UNITED STATES PATENT OFFICE.

DAVID UNTERMAYER, OF NEW YORK, N. Y.

IMPROVEMENT IN LOCKETS.

Specification forming part of Letters Patent No. **175,394**, dated March 28, 1876; application filed January 15, 1876.

To all whom it may concern:

Be it known that I, DAVID UNTERMAYER, of the city, county, and State of New York, have invented a new and useful Improvement in Lockets, of which the following is a specification:

Figure 1 is an edge view of my improved locket partly opened. Fig. 2 is a front view of the same, with one part fully opened, and Fig. 3 is a cross-section of the same closed.

Similar letters of reference indicate corresponding parts.

The object of this invention is to furnish lockets which shall be so constructed as to hold four, six, or more pictures, as may be desired, and which, when closed, will resemble ordinary lockets.

The invention consists in the combination of one or more intermediate parts with the outer parts of a locket, to adapt it to hold four or more pictures, as hereinafter fully described.

A and B are the outer parts of the locket, which may be made of gold or of a gold setting and stone fronts, or of other suitable material. In the inner sides of the parts A B

are secured pictures in the usual way. C is a third part, one, two, or more of which may be used, and which are so formed as to fit in between the rims of the parts A B, when the locket is closed, and be entirely hid from view. The parts C are so formed as to receive a picture upon each side, which pictures are secured in place in the usual way. Upon the end of one of the parts, as A, are formed two lugs, *a'*, between which are placed, and to which are pivoted, lugs *b' c'* formed upon the ends of the other parts B C. D is the guard-loop, which is pivoted to the same pin that pivots the lugs *a' b' c'* to each other.

Having thus described my invention, I claim as new and desire to secure by Letters Patent—

The combination, in a locket, of the pivoted parts A B C, the latter holding a picture on both sides, and the two former having opposite rims or flanges that fit over and inclose the pictures, as shown and described.

DAVID UNTERMAYER.
