, at step 153, the ticket information manager 70 determines that the ticket 40 does not have a valid identification code, or has a code for a ticket 40 that has already been used once, then a message is returned to the service provider 80 indicating that the ticket 40 is not valid and that the service provider should not accept the ticket 40 as payment for services. A similar message would result if, at step 152, the ticket information manager 70 does not recognize the service provider 80 as one who has agreed to participate in the prepaid leisure activity services system, or where the level assigned to the service provider's service does not match the ticket level. In this situation, the service provider 80 would likely not be listed in the ticket information manager's 70 inclusion table.

FIG. 4 is a flow diagram illustrating an overview of the steps for using the ticket 40 according to an embodiment of the present invention. At step 402, the end user selects a service provider 80 and selects one or more services offered by the service provider 80. At step 404, the service provider 80 processes the ticket (as detailed above) to determine whether the ticket is valid for the selected service. At step 406, the process 400 determines whether the access level of the ticket matches the access level of the selected services. At step 408, the process 400 determines whether the ticket needs an upgrade. If an upgrade is needed then at step 410, the access level of the ticket is upgraded. The process for upgrading the ticket is discussed in more detail below in conjunction with step 140 of FIG. 2. At step 412, the ticket is redeemed (i.e., the service provider 80 completes the financial transaction using ticket 40 as payment), and at step 414, the ticket user is admitted to the selected services.

Preferably, the ticket 40 provides information and enables the end user 35 to obtain and remit for an incremental service, as opposed to an incremental sum of money. The various service providers 80 may charge different amounts for similar or different services. A given service provider may assess different charges at
different times for its particular services. Preferably, the different charges are within
the threshold price range associated with the ticket level. In addition, the services
can be associated with different levels for different times of day. For instance, golf
services offered by a golf provider can be assigned a Level One rating during
periods of less than maximal use or demand, such as off-peak hours, while its
services can be assigned a Level Two rating during peak hours.

Referring back to FIGS. 1 and 2, from the end user's standpoint, the system
treats the ticket 40 as the mechanism to provide an increment of services (or
possibly goods) apart from these pricing considerations, which is advantageous. At
step 160, after the system 10 has been in operation for some period of time, the
ticketing program manager 95 can compare and reconcile any overage/underage on
proceeds received on tickets 40 presented for higher or lower priced service
providers 80 and/or sold by sellers 20 with higher or lower markups. Accordingly,
the ticket program manager 95 adjusts pricing and payment strategies or provider
membership arrangements, if necessary. These differences are absorbed and
averaged by the ticketing program manager 95, who can make certain decisions
about how the system 10 is run and how tickets 40 are leveled (threshold ranges) and
priced. For example, the ticketing program manager 95 may decide based on
experience to adjust the sale price of future tickets 40 and/or to adjust the threshold
price ranges per level of tickets. Further, the ticketing program manager 95 may
determine that certain sellers 20 and/or providers 80 will or will not become or
remain active, with competition and supply and demand causing the market to reach
an equilibrium. However, because the ticket 40 represents credit toward a service
(or a prepaid or credited service) and not a monetary value to the users, a change in
price for new ticket purchases will not affect the redeem-ability of tickets already
purchased.

Upgrading a Ticket

The purchasers 30 or ticket users 35 can be provided with the ability to add a
limited amount of incremental value to the ticket 40 (an upgrade), either at time of
initial ticket purchase or at any time after purchase and prior to redemption of the
ticket 40 for services (step 140 in FIG. 2). The addition of incremental value can
allow the ticket user to upgrade the ticket level to match the level associated with the services and service provider that the user has selected. The feature incorporating the addition of incremental value can apply to allow use of the ticket 40 at service providers 80 whose services are priced significantly higher than the initial value of the ticket 40, e.g., services that are within a different threshold price range than the price range associated with the ticket level. For example, as shown in FIG. 5A, Merchant 1 (at 504-1) is a Level 1 golf course, while Merchant 3 (at 504-3) is a Level 3 golf course. If the end user 35 has a Level 1 ticket, and intends to use it at Merchant 3, which is a Level 3 golf course, the end user 35 will have to upgrade the ticket.

When a user 35 intends to redeem the ticket 40 for a service provider's services having a level that exceeds the level of the ticket, incremental value can be added to the ticket as illustrated in FIG. 5A. Incremental value need not necessarily be an integer multiple of the ticket's initial value, but can be a fraction of the initial value. Preferably, the ticket 40 reflects access to incremental levels of providers and such experiential services, to the user 35, and not monetary value. While the ticket information manager 70 may store, for each ticket, data representing the actual monetary value that has been purchased by the ticket user, any features that allow the user to retrieve information about the ticket 40 (such as Interactive Voice Response or Internet access described more fully below) preferably return incremental credit (or ticket level) information and not monetary value to the user 35. This distinction reinforces the premise that the ticket 40 represents the ability to redeem (exchange the ticket for) a service from agreed providers 80 regardless of the cost differential of that service at the time of redemption relative to the time when the ticket was initially purchased.

Additional incremental value can be used to allow the user to redeem the ticket 40 to accommodate providing the service to additional people at the time of redemption, for example, so that the user and a guest or guests can pay for all of their rounds of golf on the ticket 40. Preferably, a ticket 40 with additional incremental level, like an initial ticket, cannot be presented on more than one occasion. Instead, the ticket 40 is marked and can be used as a ticket 40 for a given service, and adding increments refers to adding (or perhaps changing) the service
that is provided when the use is redeemed by one or more associated users. It will be recognized that the incremental upgrades for higher-priced service providers (services associated with higher levels) and for allowing additional guests can also be combined to allow either or both options as part of the method.

In another embodiment of the invention, a user can purchase additional incremental level directly from the ticketing program manager 95, or an agent 20 of the ticketing program manager 95 as shown in FIG. 5A. This can be implemented in various ways, including via telephone or a global computer network.

A telephone-based method for allowing purchase of additional incremental value can be implemented either with "live" operators who respond to users' telephone calls or with Interactive Voice Response (IVR) equipment. In a live operator system, the operators will have access to the ticket information manager's database of ticket 40 and, if applicable, user information and can search, access and modify the information via a computer terminal or like device. Another option provides for the ticket information manager 70 (or, alternatively the ticketing program manager 95) to maintain an (IVR) system that is entirely computerized. Users who call to add additional value to their tickets will do so by entering numbers on the telephone keypad, in response to computer generated messages, such as "Please enter 1 to add value to your ticket. Now enter your 16 digit ticket number followed by the pound sign." Ticket information can be read back to the user with voice simulation or prerecorded messages stored as a part of the IVR system. It is also possible to combine live and IVR systems so that users have the option of performing the transaction with a person or a computer.

A further embodiment of the system provides for Internet-based account management. The ticket information manager 70 (or, alternatively the ticketing program manager 95) maintains computers connected to the Internet and programmed to allow users to access and update ticket information or upgrade ticket value via a web page. The web address is preprinted on the tickets or on the packaging with which the tickets are sold. Upon entering the ticket information manager's 70 secure web site, users are asked to enter the unique identification code of their ticket. The ticket information manager's 70 computer checks the ticket number against the database of valid ticket numbers and if the number is valid,
allows the user to add value to the ticket and pay for the transaction through a standard credit card. In turn, the ticket information manager's 70 database is updated to reflect the additional value added to the user's ticket 40 and credit is added to the ticketing program manager's 95 account. In an Internet based option, the user can also use the Internet to simply verify ticket value or expiration date and once connected to the ticket information manager's 70 web page also search for service providers in the user's locality, or in a travel destination where the user expects to redeem the ticket. This feature gives added value to service providers since the web access gives the service providers an opportunity to provide web page links with customized advertising or other information in addition to standard information provided by the ticketing program manager's 95 web site.

In any embodiment of the invention that allows user retrieval of ticket information, the actual cash value that has been purchased in connection with the ticket 40 is preferably never available to the user, only the number of incremental credits loaded onto the ticket and/or current useable ticket level.

Those skilled in the art will recognize that the ticket information manager's 70 database can be set up to store information beyond the ticket number and value associated with a ticket. For example, user identification information such as name, address and e-mail address can be stored at the time a user purchases a ticket. Storage of this information would, for example, allow the ticketing program manager 95 to replace a lost ticket upon presentation by the user of such personal identification information. The ticket information manager 70 can search its database for a user's name and determine whether the user's ticket 40 has been redeemed. If the ticket 40 has not yet been redeemed, then the lost ticket number can be canceled and a new ticket 40 issued to the user. This transaction could be implemented either in person through a seller or with the ticketing program manager 95 (or, alternatively, the ticket information manager 70) via telephone or a global computer network (the Internet) as described above. Recordation of user information can also provide a valuable feature to service providers who, if given access to such information (either for a fee or by other agreement with the ticketing program manager 95) can access that information for marketing purposes, and can
target marketing specifically to users who have redeemed their tickets at that particular service provider.

In the case where a ticket 40 can have additional incremental level added, part of step 153 (FIG. 2) would include not only verifying that the ticket 40 is valid, but determining the total value of the ticket. Again, the ticket's value as seen by a user is not intended to be in monetary units, but incremental credits or ticket level. For example, a ticket 40 may be initialized with one credit at level 2 at time of sale (a base value), and be valid for a single use at all service providers of level 2 services. Additional credits can be fractions of the base value. For example, additional increments might be one quarter of the initial value. A user can then purchase four additional increments to take a guest if that is a feature of the system, or might purchase only the number of incremental credits to be able to use the ticket 40 at a particular service provider who provides the corresponding level of services. In this embodiment of the invention, the service provider verifies the ticket's validity and its value (level) at time of redemption. Because the ticket 40 can be a one-time-use ticket, any additional value on the ticket 40 that exceeds that needed for the user to redeem for the service will be lost to the user.

Processing Environment

According to the foregoing principals, other embodiments of the present invention may operate on a global computer network such as the Internet or the like. The seller 20 and point of sale 50 may be a venue owner with an online box office or the like. Thus seller 20 and point of sale 50 in the description of Figures 1 and 2 may be a home site (of the venue owner) or node on the global computer network.

Further the purchaser 30 may be a distributor or ticket agent of the venue owner 20 and possibly of other venue owners. The ticket agent 30 himself may have a home site/node on the global computer network for selling tickets 40 to ticket users 35. This is particularly ideal for venues with limited or certain seating capacity (number of seats) per event (date/time). Examples include concert halls, sports arenas, theatre houses/cinemas and other spectator sports, leisure or entertainment facilities. Each ticket is thus sold for a seat or certain date/time access to a showing, session, event, appointment or the like.
FIG. 6 illustrates a computer network or similar digital processing environment 600 in which the present invention may be implemented. In this case, seller/venue owner 20 computer node 150a and purchaser/distributor agent 30 computer node 150b communicate with one or more server(s) 160 operating ticket information manager 70 and ticketing program manager 95.

Client computer(s)/devices 150 and server computer(s) 160 provide processing, storage, and input/output devices executing application programs and the like. Client computer(s)/devices 150 can also be linked through communications network 170 to other computing devices, including other client devices/processes 150 and server computer(s) 160. Communications network 170 can be part of a remote access network, a global network (e.g., the Internet), a worldwide collection of computers, Local area or Wide area networks, and gateways that currently use respective protocols (TCP/IP, Bluetooth, etc.) to communicate with one another. Other electronic device/computer network architectures are suitable.

FIG. 7 is a diagram of the internal structure of a computer (e.g., client processor/device 150 or server computers 160) in the computer system of FIG. 16. Each computer 150, 160 contains system bus 179, where a bus is a set of hardware lines used for data transfer among the components of a computer or processing system. Bus 179 is essentially a shared conduit that connects different elements of a computer system (e.g., processor, disk storage, memory, input/output ports, network ports, etc.) that enables the transfer of information between the elements. Attached to system bus 179 is an Input/Output (I/O) device interface 182 for connecting various input and output devices (e.g., keyboard, mouse, displays, printers, speakers, etc.) to the computer 150, 160. Network interface 186 allows the computer to connect to various other devices attached to a network (e.g., network 170 of FIG. 6). Memory 190 provides volatile storage for computer software instructions 192 and data 194 used to implement an embodiment of the present invention (e.g., services system 10, 300, 400, ticket information manager 70, ticketing program manager 95 and the steps of FIG. 2 detailed above). Disk storage 195 provides non-volatile storage for computer software instructions 192 and data 194 used to implement an embodiment of the present invention. Central processor unit 184 is also attached to system bus 179 and provides for the execution of computer instructions.
In one embodiment, the processor routines 192 and data 194 are a computer program product, including a computer readable medium (e.g., a removable storage medium, such as one or more DVD-ROM's, CD-ROM's, diskettes, tapes, etc.) that provides at least a portion of the software instructions for the invention system. Computer program product can be installed by any suitable software installation procedure, as is well known in the art. In another embodiment, at least a portion of the software instructions may also be downloaded over a cable, communication and/or wireless connection. In other embodiments, the invention programs are a computer program propagated signal product embodied on a propagated signal on a propagation medium (e.g., a radio wave, an infrared wave, a laser wave, a sound wave, or an electrical wave propagated over a global network, such as the Internet, or other network(s)). Such carrier medium or signals provide at least a portion of the software instructions for the present invention routines/program 192.

In alternate embodiments, the propagated signal is an analog carrier wave or digital signal carried on the propagated medium. For example, the propagated signal may be a digitized signal propagated over a global network (e.g., the Internet), a telecommunications network, or other network. In one embodiment, the propagated signal is a signal that is transmitted over the propagation medium over a period of time, such as the instructions for a software application sent in packets over a network over a period of milliseconds, seconds, minutes, or longer. In another embodiment, the computer readable medium of computer program product is a propagation medium that the computer system may receive and read, such as by receiving the propagation medium and identifying a propagated signal embodied in the propagation medium, as described above for computer program propagated signal product.

Generally speaking, the term carrier medium or transient carrier encompasses the foregoing transient signals, propagated signals, propagated medium, storage medium and the like.

Ticket end-user 35 accesses the distributing agent node 150b through global computer network 170. In particular, end user 35 computer 150c employs a browser to search, find and interactively communicate with distributor agent home site at 150b. In turn, end user 35 is able to log on to the distributor agent home site and
order desired electronic tickets 40. The electronic tickets represent remittance for
services and may be in non-paper (electronic) form only. Distributor agent home
site/node 150b in communication with invention servers 160 effects steps 130-134
of Figure 2 discussed above.

Likewise, ticket end-user 35 may access the venue owner (seller) 20 node
5 501a through global computer network 170. Through his computer 150c browser,
the ticket end-user 35 interactively communicates with venue owner network site
150a and purchases desired electronic tickets 40. Venue owner network
site/computer node 150a (in electronic-communication with server 160) effects steps
10 130-134 of Fig. 2 described above with the purchasing party being the ticket end-
user 35.

Meanwhile the online transaction with the ticket end user 35 results in the
end user 35 obtaining an electronic ticket 40 (in the form of machine readable
electronic code or data (e.g. barcode), email confirmation, an electronic message, a
pass number, and the like) which is usable for remittance for services at the
15 particular service provider 80. A printable or other form of the ticket 40 may also be
supplied. Each form of ticket 40 represents remittance for the user ordered services
(i.e. certain concert, movie, entertainment production, game/match, appointment,
reservation, etc.). In that sense, the electronic ticket 40 is a "token" having a unique
identification code as discussed above which is used or associated with the
electronic code data, email confirmation, electronic message, pass number, etc.

While this invention has been particularly shown and described with
references to preferred embodiments thereof, it will be understood by those skilled
in the art that various changes in form and details may be made therein without
departing from the scope of the invention encompassed by the appended claims.

For example, the present invention may be implemented in a variety of
computer architectures. The computer networks illustrated in FIGS. 1, 2, 6 and 7 are
for purposes of illustration and not limitation of the present invention. Servers 160
may be parallel processors, may employ distributed processing or other

configurations.

The invention can take the form of an entirely hardware embodiment, an
entirely software embodiment or an embodiment containing both hardware and-
software elements. In a preferred embodiment, the invention is implemented in software, which includes but is not limited to firmware, resident software, microcode, etc.

Furthermore, the invention can take the form of a computer program product accessible from a computer-readable medium providing program code for use by or in connection with a computer or any instruction execution system. For the purposes of this description, a computer-readable medium can be any apparatus that can contain, store, communicate, propagate, or transport the program for use by or in connection with the instruction execution system, apparatus, or device.

The medium can be an electronic, magnetic, optical, electromagnetic, infrared, or semiconductor system (or apparatus or device) or a propagation medium. Examples of a computer-readable medium include a semiconductor or solid state memory, magnetic tape, a removable computer diskette, a random access memory (RAM), a read-only memory (ROM), a rigid magnetic disk and an optical disk. Some examples of optical disks include compact disk - read only memory (CD-ROM), compact disk - read/write (CD-R/W) and DVD.

The term "distributor" may be a dedicated distributor of one or more service providers, or may be a general distributor across many and varied other providers and business entities. Likewise, the term "ticket agent" may be a third party broker type agent or more closely related agent of a service provider. It is understood that various other parties may play effectively similar roles or functions to those described above and are intended to generally be covered by one of these terms.

Further the above terms describing the various services and/or service providers and venues are for purposes of illustration and not limitation. Given the foregoing examples, one of ordinary skill will easily see application of the present invention to numerous other industries, such as, but not limited to, health and wellbeing services (hair dresser/manicure/electrolysis appointments, chiropractor appointments, spiritual or psychological session appointments, etc.), private or group scheduled lessons or tutors (tennis/golf lessons, music lessons, driving lessons, etc.) and industries which utilize reservations, and so on.
It should be noted that the headings used above are meant as a guide to the reader and should not be considered limiting in any way.
What is claimed is:

1. A method of providing access to experiential services, comprising the steps of:

   enabling distribution of a ticket that permits use of a service offered by one or more providers;
   determining a price range for the service; and
   establishing an access level for the ticket based on the price range, the access level indicating which certain ones of the providers accept the leveled ticket as a provision of access to the service by the certain providers.

2. A method as in Claim 1 further including the steps of:

   selecting, by a ticket user, one of the certain providers; and
   enabling the ticket user, using the leveled ticket at the selected provider, to obtain access to the service by the selected provider.

3. A method as in Claim 2 wherein using the leveled ticket at the selected provider further includes:

   using a communications network, processing the leveled ticket to determine whether the leveled ticket is valid;
   using the communications network, redeeming the leveled ticket if the leveled ticket is valid; and
   responding to the redeeming of the leveled ticket by allowing the ticket user access to the service by the selected provider.

4. A method as in Claim 3 wherein processing the leveled ticket to determine whether the leveled ticket is valid further includes the step
of processing the leveled ticket to determine whether the access level of the leveled ticket matches an access level assigned to the service.

5. A method as in Claim 4 wherein if the access level of the leveled ticket does not match the access level of the service, allowing the ticket user to upgrade the access level of the leveled ticket by:
   enabling optional purchase of additional incremental level above a base ticket level on the leveled ticket; and
   presenting the leveled ticket by the ticket user to the selected provider in exchange for access to the service where price debited by the selected provider is allowed to be higher than the base ticket level.

6. A method as in Claim 4 wherein the communications network is any one or combination of the following: credit card network, debit card network, or private label network.

7. A method as in Claim 6 wherein the providers are authorized merchants that are part of the communications network, each merchant having access to the communications network to process the leveled ticket using an input/out port to a card processor of the communications network; and
   the step of processing the leveled ticket using the communications network to determine whether the access level of the leveled ticket matches the access level of the service further includes excluding any reporting to the ticket user of monetary value associated with the leveled ticket, while including reporting incremental credit information.

8. A method as in Claim 2 wherein using the leveled ticket at the selected provider to enable the ticket user to obtain access to the service further includes the steps of:
   redeeming the leveled ticket at a variable rate; and
in response to redemption of the leveled ticket, allowing the
ticket user access to the service.

9. A method as in Claim 8 wherein the variable rate is within the
determined price range for the service.

10. A method as in Claim 8 wherein redeeming the leveled ticket at a
variable rate further includes the steps of:
   debiting a price set by the selected provider for the service,
   wherein the price debited for the service by a portion of the providers
   is different from price debited by others of the providers for the same
   service, such that the leveled ticket is redeemed at a variable rate
   among the providers for the same service; and
   effecting payment at the price debited by the selected provider
   for the service.

11. A method as in Claim 10 wherein any differences in prices debited by
the providers for the same service are absorbed.

12. A method as in Claim 8 wherein redeeming the leveled ticket at a
variable rate further includes accepting the leveled ticket for one or
more uses of the service by the selected provider.

13. A method as in Claim 2 wherein the leveled ticket is redeemable for
the service by the selected provider, as opposed to a cash value.

14. A method as in Claim 1 wherein providers provide similar services,
the similar services being any one of the following: concerts, sports
events, theatrical shows, broadway shows, family events, golf
services, spa services, or movie theatre services.
15. A method as in Claim 1 wherein the leveled ticket is implemented using any one or combination of a plastic card, an electronic ticket, an access code, or a pin number.

16. A method as in Claim 2 wherein the selecting by a ticket user includes obtaining the leveled ticket by making an online reservation, wherein the online reservation enables the ticket user to reserve seats at a selected provider.

17. A method as in Claim 1 wherein the distribution of the leveled ticket further includes enabling a ticket reseller to sell any of his ticket inventory as a leveled ticket.

18. A method as in Claim 17 wherein the distribution of the tickets further includes aggregating tickets from a network of distributors to create the leveled ticket.

19. A method as in Claim 18 wherein the network of distributors include any ticket distributors in a secondary ticket distribution market, where the secondary ticket distributes include any ticket brokers, agents online, or fans selling their tickets.

20. A method as in Claim 17 wherein the ticket reseller is a ticket auction site where service providers, artists, promoters, fans or venues are provided with the option of auctioning their respective tickets, and the auction site enables auctioning their respective tickets as leveled tickets.

21. A system for providing access to experiential services comprising:

   a network of ticket providers; and

   an aggregation engine in communication with the network of ticket providers, the aggregation engine facilitating distribution of a
leveled ticket that permits access to a service offered by one or more providers, the leveled ticket being redeemable at a variable rate that is within a price range for the service, the price range defining an access level for the leveled ticket, the access level indicating which certain ones of the providers accept the leveled ticket as a provision of access to the service offered by the certain providers.

22. A system as in Claim 21 wherein the providers in the network of ticket providers use an auction portal to auction tickets, the aggregation engine being in communication with the auction portal to facilitate distribution of the auctioned tickets to ticket purchasers as leveled tickets.

23. A system as in Claim 22 wherein the providers in the network of ticket providers includes any service providers, artists, promoters, fans or venues who use the auction site to enable distribution and sale of one or more of their respective tickets.

24. A system as in Claim 21 wherein a redeem-for-services engine is in communication with one or more of the providers, the redeem-for-services engine processing the leveled ticket to determine whether the ticket is valid by determining whether the access level of the leveled ticket matches an access level assigned to the service.

25. A system as in Claim 24 wherein the variable rate is within the price range for the service and the redeem-for-services engine processes the leveled ticket at a variable rate by:

   debiting a price set by the provider for the service, wherein the price debited for the service by a portion of the providers is different from price debited by others of the providers for the same service, such that the leveled ticket is redeemed at a variable rate among the providers for the same service;
effecting payment at the price debited by the selected provider for the service; and
adsorbing any differences in prices debited by the providers for the same.

26. A remittance for services method comprising:
enabling a seller-distributor node on a global computer network to affect transactions that exchange tokens for payment, the tokens representing remittance for services provided by a plurality of service providers; and
for each token obtained through the seller-distributor node, affecting variable rate redemption of the token by a user at any one of the plurality of service providers upon user request, the user selecting which one of the plurality of service providers to request remittance for services and each service provider of the plurality setting respective rates of his services, such that different rates exist for a same or equivalent service across at least some of the service providers, the token enabling remittance for service by the user selected service provider at the selected service provider rate.

27. A method as claimed in claim 26 wherein the seller-distributor node is provided by one of a venue owner, a ticket agent, a distributor of a service provider of the plurality of service providers, and one or more of the service providers.

28. A method as claimed in claim 26 wherein the services provided by the plurality of service providers is any of movie showings, a spectator sport session, a participatory sport session, a concert, an entertainment session and a leisure session.

29. A method as claimed in claim 28 wherein the service of the selected service provider has a certain seating limit per date and time.
30. A method as claimed in claim 26 wherein the token may be any one or combination of an electronic ticket, a bar code, an email message, an electronic message, a code number and machine readable data.

31. A method as claimed in claim 26 wherein the user redeems the token by any of:
   - downloading to the selected service provider, transmitting by facsimile, communicating by electronic mail and electronically
   - rendering the token to the selected service provider.

32. A remittance for services system comprising:
   - a node on a global computer network affecting transactions that exchange tokens for payment, the tokens representing remittance for services provided by a plurality of service providers;
   - a token manager responsive to the tokens obtained through the node, the token manager affecting variable rate redemption of each token by a respective user at any one of the plurality of service providers upon user request, the user selecting one of the plurality of service providers to request remittance for services and each service provider of the plurality setting respective rates of his services, such that different rates exist for a same or equivalent service across at least some service providers, the token enabling remittance for service by the user selected service provider at the selected service provider rate.

33. The system as claimed in claim 32 wherein the node is provided by one of a venue owner, a ticket agent, a distributor of a service provider of the plurality of service providers, and one or more of the service providers.
34. The system as claimed in claim 32 wherein services provided by the plurality of service providers is any of movie showings, a participatory sport session, a spectator sport event, a concert, an entertainment session and a leisure session.

35. The system as claimed in claim 34 wherein service of the selected service provider has a certain seating limit per date and time.

36. The system as claimed in claim 32 wherein the token may be any one or combination of an electronic ticket, a bar code, an electronic message, an email message, a code number and a set of machine readable code.

37. The system as claimed in claim 32 wherein the user redeems the token by any of:
   downloading to the selected service provider, transmitting by facsimile, communicating by electronic mail and electronically rendering the token to the selected service provider.

38. Computer apparatus for providing remittance for services comprising:
   computer node means for affecting transactions that exchange tokens for payment, the tokens representing remittance for services provided by a plurality of service providers;
   redemption means for affecting variable rate redemption of each token via a respective user at any one of the plurality of service providers upon user request, the user selecting which one of the plurality of service providers to request remittance for services and each service provider of the plurality setting respective rates of his services such that different rates exist for a same or equivalent service across at least some service providers, the token enabling remittance for service by the user selected service provider at the selected service provider rate.
39. Computer apparatus as claimed in Claim 38 wherein the computer node means is provided by one of a venue owner, a ticket agent, a distributor of a service provider of the plurality of service providers, and one or more of the service providers.

40. Computer apparatus as claimed in claim 38 wherein services provided by the plurality of service providers is any of movie showings, a participatory sport session, a spectator sport event, a concert, an entertainment session and a leisure session.

41. Computer apparatus as claimed in claim 38 wherein service of the selected service provider has a certain seating limit per date and time.

42. Computer apparatus as claimed in claim 38 wherein the token may be any one or combination of an electronic ticket, a bar code, an email message, an electronic message, a code number and a set of machine readable code.

43. Computer apparatus as claimed in claim 38 wherein the user redeems the token by any of:
   - downloading to the selected service provider, transmitting by facsimile, communicating by electronic mail and electronically rendering the token to the selected service provider.

44. A computer program product comprising:
   - a computer useable medium having a computer readable program;
   - the computer readable program when executed by a digital processor causes:
     - a seller-distributor node on a global computer network to affect transactions that exchange tokens for payment, the tokens
representing remittance for services provided by a plurality of service providers; and

for each token obtained through the seller-distributor node, a variable rate redemption of the token by a user at any one of the plurality of service providers upon user request, the user selecting which one of the plurality of service providers to request remittance for services and each service provider of the plurality setting respective rates of his services, such that different rates exist for a same or equivalent service across at least some of the service providers, the token enabling remittance for service by the user selected service provider at the selected service provider rate.

45. A computer program product as claimed in Claim 44 wherein:

the token may be any one or combination of an electronic ticket, a bar code, an email message, an electronic message, a code number and machine readable data; and

the user redeems the token by any of:
downloading to the selected service provider, transmitting by facsimile, communicating by electronic mail and electronically rendering the token to the selected service provider.

FIG. 1
Step 100  Establish agreed service provider network

Step 110  Establish seller network

Step 120  Distribute tickets to sellers

Step 130  Sell tickets to purchasers

Step 131  Seller contacts ticket information manager

Step 132  Ticket information manager confirms ticket valid & stores information

Step 133  Ticket information manager notifies Seller ticket is valid

Step 134  Seller sends funds to ticketing program manager

Step 140  User can add incremental value to ticket if desired

Step 150  User redeems ticket at service provider

Step 151  Service provider contacts ticket info. manager

Step 152  Ticket info. manager checks vendor inclusion table

Step 153  Ticket information manager checks if ticket is valid

Step 154  If ticket is valid, ticket information manager updates data and notifies service provider

Step 155  Ticketing program manager sends funds to service provider

Step 160  Ticketing program manager reconciles income & adjusts ticket prices accordingly

FIG. 2
Create tickets that permit use of services based on a level associated with the service

- Analyzes prices set by participating service providers for their services

- Determine threshold price ranges (levels) based on the analyzed prices

- Participating service providers assigned to respective service levels based on the threshold price ranges and service prices

- Provide tickets corresponding to each level

- Enable tickets to be used in exchange for services that match the ticket level

FIG. 3
Selecting, by a ticket user, services offered by one of the service providers

Process the ticket to determine whether the ticket is valid for the selected service

Determine whether the access level of the ticket matches the access level of the selected services

Does the ticket require a level upgrade?

Yes
Upgrade ticket access level

No

Redeem ticket

Allow the ticket user access to the selected services

FIG. 4
FIG. 7
