A pharmaceutical combination comprising a platinum-containing anticancer agent, and an Hsp90 inhibitor according to the following formulae (I) & (la), a tautomer, or a pharmaceutically acceptable salt thereof, wherein the variables structural formulae are defined herein. Also provided is a method of treating a proliferative disorder such as cancer in a subject in need thereof, using the pharmaceutical combination described herein.
COMBINATION THERAPY OF HSP90 INHIBITORS WITH PLATINUM-
CONTAINING AGENTS

CROSS-REFERENCE TO RELATED PATENTS

[0001] This application claims the benefit of priority to U.S. Provisional Patent Application Nos. 61/554,706, filed on November 2, 2011. The contents of the above application are incorporated herein by reference in their entirety.

BACKGROUND OF THE INVENTION

[0002] Although tremendous advances have been made in elucidating the genomic abnormalities that cause malignant cancer cells, currently available chemotherapy remains unsatisfactory, and the prognosis for the majority of patients diagnosed with cancer remains dismal. Most chemotherapeutic agents act on a specific molecular target thought to be involved in the development of the malignant phenotype. However, a complex network of signaling pathways regulate cell proliferation and the majority of malignant cancers are facilitated by multiple genetic abnormalities in these pathways. Therefore, it is less likely that a therapeutic agent that acts on one molecular target will be fully effective in curing a patient who has cancer.

[0003] Heat shock proteins (HSPs) are a class of chaperone proteins that are up-regulated in response to elevated temperature and other environmental stresses, such as ultraviolet light, nutrient deprivation and oxygen deprivation. HSPs act as chaperones to other cellular proteins (called client proteins), facilitate their proper folding and repair and aid in the refolding of mis-folded client proteins. There are several known families of HSPs, each having its own set of client proteins. The Hsp90 family is one of the most abundant HSP families, accounting for about 1-2% of proteins in a cell that is not under stress and increasing to about 4-6% in a cell under stress. Inhibition of Hsp90 results in the degradation of its client proteins via the ubiquitin proteasome pathway. Unlike other chaperone proteins, the client proteins of Hsp90 are mostly protein kinases or transcription factors involved in signal transduction, and a number of its client proteins have been shown to be involved in the progression of cancer.
SUMMARY OF THE INVENTION

[0004] It has been found that certain triazolone Hsp90 inhibitor and platinum-containing anti-cancer agent combinations are surprisingly effective at treating subjects with certain cancers without further increasing the side effects profile of the individual agents. The particular combination therapies disclosed herein demonstrate surprising biological activity by demonstrating significant anticancer effects.

[0005] In an embodiment, the invention provides a method of utilizing Hsp90 inhibitors according to formulae (I) or (Ia), or a compound in Tables 1 or 2 for the treatment of proliferative disorders such as cancer, in combination with a platinum-containing anti-cancer agent. In an embodiment, a method of treating a subject with cancer includes administering to the subject an Hsp90 inhibitor according to formulae (I) or (Ia), or a compound in Tables 1 or 2, and a platinum-containing anti-cancer agent. In an embodiment, the administration of the Hsp90 inhibitor and the platinum-containing agent are done concurrently. In another embodiment, the administration of the Hsp90 inhibitor and the platinum-containing agent are done sequentially. In another embodiment, the administration of the Hsp90 inhibitor and the platinum-containing agent are dosed independently. In any one of these embodiments, the platinum-containing agent may be cisplatin, carboplatin, oxaliplatin, or their analogues. In any one of these embodiments, the Hsp90 inhibitor may be a compound represented in Tables 1 or 2. In any one of these embodiments, the platinum-containing agent may be cisplatin.

[0006] In some embodiments, the cancer may have mutations or translocations in the EGFR, K-Ras, c-Metc-Met, c-Kit, HER2, B-Raf, PI3K and/or ALK proteins. In some embodiments, the cancer may express wild-type EGFR and K-Ras. In some embodiments, the cancer may express mutated EGFR and wild-type K-Ras. In some embodiments, the cancer may express wild-type EGFR and mutated K-Ras protein. In some embodiments, the cancer may be ALK positive ("ALK+".) In some embodiments, the cancer may have an EML4-ALK translocation. In some embodiments, the cancer may have a HER2 mutation. In some embodiments, the cancer may have a PI#K mutation. In some embodiments, the cancer may have a B-Raf protein mutation.
In an embodiment, kits for administration of the combination therapy are provided. In an embodiment, the kit includes separate pharmaceutical compositions containing the Hsp90 inhibitor according to formulae (I) or (Ia) or a compound in Tables 1 or 2, and a platinum-containing anti-cancer agent. In another embodiment, the kit includes one pharmaceutical composition containing both the Hsp90 inhibitor and the platinum-containing anti-cancer agent. In any of these embodiments, each pharmaceutical composition includes one or more pharmaceutically acceptable carrier or diluent. In any one of these embodiments, the platinum-containing agent may be cisplatin, carboplatin, oxaliplatin, or their analogues. In any one of these embodiments, the Hsp90 inhibitor may be a compound represented in Tables 1 or 2. In any one of these embodiments, the platinum-containing agent may be cisplatin.

In an embodiment, the invention provides the use of an Hsp90 inhibitor according to formulae (I) or (Ia) or a compound in Tables 1 or 2 for the manufacture of a medicament for treating cancer in combination with a platinum-containing anti-cancer agent.

In an embodiment, a method of treating drug-resistant cancer in a subject includes administering to the subject an effective amount of the pharmaceutical combination including an Hsp90 compound according to formulae (I) or (Ia) or a compound in Tables 1 or 2 and a platinum-containing anti-cancer agent. In an embodiment, the method further includes the administration of one or more therapeutic agents. In certain embodiments, the combination treatment utilizes an Hsp90 compound according to formulae (I) or (Ia) or a compound in Tables 1 or 2 with a platinum-containing anti-cancer agent to help to arrest, partially or fully, or reduce the development of drug resistant cancer in a subject. The combinations described herein may allow a reduced dose of the platinum-containing agent given to a subject, because the Hsp90 inhibitor should inhibit the development of multidrug-resistant cancer cells. In an embodiment, the platinum-containing anti-cancer agent may be cisplatin, carboplatin, oxaliplatin, or their derivatives. In another embodiment, the platinum-containing agent may be cisplatin.
BRIEF DESCRIPTION OF THE DRAWINGS

[0010] The foregoing and other objects, features and advantages of the invention will be apparent from the following more particular description of some embodiments of the invention, as illustrated in the accompanying drawings. The drawings are not necessarily to scale, emphasis instead being placed upon illustrating the principles of the invention.

[0011] Figure 1 shows a dose-dependent curve with the IC_{so} of ganetespib, at about 32 nM.

[0012] Figure 2 shows a dose-dependent curve with the IC_{so} of cisplatin at about 5.7 μM.

[0013] Figure 3 shows significant killing of HCT-116 cells by ganetespib in combination with cisplatin. Cells were exposed to the indicated single agent or combination, concurrently, for 3 days.

[0014] Figure 4 shows significant killing of HCT-116 cells by the sequential combination of ganetespib with cisplatin. Cells were exposed to ganetespib for 1 hour, washed and then treated with vehicle (DMSO) or indicated chemotherapeutic for 3 days. Single agent chemotherapeutic was dosed for 3 days.

[0015] Figure 5 shows substantial treatment improvement by a combination of ganetespib with cisplatin in an animal model of HCT-116 colon cancer xenograft. Ganetespib (150 mg/kg) was given as a single bolus injection 6 hours prior to cisplatin (2 mg/kg) administration.

[0016] Figure 6 shows substantial treatment improvement by a combination of ganetespib with cisplatin in an animal model of MDA-MB-231 breast cancer tumor xenograft. Ganetespib (150 mg/kg) was given as a single bolus injection 6 hours prior to cisplatin (2 mg/kg) administration.
DETAILED DESCRIPTION OF THE INVENTION

Definitions

[0017] Unless otherwise specified, the below terms used herein are defined as follows:

[0018] As used herein, the term "alkyl" means a saturated or unsaturated, straight chain or branched, non-cyclic hydrocarbon having from 1 to 10 carbon atoms. Representative straight chain alkyls include methyl, ethyl, n-propyl, n-butyl, n-pentyl, n-hexyl, n-heptyl, n-octyl, n-nonyl and n-decyl; while representative branched alkyls include isopropyl, sec-butyl, isobutyl, teri-butyl, isopentyl, 2-methylbutyl, 3-methylbutyl, 2-methylpentyl, 3-methylpentyl, 4-methylpentyl, 2-methylhexyl, 3-methylhexyl, 4-methylhexyl, 5-methylhexyl, 2,3-dimethylbutyl, 2,3-dimethylpentyl, 2,4-dimethylpentyl, 2,3-dimethylhexyl, 2,4-dimethylhexyl, 2,5-dimethylhexyl, 2,2-dimethylpentyl, 2,2-dimethylhexyl, 3,3-dimethylpentyl, 3,3-dimethylhexyl, 4,4-dimethylhexyl, 2-ethylpentyl, 3-ethylpentyl, 2-ethylhexyl, 3-ethylhexyl, 4-ethylhexyl, 2-methyl-2-ethylpentyl, 2-methyl-3-ethylpentyl, 2-methyl-4-ethylpentyl, 2-methyl-2-ethylhexyl, 2-methyl-3-ethylhexyl, 2-methyl-4-ethylhexyl, 2,2-diethylhexyl, 2,2-diethylhexyl, 3,3-diethylhexyl, and the like. The term "(C1-C6)alkyl" means a saturated, straight chain or branched, non-cyclic hydrocarbon having from 1 to 6 carbon atoms. Alkyl groups included in compounds described herein may be optionally substituted with one or more substituents. Examples of unsaturated alkyls include vinyl, allyl, 1-butenyl, 2-butenyl, isobutylene, 1-pentenyl, 2-pentenyl, 3-methyl-1-butenyl, 2-methyl-2-butenyl, 2,3-dimethyl-2-butenyl, 1-hexenyl, 2-hexenyl, 3-hexenyl, 1-heptenyl, 2-heptenyl, 3-heptenyl, 1-octenyl, 2-octenyl, 3-octenyl, 1-noneny, 2-noneny, 3-noneny, 1-deceny, 2-deceny, 3-deceny, acetylenyl, propynyl, 1-butynyl, 2-butynyl, 1-pentynyl, 2-pentynyl, 3-methyl-1-butynyl, 4-pentynyl, 1-hexynyl, 2-hexynyl, 5-hexynyl, 1-heptynyl, 2-heptynyl, 6-heptynyl, 1-octynyl, 2-octynyl, 7-octynyl, 1-nonynyl, 2-nonynyl, 8-nonynyl, 1-decynyl, 2-decynyl, 9-decynyl, and the like. Alkyl groups included in compounds described herein may be optionally substituted with one or more substituents.
[0019] As used herein, the term "cycloalkyl" means a saturated or unsaturated, mono- or polycyclic, non-aromatic hydrocarbon having from 3 to 20 carbon atoms. Representative cycloalkyls include cyclopropyl, 1-methylcyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, cycloheptyl, cyclooctyl, cyclononyl, cyclodecyl, octahydropentalenyl, cyclohexenyl, cyclooctenyl, cyclohexynyl, and the like. Cycloalkyl groups included in compounds described herein may be optionally substituted with one or more substituents.

[0020] As used herein, the term "alkylene" refers to an alkyl group that has two points of attachment. The term "(C_{1-6})alkylene" refers to an alkylene group that has from one to six carbon atoms. Straight chain (C_{1-6})alkylene groups are preferred. Non-limiting examples of alkylene groups include methylene (-CH2-), ethylene (-CH2CH2-), n-propylene (-CH2CH2CH2-), isopropylene (-CH2CH(CH3)-), and the like. Alkylene groups may be saturated or unsaturated, and may be optionally substituted with one or more substituents.

[0021] As used herein, the term "lower" refers to a group having up to four atoms. For example, a "lower alkyl" refers to an alkyl radical having from 1 to 4 carbon atoms, "lower alkoxy" refers to "-O-(C_{1-4})alkyl.

[0022] As used herein, the term "haloalkyl" means an alkyl group, in which one or more, including all, the hydrogen radicals are replaced by a halo group(s), wherein each halo group is independently selected from -F, -Cl, -Br, and -I. For example, the term "halomethyl" means a methyl in which one to three hydrogen radical(s) have been replaced by a halo group. Representative haloalkyl groups include trifluoromethyl, bromomethyl, 1,2-dichloroethyl, 4-iodobutyl, 2-fluoropentyl, and the like.

[0023] As used herein, an "alkoxy" is an alkyl group which is attached to another moiety via an oxygen linker. Alkoxy groups included in compounds described herein may be optionally substituted with one or more substituents.

[0024] As used herein, a "haloalkoxy" is a haloalkyl group which is attached to another moiety via an oxygen linker.
As used herein, the term an "aromatic ring" or "aryl" means a mono- or polycyclic hydrocarbon, containing from 6 to 15 carbon atoms, in which at least one ring is aromatic. Examples of suitable aryl groups include phenyl, tolyl, anthracenyl, fluorenlyl, indenyl, azulenyl, and naphthyl, as well as benzo-fused carbocyclic moieties such as 5,6,7,8-tetrahydronaphthyl. Aryl groups included in compounds described herein may be optionally substituted with one or more substituents. In an embodiment, the aryl group is a monocyclic ring, wherein the ring comprises 6 carbon atoms, referred to herein as "(C6) aryl."

As used herein, the term "aralkyl" means an aryl group that is attached to another group by a (Cl-Ce)alkylene group. Representative aralkyl groups include benzyl, 2-phenyl-ethyl, naphth-3-yl-methyl and the like. Aralkyl groups included in compounds described herein may be optionally substituted with one or more substituents.

As used herein, the term "heterocyclyl" means a monocyclic or a polycyclic, saturated or unsaturated, non-aromatic ring or ring system which typically contains 5- to 20-members and at least one heteroatom. A heterocyclic ring system can contain saturated ring(s) or unsaturated non-aromatic ring(s), or a mixture thereof. A 3- to 10-membered heterocycle can contain up to 5 heteroatoms, and a 7- to 20-membered heterocycle can contain up to 7 heteroatoms. Typically, a heterocycle has at least one carbon atom ring member. Each heteroatom is independently selected from nitrogen, which can be oxidized (e.g., N(O)) or quaternized, oxygen and sulfur, including sulfoxide and sulfone. The heterocycle may be attached via any heteroatom or carbon atom. Representative heterocycles include morpholinyl, thiomorpholinyl, pyrrolidinonyl, pyrrolidinyl, piperidinyl, pipеразинyl, hydantoinyl, valerolactamyl, oxiranyl, oxetanyl, tetrahydrofuranyl, tetrahydropyranyl, tetrahydropyrindinyl, tetrahydropyrimidinyl, tetrahydrothiophenyl, tetrahydrothiopyranyl, and the like. A heteroatom may be substituted with a protecting group known to those of ordinary skill in the art, for example, a nitrogen atom may be substituted with a tert-butoxycarbonyl group. Furthermore, the heterocycle included in compounds described herein may be optionally substituted with one or more substituents. Only stable isomers of such substituted heterocyclic groups are contemplated in this definition.
As used herein, the term "heteroaryl", or like terms, means a monocyclic or a polycyclic, unsaturated radical containing at least one heteroatom, in which at least one ring is aromatic. Polycyclic heteroaryl rings must contain at least one heteroatom, but not all rings of a polycyclic heteroaryl moiety must contain heteroatoms. Each heteroatom is independently selected from nitrogen, which can be oxidized (e.g., N(O)) or quaternized, oxygen and sulfur, including sulfoxide and sulfone. Representative heteroaryl groups include pyridyl, 1-oxo-pyridyl, furanyl, benzo[1,3]dioxolyl, benzo[1,4]dioxinyl, thienyl, pyrrolyl, oxazolyl, imidazolyl, thiazolyl, an isoxazolyl, quinolinyl, pyrazolyl, isothiazolyl, pyridazinyl, pyrimidinyl, pyrazinyl, a triazinyl, triazolyl, thiadiazolyl, isoquinolinyl, indazolyl, benzoxazolyl, benzofuryl, indolizinyl, imidazopyridyl, tetrazolyl, benzimidazolyl, benzothiazolyl, benzothiadiazoxyyl, benzo[1,4]diazinyl, indolyl, tetrahydroindolyl, azaindolyl, imidazopyridyl, quinazolinyl, purinyl, pyrrolo[2,3]pyrimidinyl, pyrazolo[3,4]pyrimidinyl, imidazo[1,2-a]pyridyl, and benzothienyl. In one embodiment, the heteroaromatic ring may be a 5-8 membered monocyclic heteroaryl ring. The point of attachment of a heteroaromatic or heteroaryl ring may be at either a carbon atom or a heteroatom. Heteroaryl groups included in compounds described herein may be optionally substituted with one or more substituents. As used herein, the term "(Cs)heteroaryl" means an heteroaromatic ring of 5 members, wherein at least one carbon atom of the ring is replaced with a heteroatom, such as, for example, oxygen, sulfur or nitrogen. Representative (Cs)heteroaryls include furanyl, thienyl, pyrrolyl, oxazolyl, imidazolyl, thiazolyl, isoxazolyl, pyrazolyl, isothiazolyl, pyrazinyl, triazolyl, thiadiazolyl, and the like. As used herein, the term "(Cs)heteroaryl" means an aromatic heterocyclic ring of 6 members, wherein at least one carbon atom of the ring is replaced with a heteroatom such as, for example, oxygen, nitrogen or sulfur. Representative (Ce)heteroaryls include pyridyl, pyridazinyl, pyrazinyl, triazinyl, tetrazinyl, and the like.

As used herein, the term "heteroaalkyl" means a heteroaryl group that is attached to another group by a (C1-C6)alkylene. Representative heteroaalkyls include 2-(pyridin-4-yl)-propyl, 2-(thien-3-yl)-ethyl, imidazol-4-yl-methyl, and the like. Heteroaalkyl groups included in compounds described herein may be optionally substituted with one or more substituents.
As used herein, the term "halogen" or "halo" means -F, -Cl, -Br or -I.

Suitable substituents for an alkyl, alkyiene, alkenyl, alkynyl, cycloalkeny1, heterocyclyl, aryl, aralkyl, heteroaryl, and heteroaralkyl groups include are those substituents which form a stable compound described herein without significantly adversely affecting the reactivity or biological activity of the compound described herein. Examples of substituents for an alkyl, alkyiene, alkenyl, alkynyl, cycloalkyl, cycloalkenyl, heterocyclyl, aryl, aralkyl, heteroaryl, and heteroaralkyl include an alkyl, alkenyl, alkynyl, cycloalkyl, cycloalkenyl, heterocyclyl, aryl, heteroaryl, aralkyl, heteraralkyl, heteroaryl, haloxy, (each of which can be optionally and independently substituted), -C(0)NR,R29, -C(S)NR,R29, -C(NR,R29)NR,R29, -NR,R30C(0)R31, -NR,R30C(S)R31, -NR,R30C(NR,R32)R31, halo, -OR,R33, cyano, nitro, -C(0)R3 3, -C(S)R3, -C(NR,R32)R3, -NR,R30R32, -C(0)OR,R31, -C(S)OR,R3, -C(NR,R32)OR,R3, -OC(0)R3, -OC(S)R3, -OC(NR,R32)R3, -NR,R30C(0)NR,R29, -NR,R30C(S)NR,R29, -NR,R30C(0)OR,R31, -NR,R30C(S)OR,R31, -NR,R30C(NR,R32)OR,R31, -S(0)kR3, -OS(0)kR3, -NR,R30S(0)kR3, -S(0)kNR,R29, -OS(0)kNR,R29, -NR,R30S(0)kNR,R29, guanidino, -C(0)SR,R, -C(S)SR,R, -C(NR,R32)SR,R, -OC(0)OR,R, -OC(S)OR,R, -OC(NR,R32)OR,R, -SC(0)R3, -SC(S)OR,R, -SC(NR,R32)OR,R, -SC(S)R3, -SC(0)NR,R29, -SC(NR,R32)NR,R29, -SC(S)NR,R29, -SC(NR,R32)R3, -OS(0)kOR,R, -S(0)kOR,R, -NR,R30S(0)kOR,R, -SS(0)kR3, -SS(0)kOR,R, -SS(0)kNR,R29, -OP(0)(OR,R)3, or -SP(0)(OR,R)3. In addition, any saturated portion of an alkyl, cycloalkyl, alkyiene, heterocyclyl, alkenyl, cycloalkenyl, alkynyl, aralkyl and heteroaralkyl groups, may also be substituted with =0, =S, or =N-R32. Each R28 and R29 is independently H, alkyl, alkenyl, alkynyl, cycloalkyl, cycloalkenyl, heterocyclyl, aryl, heteroaryl, aralkyl, or heteraralkyl, wherein each alkyl, alkenyl, alkynyl, cycloalkyl, cycloalkenyl, heterocyclyl, aryl, heteroaryl, aralkyl, or heteroalkyl represented by R28 or R29 is optionally and independently substituted. Each R30, R31 and R33 is independently H, alkyl, alkenyl, alkynyl, cycloalkyl, cycloalkenyl, heterocyclyl, aryl, heteroaryl, aralkyl, or heteraralkyl, wherein each alkyl, alkenyl, alkynyl, cycloalkyl, cycloalkenyl, heterocyclyl, aryl, heteroaryl, aralkyl, or heteroalkyl represented by R30 or R31 or R33 is optionally and independently unsubstituted. Each R32 is independently H, alkyl, alkenyl, alkynyl, cycloalkyl, cycloalkenyl, heterocyclyl, aryl, heteroaryl, aralkyl,
heteraralkyl, -C(0)R₃, -C(0)NR₂, -S(0)¾R₃, or -S(0)kNR₂, wherein each alkyl, alkenyl, alkynyl, cycloalkyl, cycloalkenyl, heterocyclyl, aryl, heteroaryl, aralkyl and heteraralkyl represented by R₃ is optionally and independently substituted. The variable k is 0, 1 or 2. In some embodiments, suitable substituents include C1-C4 alkyl, C1-C4 haloalkyl, C1-C4 alkoxy, C1-C4 haloalkoxy, C1-C4 hydroxyalkyl, halo, or hydroxyl.

[0032] When a heterocyclyl, heteroaryl or heteraralkyl group contains a nitrogen atom, it may be substituted or unsubstituted. When a nitrogen atom in the aromatic ring of a heteroaryl group has a substituent, the nitrogen may be oxidized or a quaternary nitrogen.

[0033] Unless indicated otherwise, the compounds described herein containing reactive functional groups, such as, for example, carboxy, hydroxy, thiol and amino moieties, also include corresponding protected derivatives thereof. "Protected derivatives" are those compounds in which a reactive site or sites are blocked with one or more protecting groups. Examples of suitable protecting groups for hydroxyl groups include benzyl, methoxymethyl, allyl, trimethylsilyl, tert-butyldimethylsilyl, acetate, and the like. Examples of suitable amine protecting groups include benzylcarboxylic ester, tert-butoxycarbonyl, tert-butyl, benzyl and fluorenlymethoxy-carboxyl (Fmoc). Examples of suitable thiol protecting groups include benzyl, tert-butyl, acetyl, methoxymethyl and the like. Other suitable protecting groups are well known to those of ordinary skill in the art and include those found in T.W. Greene, *Protecting Groups in Organic Synthesis*, (John Wiley & Sons, Inc., 1981).

[0034] As used herein, the term "compound(s) described herein" or similar terms refers to a compound of formulae (I), or (Ia) or a compound in Tables 1 or 2 or a tautomer or pharmaceutically acceptable salt thereof. Also included in the scope of the embodiments are a solvate, clathrate, hydrate, polymorph, prodrug, or protected derivative of a compound of formulae (I), or (la), or a compound in Tables 1 or 2.

[0035] The compounds described herein may contain one or more chiral centers and/or double bonds and, therefore, exist as stereoisomers, such as double-bond isomers (i.e., geometric isomers), enantiomers or diastereomers. Each chemical
structure shown herein, including the compounds described herein, encompass all of the corresponding compound's enantiomers, diastereomers and geometric isomers, that is, both the stereochemically pure form (e.g., geometrically pure, enantiomerically pure, or diastereomerically pure) and isomeric mixtures (e.g., enantiomeric, diastereomeric and geometric isomeric mixtures). In some cases, one enantiomer, diastereomer or geometric isomer will possess superior activity or an improved toxicity or kinetic profile compared to other isomers. In those cases, such enantiomers, diastereomers and geometric isomers of compounds described herein are preferred.

[0036] When a disclosed compound is named or depicted by structure, it is to be understood that solvates (e.g., hydrates) of the compound or a pharmaceutically acceptable salt thereof is also included. "Solvates" refer to crystalline forms wherein solvate molecules are incorporated into the crystal lattice during crystallization. Solvates may include water or nonaqueous solvents such as ethanol, isopropanol, DMSO, acetic acid, ethanolamine and ethyl acetate. When water is the solvent molecule incorporated into the crystal lattice of a solvate, it is typically referred to as a "hydrate". Hydrates include stoichiometric hydrates as well as compositions containing variable amounts of water.

[0037] When a disclosed compound is named or depicted by structure, it is to be understood that the compound, including solvates thereof, may exist in crystalline forms, non-crystalline forms or a mixture thereof. The compounds or solvates may also exhibit polymorphism (i.e., the capacity to occur in different crystalline forms). These different crystalline forms are typically known as "polymorphs." It is to be understood that when named or depicted by structure, the disclosed compounds and solvates (e.g., hydrates) also include all polymorphs thereof. Polymorphs have the same chemical composition but differ in packing, geometrical arrangement and other descriptive properties of the crystalline solid state. Polymorphs, therefore, may have different physical properties such as shape, density, hardness, deformability, stability and dissolution properties. Polymorphs typically exhibit different melting points, IR spectra and X-ray powder diffraction patterns, which may be used for identification. One of ordinary skill in the art will appreciate that different polymorphs may be produced, for example, by changing or adjusting the conditions used in crystallizing
the compound. For example, changes in temperature, pressure or solvent may result in
different polymorphs. In addition, one polymorph may spontaneously convert to
another polymorph under certain conditions.

[0038] When a disclosed compound is named or depicted by structure, it is to be
understood that clathrates ("inclusion compounds") of the compound or its
pharmacetically acceptable salt, solvate or polymorph, are also included. "Clathrate"
means a compound described herein, or a salt thereof, in the form of a crystal lattice
that contains spaces (e.g., channels) that have a guest molecule trapped within (e.g., a
solvent or water).

[0039] As used herein, and unless otherwise indicated, the term "prodrug" means a
derivative of a compound that can hydrolyze, oxidize, or otherwise react under
biological conditions (in vitro or in vivo) to provide a compound described herein.
Prodrugs may become active upon such reaction under biological conditions, or they
may have activity in their unreacted forms. Examples of prodrugs contemplated herein
include analogs or derivatives of compounds of formulae (I) or (Ia) or a compound in
Tables 1 or 2 that comprise biohydrolyzable moieties such as biohydrolyzable amides,
biohydrolyzable esters, biohydrolyzable carbamates, biohydrolyzable carbonates,
biohydrolyzable ureides and phosphate analogues. Prodrugs can typically be prepared
using well-known methods, such as those described by BURGER'S MEDICINAL
CHEMISTRY AND DRUG DISCOVERY, (Manfred E. Wolff Ed., 5th ed. (1995)) 172-178, 949-
982.

[0040] The articles "a", "an" and "the" are used herein to refer to one or to more
than one (i.e., to at least one) of the grammatical object of the article unless otherwise
clearly indicated by contrast. By way of example, "an element" means one element or
more than one element.

[0041] The term "including" is used herein to mean, and is used interchangeably
with, the phrase "including but not limited to".

[0042] The term "or" is used herein to mean, and is used interchangeably with, the
term "and/or," unless context clearly indicates otherwise.
[0043] The term "such as" is used herein to mean, and is used interchangeably, with the phrase "such as but not limited to".

[0044] Unless specifically stated or obvious from context, as used herein, the term "about" is understood as within a range of normal tolerance in the art, for example within 2 standard deviations of the mean. About can be understood as within 10%, 9%, 8%, 7%, 6%, 5%, 4%, 3%, 2%, 1%, 0.5%, 0.1%, 0.05%, or 0.01% of the stated value. Unless otherwise clear from context, all numerical values provided herein can be modified by the term about.

[0045] As used herein, the terms "subject", "patient" and "mammal" are used interchangeably. The terms "subject" and "patient" refer to an animal (e.g., a bird such as a chicken, quail or turkey, or a mammal), preferably a mammal including a non-primate (e.g., a cow, pig, horse, sheep, rabbit, guinea pig, rat, cat, dog, and mouse) and a primate (e.g., a monkey, chimpanzee and a human), and more preferably a human. In an embodiment, the subject is a non-human animal such as a farm animal (e.g., a horse, cow, pig or sheep), or a pet (e.g., a dog, cat, guinea pig or rabbit). In another embodiment, the subject is a human.

[0046] As used herein, "Hsp90" includes each member of the family of heat shock proteins having a mass of about 90-kiloDaltons. For example, in humans the highly conserved Hsp90 family includes the cytosolic Hsp90\(\alpha\) and Hsp90\(\beta\) isoforms, as well as GRP94, which is found in the endoplasmic reticulum, and HSP75/TRAP\(1\), which is found in the mitochondrial matrix.

[0047] The term "c-Kit" or "c-Kit kinase" refers to a membrane receptor protein tyrosine kinase which is preferably activated upon binding Stem Cell Factor (SCF) to its extracellular domain. Yarden, et ah, Embo. J., (1987) 11:3341-3351; Qiu, et ah, Embo. J., (1988) 7:1003-1011. The full length amino acid sequence of a c-Kit kinase preferably is as set forth in Yarden, et ah; and Qiu, et ah, which are incorporated by reference herein in their entirety. Mutant versions of c-Kit kinase are encompassed by the term "c-Kit" or "c-Kit kinase" and include those that fall into two classes: (1) having a single amino acid substitution at codon 816 of the human c-Kit kinase, or its equivalent position in other species (Ma, et ah, J. Invest Dermatol., (1999) 222:165-170), and (2) those which have
mutations involving the putative juxtamembrane \( \alpha \)-helix of the protein (Ma, et al., J. Biol. Chem., (1999) 274:13399-13402). Both of these publications are incorporated by reference herein in their entirety, including any drawings.

[0048] As used herein, "BCR-ABL" is a fusion protein that results from the translocation of gene sequences from c-ABL protein tyrosine kinase on chromosome 9 into BCR sequences on chromosome 22 producing the Philadelphia chromosome. A schematic representation of human BCR, ABL and BCR-ABL can be seen in Figure 1 of U.S. patent application serial number 10/193,651, filed on July 9, 2002. Depending on the breaking point in the BCR gene, BCR-ABL fusion proteins can vary in size from 185-230 kD but they must contain at least the OLI domain from BCR and the TK domain from ABL for transforming activity. The most common BCR-ABL gene products found in humans are P230 BCR-ABL, P210 BCR-ABL and P190 BCR-ABL. P210 BCR-ABL is characteristic of CML and P190 BCR-ABL is characteristic of ALL.

FLT3 kinase mutations associated with hematologic malignancies are activating mutations. In other words, the FLT3 kinase is constitutively activated without the need for binding and dimerization by FLT3 ligand, and therefore stimulates the cell to grow continuously. Two types of activating mutations have been identified: internal tandem duplications (ITDs) and point mutation in the activating loop of the kinase domain. As used herein, the term "FLT3 kinase" refers to both wild type FLT3 kinase and mutant FLT3 kinases, such as FLT3 kinases that have activating mutations. Compounds provided herein are useful in treating conditions characterized by inappropriate FLT3 activity, such as proliferative disorders. Inappropriate FLT3 activity includes enhanced FLT3 activity resulting from increased or de novo expression of FLT3 in cells, increased FLT3 expression or activity, and FLT3 mutations resulting in constitutive activation. The existence of inappropriate or abnormal FLT3 ligand and FLT3 levels or activity can be determined using well-known methods in the art. For example, abnormally high FLT3 levels can be determined using commercially available ELISA kits. FLT3 levels can also be determined using flow cytometric analysis, immunohistochemical analysis and in situ hybridization techniques.

"Epidermal growth factor receptor" or "EGFR", as used herein, means any epidermal growth factor receptor (EGFR) protein, peptide, or polypeptide having EGFR or EGFR family activity (e.g., Her1, Her2, Her3 and/or Her4), such as encoded by EGFR Genbank Accession Nos. shown in Table I of U.S. Patent Application No. 10/923,354, filed on August 20, 2004, or any other EGFR transcript derived from a EGFR gene and/or generated by EGFR translocation. The term "EGFR" is also meant to include other EGFR proteins, peptides, or polypeptides derived from EGFR isoforms (e.g., Her1,
Her2, Her3 and/or Her4), mutant EGFR genes, splice variants of EGFR genes, and EGFR gene polymorphisms.

[0053] EGFR is a member of the type 1 subgroup of receptor tyrosine kinase family of growth factor receptors which play critical roles in cellular growth, differentiation and survival. Activation of these receptors typically occurs via specific ligand binding which results in hetero- or homodimerization between receptor family members, with subsequent autophosphorylation of the tyrosine kinase domain. Specific ligands which bind to EGFR include epidermal growth factor (EGF), transforming growth factor α (TGFα), amphiregulin and some viral growth factors. Activation of EGFR triggers a cascade of intracellular signaling pathways involved in both cellular proliferation (the ras/raf/MAP kinase pathway) and survival (the PI3 kinase/Akt pathway). Members of this family, including EGFR and HER2, have been directly implicated in cellular transformation.

[0055] c-Met is a receptor tyrosine kinase that is encoded by the Met protooncogene and transduces the biological effects of hepatocyte growth factor (HGF), which is also referred to as scatter factor (SF). Jiang et al, Crit. Rev. Oncol. Hemotol. 29: 209-248 (1999), the entire teachings of which are incorporated herein by reference. c-Met and HGF are
expressed in numerous tissues, although their expression is normally confined predominantly to cells of epithelial and mesenchymal origin, respectively. c-Met and HGF are required for normal mammalian development and have been shown to be important in cell migration, cell proliferation and survival, morphogenic differentiation, and organization of 3-dimensional tubular structures (e.g., renal tubular cells, gland formation, etc.). The c-Met receptor has been shown to be expressed in a number of human cancers. c-Met and its ligand, HGF, have also been shown to be co-expressed at elevated levels in a variety of human cancers (particularly sarcomas). However, because the receptor and ligand are usually expressed by different cell types, c-Met signaling is most commonly regulated by tumor-stroma (tumor-host) interactions. Furthermore, c-Met gene amplification, mutation, and rearrangement have been observed in a subset of human cancers. Families with germline mutations that activate c-Met kinase are prone to multiple kidney tumors as well as tumors in other tissues. Numerous studies have correlated the expression of c-Met and/or HGF/SF with the state of disease progression of different types of cancer (including lung, colon, breast, prostate, liver, pancreas, brain, kidney, ovaries, stomach, skin, and bone cancers). Furthermore, the overexpression of c-Met or HGF have been shown to correlate with poor prognosis and disease outcome in a number of major human cancers including lung, liver, gastric, and breast.

[0056] The anaplastic lymphoma kinase (ALK) tyrosine kinase receptor is an enzyme that, in humans, is encoded by the ALK gene. The 2;5 chromosomal translocation is frequently associated with anaplastic large cell lymphomas (ALCLs). The translocation creates a fusion gene consisting of the ALK (anaplastic lymphoma kinase) gene and the nucleophosmin (NPM) gene; the 3' half of ALK, derived from chromosome 2, is fused to the 5' portion of NPM from chromosome 5. The product of the NPM-ALK fusion gene is oncogenic. Other possible translocations of the ALK gene, such as the eml4 translocation, are also implicated in cancer.

[0057] The general role of ALK in cancer has been described. See, e.g., Pulford et al., J. Cell Physiol. 199(3): 330-358 (2004). Abnormalities in the anaplastic lymphoma kinase (ALK) gene have an established pathogenic role in many pediatric and adult cancers, including non-small cell lung cancer (NSCLC), diffuse large B-cell lymphoma (DLBCL),
anaplastic large cell lymphoma (ALCL), neuroblastoma (NBL), and inflammatory myofibroblastic tumors (IMT), non-Hodgkin’s lymphoma (NHL), and esophageal squamous cell carcinoma (ESCC). These diseases account for more than 250,000 new cancer diagnoses each year in the United States alone.

[0058] More particularly, EML4-ALK and KIF5B-ALK translocations have been found in non-small cell lung cancer. See e.g. Mano H., Cancer Sci. 2008 Dec;99(12):2349-55; Takeuchi K et al., Clin Cancer Res. 2009 May 1;15(9):3143-9. CLTC-ALK mutation has been found in DLBCL. See e.g. Rudzki Z et al., Pol J Pathol. 2005; 56 (1):37-45. NPM-ALK, MSN-ALK, and other mutations have been found in ALCL. See e.g. Lamant L et al., Genes Chromosomes Cancer. 2003 Aug; 37 (4):427-32; Webb TR et al. Expert Rev Anticancer Ther 2009 Mar; 9(3):331-56. TPM4-ALK mutation has been found in esophageal squamous cell carcinoma (ESCC). See e.g. Li R, Morris SW., Med Res Rev. 2008 May; 28 (3):372-412. F1174L, R1275Q, and other point mutations have been found in NBL. See e.g. van Roy N et al. Genome Med 2009 July 27; 1 (7):74. TPM3-ALK, TPM4-ALK, CLTC-ALK, RanBP2-ALK, and TPM4-ALK mutations have been found in IMT. See e.g. Gleason BC, Hornick JL. J Clin Pathol 2008 Apr;61(4):428-37. The methods of detection and identification of these alterations, mutations or rearrangements in an ALK gene or gene product can be found in the above-identified references and references cited therein.

[0059] The KRAS oncogene (the cellular homolog of the Kirsten rat sarcoma virus gene) is a critical gene in the development of a variety of cancers, and the mutation status of this gene is an important characteristic of many cancers. Mutation status of the gene can provide diagnostic, prognostic and predictive information for several cancers. The KRAS gene is a member of a family of genes (KRAS, NRAS and HRAS). KRAS is a member of the RAS family of oncogenes, a collection of small guanosine triphosphate (GTP)-binding proteins that integrate extracellular cues and activate intracellular signaling pathways to regulate cell proliferation, differentiation, and survival. Gain-of-function mutations that confer transforming capacity are frequently observed in KRAS, predominantly arising as single amino acid substitutions at amino acid residues G12, G13 or Q61. Constitutive activation of KRAS leads to the persistent stimulation of downstream signaling pathways that promote tumorigenesis, including
the RAF/MEK/ERK and PBK/AKT/mTOR cascades. In NSCLC, KRAS mutations are highly prevalent (20-30%) and are associated with unfavorable clinical outcomes. Mutations in KRAS appear mutually exclusive with those in EGFR in NSCLC tumors; more importantly, they can account for primary resistance to targeted EGFR TKI therapies. Mutations in the KRAS gene are common in many types of cancer, including pancreatic cancer (-65%), colon cancer (-40%), lung cancer (-20%) and ovarian cancer (-15%).

[0060] The methods and procedures for the detections and/or identifications of EGFR, KRAS, and/or ALK over-expressions and/or mutations are known in the literature and can be easily carried out by a skilled person. See, e.g., U.S. Patent Nos. 7,700,339; 5,529,925; 5,770,421; U.S. Patent Application Publication No. US2011/0110923; Palmer et al, Biochem. J. (2009), 345-361; Koivunen et al, Clin. Can. Res., 2008, 14, 4275-4283; Anderson, Expert Rev. Mol. Diagn. 11(6), 635-642 (2011); Pinto et al, Cancer Genetics 204 (2011), 439-446; Rekhtman et al, Clin Cancer Res 2012;18:1167-1176; Massarelli et al, Clin Cancer Res 2007;13:2890-2896; Lamy et al, Modern Pathology (2011) 24, 1090-1100; Balschun et al, Expert Rev. Mol. Diagn. 11(8), 799-802 (2011); Vakiani et al, J Pathol 2011; 223, 219-229; Okudela et al, Pathology International 2010; 60: 651-660; John et al, Oncogene (2009) 28, S14-S23; Jimeno et al, J. Clin. Oncol. 27, 1130-1135 (2009); Van Krieken et al, Virchows Archiv. 453, 417-431 (2008); and the references cited in the-above identified references. Thresholds of increased expression that constitute an EGFR mutation or an ALK mutation are well known in the art. Moreover, it is generally recognized that once an EGFR mutation is detected in a cancer, the KRAS mutation will be eliminated in the same cancer. Put reversely, if a KRAS mutation is positively identified in a cancer from a subject, it is then not necessary to engage in any further EGFR-related identification. Similar principle can be applied to an ALK mutation in a cancer. That is if there is an ALK mutation detected in a cancer, it is extremely rare that an EGFR or KRAS mutation will be implicated. Stated another way, once an ALK mutation is positively identified in a cancer, no further identification is necessary either for EGFR mutation or for KRAS mutation in the same cancer.

[0061] As used herein, a "proliferative disorder" or a "hyperproliferative disorder," and other equivalent terms, means a disease or medical condition involving
pathological growth of cells. Proliferative disorders include cancer, smooth muscle cell proliferation, systemic sclerosis, cirrhosis of the liver, adult respiratory distress syndrome, idiopathic cardiomyopathy, lupus erythematosus, retinopathy, (e.g., diabetic retinopathy or other retinopathies), cardiac hyperplasia, reproductive system associated disorders such as benign prostatic hyperplasia and ovarian cysts, pulmonary fibrosis, endometriosis, fibromatosis, harmatomas, lymphangiomatosis, sarcoidosis and desmoid tumors. Non-cancerous proliferative disorders also include hyperproliferation of cells in the skin such as psoriasis and its varied clinical forms, Reiter's syndrome, pityriasis rubra pilaris, hyperproliferative variants of disorders of keratinization (e.g., actinic keratosis, senile keratosis), scleroderma, and the like. In an embodiment, the proliferative disorder is cancer.

[0062] In an embodiment, the invention provides a method of treating a proliferative disorder in a subject, comprising administering to the subject an effective amount of the combination of Hsp90 inhibitor and platinum-containing anti-cancer agent as described herein. In an embodiment, the proliferative disorder is cancer. In an embodiment, the cancer is breast cancer, gastric cancer, colorectal cancer, pancreatic cancer, ocular melanoma, prostate cancer, gastrointestinal stromal tumors (GIST), advanced esophagogastric cancer, melanoma, hepatocellular cancer, solid tumor, liver cancer, head and neck cancer, small cell lung cancer, non-small cell lung cancer, bladder cancer, testicular tumor, ovarian cancer, lymphoma, leukemia, multiple myeloma, or colon cancer. In an embodiment, the cancer is solid cancer, gastric cancer, bladder cancer, ovarian cancer, or colorectal cancer. In an embodiment, the cancer is colon cancer. In an embodiment, the cancer is metastatic colorectal cancer. In an embodiment, the cancer is bladder cancer. In an embodiment, the cancer is solid cancer. In an embodiment, the cancer is gastric cancer. In an embodiment, the cancer may have a mutation or translocation in EGFR, K-Ras, PI3K, ALK, HER2 and/or B-Raf proteins.

[0063] Some of the disclosed methods can be particularly effective at treating subjects whose cancer has become "drug resistant" or "multi-drug resistant". A cancer which initially responded to an anti-cancer drug becomes resistant to the anti-cancer drug when the anti-cancer drug is no longer effective in treating the subject with the
For example, many tumors will initially respond to treatment with an anti-cancer drug by decreasing in size or even going into remission, only to develop resistance to the drug. "Drug resistant" tumors are characterized by a resumption of their growth and/or reappearance after having seemingly gone into remission, despite the administration of increased dosages of the anti-cancer drug. Cancers that have developed resistance to two or more anti-cancer drugs are said to be "multi-drug resistant". For example, it is common for cancers to become resistant to three or more anti-cancer agents, often five or more anti-cancer agents and at times ten or more anti-cancer agents.

Other anti-proliferative or anti-cancer therapies may be combined with the pharmaceutical combination of this invention to treat proliferative diseases and cancer. Other therapies or anti-cancer agents that may be used in combination with the inventive anti-cancer agents of the present invention include surgery, radiotherapy (including, but not limited to, gamma-radiation, neutron beam radiotherapy, electron beam radiotherapy, proton therapy, brachytherapy, and systemic radioactive isotopes), endocrine therapy, biologic response modifiers (including, but not limited to, interferons, interleukins, and tumor necrosis factor (TNF)), hyperthermia and cryotherapy, agents to attenuate any adverse effects (e.g., antiemetics), and other approved chemotherapeutic drugs. In an embodiment, the pharmaceutical combination of the invention is administered with one or more therapeutic agent selected from DFMO, vandetanib, trastuzumab, temodar, dexamethasone, epirubicin, ifosfamide, mitoxantrone, vorinostat, interferon alpha, rituximab, prednisone, cyclophosphamide, bendamustine, adriamycin, valproate, celecoxib, thalidomide, nelarabine, methotrexate, filgrastim, gemtuzumab ozogamicin, testosterone, clofarabine, cytarabine, everolimus, rituxumab, busulfan, capecitabine, pegfilgrastim, mesna, amrubicin, obatoclax, gefitinib, cyclosporine, dasatinib, temozolomide, thiotepa, plerixafor, mitotane, vincristine, doxorubicin, cixutumumab, endostar, fenofibrate, melphalan, sunitinib, rubitecan, enoxaparin, isotretinoin, tariquidar, pomalidomide, sorafenib, altretamine, idarubicin, rapamycin, zevalin, everolimus, pravastatin, carmustine, nelfinavir, streptozocin, tirapazamine, aprepitant, lenalidomide,G-CSF, procarbazine, alemtuzumab, amifostine, valspodar, lomustine, oblimersen,
temsirilimus, vinblastine, figitumumab, belinostat, niacinamide, tipifarnib, erlotinib, bevacizumab, paclitaxel, docetaxel, Abraxane®, pemetrexed, bortezomib, cetuximab, gemcitabine, 5-fluorouracil, leucovorin and tetracycline. In an embodiment, the one or more therapeutic agent is selected from erlotinib, bevacizumab, bortezomib, paclitaxel, doxorubicin, docetaxel, mitoxantrone, cytarabine, 5-fluorouracil, leucovorin, pemetrexed and vincristine.

[0065] As used herein, the term "pharmaceutically acceptable salt" refers to a salt prepared from a compound of formulae (I) or (la) or a compound in Tables 1 or 2 having an acidic functional group, such as a carboxylic acid functional group, and a pharmaceutically acceptable inorganic or organic base. Suitable bases include hydroxides of alkali metals such as sodium, potassium, and lithium; hydroxides of alkaline earth metal such as calcium and magnesium; hydroxides of other metals, such as aluminum and zinc; ammonia, and organic amines, such as unsubstituted or hydroxy-substituted mono-, di-, or trialkylamines; dicyclohexylamine; tributyl amine; pyridine; N-methyl,N-ethylamine; diethylamine; triethylamine; mono-, bis-, or tris-(2-hydroxy-lower alkyl amines), such as mono-, bis-, or tris-(2-hydroxyethyl)amine, 2-hydroxy-tert-butylamine, or tris-(hydroxymethyl) methylamine, N,N-di-lower alkyl-N-(hydroxy lower alkyl)-amines, such as N,N-dimethyl-N-(2-hydroxyethyl)amine, or tri-(2-hydroxyethyl)amine; N-methyl-D-glucamine; and amino acids such as arginine, lysine, and the like. The term "pharmaceutically acceptable salt" also refers to a salt prepared from a compound of formulae (I) or (la) or a compound in Tables 1 or 2 having a basic functional group, such as an amine functional group, and a pharmaceutically acceptable inorganic or organic acid. Suitable acids include hydrogen sulfate, citric acid, acetic acid, oxalic acid, hydrochloric acid (HQ), hydrogen bromide (HBr), hydrogen iodide (HI), nitric acid, hydrogen bisulfide, phosphoric acid, isonicotinic acid, oleic acid, tannic acid, pantothenic acid, saccharic acid, lactic acid, salicylic acid, tartaric acid, bitartratic acid, ascorbic acid, succinic acid, maleic acid, besylic acid, fumaric acid, gluconic acid, glucaronic acid, formic acid, benzoic acid, glutamic acid, methanesulfonic acid, ethanesulfonic acid, benzenesulfonic acid, pamoic acid and p-toluenesulfonic acid.
As used herein, the term "pharmaceutically acceptable solvate," is a solvate formed from the association of one or more pharmaceutically acceptable solvent molecules to one of the compounds of formulae (I) or (II) or a compound in Tables 1 or 2. The term "solvate" includes hydrates, e.g., hemihydrate, monohydrate, dihydrate, trihydrate, tetrahydrate, and the like.

A pharmaceutically acceptable carrier may contain inert ingredients which do not unduly inhibit the biological activity of the compound(s) described herein. The pharmaceutically acceptable carriers should be biocompatible, i.e., non-toxic, non-inflammatory, non-immunogenic and devoid of other undesired reactions upon the administration to a subject. Standard pharmaceutical formulation techniques can be employed, such as those described in REMINGTON, J. P., REMINGTON'S PHARMACEUTICAL SCIENCES (Mack Pub. Co., 17th ed., 1985). Suitable pharmaceutical carriers for parenteral administration include, for example, sterile water, physiological saline, bacteriostatic saline (saline containing about 0.9% mg/ml benzyl alcohol), phosphate-buffered saline, Hank's solution, Ringer's lactate, and the like. Methods for encapsulating compositions, such as in a coating of hard gelatin or cyclodextran, are known in the art. See BAKER, ETAL., CONTROLLED RELEASE OF BIOLOGICAL ACTIVE AGENTS, (John Wiley and Sons, 1986).

As used herein, the term "effective amount" refers to an amount of a compound described herein which is sufficient to reduce or ameliorate the severity, duration, progression, or onset of a disease or disorder, delay onset of a disease or disorder, retard or halt the advancement of a disease or disorder, cause the regression of a disease or disorder, prevent or delay the recurrence, development, onset or progression of a symptom associated with a disease or disorder, or enhance or improve the therapeutic effect(s) of another therapy. In an embodiment of the invention, the disease or disorder is a proliferative disorder. The precise amount of compound administered to a subject will depend on the mode of administration, the type and severity of the disease or condition and on the characteristics of the subject, such as general health, age, sex, body weight and tolerance to drugs. For example, for a proliferative disease or disorder, determination of an effective amount will also depend on the degree, severity and type of cell proliferation. The skilled artisan will be able to
determine appropriate dosages depending on these and other factors. When co-
administered with other therapeutic agents, e.g., when co-administered with an anti-
cancer agent, an "effective amount" of any additional therapeutic agent(s) will depend
on the type of drug used. Suitable dosages are known for approved therapeutic agents
and can be adjusted by the skilled artisan according to the condition of the subject, the
type of condition(s) being treated and the amount of a compound of the invention
being used. In cases where no amount is expressly noted, an effective amount should
be assumed. Non-limiting examples of an effective amount of a compound described
herein are provided herein below. In a specific embodiment, the invention provides a
method of treating, managing, or ameliorating a disease or disorder, e.g. a proliferative
disorder, or one or more symptoms thereof, the method comprising administering to a
subject in need thereof a dose of the Hsp90 inhibitor at least 150 μg/kg, at least 250
μg/kg, at least 500 μg/kg, at least 1 mg/kg, at least 5 mg/kg, at least 10 mg/kg, at least 25
mg/kg, at least 50 mg/kg, at least 75 mg/kg, at least 100 mg/kg, at least 125 mg/kg, at
least 150 mg/kg, or at least 200 mg/kg or more of one or more compounds described
herein once every day, once every 2 days, once every 3 days, once every 4 days, once
every 5 days, once every 6 days, once every 7 days, once every 8 days, once every 10
days, once every two weeks, once every three weeks, or once a month.

[0069] The dosage of the individual platinum-containing anti-cancer agent used in
the pharmaceutical combination may be equal to or lower than the dose of an
individual therapeutic agent when given independently to treat, manage, or ameliorate
a disease or disorder, or one or more symptoms thereof. In an embodiment of the
invention, the disease or disorder being treated with a combination therapy is a
proliferative disorder. In an embodiment, the proliferative disorder is cancer. In an
embodiment, the platinum-containing anticancer agent cisplatin is administered IV at a
dose of between about 20 mg/m² to about 150 mg/m². In an embodiment, cisplatin is
administered once daily. In an embodiment, cisplatin is administered IV at 20 mg/m²
once daily. In an embodiment, cisplatin is administered IV at a dose of between about
75 mg/m² to about 100 mg/m². A treatment cycle can last between one and 6 weeks.
The recommended dosages of therapeutic agents currently used for the treatment,
management, or amelioration of a disease or disorder, or one or more symptoms
thereof, can obtained from any reference in the art. For a more in depth review of
dosage and treatment schedules for various disorders, see, e.g., GOODMAN & GilMAN'S
THE PHARMACOLOGICAL BASIS OF HEAD OF THERAPEUTICS 9™ED. (Hardman, et al., Eds.,
NY:Mc-Graw-Hill (1996)); PHYSICIAN'S DESK REFERENCE 57™ED. (Medical Economics
Co., Inc., Montvale, NJ (2003)).

[0070] As used herein, the terms "treat", "treatment", "inhibiting", and "treating" refer to the reduction or amelioration of the progression, severity and/or duration of a
disease or disorder, delay of the onset of a disease or disorder, or the amelioration of
one or more symptoms (preferably, one or more discernible symptoms) of a disease or
disorder, resulting from the administration of one or more therapies (e.g., one or more
therapeutic agents such as a compound of the invention). The terms "treat",
"treatment" and "treating" also encompass the reduction of the risk of developing a
disease or disorder, and the delay or inhibition of the recurrence of a disease or
disorder. In an embodiment, the disease or disorder being treated is a proliferative
disorder such as cancer. In specific embodiments, the terms "treat", "treatment" and
"treating" refer to the amelioration of at least one measurable physical parameter of a
disease or disorder, such as growth of a tumor, not necessarily discernible by the
patient. In other embodiments the terms "treat", "treatment" and "treating" refer to the
inhibition of the progression of a disease or disorder, e.g., a proliferative disorder, either
physically by the stabilization of a discernible symptom, physiologically by the
stabilization of a physical parameter, or both. In another embodiment, the terms
"treat", "treatment" and "treating" of a proliferative disease or disorder refers to the
reduction or stabilization of tumor size or cancerous cell count, and/or delay of tumor
formation. In another embodiment, the terms "treat", "treating" and "treatment" also
encompass the administration of a compound described herein as a prophylactic
measure to patients with a predisposition (genetic or environmental) to any disease or
disorder described herein.

[0071] As used herein, the terms "therapeutic agent" and "therapeutic agents" refer
to any agent(s) that can be used in the treatment of a disease or disorder, e.g. a
proliferative disorder, or one or more symptoms thereof. In certain embodiments, the
term "therapeutic agent" refers to a compound described herein. In certain other
embodiments, the term "therapeutic agent" does not refer to a compound described herein. Preferably, a therapeutic agent is an agent that is known to be useful for, or has been or is currently being used for the treatment of a disease or disorder, e.g., a proliferative disorder, or one or more symptoms thereof.

[0072] As used herein, the term "synergistic" refers to a combination of a compound described herein and another therapeutic agent, which, when taken together, is more effective than the additive effects of the individual therapies. A synergistic effect of a combination of therapies (e.g., a combination of therapeutic agents) permits the use of lower dosages of one or more of the therapeutic agent(s) and/or less frequent administration of the agent(s) to a subject with a disease or disorder, e.g., a proliferative disorder. The ability to utilize lower the dosage of one or more therapeutic agent and/or to administer the therapeutic agent less frequently reduces the toxicity associated with the administration of the agent to a subject without reducing the efficacy of the therapy in the treatment of a disease or disorder. In addition, a synergistic effect can result in improved efficacy of agents in the prevention, management or treatment of a disease or disorder, e.g., a proliferative disorder. Finally, a synergistic effect of a combination of therapies may avoid or reduce adverse or unwanted side effects associated with the use of either therapeutic agent alone.

[0073] As used herein, the phrase "side effects" encompasses unwanted and adverse effects of a therapeutic agent. Side effects are always unwanted, but unwanted effects are not necessarily adverse. An adverse effect from a therapeutic agent might be harmful or uncomfortable or risky to a subject. Side effects include fever, chills, lethargy, gastrointestinal toxicities (including gastric and intestinal ulcerations and erosions), nausea, vomiting, neurotoxicities, nephrotoxicities, renal toxicities (including such conditions as papillary necrosis and chronic interstitial nephritis), hepatic toxicities (including elevated serum liver enzyme levels), myelotoxicities (including leukopenia, myelosuppression, thrombocytopenia and anemia), dry mouth, metallic taste, prolongation of gestation, weakness, somnolence, pain (including muscle pain, bone pain and headache), hair loss, asthenia, dizziness, extra-pyramidal symptoms, akathisia, cardiovascular disturbances and sexual dysfunction.
As used herein, the term "in combination" refers to the use of more than one therapeutic agent. The use of the term "in combination" does not restrict the order in which the therapeutic agents are administered to a subject with a disease or disorder, e.g., a proliferative disorder. A first therapeutic agent, such as a compound described herein, can be administered prior to (e.g., 5 minutes, 15 minutes, 30 minutes, 45 minutes, 1 hour, 2 hours, 4 hours, 6 hours, 12 hours, 24 hours, 48 hours, 72 hours, 96 hours, 1 week, 2 weeks, 3 weeks, 4 weeks, 5 weeks, 6 weeks, 8 weeks, or 12 weeks before), concomitantly with, or subsequent to (e.g., 5 minutes, 15 minutes, 30 minutes, 45 minutes, 1 hour, 2 hours, 4 hours, 6 hours, 12 hours, 24 hours, 48 hours, 72 hours, 96 hours, 1 week, 2 weeks, 3 weeks, 4 weeks, 5 weeks, 6 weeks, 8 weeks, or 12 weeks after) the administration of a second therapeutic agent, such as an anti-cancer agent, to a subject with a disease or disorder, e.g., a proliferative disorder, such as cancer. In an embodiment, the Hsp90 inhibitor and the platinum-containing anti-cancer agent are dosed on independent schedules. In another embodiment, the Hsp90 inhibitor and the platinum-containing anti-cancer agent are dosed on approximately the same schedule. In another embodiment, the Hsp90 inhibitor and the platinum-containing anticancer agent are dosed concurrently or sequentially on the same day.

As used herein, the terms "therapies" and "therapy" can refer to any protocol(s), method(s), and/or agent(s) that can be used in the prevention, treatment, management, or amelioration of a disease or disorder, e.g., a proliferative disorder, or one or more symptoms thereof.

A used herein, a "protocol" includes dosing schedules and dosing regimens. The protocols herein are methods of use and include therapeutic protocols.

As used herein, a composition that "substantially" comprises a compound means that the composition contains more than about 80% by weight, more preferably more than about 90% by weight, even more preferably more than about 95% by weight, and most preferably more than about 97% by weight of the compound.

As used herein, a "racemic mixture" means about 50% of one enantiomer and about 50% of is corresponding enantiomer of the molecule. The combination encompasses all enantiomerically-pure, enantiomerically-enriched, diastereomerically
pure, diastereomerically enriched, and racemic mixtures of the compounds described herein. Enantiomeric and diastereomeric mixtures can be resolved into their component enantiomers or diastereomers by well-known methods, such as chiral-phase gas chromatography, chiral-phase high performance liquid chromatography, crystallizing the compound as a chiral salt complex, or crystallizing the compound in a chiral solvent. Enantiomers and diastereomers can also be obtained from diastereomerically- or enantiomerically-pure intermediates, reagents, and catalysts by well-known asymmetric synthetic methods.

[0079] The compounds described herein are defined by their chemical structures and/or chemical names. Where a compound is referred to by both a chemical structure and a chemical name, and the chemical structure and the chemical name conflict, the chemical structure is determinative of the compound's identity.

[0080] When administered to a subject (e.g., a non-human animal for veterinary use or for improvement of livestock or to a human for clinical use), the compounds described herein are administered in an isolated form, or as the isolated form in a pharmaceutical composition. As used herein, "isolated" means that the compounds described herein are separated from other components of either: (a) a natural source, such as a plant or cell, preferably bacterial culture, or (b) a synthetic organic chemical reaction mixture. Preferably, the compounds described herein are purified via conventional techniques. As used herein, "purified" means that when isolated, the isolate contains at least 95%, preferably at least 98%, of a compound described herein by weight of the isolate either as a mixture of stereoisomers, or as a diastereomerically or enantiomerically pure isolate.

[0081] Only those choices and combinations of substituents that result in a stable structure are contemplated. Such choices and combinations will be apparent to those of ordinary skill in the art and may be determined without undue experimentation.

[0082] The invention can be understood more fully by reference to the following detailed description and illustrative examples, which are intended to exemplify non-limiting embodiments of the invention.
The methods described herein utilize triazolone compounds listed in Tables 1 or 2, or a compound represented by Formulae (I) or (la):

or a tautomer, or a pharmaceutically acceptable salt thereof, wherein:

Z is OH, SH, or NH₂;

X is CR₄ or N;

Rᵢ is -H, -OH, -SH, an optionally substituted alkyl, an optionally substituted alkenyl, an optionally substituted alkynyl, an optionally substituted cycloalkyl, an optionally substituted cycloalkenyl, an optionally substituted heterocyclyl, an optionally substituted aryl, an optionally substituted heteroaryl, an optionally substituted aralkyl, an optionally substituted heteraralkyl, halo, cyano, nitro, guanidino, a haloalkyl, a heteroalkyl, a haloalkoxy, a heteroalkoxy, -NR io R n, -OR, -C(0)R, -C(0)OR, -C(S)SR, -C(S)SR₂, -C(S)OR, -C(S)NR io R n, -C(NR s)SR, -C(NR s)OR, -OC(0)R, -OC(0)OR, -OC(0)SR, -OC(0)NR io R n, -OC(0)S(0)OR, -OC(0)S(0)NR io R n, -OC(0)S(0)S(0)OR, -OC(0)S(0)S(0)NR io R n, -S(0)OR, -S(0)SR, -S(0)NR io R n, -S(0)S(0)OR, -S(0)S(0)SR, -S(0)S(0)NR io R n, -SP(0)(OR)₂;

R₂ is -H, -OH, -SH, -NR-H, -ORis, -SRis, -NR-H, -ORioRn, -OS(0)OR, -OS(0)SR, -OS(0)S(0)OR, -OS(0)S(0)SR, -NR-H, -ORioRn, -OS(0)OR, -OS(0)SR, -OS(0)S(0)OR, -OS(0)S(0)SR, -NR-H, -ORioRn, -OS(0)OR, -OS(0)SR, -OS(0)S(0)OR, -OS(0)S(0)SR, -NR-H, -ORioRn, -OS(0)OR, -OS(0)SR, -OS(0)S(0)OR, -OS(0)S(0)SR, -NR-H, -ORioRn, -OS(0)OR, -OS(0)SR, -OS(0)S(0)OR, -OS(0)S(0)SR, -NR-H, -ORioRn, -OS(0)OR, -OS(0)SR, -OS(0)S(0)OR, -OS(0)S(0)SR, -NR-H, -ORioRn, -OS(0)OR, -OS(0)SR, -OS(0)S(0)OR, -OS(0)S(0)SR.
-N\textsubscript{R}C(0)R\textsubscript{7}, -OC(0)OR \gamma, -SC(0)OR \gamma, -NR\textsubscript{C}(0)OR \gamma, -OCH \textsubscript{2}C(0)R \gamma, -SCH \textsubscript{2}C(0)R \gamma, -NR\textsubscript{C}H\textsubscript{2}C(0)R \gamma, -OCH\textsubscript{2}C(0)OR\textsubscript{7}, -SCH\textsubscript{2}C(0)OR\textsubscript{7}, -NR\textsubscript{C}(0)NR\textsubscript{IOR\textsubscript{II}}, -SCH\textsubscript{2}(0)NR\textsubscript{IOR\textsubscript{II}}, -NR\textsubscript{C}(0)NR\textsubscript{IOR\textsubscript{II}}, -OC(0)R \gamma, -SC(0)R \gamma, -NR\textsubscript{C}(0)NR\textsubscript{IOR\textsubscript{II}}, -OC(0)NR\textsubscript{IOR\textsubscript{II}}, -SC(0)NR\textsubscript{IOR\textsubscript{II}}, -NR\textsubscript{C}(0)NR\textsubscript{IOR\textsubscript{II}}, -OC(S)R \gamma, -SC(S)R \gamma, -NR\textsubscript{C}(0)NR\textsubscript{IOR\textsubscript{II}}, -OC(S)NR\textsubscript{IOR\textsubscript{II}}, -SC(S)NR\textsubscript{IOR\textsubscript{II}}, -NR\textsubscript{C}(0)NR\textsubscript{IOR\textsubscript{II}}.

\textbf{R\textsubscript{3}} is -H, an optionally substituted alkyl, an optionally substituted alkenyl, an optionally substituted alkynyl, an optionally substituted cycloalkyl, an optionally substituted cycloalkenyl, an optionally substituted heterocycyl, an optionally substituted aryl, an optionally substituted heteroaryl, an optionally substituted aralkyl, an optionally substituted heteraralkyl, hydroxyalkyl, alkoxyalkyl, a haloalkyl, a heteroalkyl, -C(0)R \gamma, -(CH\textsubscript{2})\textsubscript{3}C(0)OR \gamma, -C(0)OR \gamma, -OC(0)R \gamma, -C(0)NR\textsubscript{IOR\textsubscript{II}}, -S(0) \rho R\gamma, -S(0) \rho OR\gamma, or -S(0)pNR\textsubscript{IOR\textsubscript{II}};

\textbf{R\textsubscript{4}} is -H, -OH, an optionally substituted alkyl, an optionally substituted alkenyl, an optionally substituted alkynyl, an optionally substituted cycloalkyl, an optionally substituted cycloalkenyl, an optionally substituted heterocycyl, an optionally substituted aryl, an optionally substituted heteroaryl, an optionally substituted aralkyl, an optionally substituted heteraralkyl, hydroxyalkyl, alkoxyalkyl, haloalkyl, a heteroalkyl, -C(0)R \gamma, -C(0)OR \gamma, -OC(0)R \gamma, -C(0)NR\textsubscript{IOR\textsubscript{II}}, -NR\textsubscript{C}(0)R \gamma, -SR\gamma, -S(0)pR\gamma, -OS(0)pR\gamma, -NR\textsubscript{C}(0)S(0) \rho R\gamma, -S(0) \rho NR\textsubscript{IOR\textsubscript{II}}, or \textbf{R\textsubscript{3}} and \textbf{R\textsubscript{4}} taken together with the carbon atoms to which they are attached form an optionally substituted cycloalkenyl, an optionally substituted aryl, an optionally substituted heterocycyl, or an optionally substituted heteroaryl;

\textbf{R\textsubscript{7}} and \textbf{R\textsubscript{8}}, for each occurrence, are, independently, -H, an optionally substituted alkyl, an optionally substituted alkenyl, an optionally substituted alkynyl, an optionally substituted cycloalkyl, an optionally substituted cycloalkenyl, an optionally substituted heterocycyl, an optionally substituted aryl, an optionally substituted heteroaryl, an optionally substituted aralkyl, an optionally substituted heteraralkyl, hydroxyalkyl, alkoxyalkyl, haloalkyl, a heteroalkyl, -C(0)R \gamma, -C(0)OR \gamma, -OC(0)R \gamma, -C(0)NR\textsubscript{IOR\textsubscript{II}}, -NR\textsubscript{C}(0)R \gamma, -SR\gamma, -S(0)pR\gamma, -OS(0)pR\gamma, -NR\textsubscript{C}(0)S(0) \rho R\gamma, -S(0) \rho NR\textsubscript{IOR\textsubscript{II}}, or \textbf{R\textsubscript{3}} and \textbf{R\textsubscript{4}} taken together with the carbon atoms to which they are attached form an optionally substituted cycloalkenyl, an optionally substituted aryl, an optionally substituted heterocycyl, or an optionally substituted heteroaryl;
alkynyl, an optionally substituted cycloalkyl, an optionally substituted
cycloalkenyl, an optionally substituted heterocyclyl, an optionally substituted
aryl, an optionally substituted heteroaryl, an optionally substituted aralkyl, or
an optionally substituted heteraralkyl;

R\text{io} and R\text{ii}, for each occurrence, are independently -H, an optionally
substituted alkyl, an optionally substituted alkenyl, an optionally substituted
alkynyl, an optionally substituted cycloalkyl, an optionally substituted
cycloalkenyl, an optionally substituted heterocyclyl, an optionally substituted
aryl, an optionally substituted heteroaryl, an optionally substituted aralkyl, or
an optionally substituted heteraralkyl; or R\text{io} and R\text{u}, taken together with the
nitrogen to which they are attached, form an optionally substituted heterocyclyl
or an optionally substituted heteroaryl;

R\text{is}, for each occurrence, is independently a lower alkyl;

p, for each occurrence, is, independently, 1 or 2; and

m, for each occurrence, is independently, 1, 2, 3, or 4.

[0084] In an embodiment, in formula (I) or (la), X is CR\text{iv}. In another embodiment, in
formula (I) or (la), X is N.

[0085] In another embodiment, in formula (I) or (la), R\text{i} may be -H, lower alkyl,
lower alkoxy, lower cycloalkyl, or lower cycloalkoxy.

[0086] In another embodiment, in formula (I) or (la), R\text{i} may be -H, methyl, ethyl,
propyl, isopropyl, cyclopropyl, methoxy, ethoxy, propoxy, or cyclopropoxy.

[0087] In another embodiment, in formula (I) or (la), R\text{m} may be -H, a lower alkyl, a
lower cycloalkyl, -C(0)N(R\text{e})2, or -C(0)OH, wherein R\text{e} is -H or a lower alkyl.

[0088] In another embodiment, in formula (I) or (la), R\text{m} may be -H, methyl, ethyl, n-
propyl, isopropyl, cyclopropyl, n-butyl, sec-butyl, teri-butyl, n-pentyl, n-hexyl,
-C(0)OH, -(CH\text{m})\text{n}C(0)OH, -CH2CH3, -CH2CH2CH3, or -C(0)N(CH\text{m})\text{h}.
In another embodiment, $R_4$ may be H or a lower alkyl. In another embodiment, in formula (I) or (la), $R_4$ may be -H, methyl, ethyl, propyl, isopropyl or cyclopropyl.

In another embodiment, in formula (I) or (la), $R_i$ may be -H, -OH, -SH, -NH$_2$, a lower alkoxy or a lower alkyl amino. In another embodiment, in formula (I) or (la), $R_i$ may be -H, -OH, methoxy or ethoxy.

In another embodiment, in formula (I) or (la), $R_i$ is -OH.

In another embodiment, in formula (I) or (la), $Z$ is -SH.

In another embodiment, in formula (I) or (la), $R_2$ may be -H, -OH, -SH, -NH$_2$, a lower alkoxy or a lower alkyl amino.

In another embodiment, in formula (I) or (la), $R_2$ may be -H, -OH, methoxy, or ethoxy.

In another embodiment, in formula (I) or (la), $R_i$ may be -H, methyl, ethyl, propyl, isopropyl, cyclopropyl, methoxy, ethoxy, propoxy, or cyclopropoxy; $R_3$ may be -H, methyl, ethyl, n-propyl, isopropyl, cyclopropyl, n-butyl, sec-butyl, teri-butyl, n-pentyl, n-hexyl, -(CH$_2$)$_m$C(0)OH, -(CH$_2$)$_m$C(0)OH, -CH$_2$OHCH$_3$, -CH$_2$CH$_2$OHCH$_3$, or -C(0)N(CH$_3$)$_2$; $R_4$ may be -H, methyl, ethyl, propyl, isopropyl or cyclopropyl; $R_2$ may be -H, -OH, -SH, -NH$_2$, a lower alkoxy or a lower alkyl amino; and $Z$ is OH.

In another embodiment, in formula (I) or (la), $R_i$ may be -H, methyl, ethyl, propyl, isopropyl, cyclopropyl, methoxy, ethoxy, propoxy, or cyclopropoxy; $R_3$ may be of -H, methyl, ethyl, n-propyl, isopropyl, cyclopropyl, n-butyl, sec-butyl, ieri-butyl, n-pentyl, n-hexyl, -(CH$_2$)$_m$C(0)OH, -(CH$_2$)$_m$C(0)OH, -CH$_2$OHCH$_3$, -CH$_2$CH$_2$OHCH$_3$, or -C(0)N(CH$_3$)$_2$; $R_4$ may be -H, methyl, ethyl, propyl, isopropyl or cyclopropyl; $R_2$ may be of -H, -OH, -SH, -NH$_2$, a lower alkoxy or a lower alkyl amino; and $Z$ is SH.
In another embodiment, the compound may be:

3-(2,4-dihydroxy-5-ethyl-phenyl)-4-(1,3-dimethyl-indol-5-yl)-5-hydroxy-[1,2,4]triazole,

3-(2,4-dihydroxy-5-isopropyl-phenyl)-4-(1,3-dimethyl-indol-5-yl)-5-hydroxy-[1,2,4]triazole,

3-(2,4-dihydroxy-5-isopropyl-phenyl)-4-(1-methyl-indol-5-yl)-5-hydroxy-[1,2,4]triazole,

3-(2,4-dihydroxy-5-isopropyl-phenyl)-4-(1-isopropyl-indol-4-yl)-5-hydroxy-[1,2,4]triazole,

3-(2,4-dihydroxy-5-isopropyl-phenyl)-4-(1-methyl-indazol-5-yl)-5-mercapto-[1,2,4]triazole,

3-(2,4-dihydroxy-5-isopropyl-phenyl)-4-(1-methyl-indazol-6-yl)-5-mercapto-[1,2,4]triazole,

3-(2,4-dihydroxy-phenyl)-4-(1-ethyl-indol-4-yl)-5-mercapto-[1,2,4]triazole,

3-(2,4-dihydroxy-phenyl)-4-(1-isopropyl-indol-4-yl)-5-mercapto-[1,2,4]triazole,

3-(2,4-dihydroxy-phenyl)-4-(indol-4-yl)-5-mercapto-[1,2,4]triazole,

3-(2,4-dihydroxy-phenyl)-4-(1-methoxyethyl-indol-4-yl)-5-mercapto-[1,2,4]triazole,

3-(2,4-dihydroxy-5-ethyl-phenyl)-4-(1-isopropyl-indol-4-yl)-5-mercapto-[1,2,4]triazole,

3-(2,4-dihydroxyphenyl)-4-(1-dimethylcarbamoyl-indol-4-yl)-5-mercapto-[1,2,4]triazole,

3-(2,4-dihydroxy-5-ethyl-phenyl)-4-(1-propyl-indol-4-yl)-5-mercapto-[1,2,4]triazole,

3-(2,4-dihydroxy-5-ethyl-phenyl)-4-(1,2,3-trimethyl-indol-5-yl)-5-mercapto-[1,2,4]triazole,
3-(2,4-dihydroxy-5-ethyl-phenyl)-4-(2,3-dimethyl-indol-5-yl)-5-mercapto-[1,2,4]triazole,

3-(2,4-dihydroxy-5-ethyl-phenyl)-4-(l-acetyl-2,3-dimethyl-indol-5-yl)-5-mercapto-[1,2,4]triazole,

3-(2,4-dihydroxy-5-ethyl-phenyl)-4-(l-propyl-2,3-dimethyl-indol-5-yl)-5-mercapto-[1,2,4]triazole,

3-(2,4-dihydroxy-5-ethyl-phenyl)-4-(l-n-butyl-indol-4-yl)-5-mercapto-[1,2,4]triazole,

3-(2,4-dihydroxy-5-ethyl-phenyl)-4-(l-n-pentyl-indol-4-yl)-5-mercapto-[1,2,4]triazole,

3-(2,4-dihydroxy-5-ethyl-phenyl)-4-(l-n-hexyl-indol-4-yl)-5-mercapto-[1,2,4]triazole,

3-(2,4-dihydroxy-5-cyclopropyl-phenyl)-4-(l-(l-methylcyclopropyl)-indol-4-yl)-5-mercapto-[1,2,4]triazole,

3-(2,4-dihydroxy-5-cyclopropyl-phenyl)-4-(l,2,3-trimethyl-indol-5-yl)-5-mercapto-[1,2,4]triazole,

3-(2,4-dihydroxy-5-ethyl-phenyl)-4-(l-methyl-3-ethyl-indol-5-yl)-5-mercapto-[1,2,4]triazole,

3-(2,4-dihydroxy-5-ethyl-phenyl)-4-(l,3-dimethyl-indol-5-yl)-5-mercapto-[1,2,4]triazole,

3-(2,4-dihydroxy-5-ethyl-phenyl)-4-(l-methyl-3-isopropyl-indol-5-yl)-5-mercapto-[1,2,4]triazole,

3-(2,4-dihydroxy-5-ethyl-phenyl)-4-(l,2-dimethyl-indol-5-yl)-5-mercapto-[1,2,4]triazole,

3-(2,4-dihydroxy-5-ethyl-phenyl)-4-(N-methyl-indol-5-yl)-5-mercapto-[1,2,4]triazole,

3-(2,4-dihydroxy-5-isopropyl-phenyl)-4-(l,3-dimethyl-indol-5-yl)-5-mercapto-[1,2,4]triazole,
3-(2,4-dihydroxy-5-cyclopropyl-phenyl)-4-(1,3-dimethyl-indol-5-yl)-5-mercapto-
[1,2,4]triazole,

3-(2,4-dihydroxy-5-cyclopropyl-phenyl)-4-(1-methyl-indol-5-yl)-5-mercapto-
[1,2,4]triazole,

3-(2,4-dihydroxy-5-isopropyl-phenyl)-4-(1H-indol-5-yl)-5-mercapto-
[1,2,4]triazole,

3-(2,4-dihydroxy-5-ethyl-phenyl)-4-(1,2-dimethyl-indol-5-yl)-5-mercapto-
[1,2,4]triazole,

3-(2,4-dihydroxy-5-isopropyl-phenyl)-4-(1-ethyl-indol-5-yl)-5-mercapto-
[1,2,4]triazole,
or

3-(2,4-dihydroxy-5-isopropyl-phenyl)-4-(1-propyl-indol-5-yl)-5-mercapto-
[1,2,4]triazole, or a tautomer, or a pharmaceutically acceptable salt thereof.

[0098] In another embodiment, the compound may be:

3-(2,4-dihydroxy-5-ethyl-phenyl)-4-(1-ethyl-benzimidazol-4-yl)-5-mercapto-
[1,2,4]triazole,

3-(2,4-dihydroxy-5-ethyl-phenyl)-4-(1-ethyl-benzimidazol-4-yl)-5-mercapto-
[1,2,4]triazole HCL salt,

3-(2,4-dihydroxy-5-ethyl-phenyl)-4-(2-methyl-3-ethyl-benzimidazol-5-yl)-5-
mercapto-[1,2,4]triazole,

3-(2,4-dihydroxy-5-ethyl-phenyl)-4-(1-ethyl-2-methyl-benzimidazol-5-yl)-5-
mercapto-[1,2,4]triazole, or

3-(2,4-dihydroxy-5-isopropyl-phenyl)-4-(1-methyl-2-trifluoromethyl-
benzimidazol-5-yl)-5-mercapto-[1,2,4]triazole,

or a tautomer, or a pharmaceutically acceptable salt thereof.

[0099] In another embodiment, the compound may be:
5-hydroxy-4-(5-hydroxy-4-(1-methyl-4H-indol-5-yl)-4H-1,2,4-triazol-3-yl)-2-isopropylphenyl dihydrogen phosphate,
sodium 5-hydroxy-4-(5-hydroxy-4-(1-methyl-1H-indol-5-yl)-4H-1,2,4-triazol-3-yl)-2-isopropylphenyl phosphate,
2-(3,4-dimethoxyphenethyl)-5-hydroxy-4-(5-hydroxy-4-(1-methyl-1H-indol-5-yl)-4H-1,2,4-triazol-3-yl)phenyl dihydrogen phosphate,
5-hydroxy-2-isopropyl-4-(5-mercapto-4-(4-methoxybenzyl)-4H-1,2,4-triazol-3-yl)phenyl dihydrogen phosphate,
5-hydroxy-4-(5-hydroxy-4-(4-methoxybenzyl)-4H-1,2,4-triazol-3-yl)-2-isopropylphenyl dihydrogen phosphate, or
4-(4-(1,3-dimethyl-1H-indol-5-yl)-5-hydroxy-4H-1,2,4-triazol-3-yl)-2-ethyl-5-hydroxyphenyl dihydrogen phosphate,
or a tautomer, or a pharmaceutically acceptable salt thereof.

Hsp90 inhibitory compounds, as well as tautomers or pharmaceutically acceptable salts thereof that may be used in the methods described herein are depicted in Tables 1 or 2.

The Hsp90 inhibitory compounds used in the disclosed combination methods can be prepared according to the procedures disclosed in U.S. Patent Publication No. 2006/0,167,070, and \( \text{WO2009/023,211} \).

These triazolone compounds typically can form a tautomeric structure as shown below and as exemplified by the tautomeric structures shown in Tables 1 and 2:

In an embodiment, the present invention provides a pharmaceutical combination for the treatment, prophylaxis, and amelioration of proliferative disorders, such as cancer. In a specific embodiment, the combination comprises one or more Hsp90 inhibitors according to formulae (I) or (la), or a compound in Tables 1 or 2, or a tautomer or a pharmaceutically acceptable salt thereof in addition to a platinum-containing anti-cancer agent.

In an embodiment, the combination includes a pharmaceutical composition or a single unit dosage form containing both an Hsp90 inhibitor and a platinum-containing anti-cancer agent. Pharmaceutical combinations and dosage forms described herein comprise the two active ingredients in relative amounts and formulated in such a way that a given pharmaceutical combination or dosage form can be used to treat proliferative disorders, such as cancer. Preferred pharmaceutical combinations and dosage forms comprise a compound of formulae (I) or (la), or a compound in Tables 1 or 2, or a tautomer or pharmaceutically acceptable salt thereof, in combination with a platinum-containing anticancer agent. In other embodiments, the Hsp90 inhibitor and the platinum-containing anticancer agent may be in individual or separate pharmaceutical compositions, depending on the dosing schedules, preferred routes of administration, and available formulations of the two compounds. Optionally, these embodiments can also contain one or more additional therapeutic agents.

The pharmaceutical combinations described herein are formulated to be compatible with its intended route of administration. Examples of routes of administration include parenteral, e.g., intravenous, intradermal, subcutaneous, oral, intranasal (e.g., inhalation), transdermal (topical), transmucosal, and rectal administration. In a specific embodiment, the combination is formulated in accordance with
with routine procedures as a pharmaceutical composition adapted for intravenous, subcutaneous, intramuscular, oral, intranasal or topical administration to human beings. In an embodiment, the combination is formulated in accordance with routine procedures for subcutaneous administration to human beings.

[00106] In a specific embodiment, the combination therapies described herein comprise one or more compounds and at least one other therapy which has the same mechanism of action as the compounds. In another specific embodiment, the combination therapies described herein comprise one or more compounds described herein and at least one other therapy which has a different mechanism of action than the compounds. In certain embodiments, the combination therapies described herein improve the therapeutic effect of one or more triazolone compounds described herein by functioning together with the platinum-containing anticancer agent to have an additive or synergistic effect. In certain embodiments, the combination therapies described herein reduce the side effects associated with the therapies. In certain embodiments, the combination therapies described herein reduce the effective dosage of one or more of the therapies.

[00107] In a specific embodiment, the combination comprising one or more triazolone compounds described herein is administered to a subject, preferably a human, to prevent, treat, manage, or ameliorate cancer, or one or more symptom thereof. In accordance with the invention, the pharmaceutical combinations described herein may also comprise one or more other agents being used, have been used, or are known to be useful in the treatment or amelioration of cancer, particularly breast cancer, gastric cancer, colorectal cancer, pancreatic cancer, ocular melanoma, prostate cancer, gastrointestinal stromal tumors (GIST), advanced esophagogastric cancer, melanoma, hepatocellular cancer, solid tumor, liver cancer, head and neck cancer, small cell lung cancer, non-small cell lung cancer, bladder cancer, or colon cancer. The pharmaceutical combinations described herein utilize pharmaceutical compositions and dosage forms which comprise one or more excipients. Suitable excipients are well known to those skilled in the art of pharmacy.
[00108] The triazolone compounds described herein can be also formulated into or administered by controlled release means or by delivery devices that are well known to those of ordinary skill in the art. Examples include those described in U.S. Patent Nos.: 3,845,770; 3,916,899; 3,536,809; 3,598,123; and 4,008,719, 5,674,533, 5,059,595, 5,591,767, 5,120,548, 5,073,543, 5,639,476, 5,354,556, and 5,733,566.

[00109] In an embodiment, the present invention also provides a method of treating a proliferative disorder in a subject, comprising administering to the subject an effective amount of the combination of an Hsp90 inhibitor and a platinum-containing anticancer agent as described herein. In an embodiment, the proliferative disorder is cancer. In one aspect of this embodiment, the cancer is breast cancer, gastric cancer, colorectal cancer, pancreatic cancer, ocular melanoma, prostate cancer, gastrointestinal stromal tumors (GIST), advanced esophagogastric cancer, melanoma, hepatocellular cancer, solid tumor, liver cancer, head and neck cancer, small cell lung cancer, non-small cell lung cancer, bladder cancer, testicular tumor, ovarian cancer, lymphoma, leukemia, multiple myeloma, or colon cancer.

[00110] Other anti-proliferative or anti-cancer therapies may be combined with the compounds described herein to treat proliferative diseases and cancer. Other therapies or anti-cancer agents that may be used in combination with the inventive anti-cancer agents described herein include surgery, radiotherapy (including gamma-radiation, neutron beam radiotherapy, electron beam radiotherapy, proton therapy, brachytherapy, and systemic radioactive isotopes), endocrine therapy, biologic response modifiers (including interferons, interleukins, and tumor necrosis factor (TNF)), hyperthermia and cryotherapy, agents to attenuate any adverse effects (e.g., antiemetics), and other approved chemotherapeutic drugs.

[00111] The therapeutic agents of the combination therapies described herein can be administered sequentially or concurrently. In an embodiment, the administration of the Hsp90 inhibitor and the platinum-containing anticancer agent are done concurrently. In another embodiment, the administration of the Hsp90 inhibitor and the platinum-containing anticancer agent are done separately. In another embodiment, the administration of the Hsp90 inhibitor and the platinum-containing anticancer agent
are done sequentially. In an embodiment, the administration of the Hsp90 inhibitor and the platinum-containing anticancer agent are done until the cancer is cured or stabilized or improved.

[00112] In a specific embodiment, the present method includes treating, managing, or ameliorating cancer, or one or more symptoms thereof, comprising administering to a subject in need thereof one or more compounds represented by the structural formulae (I) or (la) or a compound in Table 1 or Table 2, in combination with a platinum-containing anticancer agent such as cisplatin, carboplatin, or oxaliplatin, wherein the cancer is breast cancer, gastric cancer, colorectal cancer, pancreatic cancer, ocular melanoma, prostate cancer, gastrointestinal stromal tumors (GIST), advanced esophagogastric cancer, melanoma, hepatocellular cancer, solid tumor, liver cancer, head and neck cancer, small cell lung cancer, non-small cell lung cancer, bladder cancer, testicular tumor, ovarian cancer, lymphoma, leukemia, multiple myeloma, or colon cancer.

[00113] In another embodiment, the method of treating a subject with cancer includes administering to the subject an effective amount of a triazolone compound of 3-(2,4-dihydroxy-5-isopropyl-phenyl)-4-(1-methyl-indol-5-yl)-5-hydroxy-[1,2,4]triazole, or a tautomer, or a pharmaceutically acceptable salt thereof, in combination with an effective amount of a platinum-containing anticancer agent such as cisplatin, carboplatin, or oxaliplatin. In an embodiment, the cancer has a KRAS mutation. In an embodiment, the cancer has an ALK mutation. In an embodiment, the cancer has a BRAF mutation.

[00114] In another embodiment, the method of treating a subject with cancer includes administering to the subject an effective amount of a triazolone compound of 3-(2,4-dihydroxy-5-isopropyl-phenyl)-4-(1-methyl-indol-5-yl)-5-hydroxy-[1,2,4]triazole, or a tautomer, or a pharmaceutically acceptable salt thereof, in combination with an effective amount of cisplatin. In another embodiment, the method of treating a subject with cancer includes administering to the subject an effective amount of a triazolone compound of 3-(2,4-dihydroxy-5-isopropyl-phenyl)-4-(1-methyl-indol-5-yl)-5-hydroxy-[1,2,4]triazole, or a tautomer, or a pharmaceutically acceptable salt thereof, in
combination with a synergistic amount of cisplatin. In an embodiment, cisplatin is administered IV at a dose of between about 20 mg/m² to about 150 mg/m². In an embodiment, cisplatin is administered at a dose of about 20 mg/m² once daily. In an embodiment, cisplatin is administered IV at about 20 mg/m² once daily for 5 days per cycle. In an embodiment, cisplatin is administered IV at a dose of between about 75 mg/m² to about 100 mg/m². In an embodiment, cisplatin is administered IV at a dose of between about 75 mg/m² to about 100 mg/m² once every 4 weeks per cycle. In an embodiment, cisplatin is administered IV at a dose of about 100 mg/m² once every 4 weeks per cycle. In an embodiment, cisplatin is administered IV at a dose of between about 50 mg/m² to about 70 mg/m² once every 3 or 4 weeks per cycle. In an embodiment, the amount of the Hsp90 inhibitor is from about 2 mg/m² to about 260 mg/m². In an embodiment, the amount of the Hsp90 inhibitor is about 75 mg/m², about 85 mg/m², about 100 mg/m², about 110 mg/m², about 115 mg/m², about 120 mg/m², about 145 mg/m², about 150 mg/m², about 175 mg/m², about 180 mg/m², about 200 mg/m², about 215 mg/m² or about 260 mg/m². In an embodiment, the Hsp90 inhibitor is administered IV once weekly or twice weekly. In any one of the above embodiments, the cancer may have a KRAS mutation. In any one of the above embodiments, the cancer may have an ALK mutation. In any one of the above embodiments, the cancer may have a BRAF mutation.

[00115] In another embodiment, the method of treating a subject with cancer includes administering to the subject an effective amount of a triazolone compound of 5-hydroxy-4-(5-hydroxy-4-(1-methyl-1H-indol-5-yl)-4H-1,2,4-triazol-3-yl)-2-isopropylphenyl dihydrogen phosphate, or a tautomer, or a pharmaceutically acceptable salt thereof, in combination with an effective amount of a platinum-containing anticancer agent such as cisplatin, carboplatin, or oxaliplatin. In an embodiment, the cancer has a KRAS mutation. In an embodiment, the cancer has an ALK mutation. In an embodiment, the cancer has a BRAF mutation.

[00116] In another embodiment, the method of treating a subject with cancer includes administering to the subject an effective amount of a triazolone compound of 5-hydroxy-4-(5-hydroxy-4-(1-methyl-1H-indol-5-yl)-4H-1,2,4-triazol-3-yl)-2-isopropylphenyl dihydrogen phosphate, or a tautomer, or a pharmaceutically
acceptable salt thereof, in combination with an effective amount of cisplatin. In another embodiment, the method of treating a subject with cancer includes administering to the subject an effective amount of a triazolone compound of 5-hydroxy-4-(5-hydroxy-4-(1-methyl-1H-indol-5-yl)-4H-1,2,4-triazol-3-yl)-2-isopropylphenyl dihydrogen phosphate, or a tautomer, or a pharmaceutically acceptable salt thereof, in combination with a synergistic amount of cisplatin. In an embodiment, cisplatin is administered IV at a dose of between about 20 mg/m² to about 150 mg/m². In an embodiment, cisplatin is administered at a dose of about 20 mg/m² once daily. In an embodiment, cisplatin is administered IV at about 20 mg/m² once daily for 5 days per cycle. In an embodiment, cisplatin is administered IV at a dose of between about 75 mg/m² to about 100 mg/m². In an embodiment, cisplatin is administered IV at a dose of between about 75 mg/m² to about 100 mg/m² once every 4 weeks per cycle. In an embodiment, cisplatin is administered IV at a dose of about 100 mg/m² once every 4 weeks per cycle. In an embodiment, cisplatin is administered IV at a dose of between about 50 mg/m² to about 70 mg/m² once every 3 or 4 weeks per cycle. In an embodiment, the amount of the Hsp90 inhibitor is from about 2 mg/m² to about 260 mg/m². In an embodiment, the amount of the Hsp90 inhibitor is about 75 mg/m², about 85 mg/m², about 100 mg/m², about 110 mg/m², about 115 mg/m², about 120 mg/m², about 145 mg/m², about 150 mg/m², about 175 mg/m², about 180 mg/m², about 200 mg/m², about 215 mg/m² or about 260 mg/m². In an embodiment, the Hsp90 inhibitor is administered IV once weekly or twice weekly. In any one of the above embodiments, the cancer may have a KRAS mutation. In any one of the above embodiments, the cancer may have an ALK mutation. In any one of the above embodiments, the cancer may have a BRAF mutation.

[00117] In another embodiment, the method of treating a subject with cancer includes administering to the subject an effective amount of a triazolone compound of 3-(2,4-dihydroxy-5-isopropyl-phenyl)-4-(1-methyl-indol-5-yl)-5-hydroxy-[1,2,4]triazole, or a tautomer, or a pharmaceutically acceptable salt thereof, in combination with a platinum-containing anticancer agent such as cisplatin, carboplatin, or oxaliplatin, wherein the cancer is breast cancer, gastric cancer, colorectal cancer, pancreatic cancer, ocular melanoma, prostate cancer, gastrointestinal stromal tumors (GIST), advanced
esophagogastric cancer, melanoma, hepatocellular cancer, solid tumor, liver cancer, head and neck cancer, small cell lung cancer, non-small cell lung cancer, bladder cancer, testicular tumor, ovarian cancer, lymphoma, leukemia, multiple myeloma, or colon cancer. In an embodiment, the cancer has a KRAS mutation. In an embodiment, the cancer has an ALK mutation. In an embodiment, the cancer has a BRAF mutation.

[00118] In another embodiment, the method of treating a subject with cancer includes administering to the subject an effective amount of a triazolone compound of 5-hydroxy-4-(5-hydroxy-4-(1-methyl-1H-indol-5-yl)-4H-1,2,4-triazol-3-yl)-2-isopropylphenyl dihydrogen phosphate, or a tautomer, or a pharmaceutically acceptable salt thereof, in combination with a platinum-containing anticancer agent such as cisplatin, carboplatin, or oxaliplatin, wherein the cancer is breast cancer, gastric cancer, colorectal cancer, pancreatic cancer, ocular melanoma, prostate cancer, gastrointestinal stromal tumors (GIST), advanced esophagogastric cancer, melanoma, hepatocellular cancer, solid tumor, liver cancer, head and neck cancer, small cell lung cancer, non-small cell lung cancer, bladder cancer, testicular tumor, ovarian cancer, lymphoma, leukemia, multiple myeloma, or cancer. In an embodiment, the cancer has a KRAS mutation. In an embodiment, the cancer has an ALK mutation. In an embodiment, the cancer has a BRAF mutation.

[00119] In yet another embodiment, the method of treating a subject with cancer, wherein the subject is being or has been treated with a chemotherapeutic agent, includes administering to the subject an effective amount of a triazolone compound represented by the structural formulae (I) or (Ia) or a compound in Table 1 or Table 2, in combination with a platinum-containing anticancer agent such as cisplatin, carboplatin, or oxaliplatin. In an embodiment, the cancer has a KRAS mutation. In an embodiment, the cancer has an ALK mutation. In an embodiment, the cancer has a BRAF mutation.

[00120] In an embodiment, the method of treating a subject with cancer, wherein the subject is being or has been treated with a chemotherapeutic agent, includes administering to the subject an effective amount of a triazolone compound represented by the structural formulae (I) or (Ia) or a compound in Table 1 or Table 2, in combination with a platinum-containing anticancer agent such as cisplatin, carboplatin,
or oxaliplatin, wherein the cancer is breast cancer, gastric cancer, colorectal cancer, pancreatic cancer, ocular melanoma, prostate cancer, gastrointestinal stromal tumors (GIST), advanced esophagogastric cancer, melanoma, hepatocellular cancer, solid tumor, liver cancer, head and neck cancer, small cell lung cancer, non-small cell lung cancer, bladder cancer, testicular tumor, ovarian cancer, lymphoma, leukemia, multiple myeloma, or colon cancer. In an embodiment, the cancer has a KRAS mutation. In an embodiment, the cancer has an ALK mutation. In an embodiment, the cancer has a BRAF mutation.

[00121] In another embodiment, the method of treating a subject with cancer, wherein the subject is being or has been treated with a chemotherapeutic agent, includes administering to the subject an effective amount of 3-(2,4-dihydroxy-5-isopropyl-phenyl)-4-(1-methyl-indol-5-yl)-5-hydroxy-[1,2,4]triazole, or a tautomer, or a pharmaceutically acceptable salt thereof, in combination with a platinum-containing anticancer agent such as cisplatin, carboplatin, or oxaliplatin. In an embodiment, the cancer has a KRAS mutation. In an embodiment, the cancer has an ALK mutation. In an embodiment, the cancer has a BRAF mutation.

[00122] In another embodiment, the method of treating a subject with cancer, wherein the subject is being or has been treated with a chemotherapeutic agent, includes administering to the subject an effective amount of 3-(2,4-dihydroxy-5-isopropyl-phenyl)-4-(1-methyl-indol-5-yl)-5-hydroxy-[1,2,4]triazole, or a tautomer, or a pharmaceutically acceptable salt thereof, in combination with cisplatin. In an embodiment, cisplatin is administered IV at a dose of between about 20 mg/m² to about 150 mg/m². In an embodiment, cisplatin is administered at a dose of about 20 mg/m² once daily. In an embodiment, cisplatin is administered IV at about 20 mg/m² once daily for 5 days per cycle. In an embodiment, cisplatin is administered IV at a dose of between about 75 mg/m² to about 100 mg/m². In an embodiment, cisplatin is administered IV at a dose of between about 75 mg/m² to about 100 mg/m² once every 4 weeks per cycle. In an embodiment, cisplatin is administered IV at a dose of about 100 mg/m² once every 4 weeks per cycle. In an embodiment, cisplatin is administered IV at a dose of between about 50 mg/m² to about 70 mg/m² once every 3 or 4 weeks per cycle. In an embodiment, the amount of the Hsp90 inhibitor is from about 2 mg/m² to
about 260 mg/m². In an embodiment, the amount of the Hsp90 inhibitor is about 75 mg/m², about 85 mg/m², about 100 mg/m², about 110 mg/m², about 115 mg/m², about 120 mg/m², about 145 mg/m², about 150 mg/m², about 175 mg/m², about 180 mg/m², about 200 mg/m², about 215 mg/m² or about 260 mg/m². In an embodiment, the Hsp90 inhibitor is administered IV once weekly or twice weekly. In any one of the above embodiments, the cancer may have a KRAS mutation. In any one of the above embodiments, the cancer may have an ALK mutation. In any one of the above embodiments, the cancer may have a BRAF mutation.

[00123] In another embodiment, the method of treating a subject with cancer, wherein the subject is being or has been treated with a chemotherapeutic agent, includes administering to the subject an effective amount of 5-hydroxy-4-(5-hydroxy-4-(1-methyl-1H-indol-5-yl)-4H-1,2,4-triazol-3-yl)-2-isopropylphenyl dihydrogen phosphate, or a tautomer, or a pharmaceutically acceptable salt thereof, in combination with a platinum-containing anticancer agent such as cisplatin, carboplatin, or oxaliplatin. In an embodiment, the cancer has a KRAS mutation. In an embodiment, the cancer has an ALK mutation. In an embodiment, the cancer has a BRAF mutation.

[00124] In another embodiment, the method of treating a subject with cancer, wherein the subject is being or has been treated with a chemotherapeutic agent, includes administering to the subject an effective amount of 5-hydroxy-4-(5-hydroxy-4-(1-methyl-1H-indol-5-yl)-4H-1,2,4-triazol-3-yl)-2-isopropylphenyl dihydrogen phosphate, or a tautomer, or a pharmaceutically acceptable salt thereof, in combination with cisplatin. In an embodiment, cisplatin is administered IV at a dose of between about 20 mg/m² to about 150 mg/m². In an embodiment, cisplatin is administered at a dose of about 20 mg/m² once daily. In an embodiment, cisplatin is administered IV at about 20 mg/m² once daily for 5 days per cycle. In an embodiment, cisplatin is administered IV at a dose of between about 75 mg/m² to about 100 mg/m². In an embodiment, cisplatin is administered IV at a dose of between about 75 mg/m² to about 100 mg/m² once every 4 weeks per cycle. In an embodiment, cisplatin is administered IV at a dose of about 100 mg/m² once every 4 weeks per cycle. In an embodiment, cisplatin is administered IV at a dose of between about 50 mg/m² to about 70 mg/m² once every 3 or 4 weeks per cycle. In an embodiment, the amount of the Hsp90
inhibitor is from about 2 mg/m² to about 260 mg/m². In an embodiment, the amount of
the Hsp90 inhibitor is about 75 mg/m², about 85 mg/m², about 100 mg/m², about 110
mg/m², about 115 mg/m², about 120 mg/m², about 145 mg/m², about 150 mg/m², about
175 mg/m², about 180 mg/m², about 200 mg/m², about 215 mg/m² or about 260 mg/m².
In an embodiment, the Hsp90 inhibitor is administered IV once weekly or twice
weekly. In any one of the above embodiments, the cancer may have a KRAS mutation.
In any one of the above embodiments, the cancer may have an ALK mutation. In any
one of the above embodiments, the cancer may have a BRAF mutation.

[00125] In an embodiment, the method of treating a subject with cancer, wherein the
subject is being or has been treated with a chemotherapeutic agent, includes
administering to the subject an effective amount of a triazolone compound of 3-(2,4-
dihydroxy-5-isopropyl-phenyl)-4-(l-methyl-indol-5-yl)-5-hydroxy-1H,2,4-triazole, or a
tautomer, or a pharmaceutically acceptable salt thereof, in combination with a
platinum-containing anticancer agent such as cisplatin, carboplatin, or oxaliplatin,
wherein the cancer is breast cancer, gastric cancer, colorectal cancer, pancreatic cancer,
ocular melanoma, prostate cancer, gastrointestinal stromal tumors (GIST), advanced
esophagogastric cancer, melanoma, hepatocellular cancer, solid tumor, liver cancer,
head and neck cancer, small cell lung cancer, non-small cell lung cancer, bladder
cancer, testicular tumor, ovarian cancer, lymphoma, leukemia, multiple myeloma, or
colon cancer. In an embodiment, the cancer has a KRAS mutation. In an embodiment,
the cancer has an ALK mutation. In an embodiment, the cancer has a BRAF mutation.

[00126] In an embodiment, the method of treating a subject with cancer, wherein the
subject is being or has been treated with a chemotherapeutic agent, includes
administering to the subject an effective amount of a triazolone compound of 5-
hydroxy-4-(5-hydroxy-4-(l-methyl-lH-indol-5-yl)-4H-1,2,4-triazol-3-yl)-2-
isopropylphenyl dihydrogen phosphate, or a tautomer, or a pharmaceutically
acceptable salt thereof, in combination with a platinum-containing anticancer agent
such as cisplatin, carboplatin, or oxaliplatin, wherein the cancer is breast cancer, gastric
cancer, colorectal cancer, pancreatic cancer, ocular melanoma, prostate cancer,
gastrointestinal stromal tumors (GIST), advanced esophagogastric cancer, melanoma,
hepatocellular cancer, solid tumor, liver cancer, head and neck cancer, small cell lung
cancer, non-small cell lung cancer, bladder cancer, testicular tumor, ovarian cancer, lymphoma, leukemia, multiple myeloma, or colon cancer. In an embodiment, the cancer has a KRAS mutation. In an embodiment, the cancer has an ALK mutation. In an embodiment, the cancer has a BRAF mutation.

[00127] In an embodiment, the method of treating a subject with cancer, wherein the subject has proven refractory to other therapies but is no longer on these therapies, includes administering to the subject an effective amount of a triazolone compound represented by the structural formulae (I) or (la) or a compound in Table 1 or Table 2, in combination with a platinum-containing anticancer agent such as cisplatin, carboplatin, or oxaliplatin, wherein the cancer is breast cancer, gastric cancer, colorectal cancer, pancreatic cancer, ocular melanoma, prostate cancer, gastrointestinal stromal tumors (GIST), advanced esophagogastric cancer, melanoma, hepatocellular cancer, solid tumor, liver cancer, head and neck cancer, small cell lung cancer, non-small cell lung cancer, bladder cancer, testicular tumor, ovarian cancer, lymphoma, leukemia, multiple myeloma, or colon cancer. In an embodiment, the cancer has a KRAS mutation. In an embodiment, the cancer has an ALK mutation. In an embodiment, the cancer has a BRAF mutation.

[00128] In another embodiment, the method of treating a subject with cancer, wherein the subject has proven refractory to other therapies but is no longer on these therapies, includes administering to the subject an effective amount of 3-(2,4-dihydroxy-5-isopropyl-phenyl)-4-(1-methyl-indol-5-yl)-5-hydroxy-[1,2,4]triazole, or a tautomer, or a pharmaceutically acceptable salt thereof, in combination with a platinum-containing anticancer agent such as cisplatin, carboplatin, or oxaliplatin. In an embodiment, the cancer has a KRAS mutation. In an embodiment, the cancer has an ALK mutation. In an embodiment, the cancer has a BRAF mutation.

[00129] In another embodiment, the method of treating a subject with cancer, wherein the subject has proven refractory to other therapies but is no longer on these therapies, includes administering to the subject an effective amount of 3-(2,4-dihydroxy-5-isopropyl-phenyl)-4-(1-methyl-indol-5-yl)-5-hydroxy-[1,2,4]triazole, or a tautomer, or a pharmaceutically acceptable salt thereof, in combination with cisplatin.
In an embodiment, cisplatin is administered IV at a dose of between about 20 mg/m² to about 150 mg/m². In an embodiment, cisplatin is administered at a dose of about 20 mg/m² once daily. In an embodiment, cisplatin is administered IV at about 20 mg/m² once daily for 5 days per cycle. In an embodiment, cisplatin is administered IV at a dose from about 75 mg/m² to about 100 mg/m². In an embodiment, cisplatin is administered IV at a dose from about 75 mg/m² to about 100 mg/m² once every 4 weeks per cycle. In an embodiment, cisplatin is administered IV at a dose of about 100 mg/m² once every 4 weeks per cycle. In an embodiment, cisplatin is administered IV at a dose of between about 50 mg/m² to about 70 mg/m² once every 3 or 4 weeks per cycle. In an embodiment, the amount of the Hsp90 inhibitor is from about 2 mg/m² to about 260 mg/m². In an embodiment, the amount of the Hsp90 inhibitor is about 75 mg/m², about 85 mg/m², about 100 mg/m², about 110 mg/m², about 115 mg/m², about 120 mg/m², about 145 mg/m², about 150 mg/m², about 175 mg/m², about 180 mg/m², about 200 mg/m², about 215 mg/m² or about 260 mg/m². In an embodiment, the Hsp90 inhibitor is administered IV once weekly or twice weekly. In any one of the above embodiments, the cancer may have a KRAS mutation. In any one of the above embodiments, the cancer may have an ALK mutation. In any one of the above embodiments, the cancer may have a BRAF mutation.

[00130] In another embodiment, the method of treating a subject with cancer, wherein the subject has proven refractory to other therapies but is no longer on these therapies, includes administering to the subject an effective amount of 5-hydroxy-4-(5-hydroxy-4-(1-methyl-1H-indol-5-yl)-4H-1,2,4-triazol-3-yl)-2-isopropylphenyl dihydrogen phosphate, or a tautomer, or a pharmaceutically acceptable salt thereof, in combination with a platinum-containing anticancer agent such as cisplatin, carboplatin, or oxaliplatin. In an embodiment, the cancer has a KRAS mutation. In an embodiment, the cancer has an ALK mutation. In an embodiment, the cancer has a BRAF mutation.

[00131] In another embodiment, the method of treating a subject with cancer, wherein the subject has proven refractory to other therapies but is no longer on these therapies, includes administering to the subject an effective amount of 5-hydroxy-4-(5-hydroxy-4-(1-methyl-1H-indol-5-yl)-4H-1,2,4-triazol-3-yl)-2-isopropylphenyl dihydrogen phosphate, or a tautomer, or a pharmaceutically acceptable salt thereof, in
combination with cisplatin. In an embodiment, cisplatin is administered IV at a dose of between about 20 mg/m^2 to about 150 mg/m^2. In an embodiment, cisplatin is administered at a dose of about 20 mg/m^2 once daily. In an embodiment, cisplatin is administered IV at about 20 mg/m^2 once daily for 5 days per cycle. In an embodiment, cisplatin is administered IV at a dose from about 75 mg/m^2 to about 100 mg/m^2 once every 4 weeks per cycle. In an embodiment, cisplatin is administered IV at a dose of about 100 mg/m^2 once every 4 weeks per cycle. In an embodiment, cisplatin is administered IV at a dose from about 75 mg/m^2 to about 100 mg/m^2 once every 3 or 4 weeks per cycle. In an embodiment, the amount of the Hsp90 inhibitor is from about 2 mg/m^2 to about 260 mg/m^2. In an embodiment, the amount of the Hsp90 inhibitor is about 75 mg/m^2, about 85 mg/m^2, about 100 mg/m^2, about 110 mg/m^2, about 115 mg/m^2, about 120 mg/m^2, about 145 mg/m^2, about 150 mg/m^2, about 175 mg/m^2, about 180 mg/m^2, about 200 mg/m^2, about 215 mg/m^2 or about 260 mg/m^2. In an embodiment, the Hsp90 inhibitor is administered IV once weekly or twice weekly. In any one of the above embodiments, the cancer may have a KRAS mutation. In any one of the above embodiments, the cancer may have an ALK mutation. In any one of the above embodiments, the cancer may have a BRAF mutation.

[00132] In an embodiment, the method of treating a subject with cancer, wherein the subject has proven refractory to other therapies but is no longer on these therapies, includes administering to the subject an effective amount of a triazolone compound of 3-(2,4-dihydroxy-5-isopropyl-phenyl)-4-(1-methyl-indol-5-yl)-5-hydroxy-[1,2,4]triazole, or a tautomer, or a pharmaceutically acceptable salt thereof, in combination with a platinum-containing anticancer agent such as cisplatin, carboplatin, or oxaliplatin, wherein the cancer is breast cancer, gastric cancer, colorectal cancer, pancreatic cancer, ocular melanoma, prostate cancer, gastrointestinal stromal tumors (GIST), advanced esophagogastric cancer, melanoma, hepatocellular cancer, solid tumor, liver cancer, head and neck cancer, small cell lung cancer, non-small cell lung cancer, bladder cancer, testicular tumor, ovarian cancer, lymphoma, leukemia, multiple myeloma, or colon cancer. In an embodiment, the cancer has a KRAS mutation. In an embodiment, the cancer has an ALK mutation. In an embodiment, the cancer has a BRAF mutation.
In an embodiment, the method of treating a subject with cancer, wherein the subject has proven refractory to other therapies but is no longer on these therapies, includes administering to the subject an effective amount of a triazolone compound of 5-hydroxy-4-(5-hydroxy-4-(1-methyl-indol-5-yl)-4H-1,2,4-triazol-3-yl)-2-isopropylphenyl dihydrogen phosphate, or a tautomer, or a pharmaceutically acceptable salt thereof, in combination with a platinum-containing anticancer agent such as cisplatin, carboplatin, or oxaliplatin, wherein the cancer is breast cancer, gastric cancer, colorectal cancer, pancreatic cancer, ocular melanoma, prostate cancer, gastrointestinal stromal tumors (GIST), advanced esophagogastric cancer, melanoma, hepatocellular cancer, solid tumor, liver cancer, head and neck cancer, small cell lung cancer, non-small cell lung cancer, bladder cancer, testicular tumor, ovarian cancer, lymphoma, leukemia, multiple myeloma, or colon cancer. In an embodiment, the cancer has a KRAS mutation. In an embodiment, the cancer has an ALK mutation. In an embodiment, the cancer has a BRAF mutation.

In an embodiment, the method includes inhibiting the growth of a cancer or tumor cell comprising the steps of: (a) contacting the cell with an effective amount of a compound of formulae (I) or (Ia) or a compound in Table (1) or Table (2), or tautomer or a pharmaceutically acceptable salt thereof; and (b) exposing the cell to an effective amount of a platinum-containing anticancer agent such as cisplatin, carboplatin, or oxaliplatin.

In an embodiment, the method includes inhibiting the growth of a cancer or tumor cell comprising the steps of: (a) contacting the cell with an effective amount of a compound of -(2,4-dihydroxy-5-isopropyl-phenyl)-4-(1-methyl-indol-5-yl)-5-hydroxy-[1,2,4]triazole, or a tautomer, or a pharmaceutically acceptable salt thereof; and (b) exposing the cell to an effective amount of a platinum-containing anticancer agent such as cisplatin, carboplatin, or oxaliplatin. In an embodiment, the cancer has a KRAS mutation. In an embodiment, the cancer has an ALK mutation. In an embodiment, the cancer has a BRAF mutation.

In another embodiment, the invention also provides a method of inhibiting the growth of a cancer or tumor cell, comprising the steps of: (a) contacting the cell with
an effective amount of a compound of -(2,4-dihydroxy-5-isopropyl-phenyl)-4-(l-
methyl-indol-5-yl)-5-hydroxy-[l,2,4]triazole, or a tautomer, or a pharmaceutically
acceptable salt thereof; and (b) exposing the cell to an effective amount of cisplatin. In
an embodiment, the cancer has a KRAS mutation. In an embodiment, the cancer has an
ALK mutation. In an embodiment, the cancer has a BRAF mutation.

[00137] In another embodiment, the invention also provides a method of inhibiting
the growth of a cancer or tumor cell, comprising the steps of: (a) contacting the cell with
an effective amount of a compound of 5-hydroxy-4-(5-hydroxy-4-(l-methyl-lH-indol-5-
yl)-4H-1,2,4-triazol-3-yl)-2-isopropylphenyl dihydrogen phosphate, or tautomer or a
pharmaceutically acceptable salt thereof; and (b) exposing the cell to an effective
amount of a platinum-containing anticancer agent such as cisplatin, carboplatin, or
oxaliplatin. In an embodiment, the cancer has a KRAS mutation. In an embodiment,
the cancer has an ALK mutation. In an embodiment, the cancer has a BRAF mutation.

[00138] In another embodiment, the invention also provides a method of inhibiting
the growth of a cancer or tumor cell, comprising the steps of: (a) contacting the cell with
an effective amount of a compound of 5-hydroxy-4-(5-hydroxy-4-(l-methyl-lH-indol-5-
yl)-4H-1,2,4-triazol-3-yl)-2-isopropylphenyl dihydrogen phosphate, or tautomer or a
pharmaceutically acceptable salt thereof; and (b) exposing the cell to an effective
amount of cisplatin. In an embodiment, the cancer has a KRAS mutation. In an
embodiment, the cancer has an ALK mutation. In an embodiment, the cancer has a
BRAF mutation.

[00139] In general, the recommended daily dose range of a triazolone compound for
the conditions described herein lie within the range of from about 0.01 mg to about
1000 mg per day, given as a single once-a-day dose preferably as divided doses
throughout a day. In an embodiment, the daily dose is administered twice daily in
equally divided doses. Specifically, a daily dose range should be from about 5 mg to
about 500 mg per day, more specifically, between about 10 mg and about 200 mg per
day. In managing the patient, the therapy should be initiated at a lower dose, perhaps
about 1 mg to about 25 mg, and increased if necessary up to about 200 mg to about 1000
mg per day as either a single dose or divided doses, depending on the patient's global
response. It may be necessary to use dosages of the active ingredient outside the ranges disclosed herein in some cases, as will be apparent to those of ordinary skill in the art. Furthermore, it is noted that the clinician or treating physician will know how and when to interrupt, adjust, or terminate therapy in conjunction with individual patient response.

[00140] Different therapeutically effective amounts may be applicable for different cancers, as will be readily known by those of ordinary skill in the art. Similarly, amounts sufficient to prevent, manage, treat or ameliorate such cancers, but insufficient to cause, or sufficient to reduce, adverse effects associated with the triazolone compounds described herein are also encompassed by the above described dosage amounts and dose frequency schedules. Further, when a patient is administered multiple dosages of a triazolone compound described herein, not all of the dosages need be the same. For example, the dosage administered to the patient may be increased to improve the prophylactic or therapeutic effect of the compound or it may be decreased to reduce one or more side effects that a particular patient is experiencing.

[00141] In a specific embodiment, the dosage of the composition comprising a triazolone compound described herein administered to prevent, treat, manage, or ameliorate cancer, or one or more symptoms thereof in a patient is 150 μg/kg, preferably 250 μg/kg, 500 μg/kg, 1 mg/kg, 5 mg/kg, 10 mg/kg, 25 mg/kg, 50 mg/kg, 75 mg/kg, 100 mg/kg, 125 mg/kg, 150 mg/kg, or 200 mg/kg or more of a patient’s body weight. In another embodiment, the dosage of the composition comprising a compound described herein administered to prevent, treat, manage, or ameliorate cancer, or one or more symptoms thereof in a patient is a unit dose of 0.1 mg to 20 mg, 0.1 mg to 15 mg, 0.1 mg to 12 mg, 0.1 mg to 10 mg, 0.1 mg to 8 mg, 0.1 mg to 7 mg, 0.1 mg to 5 mg, 0.1 to 2.5 mg, 0.25 mg to 20 mg, 0.25 to 15 mg, 0.25 to 12 mg, 0.25 to 10 mg, 0.25 to 8 mg, 0.25 mg to 7 mg, 0.25 mg to 5 mg, 0.5 mg to 2.5 mg, 1 mg to 20 mg, 1 mg to 15 mg, 1 mg to 12 mg, 1 mg to 10 mg, 1 mg to 8 mg, 1 mg to 7 mg, 1 mg to 5 mg, or 1 mg to 2.5 mg. The unit dose can be administered 1, 2, 3, 4 or more times daily, or once every 2, 3, 4, 5, 6 or 7 days, or once weekly, once every two weeks, once every three weeks or once monthly.
In certain embodiments, when the triazolone compounds described herein are administered in combination with a platinum-containing anticancer agent, the therapies are administered less than 5 minutes apart, less than 30 minutes apart, 1 hour apart, at about 1 hour apart, at about 1 to about 2 hours apart, at about 2 hours to about 3 hours apart, at about 3 hours to about 4 hours apart, at about 4 hours to about 5 hours apart, at about 5 hours to about 6 hours apart, at about 6 hours to about 7 hours apart, at about 7 hours to about 8 hours apart, at about 8 hours to about 9 hours apart, at about 9 hours to about 10 hours apart, at about 10 hours to about 11 hours apart, at about 11 hours to about 12 hours apart, at about 12 hours to about 13 hours apart, at about 12 hours to 18 hours apart, 18 hours to 24 hours apart, 24 hours to 36 hours apart, 36 hours to 48 hours apart, 48 hours to 52 hours apart, 52 hours to 60 hours apart, 60 hours to 72 hours apart, 72 hours to 84 hours apart, 84 hours to 96 hours apart, or 96 hours to 120 hours part. In one embodiment, two or more therapies are administered within the same patient visit.

In certain embodiments, one or more compounds described herein and one or more other the therapies (e.g., therapeutic agents) are cyclically administered. Cycling therapy involves the administration of a first therapy (e.g., a first prophylactic or therapeutic agents) for a period of time, followed by the administration of a second therapy (e.g., a second prophylactic or therapeutic agents) for a period of time, followed by the administration of a third therapy (e.g., a third prophylactic or therapeutic agents) for a period of time and so forth, and repeating this sequential administration, i.e., the cycle in order to reduce the development of resistance to one of the agents, to avoid or reduce the side effects of one of the agents, and/or to improve the efficacy of the treatment.

In certain embodiments, administration of the same compound described herein may be repeated and the administrations may be separated by at least 1 day, 2 days, 3 days, 5 days, 10 days, 15 days, 30 days, 45 days, 2 months, 75 days, 3 months, or 6 months. In other embodiments, administration of the same prophylactic or therapeutic agent may be repeated and the administration may be separated by at least at least 1 day, 2 days, 3 days, 5 days, 10 days, 15 days, 30 days, 45 days, 2 months, 75 days, 3 months, or 6 months.
In a specific embodiment, a method of preventing, treating, managing, or ameliorating a proliferative disorders, such as cancer, or one or more symptoms thereof, the methods comprising administering to a subject in need thereof a dose of at least 150 µg/kg, preferably at least 250 µg/kg, at least 500 µg/kg, at least 1 mg/kg, at least 5 mg/kg, at least 10 mg/kg, at least 25 mg/kg, at least 50 mg/kg, at least 75 mg/kg, at least 100 mg/kg, at least 125 mg/kg, at least 150 mg/kg, or at least 200 mg/kg or more of one or more compounds described herein once every day, preferably, once every 2 days, once every 3 days, once every 4 days, once every 5 days, once every 6 days, once every 7 days, once every 8 days, once every 10 days, once every two weeks, once every three weeks, or once a month. Alternatively, the dose can be divided into portions (typically equal portions) administered two, three, four or more times a day.

In an embodiment, the invention also provides the use of a compound of formulae (I) or (Ia), or a compound in Tables 1 or 2, or a pharmaceutically acceptable salt thereof for the manufacture of a medicament for the treatment of a subject with cancer. In an embodiment, the invention further provides the use of a compound of formulae (I) or (Ia), or a compound in Tables 1 or 2, or a pharmaceutically acceptable salt thereof for the manufacture of a medicament for the treatment of a subject with a cancer, in combination with a platinum-containing anticancer agent such as cisplatin, carboplatin, or oxaliplatin. In an embodiment, the invention further provides the use of a compound of 3-(2,4-dihydroxy-5-isopropyl-phenyl)-4-(1-methyl-indol-5-y1)-5-hydroxy-[1,2,4]triazole, or a tautomer, or a pharmaceutically acceptable salt thereof, for the manufacture of a medicament for the treatment of a subject with a cancer, in combination with a platinum-containing anticancer agent such as cisplatin, carboplatin, or oxaliplatin. In an embodiment, the invention further provides the use of a compound of 5-hydroxy-4-(5-hydroxy-4-(1-methyl-indol-5-y1)-4H-1,2,4-triazol-3-yl)-2-isopropylphenyl dihydrogen phosphate, or a tautomer, or a pharmaceutically acceptable salt thereof, for the manufacture of a medicament for the treatment of a subject with a cancer, in combination with a platinum-containing anticancer agent such as cisplatin, carboplatin, or oxaliplatin. In an embodiment, the invention further provides the use of the compound of 3-(2,4-dihydroxy-5-isopropyl-phenyl)-4-(1-methyl-indol-5-y1)-5-hydroxy-[1,2,4]triazole, or a tautomer, or a pharmaceutically
acceptable salt thereof, for the manufacture of a medicament for the treatment of a subject with a cancer, in combination with cisplatin. In an embodiment, the invention further provides the synergistic use of the compound of 3-(2,4-dihydroxy-5-isopropyl-phenyl)-4-(l-methyl-indol-5-yl)-5-hydroxy-[1,2,4]triazole, or a tautomer, or a pharmaceutically acceptable salt thereof, for the manufacture of a medicament for the treatment of a subject with a cancer, in combination with cisplatin.

[00147] In an embodiment, the invention also provides a compound of formulae (I) or (la) or a pharmaceutically acceptable salt thereof for use in treating a subject with a cancer. In an embodiment, the invention also provides a compound of formulae (I) or (la) or a pharmaceutically acceptable salt thereof for use in treating a subject with cancer in combination with a platinum-containing anticancer agent such as cisplatin, carboplatin, or oxaliplatin. In an embodiment, the invention also provides a compound of 3-(2,4-dihydroxy-5-isopropyl-phenyl)-4-(l-methyl-indol-5-yl)-5-hydroxy-[1,2,4]triazole, or a tautomer, or a pharmaceutically acceptable salt thereof, for use in treating a subject with cancer in combination with a platinum-containing anticancer agent such as cisplatin, carboplatin, or oxaliplatin. In an embodiment, the invention also provides a compound of 3-(2,4-dihydroxy-5-isopropyl-phenyl)-4-(l-methyl-indol-5-yl)-5-hydroxy-[1,2,4]triazole, or a tautomer, or a pharmaceutically acceptable salt thereof, for use in treating a subject with cancer in combination with a platinum-containing anticancer agent such as cisplatin, carboplatin, or oxaliplatin. In an embodiment, the invention also provides a compound of 3-(2,4-dihydroxy-5-isopropyl-phenyl)-4-(l-methyl-indol-5-yl)-5-hydroxy-[1,2,4]triazole, or a tautomer, or a pharmaceutically acceptable salt thereof, for use in treating a subject with cancer in combination with cisplatin.

In an embodiment, the invention also provides a compound of 3-(2,4-dihydroxy-5-isopropyl-phenyl)-4-(l-methyl-indol-5-yl)-5-hydroxy-[1,2,4]triazole, or a tautomer, or a pharmaceutically acceptable salt thereof, for synergistic use in treating a subject with cancer in combination with cisplatin.
EXAMPLES

[00148] In Vitro combination analysis of ganetespib with chemotherapy in colorectal cancer cells

A. Materials and Methods

Cell Lines

[00149] Human HCT-116 colorectal cancer cells (CRC) and MDA-MB-231 breast cancer cells were purchased from the American Type Culture Collection (Manassas, VA) and grown following ATCC recommendations, in the presence of fetal bovine serum (10%), 2 mM L-glutamine and antibiotics (100 IU/ml penicillin and 100 µg/ml streptomycin, Sigma). Cells were maintained at 37°C, 5% CO₂ atmosphere.

Cell Viability Assays

[00150] Cell viability was measured using the alamarBlue assay (Invitrogen). In brief, cells were plated in 96-well plates in triplicate at 5K cells per well and incubated at 37°C, 5% CO₂ atmosphere for 24 hr prior to the addition of drug or vehicle (0.3% DMSO) to the culture medium. After 72 hr, 10 µl/well alamarBlue was added to the wells and incubated for an additional 3 hr at 37°C, 5% CO₂ atmosphere. Fluorescence (560EX/590EM nM) was measured with a SpectraMax microplate reader (Molecular Devices) and the resulting data were used to calculate cell viability, normalized to vehicle control.

Mouse studies

[00151] Six to seven week old, female CB17/lcr-Prkdc<sup>scid</sup>/Crl (SCID) mice were obtained from Charles River Laboratories (Wilmington, Massachusetts, USA). Animals were housed 4-5/cage in micro-isolators, with a 12hr/12hr light/dark cycle, acclimated for at least 1 week prior to use and fed normal laboratory chow ad libitum. Animals were between seven to eight weeks of age at implantation. To implant HCT-116 or MDA-MB-231 tumor cells into SCID mice, cells were harvested by trypsinization, washed in PBS and re-suspended at a concentration of 5 x 10<sup>7</sup> cells/mL in 50% non-supplemented medium and 50% Matrigel Basement Membrane Matrix (BD Biosciences; Bedford, Massachusetts, USA). Using a 27 gauge needle and 1 cc syringe, 5 x 10<sup>6</sup> cells
in 0.1 mL of a cell suspension were injected subcutaneously into the flanks of SCID mice.

**[00152]** Tumors were then permitted to develop *in vivo* until the majority reached 95-195 mm³ in tumor volume. Animals with oblong, very small or large tumors were discarded and only animals carrying tumors that displayed consistent growth rates were selected for studies. Tumor volumes (V) were calculated by caliper measurement of the width (W), length (L) and thickness (T) of tumors using the following formula: 

$$ V = 0.5236 \times (L \times W \times T) $$

Animals were randomized into treatment groups so that the average tumor volumes of each group were similar at the start of dosing.

**[00153]** Ganetespib was prepared by dissolving the appropriate amounts of the compound in dimethyl sulfoxide (DMSO) by sonication in an ultrasonic water bath. Stock solutions were prepared weekly, stored at -20°C and diluted fresh each day for dosing. A solution of 20% Cremophor RH40 (polyoxyl 40 hydrogenated castor oil; BASF Corp., Aktiengesellschaft, Ludwigshafen, Germany) in 5% dextrose in water (Abbott Laboratories, North Chicago, Illinois, USA) was also prepared by first heating 100% Cremophor RH40 at 50-60°C until liquefied and clear, diluting 1:5 with 100% D5W, reheating again until clear and then mixing well. This solution can be stored at room temperature for up to 3 months prior to use. To prepare DRD formulations for daily dosing, DMSO stock solutions were diluted 1:10 with 20% Cremophor RH40. The final DRD formulation for dosing contained 10% DMSO, 18% Cremophor RH40, 3.6% dextrose, 68.4% water and the appropriate amount of test article. Animals were intravenously (i.v.) injected with this formulation at 10 mL per kg body weight 1 day each week. Cisplatin was prepared fresh in saline and given intravenously 6 hours after ganetespib injection, once per week.

B. Combination Studies with ganetespib and cisplatin

**[00154]** The half maximal inhibitory concentration (IC₅₀) for ganetespib (synthesized at Synta Pharmaceuticals) and cisplatin (purchased from Sigma) were first determined using a 1.5-fold serial dilution series of compound. After HCT-116 cells were exposed to drug for 72 hr, cell viability was measured and results were fit to a four parameter
logistic model (XLFit, ID Business Solutions) shown in Figures 1 and 2. The IC₅₀ for ganetespib was calculated at approximately 32 nM, and 5.7 µM for cisplatin.

[00155] Combinations between ganetespib and cisplatin were then performed in HCT-116 cells concurrently based on the IC₅₀ for each agent in matrix format with 54 combination pairs for each drug. The combined drugs, as well as each drug alone, were incubated with the cells for 3 days and the surviving fraction of cells relative to control was determined using the alamarBlue assay. Representative figures are shown in Figures 3 and 4. The combination of ganetespib with cisplatin displayed enhanced cytotoxicity relative to single agent drugs alone. Similar results were observed when cells were exposed to ganetespib for just one hour, washed and then treated with cisplatin for 3 days.

[00156] Combinations between ganetespib and cisplatin were further performed in animal models, using HCT-116 colon cancer or MDA-MB-231 breast cancer tumor xenografts. Ganetespib (150 mg/kg) was given as a single bolus injection 6 hours prior to cisplatin (2 mg/kg) administration. Representative figures are shown in Figures 5 and 6. In both cancer xenograft models, the combination of ganetespib with cisplatin displayed greater antitumor activity relative to monotherapy.

[00157] In conclusion, these data support the use of ganetespib in combination with cisplatin in solid cancers such as gastric, bladder, colorectal, breast, ovarian and lung. See also Acquaviva et al, Mol Cancer Ther. 2012, September issue.

[00158] All publications, patent applications, patents, and other documents cited herein are incorporated by reference in their entirety. In case of conflict, the present specification, including definitions, will control. In addition, the materials, methods, and examples throughout the specification are illustrative only and not intended to be limiting in any way.
What is claimed is:

1. A pharmaceutical composition comprising a platinum-containing anti-cancer agent and an Hsp90 inhibitor according to the following formulae:

   ![Chemical Structures]

   or a tautomer, or a pharmaceutically acceptable salt thereof, wherein:

   - Z is OH, SH, or NH₂;
   - X is CR₄ or N;
   - Ri is -H, -OH, -SH, an optionally substituted alkyl, an optionally substituted alkenyl, an optionally substituted alkynyl, an optionally substituted cycloalkyl, an optionally substituted cycloalkenyl, an optionally substituted heterocyclyl, an optionally substituted aryl, an optionally substituted heteroaryl, an optionally substituted aralkyl, an optionally substituted heteraralkyl, halo, cyano, nitro, guanidino, a haloalkyl, a heteroalkyl, an alkoxy or cycloalkoxy, a haloalkoxy, -NRioRu, -OR₇, -C(0)R₇, -C(S)R₇, -C(O)SR₇, -C(S)OR₇, -C(S)NRioRu, -C(NR₈)OR₇, -C(NR₈)SR₇, -SC(0)R₇, -SC(0)SR₇, -SC(0)NRioRu, -SC(0)NRioRii, -SC(0)NRioRu, -SC(NR₈)NRioRu, -SC(NR₈)NRioRii, -SC(NR₈)NRioRu, -SC(NR₈)NRioRii, -SC(NR₈)NRioRu,
-SC(S)NRioRu, -OC(NRs)R, -SC(NRs)R, -C(0)NRioRu, -NRsC(0)R;
-NC(S)R7, -NRTC(S)OR7, -NR C(NRs)R, -NRTC(0)OR7,
-NC(NRs)OR7, -NR7C(S)OR7, -NRTC(0)NRIORU, -NR7C(S)NRIORU,
-NC(NR)S)NRioR, -S(0)pNRioR, -S(0)NRioRu, -SS(0)S)NRioR,
-OC(p)pNRioR, -S(0)pOR7, -S(0)pNRioRu, -SS(0)pNRioRu,
-OP(0)(OR)2, or -SP(0)(OR)2;

R2 is -H, -OH, -SH, -NR7H, -ORis, -SRis, -NHRis, -0(CH2)nOH, -0(CH2)nSH,
-0(CH2)nNR,H, -OC(0)NRioRu, -SC(0)NRioRu, -OC(0)R, -SC(0)R;
-OC(0)NRioRu, -SC(0)NRioRu, -OC(0)R, -SC(0)R;

R3 is -H, an optionally substituted alkyl, an optionally substituted alkenyl, an
optionally substituted alkynyl, an optionally substituted cycloalkyl, an
optionally substituted cycloalkenyl, an optionally substituted heterocyclyl, an
optionally substituted arenyl, an optionally substituted aralkyl, an optionally substituted
heteraralkyl, hydroxyalkyl, alkoxyalkyl, a haloalkyl, a heteroalkyl,
-C(0)R, -(CH2)mC(0)OR, -C(0)OR, -OC(0)R, -C(0)NRioRu, -S(0)pR, -S(0)pOR, or -S(0)pNRioRu;

R4 is -H, -OH, an optionally substituted alkyl, an optionally substituted alkenyl,
an optionally substituted alkynyl, an optionally substituted cycloalkyl,
an optionally substituted cycloalkenyl, an optionally substituted heterocyclyl, an optionally substituted aryl, an optionally substituted heteroaryl, an optionally substituted aralkyl, an optionally substituted heteraralkyl, hydroxyalkyl, alkoxyalkyl, halo, cyano, nitro, guanidino, a haloalkyl, a heteroalkyl, -C(0)R, -C(0)OR, -OC(0)R, -C(0)NRioRu, -NRsC(0)R, -SR, -S(O)pR, -OS(O)pR, -NRsS(O)pR, -S(O)pNRioRu, or R3 and R4 taken together with the carbon atoms to which they are attached form an optionally substituted cycloalkenyl, an optionally substituted aryl, an optionally substituted heterocyclyl, or an optionally substituted heteroaryl;

R7 and R8, for each occurrence, are, independently, -H, an optionally substituted alkyl, an optionally substituted alkenyl, an optionally substituted alkynyl, an optionally substituted cycloalkyl, an optionally substituted cycloalkenyl, an optionally substituted heterocyclyl, an optionally substituted heteroaryl, an optionally substituted aryl, an optionally substituted heteroaryl, an optionally substituted aralkyl, or an optionally substituted heteraralkyl;

Rio and R11, for each occurrence, are independently -H, an optionally substituted alkyl, an optionally substituted alkenyl, an optionally substituted alkynyl, an optionally substituted cycloalkyl, an optionally substituted cycloalkenyl, an optionally substituted heterocyclyl, an optionally substituted heteroaryl, an optionally substituted aryl, an optionally substituted heteroaryl, an optionally substituted aralkyl, or an optionally substituted heteraralkyl; or Rio and R11, taken together with the nitrogen to which they are attached, form an optionally substituted heterocyclyl or an optionally substituted heteroaryl;

Ris, for each occurrence, is independently, a lower alkyl;
p, for each occurrence, is, independently, 1 or 2; and
m, for each occurrence, is independently, 1, 2, 3, or 4.
2. The pharmaceutical composition of claim 1, wherein the Hsp90 inhibitor is 3-(2,4-dihydroxy-5-isopropyl-phenyl)-4-(1-methyl-indol-5-yl)-5-hydroxy-[1,2,4]triazole or a tautomer or a pharmaceutically acceptable salt thereof.

3. The pharmaceutical composition of claim 1, wherein the Hsp90 inhibitor is 5-hydroxy-4-(5-hydroxy-4-(1-methyl-1H-indol-5-yl)-4H-1,2,4-triazol-3-yl)-2-isopropylphenyl dihydrogen phosphate, or a tautomer, or a pharmaceutically acceptable salt thereof.

4. The pharmaceutical composition of claim 1, wherein the platinum-containing anticancer agent is selected from the group consisting of cisplatin, carboplatin, and oxaliplatin.

5. The pharmaceutical composition of claim 4, wherein the platinum-containing anticancer agent is cisplatin.

6. The pharmaceutical composition of claim 1, wherein the Hsp90 inhibitor is 3-(2,4-dihydroxy-5-isopropyl-phenyl)-4-(1-methyl-indol-5-yl)-5-hydroxy-[1,2,4]triazole, or a tautomer or a pharmaceutically acceptable salt thereof, and the platinum-containing anticancer agent is cisplatin.

7. The pharmaceutical composition of claim 1, wherein the Hsp90 inhibitor is 5-hydroxy-4-(5-hydroxy-4-(1-methyl-1H-indol-5-yl)-4H-1,2,4-triazol-3-yl)-2-isopropylphenyl dihydrogen phosphate, or a tautomer, or a pharmaceutically acceptable salt thereof, and the platinum-containing anticancer agent is cisplatin.

8. The composition of claim 1, further comprising one or more additional therapeutic agents selected from the group consisting of vandetanib, trastuzumab, temodar, dexamethasone, epirubicin, ifosfamide, mitoxantrone, vorinostat, interferon alpha, rituximab, prednisone, cyclophosphamide, bendamustine, Adriamycin, valproate, celecoxib, thalidomide, nelarabine, methotrexate, filgrastim, gemtuzumab ozogamicin, testosterone, clofarabine, cytarabine, everolimus, rituxumab, busulfan, capecitabine, pegfilgrastim,
mesna, amrubicin, obatoclax, gefitinib, cyclosporine, dasatinib, temozolomide, thiotepa, plerixafor, mitotane, vincristine, doxorubicin, cixutumumab, endostar, fenofibrate, melphalan, sunitinib, rubitecan, enoxaparin, isotretinoin, tariquidar, pomalidomide, sorafenib, altretamine, idarubicin, rapamycin, zevalin, everolimus, pravastatin, carmustine, nelfinavir, streptozocin, tirapazamine, aprepitant, lenalidomide, G-CSF, procarbazine, alemtuzumab, amifostine, valspodar, lomustine, oblimersen, temsirolimus, vinblastine, figitumumab, belinostat, niacinamide, tipifarnib, estramustine, erlotinib, bevacizumab, paclitaxel, docetaxel, Abraxane®, pemetrexed, bortezomib, cetuximab, gemcitabine, 5-fluorouracil, leucovorin, and tetracycline.

9. The composition of claim 8, wherein the one or more therapeutic agents is selected from the group consisting of erlotinib, bevacizumab, bortezomib, paclitaxel, doxorubicin, docetaxel, mitoxantrone, cytarabine, 5-fluorouracil, leucovorin, and vincristine.

10. A method of treating cancer, comprising administering to the subject an effective amount of the pharmaceutical composition of claim 1.

12. The method of claim 11, wherein the cancer is gastric cancer, bladder cancer, pancreatic cancer, non-small cell lung cancer, ovarian cancer, or colorectal cancer.
13. A method of treating colorectal cancer, ovarian cancer, pancreatic cancer, non-small cell lung cancer, or bladder cancer in a subject, comprising administering to the subject an effective amount of the pharmaceutical composition of claim 1.

14. The method of claim 13, wherein the method comprising administering a compound of 3-(2,4-dihydroxy-5-isopropyl-phenyl)-4-(1-methyl-indol-5-yl)-5-hydroxy-[1,2,4] triazole, or a tautomer or a pharmaceutically acceptable salt thereof, and cisplatin.

15. The method of claim 14, wherein cisplatin is administered at a dose from about 20 mg/m² to about 150 mg/m².

16. The method of claim 14, wherein the amount of the triazole compound is from about 2 mg/m² to about 260 mg/m².

17. The method of claim 16, wherein the amount of the triazole compound is about 75 mg/m², about 85 mg/m², about 100 mg/m², about 110 mg/m², about 115 mg/m², about 120 mg/m², about 145 mg/m², about 150 mg/m², about 175 mg/m², about 180 mg/m², about 200 mg/m², about 215 mg/m² or about 260 mg/m².

18. The method of claim 16, wherein the Hsp90 inhibitor is administered IV once weekly or twice weekly.

19. A method of inhibiting the growth of a cancer or tumor cell in a subject, the method comprising the steps of: (a) contacting the cell with an effective amount of a compound of formulae (I) or (la) as defined in claim 1, and (b) exposing the cell to an effective amount of a platinum-containing anticancer agent, wherein the platinum-containing anticancer agent is selected from the group consisting of cisplatin, carboplatin, and oxaliplatin.

20. The method of claim 19, wherein the compound is 3-(2,4-dihydroxy-5-isopropyl-phenyl)-4-(1-methyl-indol-5-yl)-5-hydroxy-[1,2,4] triazole, or a tautomer or a pharmaceutically acceptable salt thereof and the platinum-containing anticancer agent is cisplatin.
21. The method of claim 19, wherein the compound is 5-hydroxy-4-(5-hydroxy-4-(1-methyl-1H-indol-5-yl)-4H-1,2,4-triazol-3-yl)-2-isopropylphenyl dihydrogen phosphate, or a tautomer, or a pharmaceutically acceptable salt thereof, and the platinum-containing anticancer agent is cisplatin.

Further documents are listed in the continuation of Box C. See patent family annex.

* Special categories of cited documents:

- **A** document defining the general state of the art which is not considered to be of particular relevance
- **E** earlier application or patent but published on or after the international filing date
- **L** document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- **O** document referring to an oral disclosure, use, exhibition or other means
- **P** document published prior to the international filing date but later than the priority date claimed

*"I" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

*"X" document of particular relevance: the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

*"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art

*"A" document member of the same patent family
