Title: DETACHABLE AND TRANSPORTABLE CPAP HOSE HOLDER

Abstract: An embodiment of the present invention relates to a CPAP hose holder device for the support of a CPAP hose. The device comprises a base, a hose entryway with one or more openings for a CPAP hose, entryway hose guides, an elongated support, support hose guides, and a platform, wherein: a bottom of the hose entryway is connected to the base and a top of the hose entryway is connected to a bottom of the support, and the platform is connected to a top of the support; and the entryway hose guides are connected to the back of the hose entryway, and the support hose guides are attached to the back of the support; wherein: the hose guides and support are arranged to partially or fully enclose the CPAP hose; and the support is substantially upright with respect to the base, and the base and platform extend from the support in substantially the same direction. An embodiment of the invention also relates to use of said CPAP hose holder, a method of moving of the CPAP hose to another position in the bed while sleeping, and a CPAP hose holder system.

Published: — with international search report (Art. 21(3))
Detachable and transportable CPAP Hose Holder

TECHNICAL FIELD

[1] The present invention relates to a CPAP hose holder device for the support of a CPAP hose and, more particularly, for the support a CPAP hose used with a CPAP machine. The present invention also relates to use of said CPAP hose holder, a method of moving the CPAP hose to another position in the bed while sleeping, and a CPAP hose holder system. It further relates to relieving some of the inconvenience of sleep apnea treatment and associated methods, systems, and uses.

BACKGROUND

[2] Sleep apnea is a serious condition that causes individuals to repeatedly stop breathing as they sleep. The most common form is obstruction sleep apnea (OSA). When people afflicted with sleep apnea are asleep, the back of their throat muscles relax, and their airways close. The individuals will often wake up snorting, choking, or gasping for breath. Depending on the severity, this can occur hundreds of times in a night.

[3] There are serious risks associated with sleep apnea. The constantly interrupted sleep reduces the amount of time the person spends in deep restful phases of sleep. Most people with sleep apnea are tired during the day time. Individuals afflicted with sleep apnea are shown to have a higher rate of high blood pressure, heart problems, diabetes, and liver problems. Additionally, sleep apnea can have a negative impact upon the quality of sleep for other people as well; with partners often sleeping in another room.

[4] In cases where the sleep apnea is moderate to severe, the person will often be advised to use a continuous positive airway pressure (CPAP) machine. The individual wears a mask (nasal or nasal/oral), that is connected to a hose, which is connected to a CPAP machine. The machine will pump air through the hose, and to
the individual, that is at a higher pressure than the surrounding air. This pressure prevents the upper airways from collapsing during sleep.

[5] Although the CPAP system is a very effective and reliable treatment, many of those afflicted find it cumbersome and uncomfortable. When the individual is sleeping, the hose is usually placed on their chest or next to them in the bed. It is common for the hose to become stuck in the bedding or to the individual. When they roll over, or move in the bed, this can cause the hose to pull off the mask. This interrupts their sleep as the individual must reattach their mask; thereby defeating the purpose of using the CPAP system in the first place. This problem can be very frustrating and cause the person to stop using the device and thus risking their health. There have been a number of attempts to solve this problem of the hose dislodging the mask as the individual sleeps.

[6] Some of these solutions require the attachment of permanent devices or structures to the headboard, wall, or ceiling. These solutions are not portable when the individual needs to travel. Additionally these structures can not be dissembled quickly if needed. They can also present a safety hazard if someone makes contact with them at speed. An individual may be unable or unwilling to attach things to their wall, ceiling, or headboard.

[7] An individual can a place a stand on the floor. These devices tend to be large, unwieldy, and are difficult to move. Also, the holder’s clinical appearance can create additional problem of making the individual feel like they are in a hospital. The sheer size of these devices can make them difficult to travel with.

[8] An individual can use devices that are wedged between the mattress and box springs. These take time to disassemble, particularly if the bed is up against a wall. It is not convenient to move these devices every time someone wishes to make or play in the bed. These solutions also do not function well when an individual goes camping and no box springs are available.

[9] There are products on the market that route the CPAP machine hose into a special pillow. The individual then attaches their mask to the pillow by means of a second hose. This requires the user to decide before they sleep which side of the pillow they will sleep upon. When the individual rolls from one side of their body to the other, the mask can either be pulled off or the hose can lay uncomfortably across
the users face. Also, the individual has no choice but to take the special pillow with them when traveling.

[10] A further problem with these solutions is how the hose is attached to the holder itself. These are often simply draped over the body of the holder. When the hose is attached, it is usually with only few clips between the holder and the hose. This makes the hose and holder system vulnerable when someone bumps it. This kind of treatment can be expected in many situations; for example: playing with children.

[11] A major problem that most of these solutions have in common is that they are fixed in one position with respect to the bed. These solutions attempt to solve the problem of the individual turning from one side to the other side. But they fail to address if the individual wishes to move to a different location in the bed.

[12] Individuals with larger beds and/or those with a partner in the same bed will move laterally on the bed as well. As the individual moves away from the point where the holder and hose connect, the chance increases of the mask dislodging. Previous solutions require that the individual decides where they are going to sleep in the bed before they go to sleep. If the individual moves to a different position in the bed, the tension between the hose holder and the mask can pull the mask off.

[13] Therefor there is a need for a device to be used with a CPAP system that would reduce the number of times the mask is pulled off or the hose gets in the way; thereby increasing the individual's quality of sleep.

SUMMARY

[14] In one aspect, there is provided a CPAP hose holder device includes a base, a hose entryway with one or more openings for a CPAP hose, entryway hose guides, an elongated support, support hose guides, and a platform, wherein: a bottom of the hose entryway is connected to the baser and a top of the hose entryway is connected to a bottom of the support, and the platform is connected to a top of the support; and the entryway hose guides are connected to the back of the hose entryway, and the support hose guides are attached to the back of the support;
wherein: the hose guides and support are arranged to partially or fully enclose the
CPAP hose; and the support is substantially upright with respect to the base, and the
base and platform extend from the support in substantially the same direction.

[15] In accordance with a preferred embodiment, the support is comprised of two
or more separate parts, preferably two. The support can be curved or straight, and is
preferably straight. The device may have a cover. The device is preferably arranged
to be partially or wholly disassembled. A pillow can be temporarily attached to the
device

[16] In another aspect, use of the CPAP hose holder device involves the
prevention of face mask removal during sleep, wherein a hose from a CPAP
machine is placed inside the device and a pillow is placed on the base of the device.

[17] In another aspect, there is provided a method of moving the CPAP hose
device including the following steps: (a) the individual lifts their head from their pillow;
(b) the individual moves the CPAP hose holder and pillow together to a new position
in the bed; (c) the individual places their head back upon the pillow.

[18] In another aspect, there is provided a CPAP hose holder system comprising:
(a) a CPAP hose holder device; (b) a pillow; (c) a CPAP machine; (d) a CPCP hose;
and (e) a CPAP facemask.

[19] Example embodiments of the CPAP hose holder provide a device used for
the support of a CPAP hose during the treatment of sleep apnea. Example
embodiments meet one or more of the deficiencies of previous solutions to the
technical problems discussed above as well as other previously unmet needs.
Example embodiments reduce the chance that the face mask will be removed
because of movement while the individual sleeps; both by rolling over or by moving
to a different location in bed.

[20] Example embodiments are not affixed to a wall, table, headboard, ceiling,
etc. This gives the individual flexibility in where they will use the device. It also
reduces the hazards of impact with this device while in the assembled position.

[21] Example embodiments are not very large. Example embodiments can be
disassembled into several pieces and stored in a CPAP system travel bag.
Additionally, the device can be broken down quickly. These factors, among others, make the device well suited for travel. These also make the device well suited for fast disassembly before making the bed or engaging in other activities where the presence of a CPAP hose or hose holder are undesirable.

5 [22] The hose sits in an example embodiment of the present invention such that it provides both protection to the hose and helps the hose stay in place. The hose is partially hidden from view which gives improves upon the aesthetics, particularly when compared to previous solutions. In addition, the holder can be decorated to fit in with the surroundings, such as cartoon prints for a child.

10 [23] Example embodiments can be used with any pillow. This allows the individual more flexibility as they travel. There is no need to take along special pillows. The device can also be used while camping.

[24] Example embodiments allow the individual to decide where they are going to sleep in the bed. It is a simple matter to move the device during sleep by moving the pillow. This allows the individual to move their sleep location at will. It does not require them to decide where they are going to sleep in the bed when they go to sleep.

BRIEF DESCRIPTION OF THE FIGURES

[25] FIG 1 discloses an isometric view from the front of an example embodiment of the invention.

[26] FIG 2A discloses an isometric view from the rear of an example embodiment of the invention.

[27] FIG 2B discloses an isometric view from the rear an alternate example embodiment of the invention.

25 [28] FIG 3 discloses a side view of the connection between the upper and lower supports.

[29] FIG 4 discloses a top view of the base.
FIG 5 discloses a detailed front view of the lower support.

FIG 6A discloses a detailed side view of the lower support.

FIG 6B discloses a detailed side view of an alternate example embodiment of the invention.

FIG 7 discloses a detailed side view of the upper support.

FIG 8A discloses a detailed rear view of the upper support.

FIG 8B discloses a detailed side view of an alternate example embodiment of the upper support.

FIG 8C discloses a detailed side view of an alternate example embodiment of the upper support.

FIG 9A discloses a detailed top view of the platform.

FIG 9B discloses a detailed top view of an alternate example embodiment of the platform.

DETAILED DESCRIPTION OF PREFERRED EMBODIMENTS

Using the attached drawings, the technical contents, and detailed descriptions, example embodiments of the present invention are described. Alternate embodiments will also be presented.

FIGS 1A, 1B, and 2 disclose isometric views of an example embodiment of the invention. The hose 1 enters the example device through the hose entryway 32. The hose 1 is found inside the lower support 3. This lower support 3 is connected to the base 2 by a base connection means 33. The lower support 3 is connected to the upper support 4 by the lower connection means 31 and the upper connection means 41. The hose 1 rests upon the platform 42. The hose 1 is removably held inside an example embodiment of the invention by means of an entryway hose guides 35,
lower hose guides 34, and upper hose guides 43. A pillow (not shown) is placed on
top of the base 2. A CPAP face mask and CPAP machine (not shown) connects to
the ends of the hose. The upper 4 and the lower 3 support combine to make a single
support. The preferred embodiment is with a hose entryway 32 with two openings
where the hose can enter. But it is also possible to have a hose entryway 32 with
one opening or with three or more openings.

[41] FIG 1B shows an alternate embodiment of the present invention. The hose
rests upon a platform 42 that has hose guides 45. Additionally, it has a cross section
profile similar to that of the top support 4. The upper connection means 41 fits
entirely inside of the lower connection means 31 and is thus hidden from view. The
base 2 show in FIG 2 has a different number and size of holes than the other figures.

[42] While the upper 4 and lower 3 supports are shown with holes 36 and 43, an
alternate embodiment could be without holes. FIGS 1 and 2 show the lower
connection means 31 on top of the upper connection means 41, this is not the only
possible configuration. The upper connection means 41 could lie on the lower
connection means 31. Additionally, the connection between the upper support 4 and
the lower support 3 could be achieved in a number of different ways. Examples
include, but are not limited to, a threaded connection, clamps, Velcro, spring type
quick connections, etc. The hose guides, 35 and 34 and 43, can be shaped different
than the arcs that are depicted in the figures. Additionally they are not required to be
immobile with respect to the lower support 3. Alternate embodiments of the hose
guides of the present invention could include, but are not limited to: flexible, spring
type, buckle, or latches. The shape of the platform 42 shown in the figures of
example embodiments of the present invention can be different than that shown.
Examples of different shapes include, but are not limited to, square, rectangle,
circular, flat, curved, etc. While the back part of an example embodiment of the
present invention is shown as open, an alternate embodiment could include a cover.

[43] Hose guides hold and guide the CPAP hose. Herein "entry hose guides"
refer to hose guides affixed to the entryway, while "support hose guides" refer to
hose guides connected to the support. The main objective of the hose guides is to
hold and guide the CPAP hose. The main objective of the support is to form the
structure that the hose and guides are connected to and supported by. Usually the
hose guides only partially enclose the hose. Under normal circumstances, this is the
preferred embodiment. However, in some circumstances these advantages may be
outweighed by other needs. For instance, if it is desired for aesthetic reasons for the hose to be as concealed as possible, the hose guides can be constructed to fully encompass the hose. This may also be done by molding the hose guides and support as one piece, or by adding a protective sleeve to the outside of the device. Such a sleeve or fully hose enclosing structure can in accordance with a preferred embodiment be produced in an insulating material. This insulating material can for example be neoprene, Styrofoam or knitted fabrics, and would provide an advantage if the CPAP machine is to be used in low temperatures. During low temperatures, such as during the winter, it is a known problem that condensation forms in the hose. By providing insulation this problem could be alleviated.

[44] Example embodiments of the present invention can be made out of a large range of different materials. Examples include, but are not limited to: wood, metal, paper, plastic, or combinations thereof. In hospital use, it could be preferable for an example embodiment of the current invention to be made out of materials that can be sterilized; such as metal. Additionally, each piece of example embodiments of the present invention could be made out of the same or different material.

[45] The figures show support is shown as two different pieces: the lower support 3 and the upper support 4. An alternative embodiment can be a support made of a single piece, or of more than two pieces.

[46] Although the figures show the support as being made up of two support pieces; a lower and upper support; this is a preferred embodiment but it is not the only embodiment of the present invention. This embodiment avoids having one long support piece when disassembling and travelling with the device, and makes it easier to pack. Other embodiments are to construct the support as one long piece, thereby making both the construction and assembly easier. The support could also be made of three or more pieces; allowing for more customization of the total support length. While a straight support is the preferred embodiment, it can also be curved if needed. This would be useful in situations where the individual has very little space above their pillow.

[47] FIG 3 discloses a side view of the connection between the upper 4 and lower 3 supports of an example embodiment of the present invention. The hose 1 is held in place by the lower hose guides 34 and the upper hose guides 43. The upper 4 and
lower 3 supports are connected by means of the upper connection means 41 and the lower connection means 31.

[48] The figures show hose guides, 34 and 43, as single molded pieces on the upper 4 and lower 3 supports. However, alternative embodiment could include hose guides that are more than a single piece. An alternate embodiment of the present invention could use straps, springs, clamps, or other mechanical means for in the place of, or in addition to, the shown hose guides. In an alternate embodiment, the hose guides could be removable from the support.

[49] The connection between the upper 4 and lower 3 supports of an example embodiment of the present invention is shown in FIG 3 as the upper support 4 connection means sliding into the lower support 3. However, there are other alternatives. The lower support could slide into the upper support. Other possible solutions include, but are not limited to, screwing any support pieces together, a clamping mechanism between the support pieces, a support telescoping from another support, and a hinge between the support pieces. The support pieces can be connected by one or more different connection means.

[50] FIG 4 discloses a top view of the base 2. The base 2 contains base holes 21. The base 2 is connected to the lower support 3 at the base connection section 22.

[51] A pillow (not shown) can be placed upon the base 2. FIG 4 shows a base plate with holes 21. Alternative embodiments could include a base with no holes. The holes make the base lighter, and allows for circulation. Additionally the base could have texturing; improving its grip to the bed and/or pillow and reducing undesired sliding. The pillow could be attached, temporarily or permanently, to an example embodiment of the present invention by an attachment means or by base texturing. The attachment means could be connected to an example embodiment of the present invention at the base or other parts of the device. Additionally, a lip or protrusion could be placed at the back of an example embodiment of the present invention so it is partially held in place by the edge of the mattress.

[52] In an example embodiment of the present invention, the base connection means 33 is slid onto the base connection section 22. There are several alternatives including, but not limited to, hinges, pins, threaded connections, and/or clamps. It is
also possible that the connection between the connection means 33 and the connection section 22 be adjustable. This could be a type connection that allows the hose entryway 32 to lean backward and forward and/or side to side with respect to the plane of the base.

5 [53] Similar types of adjustment mechanisms could also be implemented at the connections between other parts of example embodiments of the present invention. These kinds of connections could be necessary if a high degree of positional adjustment was desired.

[54] Example embodiments of the present invention can be used with any pillow. There are cases, however, where the base size will need to be changed. An example of this would be a small pillow made for a child. The base is shown in FIG 4 as a rounded rectangle, but a circular, square, rectangular, or other base shapes would be acceptable. The size and shape of the pillow and the size and shape of the base 2 should therefore be somewhat adjusted to each other. Preferably, the base should not be so large as to protrude beyond the pillow, as this might be uncomfortable, unsightly, and would expose the base to unintended movement. However, the base also should be large enough to form a solid base in order for the support to stay upright during use. When in use, both the pillow and the head of the individual resting on the pillow aids in this, as their weight and friction will keep the base oriented correctly, i.e. flat on the bed so that the supports 3 and 4 are kept vertical. The base should therefore be large enough for a head resting on the pillow to hold it in place.

[55] While FIG 4 shows that the base connection section 22 is centered on the rear part of the base 2, this choice of location is not the only choice. There are foreseeable situations where this connection will need to be made at a different place; for example: to work around the position of other equipment in the bed. The base connection section 22 could be found anywhere on the baseplate, but preferably toward the rear of the base, most preferably centered toward the rear of the base.

30 [56] FIGS 5 and 6 disclose detailed views of the lower support 3. The entryway 32 is connected to an entryway hose guide 35. A base connection means 33 is connected to the bottom of the lower support 3. Lower hose guides 34 are also
shown. There are holes 36 in the lower support 3. The top of the lower support 3 contains the lower connection means 31.

[57] FIG 6B disclose a detailed view of an alternative embodiment of the present invention with a different lower connection means than that shown in FIG 6A.

[58] FIGS 5, 6A, and 6B show a relatively small distance between the two different hose entryways 32, alternative embodiments could have distance that are larger or smaller than shown.

[59] FIG 7 and 8A disclose detailed views of the upper support 4. The upper connection means 41 is found on the bottom part of the upper support 4. Holes 44 are found in the upper support. The upper hose guides 43 are connected to the upper support 3. The platform 42 is connected to the top part of the upper support.

[60] FIG 8B discloses a side view of an alternative embodiment of the upper support 4. It uses a different type of upper connection means 41. It also shows another possible shape for the platform 42 and the addition of a platform hose guide 45. FIG 8C also discloses a side view of an alternative embodiment of the invention. In this embodiment, the platform 42 has a second platform hose guide 45. Also, the platform 42 has holes 46 and another embodiment of the upper connection means 41.

[61] While the figures show the platform as a flat surface, it an alternative would be a platform with a clamp or slot for the CPAP hose.

[62] FIG 9A discloses a detailed top view of the platform 42. The platform 42 is connected to the upper support 4. The upper hose guide 43 is connected to the upper support 4.

[63] FIG 9B discloses a top view of an alternative embodiment of the invention. In this embodiment, the platform 42 has the same width as the upper support 4. The platform hose guides 45 are connected to the platform 42.

[64] While the figures show that the platform 42 and the upper support 4 as a single molded piece, these could be two separate pieces.
Use of the CPAP hose holder for the prevention of face mask removal during sleep shall now be explained. The CPAP machine is connected to the face mask by a hose. The individual places the base 2 of an example embodiment of the present invention directly under the individual's pillow. Preferably the base 2 is placed under the pillow so that the support 3 protrudes upward from a position above the individual's head, although it could also be protruding from the left or right side of the individual's head. This hose 1 is connected to the CPAP machine and placed in an example embodiment of the present invention. The hose 1 exits the upper platform 42 and hangs freely down towards the individual's face. At the end of the hose the facemask is connected. The individual sleeps with the facemask on, as normal. When the individual turns his head or otherwise moves his face, the hose, due to being free hanging above the individual, will not become tangled up, and be in the way or pulled upon, thus preventing face mask removal.

The method for the moving of the hose holder, while the CPAP hose is attached, during sleep is given by the following steps:

a) The individual lifts their head.

b) The individual moves the hose holder and pillow together to the desired location.

c) The individual places their head back upon their pillow.

Since the base 2 is flat and fitted under the pillow, it is easy to move with the pillow even if it is not attached thereto. Sliding the pillow around in bed while mostly asleep is therefore possible, greatly improving the ability of CPAP users to change position in bed and therefore sleep more naturally.

Even though the CPAP hose holder is described herein as a separate system, it is meant to be able to function as a part of a system that is comprised of:

a) An example embodiment of the present invention.

b) A pillow.

c) A CPAP machine.
d) A CPAP hose.

e) A CPAP face mask.

[69] The CPAP machine is connected to the CPAP face mask by means of a CPAP hose. This hose is placed inside an example embodiment of the present invention. The pillow is then placed on top of the CPAP hose holder.

[70] An example embodiment of the present invention is made to fit under a pillow. The size of the base and the total height of the support can be changed as needed to fit any pillow. There is no international standard pillow size. Many manufactures simply do not adhere to any dimensions. Table 1 gives the most common standard sizes for Europe and North America.

[72] These large variations in pillow sizes account for the variations in the dimensions of the preferred embodiment.

[73] An example embodiment of the present invention is designed to fit a hose of a known diameter. Presently the standard for CPAP hoses is a 22mm outer diameter. Thus supports for the present standard CPAP hoses should have an inner diameter of 22mm. If this changes, the diameter of the supports of an example embodiment of the present invention could be changed to fit this new size.

[74] The width of the base 2 can be 15 to 40 cm, preferably 25 to 35 cm, most preferably 30 cm. The depth of the base 2 can be 10 to 30 cm, preferably 15 to 25 cm, most preferably 20 cm.
The height of the lower support 3 together with the hose entryway 32 and lower connection means 31 can be 10 to 35 cm, preferably 15 to 30 cm, most preferably 22.6 cm. The distance between the two hose entryway 32 of the lower support 3 can be 4 to 35 cm, preferably 6 to 20 cm, most preferably 7.6 cm.

The height of the upper support 4 together with the platform 42 and the upper connection means 41 can be 10 to 30 cm, preferably 15 to 25 cm, most preferably 18 cm. The width of the upper support can be 2 to 6 cm, preferably 2.5 to 4 cm, most preferably 3 cm.

The height of the platform 42 of the upper support 4 can be 3 to 10 cm, preferably 4 to 8 cm, most preferably 6.5 cm. The width of the platform 42 of the upper support 4 can be 2 to 15 cm, preferably 4 to 10 cm, most preferably 5 cm. The platform 42 overhangs the top support 4 by between 1 and 15 cm, preferably 9.2 cm.

The total height of an example embodiment of the present invention, from bottom of base 2 to the top of the platform 42, can be 20 to 60 cm, preferably 30 to 50 cm, most preferably 42 cm. The interior diameter of the supports of the present invention can be 15 to 30 mm, preferably 20 to 26 mm, most preferably 22 mm.

Optional embodiments may also be said to broadly include the parts, elements, steps and/or features referred to or indicated herein, individually or in any combination of two or more of the parts, elements, steps and/or features, and wherein specific integers are mentioned which have known equivalents in the art to which the invention relates, such known equivalents are deemed to be incorporated herein as if individually set forth.

The reference in this specification to any prior publication (or information derived from the prior publication), or to any matter which is known, is not, and should not be taken as an acknowledgment or admission or any form of suggestion that the prior publication (or information derived from the prior publication) or known matter forms part of the common general knowledge in the field of endeavour to which this specification relates.

Throughout this specification and the claims which follow, unless the context requires otherwise, the word "comprise", and variations such as "comprised", "comprises" or "comprising", will be understood to imply the inclusion of a stated
integer or step or group of integers or steps but not the exclusion of any other integer or step or group of integers or steps.

The claims defining the invention are as follows:

1. A CPAP hose holder device for the support of a CPAP hose comprising:

   a base, a hose entryway with one or more openings for a CPAP hose,
   entryway hose guides, an elongated support, support hose guides, and
   a platform, wherein:

   a bottom of the hose entryway is connected to the base, and a top of
   the hose entryway is connected to a bottom of the support, and the
   platform is connected to a top of the support; and

   the entryway hose guides are connected to the back of the hose
   entryway, and the support hose guides are attached to the back of the
   support; wherein:

   the hose guides and support are arranged to partially or fully enclose
   the CPAP hose; and

   the support is substantially upright with respect to the base, and the
   base and platform extend from the support in substantially the same
   direction.

2. The CPAP hose holder device in accordance with claim 1, wherein the
   support is comprised of two or more separate parts.

3. The CPAP hose holder device in accordance with claim 1, wherein the
   support is comprised of two separate parts.

4. The CPAP hose holder device in accordance with any one of claims 1 to 3,
   wherein the support is straight.

5. The CPAP hose holder device in accordance with any one of claims 1 to 3,
   wherein the support is curved.

6. The CPAP hose holder device in accordance with any one of claims 1 to 5,
   wherein the device has a cover.
7. The CPAP hose holder device in accordance with any one of claims 1 to 6, wherein the device is arranged to be partially or wholly disassembled.

8. The CPAP hose holder device in accordance with any one of claims 1 to 7, wherein a pillow can be temporarily attached to the device.

9. Use of a CPAP hose holder device in accordance with any one of the previous claims for the prevention of face mask removal during sleep, wherein a hose from a CPAP machine is placed inside the device and a pillow is placed on the base of the device.

10. Method of moving of the CPAP hose holder device in accordance with claim 1 to another position in the bed while an individual is sleeping, comprising the following steps:

   the individual lifts their head from their pillow;

   the individual moves the CPAP hose holder device and pillow together to a new position in the bed;

   the individual places their head back upon the pillow.

11. A CPAP hose holder system comprised of:

    a CPAP hose holder device in accordance with claim 1;

    a pillow;

    a CPAP machine;

    a CPAP hose; and

    a CPAP facemask.
INTERNATIONAL SEARCH REPORT

A. CLASSIFICATION OF SUBJECT MATTER

According to International Patent Classification (IPC) and/or both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic database consulted during the international search (name of data base and, where practicable, search terms used)

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Further documents are listed in the continuation of Box C.

See patent family annex.

* Special categories of cited documents:
  
  "A" document defining the general state of the art which is not considered to be of particular relevance
  
  "E" earlier application or patent but published on or after the international filing date
  
  "L" document which may throw doubts on priority claim(s) one of which is cited to establish the publication date of another citation or other special reason (as specified)
  
  "O" document referring to an oral disclosure, use, exhibition or other means
  
  "P" document published prior to the international filing date but later than the priority date claimed

  "T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

  "X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

  "Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art

  "A" document member of the same patent family

Date of the actual completion of the international search 12 April 2017

Form PCT/ISA/210 (second sheet) (April 2005)
### Box No. II  Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. **X** Claims Nos.: 9, 10 because they relate to subject matter not required to be searched by this Authority, namely:
   - see FURTHER INFORMATION sheet PCT/ISA/210

2. **□** Claims Nos.: because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:

3. **□** Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

### Box No. III  Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. **□** As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.

2. **□** As all searchable claims could be searched without effort justifying an additional fees, this Authority did not invite payment of additional fees.

3. **□** As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:

4. **□** No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

### Remark on Protest

- **□** The additional search fees were accompanied by the applicant's protest and, where applicable, the payment of a protest fee.
- **□** The additional search fees were accompanied by the applicant's protest but the applicable protest fee was not paid within the time limit specified in the invitation.
- **□** No protest accompanied the payment of additional search fees.

---

Form PCT/ISA/210 (continuation of first sheet (2)) (April 2005)
FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

Continuation of Box II.1

Claims Nos.: 9, 10

Methods of providing ventilation to a subject as defined in claims 9, 10 of the present application are methods for treatment of human or animal body by therapy. Indeed these methods are meant to connect a CPAP machine to a patient (see paragraph 0065) and implicitly provide treatment to a patient. Thus, claims 9, 10 relate to subject-matter considered by this Authority to be covered by the provisions of Rules 39.1(iv) and 67.1(iv) PCT, and no international search report has been established with respect to the subject-matter of these claims (Article 17(2) (a) (i) PCT). Consequently, no opinion will be formulated with respect to novelty, inventive step and industrial applicability of the subject-matter of these claims (Article 34(4) (a) (i) PCT).
