Title: NOVEL PYRROLO PYRIMIDINE DERIVATIVES

Abstract: The present invention describes new pyrrolo pyrimidine derivatives and pharmaceutically acceptable salts thereof which appear to interact with Bruton's tyrosine kinase (Btk). Accordingly, the novel pyrrolo pyrimidines may be effective in the treatment of autoimmune disorders, inflammatory diseases, allergic diseases, airway diseases, such as asthma and chronic obstructive pulmonary disease (COPD), transplant rejection, cancers e.g. of hematopoietic origin or solid tumors.
Novel Pyrrolo Pyrimidine Derivatives

The present invention describes new pyrrolo pyrimidine derivatives that are good drug candidates.

The compounds of the present invention may generally exhibit a selective inhibition of Bruton's tyrosine kinase (Btk).

Background of the invention

The essential role of Btk in autoimmune disease is underlined by the observations that Btk-deficient mice are protected in standard preclinical models for rheumatoid arthritis (Jansson and Holmdahl, 1993), systemic lupus erythematosus (Steinberg, B.J. et al., J. Clin. Invest, 70, 587-597, 1982), as well as allergic disease and anaphylaxis (Hata.D. et al., J. Exp. Med. 187, 1235-1247, 1998). In addition, many cancers and lymphomas express Btk and appear to be dependent on Btk function (Davis, R.E. et al., Nature, 463, 88-92, 2010).

Therefore, inhibition of Btk activity may be useful in the treatment of immune disorders such as rheumatoid arthritis, systemic lupus erythematosus, allergic diseases, anaphylaxis and inflammatory conditions. Moreover, inhibition of Btk may be useful in the treatment of cancers of haematopoietic origin including chronic myelogenous leukemia, myeloid leukemia, non-Hodgkin lymphoma and other B cell lymphomas.

The compounds of the present invention may therefore potentially be useful in the treatment of a wide range of disorders, particularly Btk-related diseases or disorders, and may for example be useful in the treatment of autoimmune disorders, inflammatory diseases, allergic diseases, airway diseases, such as asthma and chronic obstructive pulmonary disease (COPD), transplant rejection, or cancers e.g. of hematopoietic origin or solid tumors.

As used herein, the terms "salt" or "salts" refers to an acid addition or base addition salt of a compound of the invention. "Salts" include in particular "pharmaceutical acceptable salts". The term "pharmaceutically acceptable salts" refers to salts that retain the biological effectiveness and properties of the compounds of this invention and, which typically are not biologically or otherwise undesirable. In many cases, the compounds of the present invention are capable of forming acid and/or base salts by virtue of the presence of amino and/or carboxyl groups or groups similar thereto.

Certain organic amines include isopropylamine, benzathine, cholinate, diethanolamine, diethylamine, lysine, meglumine, piperazine and tromethamine.

The pharmaceutically acceptable salts of the present invention can be synthesized from a basic or acidic moiety, by conventional chemical methods. Generally, such salts can be prepared by reacting free acid forms of these compounds with a stoichiometric amount of the appropriate base (such as Na, Ca, Mg, or K hydroxide, carbonate, bicarbonate or the like), or by reacting free base forms of these compounds with a
stoichiometric amount of the appropriate acid. Such reactions are typically carried out in water or in an organic solvent, or in a mixture of the two. Generally, use of non-aqueous media like ether, ethyl acetate, ethanol, isopropanol, or acetonitrile is desirable, where practicable. Lists of additional suitable salts can be found, e.g., in "Remington's Pharmaceutical Sciences", 20th ed., Mack Publishing Company, Easton, Pa., (1985); and in "Handbook of Pharmaceutical Salts: Properties, Selection, and Use" by Stahl and Wermuth (Wiley-VCH, Weinheim, Germany, 2002).

Any formula given herein is also intended to represent unlabeled forms as well as isotopically labeled forms of the compounds. Isotopically labeled compounds have structures depicted by the formulas given herein except that one or more atoms are replaced by an atom having a selected atomic mass or mass number. Examples of isotopes that can be incorporated into compounds of the invention include isotopes of hydrogen, carbon, nitrogen, oxygen, phosphorous, fluorine, and chlorine, such as $^2$H, $^3$H, $^{11}$C, $^{12}$C, $^{13}$C, $^{14}$N, $^{15}$F, $^{18}$F, $^{31}$P, $^{32}$P, $^{35}$S, $^{36}$Cl, $^{125}$I respectively. The invention includes various isotopically labeled compounds as defined herein, for example those into which radioactive isotopes, such as $^3$H and $^{14}$C, or those into which non-radioactive isotopes, such as $^2$H and $^{13}$C are present. Such isotopically labelled compounds are useful in metabolic studies (with $^{14}$C), reaction kinetic studies (with, for example $^2$H or $^3$H), detection or imaging techniques, such as positron emission tomography (PET) or single-photon emission computed tomography (SPECT) including drug or substrate tissue distribution assays, or in radioactive treatment of patients. In particular, an $^{18}$F or labeled compound may be particularly desirable for PET or SPECT studies. Isotopically-labeled compounds of formula (I) can generally be prepared by conventional techniques known to those skilled in the art or by processes analogous to those described in the accompanying Examples and Preparations using an appropriate isotopically-labeled reagents in place of the non-labeled reagent previously employed.

Further, substitution with heavier isotopes, particularly deuterium (i.e., $^2$H or D) may afford certain therapeutic advantages resulting from greater metabolic stability, for example increased in vivo half-life or reduced dosage requirements or an improvement in therapeutic index. It is understood that deuterium in this context is regarded as a substituent of a compound of the formula (I). The concentration of such a heavier isotope, specifically deuterium, may be defined by the isotopic enrichment factor. The
term "isotopic enrichment factor" as used herein means the ratio between the isotopic abundance and the natural abundance of a specified isotope. If a substituent in a compound of this invention is denoted deuterium, such compound has an isotopic enrichment factor for each designated deuterium atom of at least 3500 (52.5% deuterium incorporation at each designated deuterium atom), at least 4000 (60% deuterium incorporation), at least 4500 (67.5% deuterium incorporation), at least 5000 (75% deuterium incorporation), at least 5500 (82.5% deuterium incorporation), at least 6000 (90% deuterium incorporation), at least 6466.7 (97% deuterium incorporation), at least 6600 (99% deuterium incorporation), or at least 6633.3 (99.5% deuterium incorporation).

Pharmaceutically acceptable solvates in accordance with the invention include those wherein the solvent of crystallization may be isotopically substituted, e.g. D_2O, de-acetone, d_6-DMSO.

Compounds of the invention, i.e. compounds of formula (I) that contain groups capable of acting as donors and/or acceptors for hydrogen bonds may be capable of forming co-crystals with suitable co-crystal formers. These co-crystals may be prepared from compounds of formula (I) by known co-crystal forming procedures. Such procedures include grinding, heating, co-subliming, co-melting, or contacting in solution compounds of formula (I) with the co-crystal former under crystallization conditions and isolating co-crystals thereby formed. Suitable co-crystal formers include those described in WO 2004/078163. Hence the invention further provides co-crystals comprising a compound of formula (I).

As used herein, the term "pharmaceutically acceptable carrier" includes any and all solvents, dispersion media, coatings, surfactants, antioxidants, preservatives (e.g., antibacterial agents, antifungal agents), isotonic agents, absorption delaying agents, salts, preservatives, drug stabilizers, binders, excipients, disintegration agents, lubricants, sweetening agents, flavoring agents, dyes, and the like and combinations thereof, as would be known to those skilled in the art (see, for example, Remington's Pharmaceutical Sciences, 18th Ed. Mack Printing Company, 1990, pp. 1289-1329). Except insofar as any conventional carrier is incompatible with the active ingredient, its use in the therapeutic or pharmaceutical compositions is contemplated.
The term "a therapeutically effective amount" of a compound of the present invention refers to an amount of the compound of the present invention that will elicit the biological or medical response of a subject, for example, reduction or inhibition of an enzyme or a protein activity, or ameliorate symptoms, alleviate conditions, slow or delay disease progression, or prevent a disease, etc. In one non-limiting embodiment, the term "a therapeutically effective amount" refers to the amount of the compound of the present invention that, when administered to a subject, is effective to (1) at least partially alleviating, inhibiting, preventing and/or ameliorating a condition, or a disorder or a disease (i) mediated by Btk, or (ii) associated with Btk activity, or (iii) characterized by activity (normal or abnormal) of Btk; or (2) reducing or inhibiting the activity of Btk; or (3) reducing or inhibiting the expression of Btk. In another non-limiting embodiment, the term "a therapeutically effective amount" refers to the amount of the compound of the present invention that, when administered to a cell, or a tissue, or a non-cellular biological material, or a medium, is effective to at least partially reducing or inhibiting the activity of Btk; or reducing or inhibiting the expression of Btk partially or completely.

As used herein, the term "subject" refers to an animal. Typically the animal is a mammal. A subject also refers to for example, primates (e.g., humans, male or female), cows, sheep, goats, horses, dogs, cats, rabbits, rats, mice, fish, birds and the like. In certain embodiments, the subject is a primate. In yet other embodiments, the subject is a human.

As used herein, the term "inhibit", "inhibition" or "inhibiting" refers to the reduction or suppression of a given condition, symptom, or disorder, or disease, or a significant decrease in the baseline activity of a biological activity or process.

As used herein, the term "treat", "treating" or "treatment" of any disease or disorder refers in one embodiment, to ameliorating the disease or disorder (i.e., slowing or arresting or reducing the development of the disease or at least one of the clinical symptoms thereof). In another embodiment "treat", "treating" or "treatment" refers to alleviating or ameliorating at least one physical parameter including those which may not be discernible by the patient. In yet another embodiment, "treat", "treating" or "treatment" refers to modulating the disease or disorder, either physically, (e.g., stabilization of a discernible symptom), physiologically, (e.g., stabilization of a physical parameter), or both. In yet another embodiment, "treat", "treating" or "treatment" refers
to preventing or delaying the onset or development or progression of the disease or disorder.

As used herein, a subject is "in need of" a treatment if such subject would benefit biologically, medically or in quality of life from such treatment.

As used herein, the term "a," "an," "the" and similar terms used in the context of the present invention (especially in the context of the claims) are to be construed to cover both the singular and plural unless otherwise indicated herein or clearly contradicted by the context.

All methods described herein can be performed in any suitable order unless otherwise indicated herein or otherwise clearly contradicted by context. The use of any and all examples, or exemplary language (e.g. "such as") provided herein is intended merely to better illuminate the invention and does not pose a limitation on the scope of the invention otherwise claimed.

Any asymmetric atom (e.g., carbon or the like) of the compound(s) of the present invention can be present in racemic or enantiomerically enriched, for example the (R)-, (S)- or (R,S)- configuration. In certain embodiments, each asymmetric atom has at least 50 % enantiomeric excess, at least 60 % enantiomeric excess, at least 70 % enantiomeric excess, at least 80 % enantiomeric excess, at least 90 % enantiomeric excess, at least 95 % enantiomeric excess, or at least 99 % enantiomeric excess in the (R)- or (S)- configuration. Substituents at atoms with unsaturated double bonds may, if possible, be present in c/s- (Z)- or trans- (E)- form.

Accordingly, as used herein a compound of the present invention can be in the form of one of the possible isomers, rotamers, atropisomers, tautomers or mixtures thereof, for example, as substantially pure geometric (c/s or trans) isomers, diastereomers, optical isomers (antipodes), racemates or mixtures thereof.

Any resulting mixtures of isomers can be separated on the basis of the physicochemical differences of the constituents, into the pure or substantially pure geometric or optical isomers, diastereomers, racemates, for example, by chromatography and/or fractional crystallization.
Any resulting racemates of final products or intermediates can be resolved into the optical antipodes by known methods, e.g., by separation of the diastereomeric salts thereof, obtained with an optically active acid or base, and liberating the optically active acidic or basic compound. In particular, a basic moiety may thus be employed to resolve the compounds of the present invention into their optical antipodes, e.g., by fractional crystallization of a salt formed with an optically active acid, e.g., tartaric acid, dibenzoyl tartaric acid, diacetyl tartaric acid, di-0,0'-p-toluoyl tartaric acid, mandelic acid, malic acid or camphor-10-sulfonic acid. Racemic products can also be resolved by chiral chromatography, e.g., high pressure liquid chromatography (HPLC) using a chiral adsorbent.

Furthermore, the compounds of the present invention, including their salts, can also be obtained in the form of their hydrates, or include other solvents used for their crystallization. The compounds of the present invention may inherently or by design form solvates with pharmaceutically acceptable solvents (including water); therefore, it is intended that the invention embrace both solvated and unsolvated forms. The term "solvate" refers to a molecular complex of a compound of the present invention (including pharmaceutically acceptable salts thereof) with one or more solvent molecules. Such solvent molecules are those commonly used in the pharmaceutical art, which are known to be innocuous to the recipient, e.g., water, ethanol, and the like. The term "hydrate" refers to the complex where the solvent molecule is water.

The compounds of the present invention, including salts, hydrates and solvates thereof, may inherently or by design form polymorphs.

In another aspect, the present invention provides a pharmaceutical composition comprising a compound of the present invention and a pharmaceutically acceptable carrier. The pharmaceutical composition can be formulated for particular routes of administration such as oral administration, parenteral administration, and rectal administration, etc. In addition, the pharmaceutical compositions of the present invention can be made up in a solid form (including without limitation capsules, tablets, pills, granules, powders or suppositories), or in a liquid form (including without limitation solutions, suspensions or emulsions). The pharmaceutical compositions can be subjected to conventional pharmaceutical operations such as sterilization and/or can contain conventional inert diluents, lubricating agents, or buffering agents, as well as
adjuvants, such as preservatives, stabilizers, wetting agents, emulsifiers and buffers, etc.

Typically, the pharmaceutical compositions are tablets or gelatin capsules comprising the active ingredient together with

   a) diluents, e.g., lactose, dextrose, sucrose, mannitol, sorbitol, cellulose and/or glycine;

   b) lubricants, e.g., silica, talcum, stearic acid, its magnesium or calcium salt and/or polyethyleneglycol; for tablets also

   c) binders, e.g., magnesium aluminum silicate, starch paste, gelatin, tragacanth, methylcellulose, sodium carboxymethylcellulose and/or polyvinylpyrrolidone; if desired

   d) disintegrants, e.g., starches, agar, alginic acid or its sodium salt, or effervescent mixtures; and/or

   e) absorbents, colorants, flavors and sweeteners.

Tablets may be either film coated or enteric coated according to methods known in the art.

Suitable compositions for oral administration include an effective amount of a compound of the invention in the form of tablets, lozenges, aqueous or oily suspensions, dispersible powders or granules, emulsion, hard or soft capsules, or syrups or elixirs. Compositions intended for oral use are prepared according to any method known in the art for the manufacture of pharmaceutical compositions and such compositions can contain one or more agents selected from the group consisting of sweetening agents, flavoring agents, coloring agents and preserving agents in order to provide pharmaceutically elegant and palatable preparations. Tablets may contain the active ingredient in admixture with nontoxic pharmaceutically acceptable excipients which are suitable for the manufacture of tablets. These excipients are, for example, inert diluents, such as calcium carbonate, sodium carbonate, lactose, calcium phosphate or sodium phosphate; granulating and disintegrating agents, for example, corn starch, or alginic acid; binding agents, for example, starch, gelatin or acacia; and lubricating agents, for example magnesium
stearate, stearic acid or talc. The tablets are uncoated or coated by known techniques to delay disintegration and absorption in the gastrointestinal tract and thereby provide a sustained action over a longer period. For example, a time delay material such as glycercyly monostearate or glycercyl distearate can be employed. Formulations for oral use can be presented as hard gelatin capsules wherein the active ingredient is mixed with an inert solid diluent, for example, calcium carbonate, calcium phosphate or kaolin, or as soft gelatin capsules wherein the active ingredient is mixed with water or an oil medium, for example, peanut oil, liquid paraffin or olive oil.

Certain injectable compositions are aqueous isotonic solutions or suspensions, and suppositories are advantageously prepared from fatty emulsions or suspensions. Said compositions may be sterilized and/or contain adjuvants, such as preserving, stabilizing, wetting or emulsifying agents, solution promoters, salts for regulating the osmotic pressure and/or buffers. In addition, they may also contain other therapeutically valuable substances. Said compositions are prepared according to conventional mixing, granulating or coating methods, respectively, and contain about 0.1-75%, or contain about 1-50%, of the active ingredient.

Suitable compositions for transdermal application include an effective amount of a compound of the invention with a suitable carrier. Carriers suitable for transdermal delivery include absorbable pharmacologically acceptable solvents to assist passage through the skin of the host. For example, transdermal devices are in the form of a bandage comprising a backing member, a reservoir containing the compound optionally with carriers, optionally a rate controlling barrier to deliver the compound of the skin of the host at a controlled and predetermined rate over a prolonged period of time, and means to secure the device to the skin.

Suitable compositions for topical application, e.g., to the skin and eyes, include aqueous solutions, suspensions, ointments, creams, gels or sprayable formulations, e.g., for delivery by aerosol or the like. Such topical delivery systems will in particular be appropriate for dermal application, e.g., for the treatment of skin cancer, e.g., for prophylactic use in sun creams, lotions, sprays and the like. They are thus particularly suited for use in topical, including cosmetic, formulations well-known in the art. Such may contain solubilizers, stabilizers, tonicity enhancing agents, buffers and preservatives.
As used herein a topical application may also pertain to an inhalation or to an intranasal application. They may be conveniently delivered in the form of a dry powder (either alone, as a mixture, for example a dry blend with lactose, or a mixed component particle, for example with phospholipids) from a dry powder inhaler or an aerosol spray presentation from a pressurised container, pump, spray, atomizer or nebuliser, with or without the use of a suitable propellant.

The present invention further provides anhydrous pharmaceutical compositions and dosage forms comprising the compounds of the present invention as active ingredients, since water may facilitate the degradation of certain compounds.

Anhydrous pharmaceutical compositions and dosage forms of the invention can be prepared using anhydrous or low moisture containing ingredients and low moisture or low humidity conditions. An anhydrous pharmaceutical composition may be prepared and stored such that its anhydrous nature is maintained. Accordingly, anhydrous compositions are packaged using materials known to prevent exposure to water such that they can be included in suitable formulary kits. Examples of suitable packaging include, but are not limited to, hermetically sealed foils, plastics, unit dose containers (e.g., vials), blister packs, and strip packs.

The invention further provides pharmaceutical compositions and dosage forms that comprise one or more agents that reduce the rate by which the compound of the present invention as an active ingredient will decompose. Such agents, which are referred to herein as "stabilizers," include, but are not limited to, antioxidants such as ascorbic acid, pH buffers, or salt buffers, etc.

Methods of synthesizing Pyrrolo-pyrimidines

Agents of the invention, i.e. compounds in accordance to the definition of formula (I), may be prepared by a reaction sequence (shown below) involving Suzuki coupling of a protected boronic esters II with the corresponding aryl halides I, conveniently furnishing intermediate III. Deprotection of III, e.g. with diluted hydrochloric acid in methanol or the like and acylation, e.g. with an appropriate acetylating agent, e.g. unsubstituted or substituted acetonitrile in the absence or presence of a solvent, of IV is followed by an additional Suzuki coupling with boronic ester VI and acylation of VII (optionally followed by a deprotection step), as shown in Reaction Scheme 1 below, wherein X denotes N, and the group PG refers to a protecting group such as for example, tert-
butyloxy carbonyl, that may be easily removed e.g. by diluted hydrochloric acid in methanol or the like.

Reaction Scheme 1:

Alternatively, the compounds of formula (I) may also be prepared by a reaction sequence involving Suzuki coupling of boronic esters IX with the corresponding aryl halides I', followed by an additional Suzuki coupling of V with boronic esters VI and an
acylation of VII (optionally followed by a deprotection step), as shown in Reaction Scheme 2 below:

**Reaction Scheme 2:**

Alternatively, the compounds of formula (I) may also be prepared by a reaction sequence involving Suzuki coupling of boronic esters VI with the corresponding aryl halides III, acylation of intermediate X, followed by deprotection of XI and acylation of XII (optionally followed by a deprotection step), as shown in Reaction Scheme 3 below, wherein X denotes N, and the group PG refers to a protecting group that may be easily removed, such as for example, tert-butyloxycarbonyl.

$^1$H-NMR spectra were recorded on a Bruker 600 MHz, a Bruker 500 MHz, or a Bruker 400 MHz NMR spectrometer. Significant peaks are tabulated in the order: multiplicity (s, singlet; d, doublet; t, triplet; q, quartet; m, multiplet; br, broad) and number of protons. Electron Spray Ionization (ESI) mass spectra were recorded on an Agilent 1100 Series mass spectrometer. Mass spectrometry results are reported as the ratio of mass over charge.

**Inhibition of Btk enzymatic activity**

The inhibitory activity of the present compounds against Btk was assessed in a biochemical enzyme assay. Assay plates in 384 well format were prepared with 8-point serial dilutions for the test compounds on a Thermo CatX workstation equipped with an Innovadyne Nanodrop Express. The assay plates were prepared by addition of 50 nl per well of compound solution in 90 % DMSO. The kinase reactions were started by stepwise addition of 4.5 $\mu$l per well of peptide/ATP-solution (4 $\mu$M FITC-Ahx-TSELKKVVALYDMPMNAND-NH$_2$, 164 $\mu$M ATP) in kinase buffer (50mM HEPES, pH 7.5, 1mM DTT, 0.02% Tween20, 0.02% BSA, 0.6% DMSO, 10 mM beta-glycerophosphate, and 10 $\mu$M sodium orthovanadate, 18 mM MgCl$_2$, 1 mM MnCl$_2$) and 4.5 $\mu$l per well of enzyme solution (6.4nM full-length human recombinant BTK) in kinase buffer. Kinase reactions were incubated at 30°C for 60 minutes and subsequently terminated by addition of 16 $\mu$l per well of stop solution (100 mM HEPES pH 7.5, 5 % DMSO, 0.1 % Caliper coating reagent, 10 mM EDTA, and 0.015 % Brij35). Kinase reactions were analyzed on a Caliper LC3000 workstation by separating phosphorylated and unphosphorylated peptides and kinase activities were calculated from the amounts of newly formed phospho-peptide. Inhibition data were calculated by comparison to control reactions without enzyme (100 % inhibition) and without inhibitors (0 % inhibition). The concentration of inhibitor required for 50 % inhibition (IC50) was calculated from the inhibition in response to inhibitor concentrations.

Inhibition of cellular Btk activity

Alternatively, the present compounds might also be assessed for their capacity to inhibit Btk-dependent FcG receptor-induced IL-8 secretion in human cells. The human myeloid leukemia THP1 cell line (ATCC TIB202) was grown in RPMI 1640 medium supplemented with 10 % FCS and 15 nM 1, 25-dihydroxy Vitamin D3 during 4 days before use to induced myeloid differentiation. A sufficient number of tissue-culture grade 384-well plates was coated with human IgG of unknown specificity by incubating overnight at 4°C with 40 µl/well of a 50 µg/ml IgG solution in PBS. On the day of the experiment, plates were washed 5 times with 80 µl water on a Molecular Devices Aquamax DW4 plate washer. Solutions of the test compounds in 90 % DMSO were added to each well on a Hamilton Microlab Star liquid handling station to 40 µl/well tissue culture medium and the total DMSO concentration was adjusted to 0.1 %.

Differentiated THP1 cells were then added in 40 µl/well to reach a final density of 5000
cells/well in 80 µl culture medium. After 24 hours, IL-8 secretion was measured in the supernatant by the IL-8 HTRF assay following the protocol of the vendor (CisBio international). Inhibition data were calculated by comparison to control cultures without IgG stimulus enzyme (100 % inhibition) and without inhibitors (0 % inhibition). The concentration of inhibitor required for 50 % inhibition (IC50) was calculated from the inhibition in response to inhibitor concentrations.

Inhibition of Btk activity in blood

Alternatively, the inhibitory activity of the present compounds in blood was assessed in the following in vitro B cell activation assay. Whole blood was collected from the abdominal aorta of anaesthetized adult male Lewis rats and was anticoagulated with 100 U/ml sodium heparin. Blood was then diluted to 50 % with high glucose DMEM (Amimed) supplemented with 100 U/ml penicillin, 100 mg/ml streptomycin, 2 mM L-glutamin, 50 mg/ml dextran 40 and 5% FCS (Fetadone I, Gibco). Then, 190 µl prediluted blood was mixed in 96 well U-bottomed microtiter plates (Nunc) with 10 µl of serial dilutions of test compounds in DMSO. Cultures were incubated at 37°C, 5% CO2 for 1 hour, then 30 µl of rat IL-4 (Beckton-Dickinson, final concentration 5 ng/ml) and goat anti-rat IgM (Serotec, final concentration 15 ug/ml) were added and the cultures were incubated for 24 hours. Activation of B cells was measured by flow cytometry after staining for the B cell subset with PE-Cy5-labeled anti-ratCD45RA (Beckton-Dickinson) and for the activation marker CD86 (PE-labeled anti-rat CD86 (Beckton-Dickinson). All staining procedures were performed at RT for 30 min in the dark in 96-deep well V-bottomed microtiter plates (Corning) with BD Lysing Solution (Beckton-Dickinson). Cytometric data was acquired on a FACScalibur flow cytometer (BD Biosciences) and the subpopulation of lymphocytes were gated according to size and granularity and
further analyzed for expression of CD45RA and the activation markers. Data for the inhibition of B cell activation were calculated from the percentage of cells positively stained for activation markers within the CD45RA positive population. Inhibition data were calculated by comparison to control cultures without anti-IgM and IL-4 (100 % inhibition) and without inhibitors (0 % inhibition). The concentration of inhibitor required for 50 % inhibition (IC50) was calculated from the inhibition in response to inhibitor concentrations.
