CROSS-REFERENCE TO RELATED APPLICATIONS

[0001] This application claims priority to U.S. Application No. ____________ filed September 23, 2004, which claims the benefit of U.S. Provisional Application No. 60/505,801 filed September 25, 2003, the entire disclosures of which are incorporated herein by reference.

BACKGROUND

[0002] The present invention relates generally to substituted aryl oximes and methods of using them.

[0003] The serine protease inhibitor PAI-1 is one of the primary inhibitors of the fibrinolytic system. The fibrinolytic system includes the proenzyme plasminogen, which is converted to the active enzyme, plasmin, by one of two tissue type plasminogen activators, t-PA or u-PA. PAI-1 is the principal physiological inhibitor of t-PA and u-PA. One of plasmin's main responsibilities in the fibrinolytic system is to digest fibrin at the site of vascular injury. The fibrinolytic system, however, is not only responsible for the removal of fibrin from circulation but is also involved in several other biological processes including ovulation, embryogenesis, intima proliferation, angiogenesis, tumorigenesis, and atherosclerosis.

[0004] Elevated levels of PAI-1 have been associated with a variety of diseases and conditions including those associated with impairment of the fibrinolytic system. For example, elevated levels of PAI-1 have been implicated in thrombotic diseases, e.g., diseases characterized by formation of a thrombus that obstructs vascular blood flow locally or detaches and embolizes to occlude blood flow downstream. (Krishnamurti, Blood, 69, 798 (1987); Reilly, Arteriosclerosis and Thrombosis, 11, 1276 (1991); Carmeliet, Journal of Clinical Investigation, 92, 2756 (1993), Rocha, Fibrinolysis, 8, 294, 1994; Aznar, Haemostasis 24, 243 (1994)). Antibody neutralization of PAI-1 activity resulted in promotion of endogenous thrombolysis and reperfusion (Biemond, Circulation, 91, 1175 (1995); Levi, Circulation 85, 305, (1992)). Elevated levels of PAI-1 have also been implicated in diseases such as polycystic ovary syndrome (Nordt, Journal of clinical Endocrinology and Metabolism, 85, 4, 1563 (2000)), bone loss induced by estrogen deficiency (Daci, Journal of Bone and Mineral Research, 15, 8, 1510 (2000)), cystic fibrosis, diabetes, chronic periodontitis, lymphomas, diseases associated with extracellular matrix accumulation, malignancies and diseases associated with neoangiogenesis, inflammatory diseases, vascular damage associated with infections, and diseases associated with increased uPA levels such as breast and ovarian cancer.
[0005] In view of the foregoing, there exists a need for the identification of inhibitors of PAI-1 activity and for methods of using the identified inhibitors to modulate PAI-1 expression or activity in a subject in order to treat disorders associated with elevated PAI-1 levels.

[0012] The terms “alkyl” and “alkylene,” as used herein, whether used alone or as part of another group, refer to substituted or unsubstituted aliphatic hydrocarbon chains, the difference being that alkyl groups are monovalent (i.e., terminal) in nature whereas alkyne groups are divalent and typically serve as linkers. Both include, but are not limited to, straight and branched chains containing from 1 to 12 carbon atoms, e.g. 1 to 8 carbon atoms, preferably 1 to 6 carbon atoms, more preferably 1 to 4 carbon atoms unless explicitly specified otherwise. For example, methyl, ethyl, propyl, isopropyl, butyl, i-butyl and t-butyl are encompassed by the term “alkyl.” Specifically included within the definition of “alkyl” are those aliphatic hydrocarbon chains that are optionally substituted. Representative optional substituents include, but are not limited to, hydroxy, acyloxy, alkoxy, amino, amino substituted by one or two alkyl groups of from 1 to 6 carbon atoms, aminoacyl, acylamino, thioalkoxy of from 1 to 6 carbon atoms, substituted thioalkoxy of from 1 to 6 carbon atoms, and trihalomethyl.

A skilled medical practitioner will know how to use standard methods to determine whether a patient is suffering from a disease associated with enhanced levels and/or activity of PAI-1, e.g., by examining the patient and determining whether the patient is suffering from a disease known to be associated with elevated PAI-1 levels or activity or by assaying for PAI-1 levels in blood plasma or tissue of the individual suspected of suffering from a PAI-1 related disease and comparing PAI-1 levels in the blood plasma or tissue of the individual suspected of suffering from a PAI-1 related disease to PAI-1 levels in the blood plasma or tissue of a healthy individual. Increased PAI-1 levels are indicative of disease. Accordingly, the present invention provides, inter alia, methods of administering a compound of the present invention to a subject and determining levels of PAI-1 in the subject. The level of PAI-1 in the subject can be determined before and/or after administration of the compound.

[0028] In healthy individuals, PAI-1 is found at low levels in the plasma (for example, about 5-26 ng/mL), but it is elevated in many PAI-1 related disorders, including, for example,

[0029] The term “PAI-1 related disorder or disease” refers to any disease or condition that is associated with increased or enhanced expression or activity of PAI-1 or increased or enhanced expression or activity of a gene encoding PAI-1. Examples of such increased activity or expression can include one or more of the following: activity of the protein or expression of the gene encoding the protein is increased above the level of that in normal subjects; activity of the protein or expression of the gene encoding the protein is in an organ, tissue or cell where it is not normally detected in normal subjects (i.e. spatial distribution of the protein or expression of the gene encoding the protein is altered); activity of the protein or expression of the gene encoding the protein is increased when activity of the protein or expression of the gene encoding the protein is present in an organ, tissue or cell for a longer period than in a normal subjects (i.e., duration of activity of the protein or expression of the gene encoding the protein is increased). A normal or healthy subject is a subject not suffering from a PAI-1 related disorder or disease. In some embodiments of the present invention, the PAI-I related disorder is not associated with hyperglycemia. A PAI-1 related disorder that is not associated with hyperglycemia is one, for example, that is not caused by elevated levels of glucose in the blood.

[0030] The term “pharmaceutically acceptable excipient “ means an excipient that is useful in preparing a pharmaceutical composition that is generally safe, non-toxic, and desirable, and includes excipients that are acceptable for veterinary use as well as for human pharmaceutical use. Such excipients can be solid, liquid, semisolid, or, in the case of an aerosol composition, gaseous.

Such salts include, for example, salts that can be formed where acidic protons present in the compounds are capable of reacting with inorganic or organic bases. Suitable inorganic salts include, for example, those formed with the alkali metals or alkaline earth metals, e.g. sodium and potassium,
magnesium, calcium, and aluminum. Suitable organic salts include, for example, those formed with organic bases such as the amine bases, e.g. ethanolamine, diethanolamine, triethanolamine, trimethamine, N methylglucamine, and the like. Pharmaceutically acceptable salts can also include acid addition salts formed from the reaction of basic moieties, such as amines, in the parent compound with inorganic acids (e.g. hydrochloric and hydrobromic acids) and organic acids (e.g. acetic acid, citric acid, maleic acid, and the alkane- and arene-sulfonic acids such as methanesulfonic acid and benzenesulfonic acid). Pharmaceutically acceptable esters include esters formed from carboxy, sulfonyloxy, and phosphonoxy groups present in the compounds, e.g. C1-6 alkyl esters. When there are two acidic groups present, a pharmaceutically acceptable salt or ester can be a mono-acid mono-salt or ester or a di-salt or ester; and similarly where there are more than two acidic groups present, some or all of such groups can be salified or esterified. Compounds named in this invention can be present in unsalified or unesterified form, or in salified and/or esterified form, and the naming of such compounds is intended to include both the original (unsalified and unesterified) compound and its pharmaceutically acceptable salts and esters. Also, certain compounds named in this invention can be present in more than one stereoisomeric form, and the naming of such compounds is intended to include all single stereoisomers and all mixtures (whether racemic or otherwise) of such stereoisomers.

[0032] “Inhibitors,” “activators,” and “modulators” of expression or of activity are used to refer to inhibitory, activating, or modulating molecules, respectively, identified using in vitro and in vivo assays for expression or activity. Inhibitors of the present invention are compositions that, inhibit expression of PAI-1 or bind to, partially or totally block stimulation, decrease, prevent, delay activation, inactivate, desensitize, or down regulate the activity of PAI-1. Samples or assays comprising PAI-1 can be treated with a composition of the present invention and compared to control samples without a composition of the present invention. Control samples (untreated with compositions of the present invention) can be assigned a relative activity value of 100%. In certain embodiments, inhibition of PAI-1 is achieved when the activity value relative to the control is about 80% or less, optionally 50% or 25, 10%, 5% or 1%.

[0033] The terms “pharmaceutically acceptable”, “physiologically tolerable” and grammatical variations thereof, as they refer to compositions, carriers, diluents and reagents, are used interchangeably and represent that the materials are capable of administration to or upon a human without the production of undesirable physiological effects such as nausea, dizziness, gastric upset and the like which would be to a degree that would prohibit administration of the compound.
A "therapeutically effective amount" or "pharmaceutically effective amount" means the amount that, when administered to a subject, produces effects for which it is administered. For example, a "therapeutically effective amount," when administered to a subject to inhibit PAI-1 activity, is sufficient to inhibit PAI-1 activity. A "therapeutically effective amount," when administered to a subject for treating a disease, is sufficient to effect treatment for that disease.

Except when noted, the terms "subject" or "patient" are used interchangeably and refer to mammals such as human patients and non-human primates, as well as experimental animals such as rabbits, rats, and mice, and other animals. Accordingly, the term "subject" or "patient" as used herein means any mammalian patient or subject to which the compounds of the invention can be administered. In an exemplary embodiment of the present invention, to identify subject patients for treatment according to the methods of the invention, accepted screening methods are employed to determine risk factors associated with a targeted or suspected disease or condition or to determine the status of an existing disease or condition in a subject. These screening methods include, for example, conventional work-ups to determine risk factors that are associated with the targeted or suspected disease or condition. These and other routine methods allow the clinician to select patients in need of therapy using the methods and formulations of the present invention. In some embodiments of the present invention, the subject to be treated with the methods of the present invention does not have hyperglycemia and/or a disease that has been caused by hyperglycemia. Methods of determining whether a subject has hyperglycemia are known in the art and include, for example, performing a glucose test that measures the level of glucose in the blood. Two exemplary tests that can be used to measure the presence of excess levels of glucose in the blood include a test that measures the amount of glucose in the blood after an overnight fast and a test that measures the body’s ability to process excess sugar presented after drinking a high glucose test. Typically a subject having a fasting sugar level (sugar level after an overnight fast) of about 64 to about 110 mg/dl does not have hyperglycemia whereas as person having a fasting sugar level of greater than 110 mg/dl has elevated blood sugar levels. A value above about 140 mg/dl on at least two occasions typically signifies that the subject has diabetes.

When any variable occurs more than one time in any constituent or in any formula, its definition in each occurrence is independent of its definition at every other occurrence. Combinations of substituents and/or variables are permissible only if such combinations result in stable compounds.

[0061] Compounds of the present invention can be prepared by those skilled in the art of organic synthesis employing conventional methods that utilize readily available reagents and starting materials. Representative compounds of the present invention can be prepared using the following synthetic schemes. In the following synthetic schemes, R₁, R₂, R₃, R₄, R₅, R₆, X, and A are selected from the groups defined above. The skilled practitioner will know how to make use of variants of these process steps, which in themselves are well known in the art.

[0062] Representative substituted aryl oximes of the present invention can be prepared using scheme 1.

In Scheme 1, compounds can be prepared by coupling of the oxime 2 with bromide 3 either in presence of a base like cesium carbonate in a solvent like acetone or like sodium hexamethyldisilylazide or sodium hydride in a solvent like THF, followed by saponification or by treatment under basic conditions to give acid derivatives.

D. SUBSTITUTED ARYL OXIMES AS PHARMACEUTICAL COMPOSITIONS

The present invention provides substituted aryl oximes as pharmaceuticals. In a preferred embodiment, the aryl oximes are formulated as pharmaceuticals to treat diseases associated with increased PAI-1 activity, e.g., by inhibiting PAI-1 activity in a subject.

In general, substituted aryl oximes can be administered as pharmaceutical compositions by any method known in the art for administering therapeutic drugs including oral, buccal, topical, systemic (e.g., transdermal, intranasal, or by suppository), or parenteral (e.g., intramuscular, subcutaneous, or intravenous injection). Compositions can take the form of tablets, pills, capsules, semisolids, powders, sustained release formulations, solutions, suspensions, emulsions, syrups, elixirs, aerosols, or any other appropriate compositions; and comprise at least one compound of this invention in combination with at least one pharmaceutically acceptable excipient. Suitable excipients are well known to persons of ordinary skill in the art, and they, and the methods of formulating the compositions, can be found in such standard references as Alfonso AR: Remington's Pharmaceutical Sciences, 17th ed., Mack Publishing Company, Easton PA, 1985. Suitable liquid carriers, especially for injectable solutions, include water, aqueous saline solution, aqueous dextrose solution, and glycols. In some embodiments of the present invention, substituted aryl oximes suitable for use in the practice of this invention will be administered either singly or in combination with at least one other compound of this invention. Substituted aryl oximes suitable for use in the practice of the present invention can also be administered with at least one other conventional therapeutic agent for the disease being treated.

Aqueous suspensions of the invention can contain a substituted aryl oxime in admixture with excipients suitable for the manufacture of aqueous suspensions. Such excipients can include a suspending agent, such as sodium carboxymethylcellulose, methylcellulose, hydroxypropylmethylcellulose, sodium alginate, polyvinylpyrrolidone, gum tragacanth and gum acacia, and dispersing or wetting agents such as a naturally occurring phosphatide (e.g., lecithin), a condensation product of an alkylene oxide with a fatty acid (e.g., polyoxyethylene stearate), a condensation product of ethylene oxide with a long chain aliphatic alcohol (e.g.,
heptadecaethylene oxycetanol), a condensation product of ethylene oxide with a partial ester derived from a fatty acid and a hexitol (e.g., polyoxyethylene sorbitol mono-oleate), or a condensation product of ethylene oxide with a partial ester derived from fatty acid and a hexitol anhydride (e.g., polyoxyethylene sorbitan mono-oleate). The aqueous suspension can also contain one or more preservatives such as ethyl or n-propyl p-hydroxybenzoate, one or more coloring agents, one or more flavoring agents, and one or more sweetening agents, such as sucrose, aspartame or saccharin. Formulations can be adjusted for osmolarity.

[0067] Oil suspensions can be formulated by suspending a substituted aryl oxime in a vegetable oil, such as arachis oil, olive oil, sesame oil or coconut oil, or in a mineral oil such as liquid paraffin; or a mixture of these. The oil suspensions can contain a thickening agent, such as beeswax, hard paraffin or cetyl alcohol. Sweetening agents can be added to provide a palatable oral preparation, such as glycerol, sorbitol or sucrose. These formulations can be preserved by the addition of an antioxidant such as ascorbic acid. As an example of an injectable oil vehicle, see Minto, J. Pharmacol. Exp. Ther. 281:93-102, 1997. The pharmaceutical formulations of the invention can also be in the form of oil-in-water emulsions. The oily phase can be a vegetable oil or a mineral oil, described above, or a mixture of these. Suitable emulsifying agents include naturally-occurring gums, such as gum acacia and gum tragacanth, naturally occurring phosphatides, such as soybean lecithin, esters or partial esters derived from fatty acids and hexitol anhydrides, such as sorbitan mono-oleate, and condensation products of these partial esters with ethylene oxide, such as polyoxyethylene sorbitan mono-oleate. The emulsion can also contain sweetening agents and flavoring agents, as in the formulation of syrups and elixirs. Such formulations can also contain a demulcent, a preservative, or a coloring agent.

[0068] The compound of choice, alone or in combination with other suitable components, can be made into aerosol formulations (i.e., they can be “nebulized”) to be administered via inhalation. Aerosol formulations can be placed into pressurized acceptable propellants, such as dichlorodifluoromethane, propane, nitrogen, and the like.

[0069] Formulations suitable for parenteral administration, such as, for example, by intraarticular (in the joints), intravenous, intramuscular, intradermal, intraperitoneal, and subcutaneous routes, include aqueous and non-aqueous, isotonic sterile injection solutions, which can contain antioxidants, buffers, bacteriostats, and solutes that render the formulation isotonic with the blood of the intended recipient, and aqueous and non-aqueous sterile suspensions that can include suspending agents, solubilizers, thickening agents, stabilizers, and preservatives. Among the acceptable vehicles and solvents that can be employed are water and
Ringer's solution, an isotonic sodium chloride. In addition, sterile fixed oils can conventionally be employed as a solvent or suspending medium. For this purpose any bland fixed oil can be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid can likewise be used in the preparation of injectables. These solutions are sterile and generally free of undesirable matter. Where the compounds are sufficiently soluble they can be dissolved directly in normal saline with or without the use of suitable organic solvents, such as propylene glycol or polyethylene glycol. Dispersions of the finely divided compounds can be made-up in aqueous starch or sodium carboxymethyl cellulose solution, or in suitable oil, such as arachis oil. These formulations can be sterilized by conventional, well known sterilization techniques. The formulations can contain pharmaceutically acceptable auxiliary substances as required to approximate physiological conditions such as pH adjusting and buffering agents, toxicity adjusting agents, e.g., sodium acetate, sodium chloride, potassium chloride, calcium chloride, sodium lactate and the like. The concentration of substituted aryl oxime in these formulations can vary widely, and will be selected primarily based on fluid volumes, viscosities, body weight, and the like, in accordance with the particular mode of administration selected and the patient's needs. For IV administration, the formulation can be a sterile injectable preparation, such as a sterile injectable aqueous or oleaginous suspension. This suspension can be formulated according to the known art using those suitable dispersing or wetting agents and suspending agents. The sterile injectable preparation can also be a sterile injectable solution or suspension in a nontoxic parenterally-acceptable diluent or solvent, such as a solution of 1,3-butanediol. The formulations of commends can be presented in unit-dose or multi-dose sealed containers, such as ampules and vials.

[0070] Injection solutions and suspensions can be prepared from sterile powders, granules, and tablets of the kind previously described.

[0071] Substituted aryl oximes suitable for use in the practice of this invention can be administered orally. The amount of a compound of the present invention in the composition can vary widely depending on the type of composition, size of a unit dosage, kind of excipients, and other factors well known to those of ordinary skill in the art. In general, the final composition can comprise, for example, from 0.000001 percent by weight (% w) to 10 % w of the substituted aryl oxime, preferably 0.00001 % w to 1 % w, with the remainder being the excipient or excipients.

[0072] Pharmaceutical formulations for oral administration can be formulated using pharmaceutically acceptable carriers well known in the art in dosages suitable for oral administration. Such carriers enable the pharmaceutical formulations to be formulated in unit
dosage forms as tablets, pills, powder, dragees, capsules, liquids, lozenges, gels, syrups, slurries, suspensions, etc. suitable for ingestion by the patient. Formulations suitable for oral administration can consist of (a) liquid solutions, such as an effective amount of the packaged nucleic acid suspended in diluents, such as water, saline or PEG 400; (b) capsules, sachets or tablets, each containing a predetermined amount of the active ingredient, as liquids, solids, granules or gelatin; (c) suspensions in an appropriate liquid; and (d) suitable emulsions.

[0073] Pharmaceutical preparations for oral use can be obtained through combination of the compounds of the present invention with a solid excipient, optionally grinding a resulting mixture, and processing the mixture of granules, after adding suitable additional compounds, if desired, to obtain tablets or dragee cores. Suitable solid excipients are carbohydrate or protein fillers and include, but are not limited to sugars, including lactose, sucrose, mannitol, or sorbitol; starch from corn, wheat, rice, potato, or other plants; cellulose such as methyl cellulose, hydroxymethyl cellulose, hydroxypropylmethyl-cellulose or sodium carboxymethylcellulose; and gums including arabic and tragacanth; as well as proteins such as gelatin and collagen. If desired, disintegrating or solubilizing agents can be added, such as the cross-linked polyvinyl pyrrolidone, agar, alginic acid, or a salt thereof, such as sodium alginate. Tablet forms can include one or more of lactose, sucrose, mannitol, sorbitol, calcium phosphates, corn starch, potato starch, microcrystalline cellulose, gelatin, colloidal silicon dioxide, talc, magnesium stearate, stearic acid, and other excipients, colorants, fillers, binders, diluents, buffering agents, moistening agents, preservatives, flavoring agents, dyes, disintegrating agents, and pharmaceutically compatible carriers. Lozenge forms can comprise the active ingredient in a flavor, e.g., sucrose, as well as pastilles comprising the active ingredient in an inert base, such as gelatin and glycerin or sucrose and acacia emulsions, gels, and the like containing, in addition to the active ingredient, carriers known in the art.

[0074] The substituted aryl oximes of the present invention can also be administered in the form of suppositories for rectal administration of the drug. These formulations can be prepared by mixing the drug with a suitable non-irritating excipient which is solid at ordinary temperatures but liquid at the rectal temperatures and will therefore melt in the rectum to release the drug. Such materials are cocoa butter and polyethylene glycols.

[0075] The compounds of the present invention can also be administered by intranasal, intraocular, intravaginal, and intrarectal routes including suppositories, insufflation, powders and aerosol formulations (for examples of steroid inhalants, see Rohatagi, J. Clin. Pharmacol. 35:1187-1193, 1995; Tjwa, Ann. Allergy Asthma Immunol. 75:107-111, 1995).
The substituted aryl oximes of the present invention can be delivered transdermally, by a topical route, formulated as applicator sticks, solutions, suspensions, emulsions, gels, creams, ointments, pastes, jellies, paints, powders, and aerosols.

Encapsulating materials can also be employed with the compounds of the present invention and the term “composition” is intended to include the active ingredient in combination with an encapsulating material as a formulation, with or without other carriers. For example, the compounds of the present invention can also be delivered as microspheres for slow release in the body. In one embodiment, microspheres can be administered via intradermal injection of drug-containing microspheres, which slowly release subcutaneously (see Rao, J. Biomater Sci. Polym. Ed. 7:623-645, 1995; as biodegradable and injectable gel formulations (see, e.g., Gao, Pharm. Res. 12:857-863, 1995); or, as microspheres for oral administration (see, e.g., Eyles, J. Pharm. Pharmacol. 49:669-674, 1997). Both transdermal and intradermal routes afford constant delivery for weeks or months. Cachets can also be used in the delivery of the compounds of the present invention, e.g., anti-atherosclerotic medicaments.

In another embodiment, the compounds of the present invention can be delivered by the use of liposomes which fuse with the cellular membrane or are endocytosed, i.e., by employing ligands attached to the liposome, or attached directly to the oligonucleotide, that bind to surface membrane protein receptors of the cell resulting in endocytosis. By using liposomes, particularly where the liposome surface carries ligands specific for target cells, or are otherwise preferentially directed to a specific organ, one can focus the delivery of the compound into the target cells in vivo. (See, e.g., Al-Muhammed, J. Microencapsul. 13:293-306, 1996; Chonn, Curr. Opin. Biotechnol. 6:698-708, 1995; Ostro, Am. J. Hosp. Pharm. 46:1576-1587, 1989).

In other cases, the preferred preparation can be a lyophilized powder which may contain, for example, any or all of the following: 1 mM-50 mM histidine, 0.1%-2% sucrose, 2%-7% mannitol, at a pH range of 4.5 to 5.5, that is combined with buffer prior to use.

A pharmaceutical composition of the invention can optionally contain, in addition to a substituted aryl oxime, at least one other therapeutic agent useful in the treatment of a disease or condition associated with increased PAI-1 activity.

The pharmaceutical compositions are generally formulated as sterile, substantially isotonic and in full compliance with all Good Manufacturing Practice (GMP) regulations of the U.S. Food and Drug Administration.
E. DETERMINING DOSAGE REGIMENS FOR SUBSTITUTED ARYL OXIMES

[0082] The present invention provides methods of inhibiting PAI-1 activity in a subject for the treatment of diseases and conditions associated with increased PAI-1 activity using substituted aryl oximes. In an exemplary embodiment of the present invention, a skilled practitioner will treat a subject having a disease associated with elevated PAI-1 levels and/or activity with a compound of the present invention.

[0083] For treatment purposes, the compositions or compounds disclosed herein can be administered to the subject in a single bolus delivery, via continuous delivery (e.g., continuous transdermal, mucosal, or intravenous delivery) over an extended time period, or in a repeated administration protocol (e.g., by an hourly, daily or weekly, repeated administration protocol). The pharmaceutical formulations of the present invention can be administered, for example, one or more times daily, 3 times per week, or weekly. In an exemplary embodiment of the present invention, the pharmaceutical formulations of the present invention are orally administered once or twice daily.

[0084] In this context, a therapeutically effective dosage of the biologically active agent(s) can include repeated doses within a prolonged treatment regimen that will yield clinically significant results to alleviate one or more symptoms or detectable conditions associated with increased PAI-1 activity. Determination of effective dosages in this context is typically based on animal model studies followed up by human clinical trials and is guided by determining effective dosages and administration protocols that significantly reduce the occurrence or severity of targeted exposure symptoms or conditions in the subject. Suitable models in this regard include, for example, murine, rat, porcine, feline, non-human primate, and other accepted animal model subjects known in the art. Alternatively, effective dosages can be determined using in vitro models (e.g., immunologic and histopathologic assays). Using such models, only ordinary calculations and adjustments are typically required to determine an appropriate concentration and dose to administer a therapeutically effective amount of the biologically active agent(s) (e.g., amounts that are intranasally effective, transdermally effective, intravenously effective, or intramuscularly effective to elicit a desired response). In alternative embodiments, an “effective amount” or “effective dose” of the biologically active agent(s) can simply inhibit or enhance one or more selected biological activity(ies) correlated with a disease or condition, as set forth above, for either therapeutic or diagnostic purposes.

[0085] The actual dosage of biologically active agents will of course vary according to factors such as the extent of exposure and particular status of the subject (e.g., the subject’s age,
size, fitness, extent of symptoms, susceptibility factors, etc), time and route of administration, as well as other drugs or treatments being administered concurrently. Dosage regimens can be adjusted to provide an optimum prophylactic or therapeutic response. By "therapeutically effective dose" herein is meant a dose that produces effects for which it is administered. More specifically, a therapeutically effective dose of the compound(s) of the invention preferably alleviates symptoms, complications, or biochemical indicia of diseases associated with increased PAI-1 activity. The exact dose will depend on the purpose of the treatment, and will be ascertainable by one skilled in the art using known techniques (see, e.g., Lieberman, *Pharmaceutical Dosage Forms* (Vols. 1-3, 1992); Lloyd, 1999, *The Art, Science, and Technology of Pharmaceutical Compounding*; and Pickar, 1999, *Dosage Calculations*). A therapeutically effective dose is also one in which any toxic or detrimental side effects of the active agent is outweighed in clinical terms by therapeutically beneficial effects. It is to be further noted that for each particular subject, specific dosage regimens should be evaluated and adjusted over time according to the individual need and professional judgment of the person administering or supervising the administration of the compounds.

[0086] In an exemplary embodiment of the present invention, unit dosage forms of the compounds are prepared for standard administration regimens. In this way, the composition can be subdivided readily into smaller doses at the physicians direction. For example, unit dosages can be made up in packeted powders, vials or ampoules and preferably in capsule or tablet form. The active compound present in these unit dosage forms of the composition can be present in an amount of, for example, from about one gram to about fifteen grams or more, for single or multiple daily administration, according to the particular need of the patient. By initiating the treatment regimen with a minimal daily dose of about one gram, the blood levels of PAI-1 and the patients symptomatic relief analysis can be used to determine whether a larger or smaller dose is indicated. Effective administration of the compounds of this invention can be given at an oral dose of from about 0.1 mg/kg/day to about 1,000 mg/kg/day. Preferably, administration will be from about 10/mg/kg/day to about 600 mg/kg/day, more preferably from about 25 to about 200 mg/kg/day, and even more preferably from about 50 mg/kg/day to about 100 mg/kg/day. In some embodiments, a daily dosage of from about 1 mg/kg to about 250 mg/kg is provided.

[0087] In certain embodiments, the present invention is directed to prodrugs of compounds of formulas 1-3. The term "prodrug," as used herein, means a compound that is convertible in vivo by metabolic means (e.g. by hydrolysis) to a compound of formula 1-3. Various forms of prodrugs are known in the art such as those discussed in, for example, Bundgaard, (ed.), *Design of Prodrugs*, Elsevier (1985); Widder, et al. (ed.), *Methods in*

F. KITS

[0088] After a pharmaceutical comprising a substituted aryl oxime has been formulated in a suitable carrier, it can be placed in an appropriate container and labeled for treatment of a PAI-1 related disorder, e.g., leukemia. Additionally, another pharmaceutical comprising at least one other therapeutic agent useful in the treatment of the PAI-1 related disorder can be placed in the container as well and labeled for treatment of the indicated disease. Alternatively, a single pharmaceutical comprising a substituted aryl oxime and at least one other therapeutic agent useful in the treatment of a PAI-1 related disorder can be placed in an appropriate container and labeled for treatment. For administration of pharmaceuticals comprising substituted aryl oximes and of pharmaceuticals comprising, in a single pharmaceutical, substituted aryl oximes and at least one other therapeutic agent useful in the treatment of a PAI-related disorder, such labeling would include, for example, instructions concerning the amount, frequency and method of administration. Similarly, for administration of multiple pharmaceuticals provided in the container, such labeling would include, for example, instructions concerning the amount, frequency and method of administration of each pharmaceutical.

EXAMPLES

[0089] Example 1: Synthesis of (4-{3-[1-(4-tert-Butyl-phenyl)-ethylideneaminooxy]-propoxy}-phenyl)-acetic acid.

[0090] Step 1: To a solution of methyl 4-hydroxy phenyl acetic acid (8.240g, 49.6 mmol) in acetonitrile (100 mL) was added potassium carbonate (20.75 g, 150.2 mmol) and dibromopropane (25 mL, 246.2 mmol). The reaction mixture was heated at reflux for 5 hours, cooled to room temperature and then concentrated to a small volume in vacuo. The residue was partitioned between ethyl acetate and brine and the aqueous layer was extracted with ethyl acetate. The combined organics were washed with brine, dried over anhydrous magnesium sulfate and concentrated in vacuo. The residue was purified by flash chromatography using ethyl acetate/hexanes (20/80) to afford [4-(3-bromo-proypoxy)-phenyl]-acetic acid methyl ester.

Step 1: To a solution of 2-amino-4-nitro-benzoic acid methyl ester (5.00g, 25.5 mmol) in methylene chloride (75 mL) was added triethylamine (4.13 g, 40.8 mmol) followed by 3,5-bis-trifluoromethyl-benzoyl chloride (8.46 g, 30.6 mmol). This mixture was allowed to stir overnight at ambient temperature. Work-up of an aliquot of the reaction mixture revealed incomplete reaction. Additional 0.5 equivalents of the acid chloride (2.3 mL) and triethylamine (1.8 mL) were added and the mixture was refluxed overnight. The reaction mixture was allowed to cool and filtered. The filtrate was partitioned against brine, the layers were separated, and the aqueous layer was extracted with one portion of ethyl acetate. The resultant paste was dissolved in methylene chloride (25 mL) and the product was precipitated out by the addition of hexanes (175 mL). The precipitate was isolated by filtration and determined to be a mixture of the desired amide (mono-acylated) product and the carbamate (di-acylated) side product. The crude material was purified by flash chromatography through silica gel using ethyl acetate/hexanes (15/85 gradient to 30/70) to give 2-(3,5-bis-trifluoromethyl-benzoylamino)-4-nitro-benzoic acid methyl ester (3.7g, 33%) as an off-white solid. \(^1\)H NMR (400 MHz, CDCl\(_3\)); \(\delta\) 12.40 (bs, 1H), 9.78 (d, 1H), 8.50 (s, 2H), 8.31 (d, 1H), 8.11 (s, 1H), 8.00 (dd, 1H), 4.07 (s, 3H). \(^1\)H NMR (400 MHz, DMSO-d\(_6\)); \(\delta\) 9.04 (d, 1H), 8.43 (dd, 1H), 8.34 (s, 4H), 8.24 (s, 1H), 8.22 (s, 2H), 3.87 (s, 3H).

Step 1: To a solution of 2-bromo-4-methyl-benzoic acid (5.50g, 25.6 mmol) in methanol (250 mL) was added concentrated sulfuric acid (1 mL). The reaction mixture was heated to reflux overnight (approximately 16 hours), allowed to cool to room temperature and then concentrated to approximately 1/4 volume under reduced pressure. The residue was then partitioned between water and ethyl acetate, the layers were separated and the aqueous layer was extracted with one additional portion of ethyl acetate. The combined organics were washed one time with saturated sodium bicarbonate solution, dried over anhydrous magnesium sulfate, filtered through a plug of silica gel and concentrated under reduced pressure. 2-Bromo-4-methyl-benzoic acid methyl ester was obtained as an oil (4.95g, 85%). To a solution of this oil (2.50g, 10.9 mmol) in carbon tetrachloride (100 mL) was added N-bromosuccinimide (2.04g, 11.5 mmol) and benzoylperoxide (0.106g, 0.44 mmol). The reaction mix was heated to reflux. After approximately 1 hour, the reaction mixture became colorless. At this time the heat was removed to allow the mixture to cool to room temperature and the mixture was filtered. The filtrate was concentrated under reduced pressure. The crude mixture was purified by HPLC (40% methylene chloride in hexane) to give 2-bromo-4-bromomethyl-benzoic acid methyl ester (1.50g, 45%) as a white powder. $^1$H NMR (400 MHz, CDCl$_3$); δ 7.75 (d, 1H), 7.66 (s, 1H), 7.35 (d, 1H), 4.39 (s, 2H), 3.90 (s, 3H).

The crude material was purified by flash chromatography through silica gel using ethyl acetate/hexanes (0/100 gradient to 6/94) to give 2-bromo-4-[(4-tert-butylphenyl)methylidene]amino)methyl]benzoic acid methyl ester (0.43g, 83%) as a clear, colorless oil. $^1$H NMR (400 MHz, CDCl$_3$); δ 8.13 (s, 1H), 7.78 (d, 1H), 7.69 (s, 1H), 7.49 (d, 2H), 7.39-7.36 (m, 3H), 5.18 (s, 2H), 3.92 (s, 3H), 1.32 (s, 9H).

Step 3: To a solution of 2-bromo-4-[(4-tert-butylphenyl)methylidene]amino)methyl]benzoic acid methyl ester (0.43g, 1.07 mmol), in 10/5/3 tetrahydrofuran/ethanol/water (24 mL) was added 2.5 M sodium hydroxide solution (4 mL). This mixture was heated to reflux for 3 hours and then allowed to cool back to room temperature. The mixture was concentrated to approximately 1/4 volume and partitioned between ethyl acetate and brine. The aqueous layer was acidified to approximately pH 1 using 1 N hydrochloric acid. The layers were then separated. The aqueous layer was extracted with one additional portion of ethyl acetate. The organics were combined, dried over anhydrous magnesium sulfate, filtered and concentrated under reduced pressure. The crude material was
dissolved in hot methylene chloride and crystallized out by the addition of room temperature hexanes (60 mL), and allowing the mixture to sit for 2 hours to give 2-bromo-4-[(1E)-(4-tert-butylphenyl)methylideneamino]oxy)methyl]benzoic acid (0.39g, 94%) as a white solid. mp=162-163°C. 1H NMR (500 MHz, DMSO-d6); δ 13.35 (bs, 1H), 8.31 (s, 1H), 7.74 (d, 1H), 7.71 (s, 1H), 7.52 (d, 2H), 7.46 (d, 1H), 7.42 (d, 2H), 5.19 (s, 2H), 1.26 (s, 9H). Crushed ice (50ml) was added followed by the drop-wise addition of NaN32 (4.124g, 59.759 mmol) in water (9ml). The temperature was kept below 5°C during the addition and then stirred for 1.25h at 0°C. The reaction mixture was quenched by adding urea (6g), stirred for 10 minutes at 0°C, filtered and the filtrate added drop-wise into a boiling solution of concentrated H2SO4 (39ml) and water (27ml). After the addition, the entire mixture was refluxed for 3 hours then cooled. The reaction mixture was extracted with ethyl acetate (6 x 50ml) and the combined organics washed with brine, filtered and concentrated to a small volume which was then purified by flash chromatography on silica. [0228] **Example 37: Screening for PAI-1 inhibition.** Test compounds are dissolved in DMSO at a final concentration of 10mM, then diluted 100X in physiologic buffer. The inhibitory assay is initiated by the addition of the test compound (1 – 100 μM final concentration, maximum DMSO concentration of 0.2%) in a pH 6.6 buffer containing 140 nM recombinant human plasminogen activator inhibitor-1 (PAI-1; Molecular Innovations, Royal Oak, MI). Following a 1 hour incubation at room temperature, 70 nM of recombinant human tissue plasminogen activator (tPA) is added, and the combination of the test compound, PAI-1 and tPA is incubated for an additional 30 minutes. Following the second incubation, Spectrozyme-tPA (American Diagnostica, Greenwich, CT), a chromogenic substrate for tPA, is added and absorbance read at 405 nm at 0 and 60 minutes. Relative PAI-1 inhibition is equal to the residual tPA activity in the presence of the test compounds and PAI-1. Control treatments include the complete inhibition of tPA by PAI-1 at the molar ratio employed (2:1), and the absence of any effect of the test compound on tPA alone.

[0229] **Example 38: Assay for determining the IC\(_{50}\) of inhibition of PAI-1.** This assay is based upon the non-SDS dissociable interaction between tPA and active PAI-1. Assay plates are initially coated with human tPA (10 μg/ml). Test compounds are dissolved in DMSO at 10 mM, then diluted with physiologic buffer (pH 7.5) to a final concentration of 1-50 μM. The test compounds are incubated with human PAI-1 (50 ng/ml) for 15 minutes at room temperature. The tPA-coated plate is washed with a solution of 0.05% Tween 20 and 0.1% BSA, then the plate is blocked with a solution of 3% BSA. An aliquot of the test compound/PAI-1 solution is then added to the tPA-coated plate, incubated at room temperature for 1 hour, and washed. Active PAI-1 bound to the plate is assessed by adding an aliquot of a 1:1000 dilution of the 33B8 monoclonal antibody against human PAI-1, and incubating the plate at room temperature for 1 hour (Molecular Innovations, Royal Oak, MI). The plate is again washed, and a solution of goat anti-mouse IgG-alkaline phosphatase conjugate is added at a 1:50,000 dilution in goat serum. The plate is incubated 30 minutes at room temperature, washed, and a solution of alkaline phosphatase substrate is added. The plate is incubated 45 minutes at room temperature, and color development is determined at OD405nm. The quantitation of active PAI-1 bound to tPA at varying concentrations of the test compound is used to determine the IC\(_{50}\). Results are analyzed
using a logarithmic best-fit equation. The assay sensitivity is 5 ng/ml of human PAI-1 as determined from a standard curve ranging from 0-100 ng/ml.

Representative compounds of the present invention inhibited Plasminogen Activator Inhibitor-1 as summarized in Table I.
