This application is a continuation-in-part of U.S. Patent Application Serial No. 10/861,957, filed on June 3, 2004, which is a continuation-in-part of U.S. Patent Application 10/456,275, filed on June 6, 2003, now U.S. Patent No. 6,747,037 incorporated herein by reference, and claims priority thereto.

Field of the Invention

The present invention relates to piperidinyl prostaglandin E analogs useful as therapeutic agents, e.g. treatment of inflammatory bowel disease.

Background of the Invention

Description of Related Art

Prostaglandins can be described as derivatives of prostanoic acid which have the following structural formula:

![Prostaglandin Structural Formula]

Various types of prostaglandins are known, depending on the structure and substituents carried on the alicyclic ring of the prostanoic acid skeleton. Further classification is based on the number of unsaturated bonds in the side chain indicated by
numerical subscripts after the generic type of prostaglandin [e.g. prostaglandin E₁ (PGE₁), prostaglandin E₂ (PGE₂)], and on the configuration of the substituents on the alicyclic ring indicated by α or β [e.g. prostaglandin F₂α (PGF₂α)].

Prostaglandins are useful for the long-term medical management of glaucoma (see, for example, Bito, L.Z. Biological Protection with Prostaglandins, Cohen, M.M., ed., Boca Raton, Fla, CRC Press Inc., 1985, pp. 231-252; and Bito, L.Z., Applied Pharmacology in the Medical Treatment of Glaucomas Drance, S.M. and Neufeld, A.H. eds., New York, Grune & Stratton, 1984, pp. 477-505. Such prostaglandins include PGF₂α, PGF₁α, PGE₂, and certain lipid-soluble esters, such as C₁ to C₂ alkyl esters, e.g. 1-isopropyl ester, of such compounds.

Inflammatory bowel disease (IBD) is a group of disease characterized by inflammation in the large or small intestines and is manifest in symptoms such as diarrhea, pain, and weight loss. Nonsteroidal anti-inflammatory drugs have been shown to be associated with the risk of developing IBD, and recently Kabashima and colleagues have disclosed that "EP4 works to keep mucosal integrity, to suppress the innate immunity, and to downregulate the proliferation and activation of CD4+ T cells. These findings have not only elucidated the mechanisms of IBD by NSAIDs, but also indicated the therapeutic potential of EP4-selective agonists in prevention and treatment of IBD." A "pharmaceutically acceptable salt" is any salt that retains the activity of the parent compound and does not impart any additional deleterious or untoward effects on the subject to which it is administered and in the context in which it is administered compared to the parent compound. A pharmaceutically acceptable salt also refers to any salt which may form in vivo as a result of administration of an acid, another salt, or a prodrug which is converted into an acid or salt.

Pharmaceutically acceptable salts of acidic functional groups may be derived from organic or inorganic bases. The salt may comprise a mono or polyvalent ion. Of particular interest are the inorganic ions, lithium, sodium, potassium, calcium, and
magnesium. Organic salts may be made with amines, particularly ammonium salts such as mono-, di- and trialkyl amines or ethanol amines. Hydrochloric acid or some other pharmaceutically acceptable acid may form a salt with a compound that includes a basic group, such as an amine or a pyridine ring.

A "prodrug" is a compound which is converted to a therapeutically active compound after administration, and the term should be interpreted as broadly herein as is generally understood in the art. While not intending to limit the scope of the invention, conversion may occur by hydrolysis of an ester group or some other biologically labile group. Generally, but not necessarily, a prodrug is inactive or less active than the therapeutically active compound to which it is converted. Ester prodrugs of the compounds disclosed herein are specifically contemplated. While not intending to be limiting, an ester may an allyl ester, an aryl ester, or a heteroaryl ester. The term alkyl has the meaning generally understood by those skilled in the art and refers to linear, branched, or cyclic alkyl moieties. C₄₋₈ alkyl esters are particularly useful, where alkyl part of the ester has from 1 to 6 carbon atoms and includes, but is not limited to, methyl, ethyl, propyl, isopropyl, n-butyl, sec-butyl, iso-butyl, t-butyl, pentyl isomers, hexyl isomers, cyclopentyl, cyclobutyl, cyclohexyl, and combinations thereof having from 1-6 carbon atoms, etc.

The above compounds of the present invention may be prepared by methods that are known in the art or according to the working examples below. The compounds, below, are especially preferred representative, of the compounds of the present invention.

or a pharmaceutically acceptable salt or a prodrug thereof.

The actual compounds depicted in these structures as well as their derivatives as defined herein are contemplated in these embodiments.

Thus, the following compounds are contemplated, as well as their derivatives, which will be described in detail hereafter.
Salts, and prodrugs of the compounds depicted in the structures as well as salts and prodrugs of the derivatives are also contemplated.

The following compounds are also contemplated, as well as their derivatives, which will be described in detail hereafter.

Salts, and prodrugs of the compounds depicted in the structures as well as salts and prodrugs of the derivatives are also contemplated.

In making reference to a derivative and alterations to the structure shown above, it should be emphasized that making alterations and forming derivatives is strictly a mental exercise used to define a set of chemical compounds, and has nothing to do with whether said alteration can actually be carried out in the laboratory, or whether a derivative can be prepared by an alteration described. However, whether the derivative can be prepared via any designated alteration or not, the differences between the derivatives and the aforementioned structure are such that a person of ordinary skill in the art could prepare the derivatives disclosed herein using routine methods known in the art without undue experimentation.
The α chain is the group in the solid circle in the labeled structures above. The ω chain is the group in the dashed circle in the labeled structures above. Thus, in these embodiments said derivative may be different from the formulae above at the α chain, while no alteration is made to the ω chain, as for example, in the structures shown below.

Pharmaceutically acceptable salts and prodrugs of these compounds are also contemplated.

The derivatives may also be different from the formulae above in the ω chain, while no alteration is made to the α chain, as shown in the examples below.

Pharmaceutically acceptable salts and prodrugs of these compounds are also contemplated.
Alternatively, the derivatives may be different in both the \( \alpha \) and \( \omega \) chains, as shown in the examples below.

Pharmaceutically acceptable salts and prodrugs of these compounds are also contemplated.

Changes to the structure can take several forms, if a non-hydrogen atom is added, the structure is changed by adding the atom, and any required hydrogen atoms, but leaving the remaining non-hydrogen atoms unchanged, such as in the examples shown below, with the added atoms in bold type.

Pharmaceutically acceptable salts and prodrugs of these compounds are also contemplated.

While adding a methyl group or a methylene group to the molecule is a useful alteration in many situations, it may also be useful to add other non-hydrogen atoms such as sulfur or oxygen, such as in the examples below.
Pharmacologically acceptable salts and prodrugs of these compounds are also contemplated.

If a non-hydrogen atom is removed, the structure is changed by removing the atom, and any required hydrogen atoms, but leaving the remaining non-hydrogen atoms unchanged, such as in the examples shown below, with the previous location of the missing atoms indicated by arrows.

Pharmacologically acceptable salts and prodrugs of these compounds are also contemplated.

If a non-hydrogen atom is substituted, the non-hydrogen atom is replaced by a different non-hydrogen atom, with any necessary adjustment made to the number hydrogen atoms, such as in the examples shown below, with the substituted atoms in bold type.

Pharmacologically acceptable salts and prodrugs of these compounds are also contemplated.
Another possible alteration is the conversion of an alcohol to a carbonyl, such as in the examples below.

Pharmaceutically acceptable salts and prodrugs of these compounds are also contemplated.

Another alteration includes converting a CO₂H to a moiety selected from the group consisting of CONMe₂, CONHMe, CONHET, CON(OCH₂)CH₃, CONH₂, CON(CH₂CH₂OH)₂, CONH(CH₂CH₂OH), CH₂OH, P(Ο)(ΟH)₂, CONH₂SO₂CH₂, SO₂NH₂, SO₂N(CH₃)₂, SO₂NH(CH₃),

such as in the examples below.
Pharmaceutically acceptable salts and prodrugs of these compounds are also contemplated.

The tetrazole group,

![Tetrazole structure](image)

has two tautomeric forms, which can rapidly interconvert in aqueous or biological media, and are thus equivalent to one another. The tautomer of the tetrazole shown above is shown below.

![Tetrazole structure](image)

For the purposes disclosed herein, all tautomeric forms should be considered equivalent in every way. If the tetrazole has a substituent or some other symmetry breaking feature, more than two tautomeric forms may exist. These are also considered to be equivalent to one another.

Another alteration consists of converting a phenyl moiety to a pyridinyl, furyl, or thieryl moiety, such as in the examples below.
Pharmaceutically acceptable salts and prodrugs of these compounds are also contemplated.

Another alteration consists of adding a substituent comprising from 1 to 3 non-hydrogen atoms to an aromatic or a heteroaromatic ring, as in the examples below.
Pharmaceutically acceptable salts and prodrugs of these compounds are also contemplated.

If a derivative could reasonably be construed to consist of a different number of alterations, the derivative is considered to have the lowest reasonable number of alterations. For example, the compound shown below, having the modified portion of the molecule in bold, could be reasonably construed to have 1 or 2 alterations relative to the defined structure.
By one line of reasoning, the first alteration would be to add an ethyl substituent to the phenyl ring. The second alteration would be to add a carbon atom, with its accompanying hydrogen atoms to the ethyl substituent. By a second line of reasoning, the derivative would be obtained by simply adding an isopropyl group to the phenyl ring. In accordance with the rule established above, the compound above is defined as having 1 alteration. Thus, an additional alteration could be made to the structure to obtain the compounds such as the examples shown below.

Pharmaceutically acceptable salts and prodrugs of these compounds are also contemplated.

Some alterations are considered to render particularly useful compounds. While not intending to limit the scope of the invention in any way, in certain compounds, an oxygen atom or a sulfur atom is substituted for a carbon atom, such as in the examples below. In particular, it is useful for this alteration to occur in the α chain, as in the case in 5 of the 6 examples shown below.

Pharmaceutically acceptable salts and prodrugs of these compounds are also contemplated.
The addition of CH₂, O, or S to the ω chain is also considered to yield particular useful compounds such as the ones below.

Pharmaceutically acceptable salts and prodrugs of these compounds are also contemplated.

While not intending to limit the scope of the invention in any way, particularly useful compounds are obtained when certain alterations are made twice. Alterations that are useful when made twice are the substitution of a carbon atom with a sulfur atom or an oxygen atom and the addition of a substituent to a phenyl ring.

Examples of compounds obtained by two substitutions of a carbon atom with a sulfur atom or an oxygen atom are shown below.

Pharmaceutically acceptable salts and prodrugs of these compounds are also contemplated.

Examples of compounds obtained by two additions of a substituent to a phenyl ring are shown below.
Pharmaceutically acceptable salts and prodrugs of these compounds are also contemplated.

While not intending to limit the scope of the invention in any way, certain combinations of alterations also render particularly useful compounds. In particular, the combination of substitution of carbon with sulfur or oxygen with an alteration to the phenyl ring gives particularly useful compounds. For example, substitution of a carbon atom with sulfur or oxygen and the addition of a substituent to a phenyl ring yields particularly useful compounds such as the ones shown below.
Pharmaceutically acceptable salts and prodrugs of these compounds are also contemplated.

Another combination which yields useful compounds is the substitution of phenyl with pyridinyl, furyl, or thieryl and the substitution of a carbon atom with sulfur or oxygen such as in the examples below.
Pharmaceutically acceptable salts and prodrugs of these compounds are also contemplated.

Another combination which yields useful compounds is the substitution of phenyl with pyridinyl, furyl, or thiienyl and the addition of a substituent to the heteroaryl ring such as in the examples below.
Pharmaceutically acceptable salts and prodrugs of these compounds are also contemplated.

Treatment of inflammatory bowel disease may be accomplished by the administration of the compounds described herein to the suffering mammal. Inflammatory bowel disease describes a variety of diseases characterized by inflammation of the bowels including, but not limited to, ulcerative colitis and Crohn’s disease. Treatment may be accomplished by oral administration, by suppository, or parenteral administration, or some other suitable method.

While not intending to limit the scope of the invention in any way, delivery of the compounds disclosed herein to the colon via oral dosage forms may be accomplished by any of a number of methods known in the art. For example, reviews by Chourasia and Jain in J Pharm Pharmaceut Sci 6 (1): 33-66, 2003 and Shareef et. al (AAPS PharmSci 2003; 5 (2) Article 17) describe a number of useful methods. While not intending to limit the scope of the invention in any way these methods include 1) administration of a prodrug, including an azo or a carbohydrate based prodrug; 2) coating the drug with, or encapsulating or impregnating the drug into a polymer designed for delivery to the colon, 3) time released delivery of the drug, 4) use of a bioadhesive system; and the like.
While not intending to be bound in any way by theory, it is believed that intestinal microflora are capable of reductive cleavage of an azo bond leaving the two nitrogen atoms as amine functional groups. While not intending to limit the scope of the invention in any way, the azo prodrug approach has been used to deliver to 5-aminosalicylic acid humans in clinical trials for the treatment of irritable bowel disease. It is also believed that bacteria of the lower GI also have enzymes which can digest glycosides, glucuronides, cyclodextrins, dextrins, and other carbohydrates, and ester prodrugs formed from these carbohydrates have been shown to deliver the parent active drugs selectively to the colon. For example, in vivo and in vitro studies on rats and guinea pigs with prodrugs of dexamethasone, prednisolone, hydrocortisone, and fludrocortisone, suggest that glycoside conjugates may be useful for the delivery of steroids to the human colon. Other in vivo studies have suggested that glucuronide, cyclodextrin, and dextran prodrugs of steroids or non-steroidal anti-inflammatory drugs are useful for delivery of these drugs to the lower GI tract. An amide of salicylic acid and glutamic acid has been shown to be useful for the delivery of salicylic acid to the colon of rabbit and dog.

While not intending to limit the scope of the invention in any way, carbohydrate polymers such as amylase, arabinogalactan, chitosan, chondroitin sulfate, dextran, guar gum, pectin, xylin, and the like, or azo-group containing polymers can be used to coat a drug compound, or a drug may be impregnated or encapsulated in the polymer. It is believed that after oral administration, the polymers remain stable in the upper GI tract, but are digested by the microflora of the lower GI thus releasing the drug for treatment.

Polymers which are sensitive to pH may also be used since the colon has a higher pH than the upper GI tract. Such polymers are commercially available. For example, Rohm Pharmaceuticals, Darmstadt, Germany, markets pH dependent methacrylate based polymers and copolymers which have varying solubilities over different pH ranges based upon the number of free carboxylate groups in the polymer under the tradename Eudragit®. Several Eudragit® dosage forms are currently used to deliver salsalazine for the treatment of ulcerative colitis and Crohn’s disease. Time release systems, bioadhesive systems, and other delivery systems have also been studied.

In addition to excipients and methods used specifically for delivering the drug to the upper GI tract, other carriers or excipients may be used. For solid dosage forms or medicaments, other non-toxic solid carriers include, but are not limited to, pharmaceutical grades of mannitol, lactose, starch, magnesium stearate, sodium saccharin, the polyalkylene glycols, talcum, cellulose, glucose, sucrose and magnesium carbonate. Actual methods of preparing dosage forms or medicaments are known, or will be apparent, to those skilled in this art; for example, see Remington's Pharmaceutical Sciences, Mack Publishing Company, Easton, Pa., 18th Edition, 1980. The composition of the formulation to be administered, in any event, contains a quantity of one or more of the presently useful compounds in an amount effective to provide the desired therapeutic effect.

The actual dose of the active compounds of the present invention depends on the specific compound, and on the condition to be treated; the selection of the appropriate dose is well within the knowledge of the skilled artisan.

This invention is further illustrated by the following non-limiting Examples.

Sodium hydride (60% dispersion in oil, 600 mg, 15.0 mmol) was added to a solution of (R)-6-(1-ethoxyethoxymethyl)-piperdin-2-one (from example 50, step 1, 3.00 g, 14.9 mmol) in DMF (20 mL) at 0 °C. After 1 h at 0 °C, (4-iodo-but-2-ynloxy)-acetonitrile (3.50 g, 14.9 mmol) in DMF (10 mL) was added via cannula and the reaction was allowed to warm to rt. After 16.5 h at rt, the reaction was treated with saturated aqueous NaHCO₃ (100 mL) and extracted with EtOAc (3 x 100 mL). The combined extracts were washed with water (2 x 100 mL) and brine (2 x 100 mL) then dried (Na₂SO₄), filtered and concentrated in vacuo.

20

Purification of the residue by flash column chromatography on silica gel (CH₂Cl₂ → 50% EtOAc/CH₂Cl₂, gradient) afforded 1.83 g (40%) of [4-[(R)-2-(1-ethoxy-ethoxymethyl)-6-oxo-piperdin-1-yl]-but-2-ynloxy]-acetonitrile.

Step 4. [4-((R)-2-Hydroxymethyl-6-oxo-piperidin-1-yl)-but-2-ynloxy]-acetonitrile

Trifluoroacetic acid (0.5 mL, 8.5 mmol) was added to a solution of [4-((R)-2-(1-ethoxy-ethoxymethyl)-6-oxo-piperidin-1-yl)-but-2-ynloxy]-acetonitrile (290 mg, 0.94 mmol) in CH₂Cl₂ (3 mL). After 1 h at rt, the reaction mixture was quenched with saturated aqueous NaHCO₃ (20 mL) and extracted with CH₂Cl₂ (3 x 20 mL). Combined extracts were dried (Na₂SO₄), filtered and concentrated in vacuo. Purification of the residue by flash column chromatography on silica gel (CH₂Cl₂ → 3% MeOH/CH₂Cl₂, gradient) afforded 118 mg (53%) of [4-((R)-2-hydroxymethyl-6-oxo-piperidin-1-yl)-but-2-ynloxy]-acetonitrile.

25

Step 5. [4-((R)-2-Formyl-6-oxo-piperidin-1-yl)-but-2-ynloxy]-acetonitrile

EDCI (288 mg, 1.50 mmol) was added to a solution of [4-((R)-2-hydroxymethyl-6-oxo-piperidin-1-yl)-but-2-ynloxy]-acetonitrile (118 mg, 0.50 mmol) in benzene (4 mL). The reaction mixture was cooled to 0 °C and DMSO (0.14 mL, 2.0 mmol) was added. After 5 min at 0 °C, pyridinium trifluoroacetate (106 mg, 0.55 mmol) was added. The reaction was allowed to warm to rt and then was stirred at rt for 3 h. The solution was decanted from the oily residue and the residue was washed with benzene (3 x 5 mL). The combined benzene phases were concentrated in vacuo to afford crude [4-((R)-2-formyl-6-oxo-piperidin-1-yl)-but-2-ynloxy]-acetonitrile, which was used without further purification.
Step 6. [4-{(R)-2-Oxo-6-[(E)-3-oxo-4-phenyl-but-1-enyl]-piperidin-1-yl]-but-2-ynloxy}-acetonitrile
Sodium hydride (60% dispersion in oil, 18 mg, 0.45 mmol) was added to a solution of dimethyl 2-oxo-3-phenylpropylphosphonate (110 mg, 0.45 mmol) in THF (1.5 mL) at 0 °C. After 1 h at 0 °C, a solution of [4-{(R)-2-formyl-6-oxo-piperidin-1-yl]-but-2-ynloxy]-
adetonitrile (0.50 mmol, crude from step 5) in THF (1.5 mL) was added via cannula. The reaction was allowed to warm to rt.
After 18 h at rt, the reaction was quenched with aqueous acetic acid (50%, 10 mL) and extracted with EtOAc (3 x 20 mL). The combined organic phase was washed with brine (25 mL), dried (Na₂SO₄), filtered and concentrated in vacuo. Purification of the residue by flash column chromatography on silica gel (10% → 40% EtOAc/CH₂Cl₂, gradient) afforded 75 mg (48%) of the title compound.

Example 92

[4-{(R)-2-Oxo-6-[(3-oxo-4-phenyl-butyl)-piperidin-1-yl]-butoxy}-acetonitrile
Palladium on carbon (10 wt. %, 7 mg) was added to a solution of [4-{(R)-2-oxo-6-[(E)-3-oxo-4-phenyl-but-1-enyl]-piperidin-1-yl]-but-2-ynloxy]-acetonitrile (35 mg, 0.10 mmol) in MeOH (3.0 mL). A hydrogen atmosphere was established by evacuating and refilling with hydrogen (3x) and the reaction mixture was stirred under a balloon of hydrogen for 19 h. The reaction mixture was filtered through celite, washing with MeOH, and the filtrate was concentrated in vacuo. Purification of the residue by flash column chromatography on silica gel (CH₂Cl₂ → 2% MeOH/CH₂Cl₂, gradient) afforded 20 mg (56%) of the title compound.

Example 93

[4-{(R)-2-oxo-6-[(3-hydroxy-4-phenyl-butyl)-piperidin-1-yl]-butoxy}-acetonitrile
Lithium aluminum hydride (1.0 M in THF, 0.02 mL, 0.02 mmol) was added to a solution of [4-{(R)-2-oxo-6-[(3-oxo-4-phenyl-butyl)-piperidin-1-yl]-butoxy}-acetonitrile (15.7 mg, 0.044 mmol) in THF (0.75 mL) at 0 °C. After 2 h at 0 °C the reaction was quenched with saturated aqueous NH₄Cl (5 mL) and extracted with (3 x 5 mL). The combined organic phase was dried (Na₂SO₄), filtered and concentrated in vacuo to afford 12.3 mg (78%) of the title compound.

Example 94

(R)-1-[4-{2-Amino-ethoxy}-butyl]-8-[(3-hydroxy-4-phenyl-butyl)-piperidin-2-one
Raney nickel (5 mg) was added to a solution of [4-{(R)-2-[(3-hydroxy-4-phenyl-butyl)-8-oxo-piperidin-1-yl]-butoxy}-acetonitrile (10.5 mg, 0.029 mmol) in MeOH (1.5 mL). A hydrogen atmosphere was established by evacuating and refilling with hydrogen (3x) and the reaction mixture was stirred under a balloon of hydrogen for 19 h. The reaction mixture was filtered through celite, washing with MeOH, and the filtrate was concentrated in vacuo to afford 8.9 mg (65%) of the title compound.

These compounds are tested for in vitro activity as described below and the results given in the Table.

Plasmids encoding the human EP₃, EP₅, EP₉, EP₁₀, FP, TP, IP and DP receptors were prepared by cloning the respective coding sequences into the eukaryotic expression vector pCEP4 (Invitrogen). The pCEP4 vector contains an Epstein Barr virus (EBV) origin of replication, which permits episomal replication in primate cell lines expressing EBV nuclear antigen
(EBNA-1). It also contains a hygromycin resistance gene that is used for eukaryotic selection. The cells employed for stable transfection were human embryonic kidney cells (HEK-293) that were transfected with and express the EBNA-1 protein. These HEK-293-EBNA cells (Invitrogen) were grown in medium containing Geneticin (G418) to maintain expression of the EBNA-1 protein. HEK-293 cells were grown in DMEM with 10% fetal bovine serum (FBS), 250 μg ml⁻¹ G418 (Life Technologies) and 200 μg ml⁻¹ gentamicin or penicillin/streptomycin. Selection of stable transfecants was achieved with 200 μg ml⁻¹ hygromycin, the optimal concentration being determined by previous hygromycin kill curve studies.

For transfection, the cells were grown to 50-60% confluence on 10 cm plates. The plasmid pCEP4 incorporating cDNA inserts for the respective human prostaglandin receptor (20 μg) was added to 500 μl of 250 mM CaCl₂. HEPES buffered saline x 2 (2 x HBS, 260 mM NaCl, 20 mM HEPES acid, 1.5 mM Na₂HPO₄, pH 7.05 - 7.12) was then added dropwise to a total of 500 μl, with continuous vortexing at room temperature. After 30 min, 9 ml DMEM were added to the mixture. The DNA/DMEM/calcium phosphate mixture was then added to the cells, which had been previously rinsed with 10 ml PBS. The cells were then incubated for 5 hr at 37°C in humidified 95% air/5% CO₂. The calcium phosphate solution was then removed and the cells were treated with 10% glycerol in DMEM for 2 min. The glycerol solution was then replaced by DMEM with 10% FBS. The cells were incubated overnight and the medium was replaced by DMEM/10% FBS containing 250 μg ml⁻¹ G418 and penicillin/streptomycin.

The following day hygromycin B was added to a final concentration of 200 μg ml⁻¹.

Ten days after transfection, hygromycin B resistant clones were individually selected and transferred to a separate well on a 24 well plate. At confluence each clone was transferred to one well of a 6 well plate, and then expanded in a 10 cm dish. Cells were maintained under continuous hygromycin selection until use.

**RADIOLIGAND BINDING**

Radioligand binding studies on plasma membrane fractions prepared from cells were performed as follows. Cells washed with TME buffer were scraped from the bottom of the flasks and homogenized for 30 sec using a Brinkman PT 10/35 polytron. TME buffer was added as necessary to achieve a 40 ml volume in the centrifuge tubes. TME is comprised of 50 mM TRIS base, 10 mM MgCl₂, 1 mM EDTA; pH 7.4 is achieved by adding 1 N HCl. The cell homogenate was centrifuged at 19,000 rpm for 20-25 min at 4°C using a Beckman Ti-60 or Ti-70 rotor. The pellet was then resuspended in TME buffer to provide a final protein concentration of 1 mg/ml, as determined by Bio-Rad assay. Radioligand binding assays were performed in a 100 μl or 200 μl volume.

The binding of [³H] PGE₂ (specific activity 165 Ci/mmol) was determined in duplicate and in at least 3 separate experiments. Incubations were for 60 min at 25°C and were terminated by the addition of 4 ml of ice-cold 50 mM TRIS-HCl followed by rapid filtration through Whatman GF/B filters and three additional 4 ml washes in a cell harvester (Brandel). Competition studies were performed using a final concentration of 2.5 or 5 nM [³H] PGE₂ and non-specific binding was determined with 10⁻⁶ M unlabelled PGE₂.

For all radioligand binding studies, the criteria for inclusion were >50% specific binding and between 500 and 1000 displaceable counts or better.
