(57) Abrégé/Abstract:
Peptides of general formula (I): \(R_1W_nX_m=AA_1-AA_2-AA_3-AA_4-AA_5-AA_6-Y_1-Z_2=R_2\), their stereoisomers, mixtures thereof and/or their cosmetically or pharmaceutically acceptable salts, their preparation process, cosmetic or pharmaceutical compositions which contain them and their use in the treatment and/or care of conditions, disorders and/or diseases that are a consequence of muscle contraction.
Title: COMPOUNDS WHICH INHIBIT MUSCLE CONTRACTION

Abstract: Peptides of general formula (I): \( R_1 - W_r - X_r - A_{r1} - A_{r2} - A_{r3} - A_{r4} - A_{r5} - A_{r6} - Y_r - Z - R_2 \), their stereoisomers, mixtures thereof and/or their cosmetically or pharmaceutically acceptable salts, their preparation process, cosmetic or pharmaceutical compositions which contain them and their use in the treatment and/or care of conditions, disorders and/or diseases that are a consequence of muscle contraction.
COMPONDS WHICH INHIBIT MUSCLE CONTRACTION

FIELD OF THE INVENTION

This invention relates to peptides capable of inhibiting muscle contraction and to cosmetic or pharmaceutical compositions which contain these peptides useful in the treatment and/or care of the skin, preferably for the treatment and/or care of conditions, disorders and/or diseases which are a consequence of muscle contraction, particularly of acetylcholine receptor clustering.

BACKGROUND OF THE INVENTION.

Muscle contraction is the physiological process in which muscles develop tension and are shortened or lengthened (or can also remain the same length) due to a prior excitation stimulus. These contractions produce the motive force of almost all superior animals to, for example, displace the contents of the cavity that they cover (smooth muscles) or move the organism through its environment or to move other objects (striated muscle).

Muscles are formed by contractile multinucleated muscle fibers (syncytes which result from the fusion of several myocytes), arranged forming portions which are innervated by the synaptic buttons in neuronal axons. The junction between neuron and muscle fiber is called a neuromuscular junction or NMJ. Neurons transmit stimuli in the form of action potentials and this causes the release of the neurotransmitter acetylcholine (ACh) to the synaptic cleft. In the postsynaptic part of NMJ there is an accumulation of acetylcholine receptors (AChRs) responsible for receiving the signal and causing the muscle to contract.

AChRs are classified into two large groups according to their binding with specific agonists: nicotinic acetylcholine receptors (nAChRs) and muscarinic acetylcholine receptors (mAChRs). Nicotinic acetylcholine receptors are given this name due to the high affinity with which they bind to the alkaloid nicotine; the muscarinic acetylcholine receptors, however, bind with a high affinity to the alkaloid muscarine. The nicotinic acetylcholine receptors, in turn, can be classified according to their capacity or incapacity to bind α-bungarotoxin. nAChRs are ionotropic receptors, i.e., they are coupled to ionic channels whose pathway is opened by the ligand binding. mAChRs
are metabotropic type receptors or receptors which are coupled to G proteins: in their case the circulation of ions depends on one or various metabolic pathways triggered by the ligand binding.

The neuromuscular junction has classically been used as a general neurotransmission model and therefore its functioning is described in detail. An action potential arrives at the terminal part of the motor neuron and causes the voltage-dependent calcium channels to open in the presynaptic membrane, with a resulting local intracellular increase in calcium. The Ca$^{2+}$ ions bind to proteins which link the synaptic vesicles, full of neurotransmitter ACh, to the plasma membrane. In this case, the synaptobrevin protein binds strongly to syntaxin and SNAP-25, forming the SNARE complex (SyNaptosomal-Associated Protein Receptor), which enables the fusion between vesicular and plasma membranes and causes exocytosis of ACh to the synaptic cleft. This neurotransmitter spreads through the synaptic space and binds to the AChRs in the postsynaptic membrane. The binding of ACh (or another agonist) causes the channel to open and this enables the circulation of sodium ions towards to inside of the cell and the potassium to leave. The entrance of sodium causes a depolarization which is transmitted through the cell membrane until it arrives at the specialized areas that trigger the release of calcium from endoplasmic reticulum towards the cytosol which induces the contraction of the muscle.

At a molecular level, the nAChRs are pentameric proteins formed by 5 monomers arranged in radial symmetry and forming a pore 2.5nm in diameter. These sub-units are generally found in a stoichiometry $\alpha_2\beta_\gamma\delta$, and 17 types of subunits have been described: 10 types of $\alpha$ -called $\alpha_1$ to $\alpha_{10}$-, 4 types of subunit $\beta$ -called $\beta_1$ to $\beta_4$, $\gamma$, $\delta$, and $\varepsilon$ [Lindstrom J. (1997) "Nicotinic acetylcholine receptors in health and disease" Mol. Neurobiol. 15:193-222]. The molecular composition at a sub-unit level finely determines the functionality of the receptor: in the neuromuscular junction, for example, the nAChRs are heteropentameric $\alpha_1\beta_1\gamma\delta$ in the embryonic phase, whilst in the adult phase they are heteropentameric $(\alpha_1\beta_1\gamma\delta\varepsilon$. The change of sub-unit $\gamma$ to $\varepsilon$ has been related to the maturation of the neuromuscular junction, and with the maintenance of the structure in adult muscle [Yumoto N., Wakatsuki S. and Sehara-Fujisawa A. (2005) "The acetylcholine receptor gamma-to-epsilon switch occurs in individual endplates" Biochem. Biophys. Res. Commun. 331:1522-1527].

The neuromuscular junction is a specialized structure whose function is to ensure an efficient and rapid transmission of an action potential in order to cause depolarization in
the postsynaptic muscle, which is the signal required for this to contract itself. To achieve a rapid transfer of information between neuron and muscle fiber a correct spatial disposition of the presynaptic zone with the postsynaptic membrane is required. The presynaptic part is characterized by the presence of ACh vesicles, whilst almost all the muscle fiber AChRs are concentrated and are densely packed in the postsynaptic part. The AChRs cluster in a complex process which is key in the formation of the NMJ and its maintenance [Hoch W. (1999) "Formation of the neuromuscular junction. Agrin and its unusual receptors" Eur. J. Biochem. 265:1-10].

AChR clustering requires the interaction of various proteins, of which three should be highlighted: agrin, MuSK (muscle-specific kinase) and rapsyn. The protein agrin is believed to be responsible for triggering the pathway which leads to the clustering of receptors [Mittaud P., Camilleri A.A., Willmann R., Erb-Vöglti S., Burden S.J. and Fuhrer C. (2004) "A single pulse of agrin triggers a pathway that acts to cluster acetylcholine receptors" Mol. Cell Biol. 18:7841-7854], and which results in phosphorylation, clustering and stabilization of AChRs. The protein rapsyn is capable of inducing AChR clustering in culture and it has been demonstrated that in mutants deficient for rapsyn the formation of AChR clusters is inhibited [Apel E.D., Robers S.L., Campbell K.P. and Merlie J.P. (1995) "Rapsyn may function as a link between the acetylcholine receptor and the agrin-binding dystrophin-associated glycoprotein complex" Neuron 1:115-126]. The factor that links agrin and rapsyn is MuSK [Valenzuela D.M., Stitt T.N., DiStefano P.S., Rojas E., Mattsson K., Compton D.L., Nuñez L., Park J.S., Stark J.L., Gies D.R., Thomas S., Le Beau M.M., Fernald A.A., Copeland N.G., Jenkins N.A., Burden S.J., Glass D.J. and Yancopoulos G.D. (1995) "Receptor tyrosine kinase specific for the skeletal muscle lineage: Expression in embryonic muscle, at the neuromuscular junction, and after injury" Neuron 3:573-584]. MuSK is a receptor with kinase activity which phosphorylates the protein agrin in an interaction which requires an additional component called MASC (muscle associated specificity component). The activation of MuSK through the binding of this ligand is not sufficient on its own to cause AChR clustering, and an interaction between MuSK and rapsyn has been proposed which would be mediated by a factor called RATL (rapsyn associated transmembrane linking molecule), through which the AChR-rapsyn complex could interact with the agrin-MASC-MuSK complex and form the postsynaptic apparatus of mature NMJs [Zhou H., Glass D.J., Yancopoulos G.D. and Sanes J.R. (1999) "Distinct domains of MuSK mediate its abilities to induce and to associate with postsynaptic specializations" J. Cell Biol. 146:1133-1146]. It has been found that the gene which codifies MuSK is disturbed in severe muscular diseases such as congenital

Muscle contractions are controlled by the central nervous system; the brain controls voluntary contractions, whilst the spinal cord controls involuntary reflects. Both processes are mediated by the regulated release of the neurotransmitter acetylcholine. However, different disorders or neurological diseases are characterized by involuntary muscle spasms or dystonia, in which the muscles excessively contract in a sustained way [Fahn S. (1988) "Concept and classification of dystonia" Adv. Neurol. 50:1-8]. The appearance of the movements depends on the muscles involved and strength of the contraction. In its weakest form, dystonia can appear to be a simple exaggeration of a movement which would be considered normal, whilst in its most severe form dystonia can even cause abnormal postures of the limbs which are disabling. Depending on the parts of the body which are affected, dystonia is classified as (1) focal dystonia, localized in a specific part of the body, comprising, among others, dystonia of the periocular muscle or blepharospasm, cervical dystonia or spasmodic torticollis, laryngeal dystonia or spasmodic dysphonia, oromandibular dystonia, focal hand dystonia such as writer's or musician's cramp or dystonia of the feet, bruxism, hemifacial spasm, tics and strabismus; (2) generalized dystonia, which affects the greater part or the whole body; (3) multifocal dystonia, which involves two or more unrelated parts of the body; (4) segmental dystonia, which affects two or more adjacent parts of the body, comprising Meige's Syndrome, and (5) hemidystonia, which involves the arm and leg of the same side, comprising dystonia resulting from a stroke [Jinnah H.A. and Hess E.J. (2008) "Experimental therapeutics for dystonia" Neurotherapeutics 5:198-209; Brooke M.H. (1986) "A clinician's view of neuromuscular diseases", Baltimore, Williams & Wilkins; Layzer R.B. (1986) "Muscle pain, cramps and fatigue" in Myology, AG, Engel, BQ Banker, eds, New York, McGraw-Hill].
5
On the other hand, the repeated contraction of the facial muscles, which are those that transmit expression onto the face, lead to creases in specific areas. With age, from approximately thirty years of age, the appearance of wrinkles or expression lines start to become visible in these areas: furrows, more or less linear, arranged perpendicularly to the direction of the muscle fibers, caused by the disappearance of cells in the skin's dermal layer in these areas. Their depth depends on the individual's age, and the frequency and strength of the muscle contractions which cause the crease. The principle muscles involved in the appearance of expression lines are those surrounding the eyes and eyelashes, those on the forehead, the lip, mouth, cheek and neck muscles. These muscles are found in the subcutaneous connective frontal part of the face, from where they rise towards the skin and insert themselves in the deepest part of the dermal stratum. Their contraction can lead to raising, depressing, constricting or dilatory movements of the skin. The early appearance of wrinkles is the most characteristic sign of age and aging of the skin. Aging of the skin is a process which has two principal components: the chronological component, which is due to the passing of time, and the photo-induced or photoaging component, which is due to the level of exposure to ultraviolet radiation (UV). The sum of several environmental factors such as exposure to tobacco smoke, exposure to pollution, and climate conditions such as cold and/or wind also contributes to the skin's aging. The terms "aging" and "photoaging" of the skin refer to the visible changes in the appearance of the skin such as wrinkles, fine lines, roughness, expression lines, stretch marks, discontinuities, furrows, flaccidity, sagging of the skin such as sagging cheeks, loss of resilience, loss of firmness, elastosis, keratosis, and loss of smoothness.

Since the 1990s, the use of the toxins Clostridium botulinum (marketed as Botox® by Allergan) injected into the muscle to reduce muscle contraction and to treat associated diseases such as dystonia and/or pain. Neurotoxin injections have also been used to treat and/or care for the skin with the aim of reducing, delaying or preventing the signs of aging and/or photoaging and in particular to relax the facial expression and reduce the formation of wrinkles or minimize their appearance. Its action mechanism is based on blocking ACh release in the presynaptic terminal of the axon in the neuromuscular junction, thus avoiding nerve transmission and muscle contraction. The toxin binds to receptors in the presynaptic membrane, is internalized and becomes cytoplasm. Its activity is responsible for breaking the trimolecular synaptobrevin SNARE complex, SNAP-25 and syntaxin; which avoids the binding of synaptic vesicles to plasmalemma and releasing ACh to the synaptic cleft.
Although it has been demonstrated that the effects of the botulinum neurotoxin are very lasting, since they take several weeks to reestablish a completely functional innervation of the muscle after the irreversible destruction of the SNARE complex, its administration is not risk free. The main risk is that of its toxicity: even doses lower than 50μg are lethal for an adult human being. The botulinum neurotoxin causes muscle paralysis, and can even cause death due to cardiac arrest. Administration of the botulinum toxin should, therefore, be carried out by a specialist due to the intrinsic danger of the substance as well as the administration method: direct injection into the muscle. The blocking of the nerve transmission at AChR level through botulinum toxin is not specific enough to just inhibit muscle contraction, but it has other activities which may be undesired by the patient and can cause secondary effects such as nausea, pain or erythema.

The pharmaceutical field has also used other compounds for the inhibition of muscle contraction, including modulators of the gamma-aminobutyric receptor (GABA) such as baclofen or benzodiazepines, agonists of the \( \alpha_2 \)-adrenergic receptors such as tizanidine or clonidine, modulators of AChRs such as the alkaloids derived from curare, specific antibodies against AChRs such as those described in patent US 6,780,413 B2 or agonists of the ryanodine receptor such as dantrolene. None of these treatments is free from secondary effects, since many of them act at a central nervous system level and may cause dizzy spells, sedation and even addiction in continued treatments.

The cosmetic industry has also carried out different efforts to develop new compounds for the treatment of expression lines and, therefore, to treat and/or care for the skin with the aim of reducing, delaying or preventing the signs of aging and/or photoaging through topical application which avoids the potential secondary effects which occur after injecting botulinum toxin and are, therefore, safer. Different products aimed at the inhibition of the neuromuscular junction at a synaptic level to avoid the appearance or to soften expression lines are described in the prior art. The patents EP 1180524 B1 and WO9734620 describe the use of peptides derived from the protein SNAP-25 which act pre-synaptically competing with SNAP-25 in the formation of the SNARE complex, causing a reduction in the release of ACh and inhibiting the neuronal transmission in the NMJ. Patent EP 1809652 A2 describes antagonist peptides of AChRs which act post-synaptically with a mechanism of action similar to waglerin-1 to block the nerve transmission and prevent the appearance of wrinkles. The active cosmetic pentapeptide-3 also acts post-synaptically by inhibiting AChRs, with a mechanism of
action similar to tubocurarine to block the nerve transmission and prevent the appearance of wrinkles.

However, none of the compounds developed by the cosmetic or pharmaceutical field is capable of inhibiting muscle contraction with effectiveness similar to that of botulinum toxin, but in a way that is risk free. Thus there is still a need to identify new agents capable of inhibiting muscle contraction for their co-administration with existing agents in order to achieve better results in the treatment of dystonias as well as in the reduction and/or softening of wrinkles, and in particular, expression lines and, therefore, treat and care for the skin with the aim of reducing, delaying or preventing the signs of aging and/or photoaging.

DETAILED DESCRIPTION OF THE INVENTION

This invention provides a solution to the above-mentioned problem. Surprisingly the applicant of this invention has found that certain synthetic peptides present an important effectiveness in the inhibition of AChR clustering and therefore are useful for the treatment and/or care of those conditions, disorders and/or diseases which are a consequence of muscle contraction, particularly of acetylcholine receptor clustering, as well as the treatment and/or care of the skin.

Definitions

In order to facilitate the comprehension of this invention, the meanings of some terms and expressions as they are used in the context of the invention are included.

Within the context of this invention “skin” is understood to be the layers which comprise it from the outermost layer or stratum corneum to the lowermost layer or hypodermis, both inclusive. These layers are comprised by different types of cells such as keratinocytes, fibroblasts, melanocytes and/or adipocytes among others.

Within the context of this invention the “care of the skin” comprises the prevention of the signs of aging and/photoaging.

Thus, for example, Asp represents $\text{NH}_2\text{-CH(CH}_2\text{COOH)-COO-}$, Asp- represents $\text{NH}_2\text{-CH(CH}_2\text{COOH)-CO-}$, -Asp represents $\text{-NH-CH(CH}_2\text{COOH)-COOH}$ and -Asprepresents $\text{-NH-CH(CH}_2\text{COOH)-CO-}$. Therefore, the dash, which represents the peptide bond, eliminates the OH of the 1-carboxyl group of the amino acid (represented here in the non-ionized conventional form) when located at the right of the symbol, and eliminates the H of the 2-amino group of the amino acid when located at the left of the symbol; both modifications can be applied to the same symbol (see Table 1).

The abbreviation “Ac-” is used in this description to name the acetyl group ($\text{CH}_3\text{-CO-}$) and the abbreviation “Palm-” is used to name the palmitoyl group ($\text{CH}_3\text{-(CH}_2\text{)}_{14}\text{-CO-}$).

The term “non-cyclic aliphatic group” is used in this invention to cover, for example, and not restricted to, linear or branched alkyl, alkenyl and alkynyl groups.

The term “alkyl group” relates to a saturated, linear or branched group, which has between 1 and 24, preferably between 1 and 16, more preferably between 1 and 14, even more preferably between 1 and 12, and even more preferably still 1, 2, 3, 4, 5 or 6 carbon atoms and which is bound to the rest of the molecule by a single bond,
including, for example, and not restricted to, methyl, ethyl, isopropyl, isobutyl, tert-butyl, heptyl, octyl, decyl, dodecyl, lauryl, hexadecyl, octadecyl, amyl, 2-ethylhexyl, 2-methylbutyl, 5-methylhexyl and similar.

The term “alkenyl group” relates to a linear or branched group which has between 2 and 24, preferably between 2 and 16, more preferably between 2 and 14, even more preferably between 2 and 12, even more preferably still 2, 3, 4, 5 or 6 carbon atoms, with one or more carbon-carbon double bonds, preferably with 1, 2 or 3 conjugated or unconjugated carbon-carbon double bonds, which is bound to the rest of the molecule through a single bond, including, for example, and not restricted to, the vinyl, oleyl, linoleyl and similar groups.

The term “alkynyl group” relates to a linear or branched group which has between 2 and 24, preferably between 2 and 16, more preferably between 2 and 14, even more preferably between 2 and 12, even more preferably still 2, 3, 4, 5 or 6 carbon atoms, with one or more carbon-carbon triple bonds, preferably with 1, 2 or 3 conjugated or unconjugated carbon-carbon triple bonds, which is bound to the rest of the molecule through a single bond, including, for example, and not restricted to, the ethynyl group, 1-propinyl, 2-propinyl, 1-butyln, 2-butyln, 3-butyln, pentinyl, such as 1-pentinyl and similar groups.

The term “alicyclic group” is used in this invention to cover, for example, and not restricted to, cycloalkyl or cycloalkenyl or cycloalkynyl groups.

The term “cycloalkyl” relates to a saturated mono- or polycyclic aliphatic group which has between 3 and 24, preferably between 3 and 16, more preferably between 3 and 14, even more preferably between 3 and 12, even more preferably still 3, 4, 5 or 6 carbon atoms and which is bound to the rest of the molecule through a single bond, including, for example, and not limited to, cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, cycloheptyl, methyl cyclohexyl, dimethyl cyclohexyl, octahydroindenene, decahydro-nonaphthalene, dodecahydro-phenalene and similar.

The term “cycloalkenyl” relates to a non-aromatic mono- or polycyclic aliphatic group which has between 5 and 24, preferably between 5 and 16, more preferably between 5 and 14, even more preferably between 5 and 12, even more preferably still 5 or 6 carbon atoms, with one or more carbon-carbon double bonds, preferably with 1, 2 or 3 conjugated or unconjugated carbon-carbon double bonds, which is bound to the rest of the molecule through a single bond, including, for example, and not restricted to, the cyclopent-1-en-1-yl group and similar groups.
The term "cycloalkynyl" relates to a non-aromatic mono- or polycyclic aliphatic group which has between 8 and 24, preferably between 8 and 16, more preferably between 8 and 14, even more preferably between 8 and 12, even more preferably still 8 or 9 carbon atoms, with one or more triple carbon-carbon bonds, preferably 1, 2 or 3 triple conjugated or unconjugated carbon-carbon bonds, which is bound to the rest of the molecule by a simple bond, including, for example, and not restricted to, the cyclooct-2-yn-1-yl group and similar groups.

The term "aryl group" relates to an aromatic group which has between 6 and 30, preferably between 6 and 18, more preferably between 6 and 10, even more preferably 6 or 10 carbon atoms, which comprise 1, 2, 3 or 4 aromatic rings, bound by a carbon-carbon bond or fused, including, for example, and not restricted to, phenyl, naphthyl, diphenyl, indenyl, phenanthryl or anthranyl among others; or an aralkyl group.

The term "aralkyl group" relates to an alkyl group substituted with an aromatic group, with between 7 and 24 carbon atoms and including, for example, and not restricted to, -(CH₂)₃-phenyl, -(CH₂)₃-(1-naphthyl), -(CH₂)₄-(2-naphthyl), -(CH₂)₅-CH(phenyl)₂ and similar.

The term "heterocycl group" relates to a heterocyclic or 3-10 member hydrocarbon ring, in which one or more of the ring atoms, preferably 1, 2 or 3 of the ring atoms, is a different element to carbon, such as nitrogen, oxygen or sulfur and may be saturated or unsaturated. For the purposes of this invention, the heterocycle can be a cyclic, monocyclic, bicyclic or tricyclic system which may include fused ring systems; and the nitrogen, carbon or sulfur atoms can be optionally oxidized in the heterocycl radical; the nitrogen atom can optionally be quaternized; and the heterocycl radical may be partially or completely saturated or may be aromatic. With increasing preference, the term heterocycl relates to a 5 or 6 member ring.

The term "heteroaryalkyl group" relates to an alkyl group substituted with a substituted or unsubstituted aromatic heterocycl group, the alkyl group having from 1 to 6 carbon atoms and the aromatic heterocycl group between 2 and 24 carbon atoms and from 1 to 3 atoms other than carbon and including, for example, and not restricted to, -(CH₂)₃-imidazolyl, -(CH₂)₄-triazolyl, -(CH₂)₅-thienyl, -(CH₂)₆-furyl, -(CH₂)₇-pyrrolidinyl and similar.

As used in this technical area, there may be a certain degree of substitution on the groups defined above. Therefore, there can be substitution in any of the groups of this invention. The references in this document to groups substituted in the groups of this
invention indicate that the radical specified can be substituted in one or more available positions by one or more substituents, preferably in 1, 2 or 3 positions, more preferably in 1 or 2 positions, even more preferably in 1 position. These substituents include, for example, and not restricted to, alkyl C₃-C₄; hydroxyl; alcoxyl C₁-C₄; amino; aminoalkyl C₁-C₄; carbonyloxy C₁-C₄; oxycarbonyl C₁-C₄; halogen such as fluorine, chlorine, bromine and iodine; cyano; nitro; azido; alkylsulfonyl C₁-C₄; thiol; alkylthio C₁-C₄, aryloxy such as phenoxy; -NR₅(C=NR₆)NR₇R₈; wherein R₅ and R₆ are selected independently from the group consisting of H, alkyl C₁-C₄, alkenyl C₂-C₄, alkynyl C₂-C₄, cycloalkyl C₃-C₁₀, aryl C₆-C₁₈, aralkyl C₇-C₁₇, 3-10-membered-heterocycl or protective group of the amino group.

Compounds of the invention

The compounds of the invention are defined by the general formula (I)

$$R_1-W_n-X_m-\text{AA}_1-\text{AA}_2-\text{AA}_3-\text{AA}_4-\text{AA}_5-\text{AA}_6-Y_p-Z_s-R_2$$

(I)

their stereoisomers, mixtures thereof and/or their cosmetically or pharmaceutically acceptable salts, characterized in that:

AA₁ is selected from the group consisting of -Asp-, -Glu- and -Pro-;

AA₂ is -Asp-;

AA₃ is selected from the group consisting of -Tyr- and -Arg-;

AA₄ is selected from the group consisting of -Phe- and -Tyr-;

AA₅ is selected from the group consisting of -Arg- and -Lys-;

AA₆ is selected from the group consisting of -Leu- and -Met-;

W, X, Y and Z are independently selected from amongst themselves from the group consisting of the coded amino acids and non-coded amino acids;

n, m, p and s are independently selected from amongst themselves and have a value of between 0 and 1;

R₁ is selected from the group consisting of H, substituted or unsubstituted non-cyclic aliphatic group, substituted or unsubstituted alicyclic, substituted or unsubstituted heterocyclic, substituted or unsubstituted heteroarylalkyl,
substituted or unsubstituted aryl, substituted or unsubstituted aralkyl and R₅-CO⁻; wherein R₅ is selected from the group consisting of H, substituted or unsubstituted non-cyclic aliphatic group, substituted or unsubstituted alicyclic, substituted or unsubstituted aryl, substituted or unsubstituted aralkyl, substituted or unsubstituted heterocyclyl and substituted or unsubstituted heteroarylamidyl; and

R₂ is selected from the group consisting of -NR₃R₄, -OR₃ and -SR₃; wherein R₃ and R₄ are independently selected from the group consisting of H, substituted or unsubstituted non-cyclic aliphatic group, substituted or unsubstituted alicyclic, substituted or unsubstituted heterocyclyl, substituted or unsubstituted heteroarylamidyl, substituted or unsubstituted aryl, and substituted or unsubstituted aralkyl.

The R₁ and R₂ groups are respectively bound to the amino-terminal (N-terminal) and carboxy-terminal (C-terminal) ends of the peptide sequences.

According to a preferred embodiment of this invention, R₁ is selected from the group consisting of H or R₅-CO⁻, wherein R₅ is selected from the group consisting of substituted or unsubstituted alkyl radical C₁-C₂₄, substituted or unsubstituted alkenyl C₂-C₂₄, substituted or unsubstituted alkynyl C₂-C₂₄, substituted or unsubstituted cycloalkyl C₃-C₂₄, substituted or unsubstituted cycloalkenyl C₅-C₂₄, substituted or unsubstituted cycloalkynyl C₈-C₂₄, substituted or unsubstituted aralkyl C₇-C₂₄, substituted or unsubstituted heterocyclyl with 3-10 ring members, and substituted or unsubstituted heteroarylamidyl of 2 to 24 carbon atoms and 1 to 3 atoms other than carbon and an alkylchain of 1 to 6 carbon atoms. More preferably, R₁ is selected from H, acetyl, tert-butanoxy, hexanoxy, 2-methylhexanoxy, cyclohexanecarboxyloxy, octanoxy, decanoyloxy, lauroxyloxy, myristoyloxy, palmitoyloxy, stearoyloxy, oleoyloxy and linoleoyloxy. Even more preferably, R₁ is H, acetyl, lauroxy, myristoyloxy or palmitoyloxy. In an even more preferred embodiment, R₁ is acetyl or palmitoyloxy.

According to another preferred embodiment, R₂ is -NR₃R₄, -OR₃ or -SR₃, wherein R₃ and R₄ are independently selected from the group consisting of H, substituted or unsubstituted alkyl C₁-C₂₄, substituted or unsubstituted alkenyl C₂-C₂₄, substituted or unsubstituted alkynyl C₂-C₂₄, substituted or unsubstituted cycloalkyl C₃-C₂₄, substituted or unsubstituted cycloalkenyl C₅-C₂₄, substituted or unsubstituted cycloalkynyl C₈-C₂₄, substituted or unsubstituted aryl C₆-C₃₀, substituted or unsubstituted aralkyl C₇-C₂₄, substituted or unsubstituted heterocyclyl with 3-10 ring members and substituted or
unsubstituted heteroaryalkyl of 2 to 24 carbon atoms and 1 to 3 atoms other than carbon and an alkyllic chain of 1 to 6 carbon atoms. Optionally, R3 and R4 can be bound through a saturated or unsaturated carbon-carbon bond, forming a cycle with the nitrogen atom. More preferably R2 is \(-\text{NR}_3\text{R}_4\), or \(-\text{OR}_3\), wherein R3 and R4 are independently selected from the group consisting of H, substituted or unsubstituted alkyl C1-C24, substituted or unsubstituted alkenyl C2-C24, substituted or unsubstituted alkylnyl C2-C24, substituted or unsubstituted cycloalkyl C3-C10, substituted or unsubstituted aryl C6-C15 and substituted or unsubstituted heterocycycl with 3-10 ring members, substituted or unsubstituted heteroaryalkyl with 3 to 10 ring members and an alkyllic chain of 1 to 6 carbon atoms. More preferably R3 and R4 are selected from the group consisting of H, methyl, ethyl, hexyl, dodecyl or hexadecyl. Even more preferably R3 is H and R4 is selected from the group consisting of H, methyl, ethyl, hexyl, dodecyl or hexadecyl. According to an even more preferable embodiment, R2 is selected from \(-\text{OH}\) and \(-\text{NH}_2\).

According to another embodiment of this invention R1 is selected from the group consisting of H, acetyl, lauroyl, myristoyl or palmitoyl, AA1 is \(-\text{L-Glu}\), AA2 is \(-\text{L-Asp}\), AA3 is \(-\text{L-Tyr}\), AA4 is \(-\text{L-Tyr}\), AA5 is \(-\text{L-Arg}\), AA6 is \(-\text{L-Leu}\), and R2 is \(-\text{NR}_3\text{R}_4\) or \(-\text{OR}_3\) wherein R3 and R4 are independently selected from H, methyl, ethyl, hexyl, dodecyl and hexadecyl, preferably R2 is \(-\text{OH}\) or \(-\text{NH}_2\). More preferably, R1 is acetyl or palmitoyl and R2 is \(-\text{NH}_2\). Even more preferably, n, m, p and s are 0.

According to another embodiment of this invention R1 is selected from the group consisting of H, acetyl, lauroyl, myristoyl or palmitoyl, AA1 is \(-\text{L-Pro}\), AA2 is \(-\text{L-Asp}\), AA3 is \(-\text{L-Tyr}\), AA4 is \(-\text{L-Tyr}\), AA5 is \(-\text{L-Lys}\), AA6 is \(-\text{L-Leu}\), and R2 is \(-\text{NR}_3\text{R}_4\) or \(-\text{OR}_3\) wherein R3 and R4 are independently selected from H, methyl, ethyl, hexyl, dodecyl and hexadecyl, preferably R2 is \(-\text{OH}\) or \(-\text{NH}_2\). More preferably, R1 is acetyl or palmitoyl and R2 is \(-\text{NH}_2\). Even more preferably, n, m, p and s are 0.

According to another embodiment of this invention R1 is selected from the group consisting of H, acetyl, lauroyl, myristoyl or palmitoyl, AA1 is \(-\text{L-Glu}\), AA2 is \(-\text{L-Asp}\), AA3 is \(-\text{L-Arg}\), AA4 is \(-\text{L-Phe}\), AA5 is \(-\text{L-Arg}\), AA6 is \(-\text{L-Met}\), and R2 is \(-\text{NR}_3\text{R}_4\) or \(-\text{OR}_3\) wherein R3 and R4 are independently selected from H, methyl, ethyl, hexyl, dodecyl and hexadecyl, preferably R2 is \(-\text{OH}\) or \(-\text{NH}_2\). More preferably, R1 is acetyl or palmitoyl and R2 is \(-\text{NH}_2\). Even more preferably, n, m, p and s are 0.

According to another embodiment of this invention R1 is selected from the group consisting of H, acetyl, lauroyl, myristoyl or palmitoyl, AA1 is \(-\text{L-Glu}\), AA2 is \(-\text{L-Asp}\),
AA₃ is -L-Tyr-, AA₄ is -L-Tyr-, AA₅ is -L-Arg-, AA₆ is -L-Met-, and R₂ is -NR₃R₄ or -OR₃ wherein R₃ and R₄ are independently selected from H, methyl, ethyl, hexyl, dodecyl and hexadecyl, preferably R₂ is -OH or -NH₂. More preferably, R₁ is acetyl or palmitoyl and R₂ is -NH₂. Even more preferably, n, m, p and s are 0.

According to another embodiment of this invention R₁ is selected from the group consisting of H, acetyl, lauroyl, myristoyl and palmitoyl, AA₁ is -L-Pro-, AA₂ is -L-Asp-, AA₃ is -L-Tyr-, AA₄ is -L-Tyr-, AA₅ is -L-Arg-, AA₆ is -L-Met-, and R₂ is -NR₃R₄ or -OR₃ wherein R₃ and R₄ are independently selected from H, methyl, ethyl, hexyl, dodecyl and hexadecyl, preferably R₂ is -OH or -NH₂. More preferably, R₁ is acetyl or palmitoyl and R₂ is -NH₂. Even more preferably, n, m, p and s are 0.

According to another embodiment of this invention R₁ is selected from the group consisting of H, acetyl, lauroyl, myristoyl and palmitoyl, preferably R₁ is selected from the group consisting of H, acetyl and palmitoyl and R₂ is selected from the group consisting of -OH and -NH₂.

Preferably, the compounds of formula (I) are selected from the group consisting of:

Ac-Asp-Asp-Tyr-Phe-Arg-Leu-NH₂,
Ac-Asp-Asp-Tyr-Phe-Arg-Leu-OH,
Ac-Asp-Asp-Tyr-Tyr-Arg-Met-NH₂
Ac-Asp-Asp-Tyr-Tyr-Lys-Leu-NH₂,
Ac-Asp-Asp-Tyr-Tyr-Lys-Leu-OH,
Ac-Asp-Asp-Tyr-Tyr-Lys-Met-NH₂
Ac-Glu-Asp-Arg-Phe-Arg-Leu-NH₂
Ac-Glu-Asp-Arg-Phe-Arg-Met-NH₂-(CH₂)₁₅-CH₃,
Ac-Glu-Asp-Arg-Phe-Arg-Met-NH₂,
Ac-Glu-Asp-Arg-Phe-Arg-Met-OH,
Ac-Glu-Asp-Arg-Phe-Lys-Leu-NH₂,
Ac-Glu-Asp-Arg-Phe-Lys-Leu-OH,
Ac-Glu-Asp-Arg-Tyr-Arg-Leu-NH₂,
Ac-Glu-Asp-Arg-Tyr-Arg-Leu-OH,
Ac-Glu-Asp-Tyr-Phe-Arg-Leu-NH₂,
Ac-Glu-Asp-Tyr-Phe-Arg-Leu-OH,
5    Ac-Glu-Asp-Tyr-Tyr-Arg-Leu-Gly-Gly-NH₂,
Ac-Glu-Asp-Tyr-Tyr-Arg-Leu-Gly-NH₂,
Ac-Glu-Asp-Tyr-Tyr-Arg-Leu-NH-(CH₂)₁₅-CH₃,
Ac-Glu-Asp-Tyr-Tyr-Arg-Leu-NH₂,
Ac-Glu-Asp-Tyr-Tyr-Arg-Leu-OH,
10   Ac-Glu-Asp-Tyr-Tyr-Arg-Met-NH-(CH₂)₁₅-CH₃,
Ac-Glu-Asp-Tyr-Tyr-Arg-Met-NH₂,
Ac-Glu-Asp-Tyr-Tyr-Arg-Met-OH,
Ac-Gly-Glu-Asp-Tyr-Tyr-Arg-Leu-Gly-NH₂,
Ac-Gly-Glu-Asp-Tyr-Tyr-Arg-Leu-NH₂,
15   Ac-Gly-Gly-Glu-Asp-Tyr-Tyr-Arg-Leu-NH₂,
Ac-Pro-Asp-Arg-Phe-Lys-Leu-NH₂,
Ac-Pro-Asp-Arg-Phe-Lys-Leu-OH,
Ac-Pro-Asp-Arg-Tyr-Arg-Leu-NH₂,
Ac-Pro-Asp-Arg-Tyr-Arg-Leu-OH,
20   Ac-Pro-Asp-Arg-Tyr-Lys-Leu-NH₂,
Ac-Pro-Asp-Arg-Tyr-Lys-Leu-OH,
Ac-Pro-Asp-Tyr-Phe-Arg-Leu-NH-(CH₂)₁₅-CH₃
Ac-Pro-Asp-Tyr-Phe-Lys-Leu-NH₂
Ac-Pro-Asp-Tyr-Tyr-Arg-Leu-NH₂,
25   Ac-Pro-Asp-Tyr-Tyr-Arg-Leu-OH,
Ac-Pro-Asp-Tyr-Tyr-Arg-Met-NH-(CH$_2$)$_{15}$-CH$_3$,
Ac-Pro-Asp-Tyr-Tyr-Arg-Met-NH$_2$,
Ac-Pro-Asp-Tyr-Tyr-Arg-Met-OH,
Ac-Pro-Asp-Tyr-Tyr-Lys-Leu-NH-(CH$_2$)$_{15}$-CH$_3$,
Ac-Pro-Asp-Tyr-Tyr-Lys-Leu-NH$_2$,
Ac-Pro-Asp-Tyr-Tyr-Lys-Leu-OH,
Ac-Pro-Asp-Tyr-Tyr-Lys-Met-NH$_2$
H-Glu-Asp-Arg-Phe-Arg-Met-NH$_2$
Palm-Ala-Glu-Asp-Arg-Phe-Arg-Met-Gly-NH$_2$;
Palm-Asp-Asp-Tyr-Phe-Arg-Leu-NH$_2$,
Palm-Asp-Asp-Tyr-Phe-Arg-Leu-OH,
Palm-Asp-Asp-Tyr-Tyr-Lys-Leu-NH$_2$,
Palm-Asp-Asp-Tyr-Tyr-Lys-Leu-OH,
Palm-Glu-Asp-Arg-Phe-Arg-Met-NH$_2$,
Palm-Glu-Asp-Arg-Phe-Arg-Met-OH,
Palm-Glu-Asp-Arg-Phe-Lys-Leu-NH$_2$,
Palm-Glu-Asp-Arg-Phe-Lys-Leu-OH,
Palm-Glu-Asp-Tyr-Tyr-Arg-Leu-NH$_2$,
Palm-Glu-Asp-Tyr-Tyr-Arg-Leu-OH,
Palm-Glu-Asp-Tyr-Phe-Arg-Leu-NH$_2$,
Palm-Glu-Asp-Tyr-Phe-Arg-Leu-OH,
Palm-Glu-Asp-Tyr-Tyr-Arg-Leu-Gly-Gly-NH$_2$,
Palm-Glu-Asp-Tyr-Tyr-Arg-Leu-NH$_2$,
Palm-Glu-Asp-Tyr-Tyr-Arg-Leu-OH,
Palm-Glu-Asp-Tyr-Tyr-Arg-Met-Gly-NH$_2$. 
Palm-Glu-Asp-Tyr-Tyr-Arg-Met-NH₂,
Palm-Glu-Asp-Tyr-Tyr-Arg-Met-OH,
Palm-Gly-Glu-Asp-Tyr-Tyr-Arg-Leu-NH₂,
Palm-Gly-Gly-Pro-Asp-Tyr-Tyr-Lys-Leu-NH₂,
Palm-Pro-Asp-Arg-Phe-Lys-Leu-NH₂,
Palm-Pro-Asp-Arg-Phe-Lys-Leu-OH,
Palm-Pro-Asp-Arg-Tyr-Arg-Leu-NH₂,
Palm-Pro-Asp-Arg-Tyr-Arg-Leu-OH,
Palm-Pro-Asp-Arg-Tyr-Lys-Leu-NH₂,
Palm-Pro-Asp-Arg-Tyr-Lys-Leu-OH,
Palm-Pro-Asp-Tyr-Tyr-Arg-Leu-NH₂,
Palm-Pro-Asp-Tyr-Tyr-Arg-Leu-OH,
Palm-Pro-Asp-Tyr-Tyr-Arg-Met-NH₂,
Palm-Pro-Asp-Tyr-Tyr-Arg-Met-OH,
Palm-Pro-Asp-Tyr-Tyr-Lys-Leu-NH₂, and
Palm-Pro-Asp-Tyr-Tyr-Lys-Leu-OH,
their stereoisomers, mixtures thereof and/or their cosmetically or pharmaceutically acceptable salts.

The peptides of this invention can exist as stereoisomers or mixtures of stereoisomers; for example, the amino acids which form them can have an L-, D-configuration or be racemic independently of one another. Therefore, it is possible to obtain isomeric mixtures as well as racemic mixtures or diastereomeric mixtures, or pure diastereomers or enantiomers, depending on the number of asymmetric carbons and which isomers or isomeric mixtures are present. The preferred structures of the peptides of the invention are pure isomers, i.e., enantiomers or diastereomers.

For example, when it is stated that AA₁ can be -Glu-, it is understood that AA₁ is selected from -L-Glu-, -D-Glu- or mixtures of both, racemic or non-racemic. Likewise,
when it is said that AA₂ can be -Asp-, it is understood that it can be -L-Asp-, -D-Asp- or mixtures of both, racemic or non-racemic. The preparation processes described in this document allow the person skilled in the art to obtain each of the stereoisomers of the peptide of the invention by choosing the amino acid with the appropriate configuration.

In the context of this invention, the term "non-coded amino acids" refers to any amino acids not codified by the genetic code, natural or unnatural, for example, and not restricted to, citrulline, ornithine, sarcosine, desmosine, norvaline, 4-aminobutyric acid, 2-aminobutyric acid, 2-aminoisobutyric acid, 6-aminohexanoic acid, 1-naphthylalanine, 2-naphthylalanine, 2-aminobenzoic acid, 4-aminobenzoic acid, 4-chlorophenylalanine, 2,3-diaminopropionic acid, 2,4-diaminobutyric acid, cycloserine, carnitine, cystine, penicillamine, pyrog glutamic acid, thienylalanine, hydroxyproline, allo-isoleucine, allo-threonine, isonipecotic acid, isoserine, phenylglycine, statine, β-alanine, norleucine, N-methyl amino acids, β-amino acids or γ-amino acids among others, as well as their derivates. A list of unnatural amino acids can be found in the article "Unusual acids in peptide synthesis" by D.C. Roberts and F. Vellaccio, in The Peptides, Vol. 5 (1983), Chapter VI, Gross E. and Meienhofer J., Eds., Academic Press, New York, USA or in the commercial catalogues of the companies specialized in the field, such as PolyPeptide Laboratories, Bachem, Novabiochem, Sigma-Aldrich, Peptides International, Advanced ChemTech, Chem-Impex, Maybridge Chemical, Chirotech Technology, Peninsula Laboratories or RSP Amino Acid Analogues among others.

In the context of this invention when n, m, p and/or s are different to 0 it is clearly understood that the nature of W, X, Y and/or Z does not make the activity of the peptides of this invention difficult, but it contributes to the inhibition of AChR clustering or it has no effect on it.

In the context of this invention there are also cosmetically or pharmaceutically acceptable salts of the peptides provided by this invention. The term "cosmetically or pharmaceutically acceptable salts" means a salt admitted for its use on animals and, more particularly, human beings, and includes the salts used to form base addition salts, whether inorganic, for example, and not restricted to, lithium, sodium, potassium, calcium, magnesium, manganese, copper, zinc or aluminum among others; or organic for example, and not restricted to, ethylamine, diethylamine, ethylenediamine, ethanolamine, diethanolamine, arginine, lysine, histidine or piperazine among others; or acid addition salts, whether organic, for example, and not restricted to, acetate, citrate, lactate, malonate, maleate, tartrate, fumarate, benzoate, aspartate, glutamate,
succinate, oleate, trifluoroacetate, oxalate, pamoate or gluconate among others; or inorganic, for example, and not restricted to chloride, sulfate, borate or carbonate among others. The nature of the salt is not critical, provided that it is cosmetically and pharmaceutically acceptable. Cosmetically and pharmaceutically acceptable salts of the peptides of the invention can be obtained by conventional methods, well known in the prior art [Berge S.M., Bighley L.D. and Monkhouse D.C. (1977) "Pharmaceutical Salts" J. Pharm. Sci. 66:1-19].

Another aspect of this invention relates to a peptide of general formula (I), its stereoisomers, mixtures thereof, and/or its cosmetically or pharmaceutically acceptable salts, as described in this invention, for the treatment and/or care of those conditions, disorders and/or diseases which are a consequence of muscle contraction, particularly the clustering of acetylcholine receptors.

In another particular aspect, this invention relates to a peptide of general formula (I), its stereoisomers, mixtures thereof, and/or its cosmetically or pharmaceutically acceptable salts, as described in this invention, for the inhibition of muscle contraction, particularly for the inhibition of acetylcholine receptor clustering.

In another particular aspect, among the disorders and/or diseases to be treated which are a consequence of muscle contraction are dystonias, and more particularly focal dystonias for example, and not restricted to blepharospasm, torsion dystonia, cervicale dystonia or torticollis, laryngeal dystonia or spasmodic dysphonia, oromandibular dystonia, dystonia of limbs such as writer’s or musician’s cramp or dystonia of the feet, bruxism, hemifacial spasm, tics and/or strabismus; segmental dystonia, Meige’s syndrome, multifocal dystonias, hemidystonias, dopamine-responsive dystonias and Segawa dystonia.

In another particular aspect, this invention relates to a peptide of general formula (I), its stereoisomers, mixtures thereof, and/or its cosmetically or pharmaceutically acceptable salts, as described in this invention, for the treatment and/or care of the skin, preferably for the treatment and/or care of facial skin.

In another particular aspect, this treatment and/or care of the skin refers to the treatment and/or prevention of the signs of aging and/or photoaging.

In another particular aspect, this invention relates to a peptide of general formula (I), its stereoisomers, mixtures thereof, and/or its cosmetically or pharmaceutically acceptable...
salts, as described in this invention, for the treatment and/or care of skin affected by wrinkles and/or expressions lines.

Processes of Preparation

The synthesis of the peptides of the invention, their stereoisomers or their cosmetically or pharmaceutically acceptable salts can be performed according to conventional methods known in the prior art, such as methods of solid phase peptide synthesis [Stewart J.M. and Young J.D. (1984) "Solid Phase Peptide Synthesis, 2nd edition" Pierce Chemical Company, Rockford, Illinois; Bodansky M. and Bodansky A. (1984) "The practice of Peptide Synthesis" Springer Verlag, New Cork; Lloyd-Williams P., Albericio F. and Giralt E. (1997) "Chemical Approaches to the Synthesis of Peptides and Proteins" CRC, Boca Raton, FL, USA], synthesis in solution, a combination of the methods for solid phase synthesis and solution synthesis or enzymatic synthesis [Kullmann W. (1980) "Proteases as catalysts for enzymic syntheses of opioid peptides" J.Biol.Chem. 255:8234-8238]. The peptides can also be obtained by fermentation of a bacterial strain, genetically engineered or not, in order to produce the desired sequences, by controlled hydrolysis of proteins of animal or vegetable origin, preferably vegetable origin, to release peptide fragments containing at least the desired sequence.

For example, a method of obtaining the peptides of the invention of formula (I) comprises the steps of:

- coupling an amino acid with the N-terminal end protected and the C-terminal end free, onto an amino acid with the N-terminal end free and the C-terminal end protected or bound to a solid support;

- removing the protective group of the N-terminal end;

- repetition of the sequence of coupling and removal of the protective group of the N-terminal end until the desired peptidic sequence is obtained;

- removal of the protective group of the C-terminal end or cleavage from the solid support.

Preferably, the C-terminal end is bound to a solid support and the process is conducted on solid phase and, therefore, includes the coupling of an amino acid with the N-terminal end protected and the C-terminal end free onto an amino acid with the N-terminal end free and the C-terminal end bound to a polymer support; removal of the
protective group of the N-terminal end; and repetition of this sequence as many times as is necessary to obtain a peptide of the desired length, and finally followed by cleaving the synthesized peptide from the original polymer support.

The functional groups of the side chains of the amino acids are adequately protected with temporary or permanent protective groups throughout synthesis, and can be deprotected simultaneously or orthogonally to the process of cleaving the peptide from the polymer support.

Alternatively, solid phase synthesis can be carried out by a convergent strategy coupling a peptide onto the polymer support or onto an amino acid previously bound to the polymer support. Convergent synthesis strategies are widely known to the person skilled in the art and are described in Lloyd-Williams P., Albericio F. and Giralt E. in "Convergent solid-phase peptide synthesis" (1993) Tetrahedron 49:11065-11133.

The process can comprise the additional stages of deprotection of the N-terminal and C-terminal ends and/or cleavage of the peptide from the polymer support in a different order, using standard processes and conditions known in the prior art, after which the functional groups of these ends can be modified. The optional modification of the N-terminal and C-terminal ends can be carried out with the peptide of formula (I) bound to the polymeric support or once the peptide has been cleaved from the polymeric support.

Alternatively, R₁ may be introduced by the reaction of the N-terminal end of the peptide of the invention with a compound R₁-J, wherein R₁ is as described above and J is a leaving group for example, and not restricted to, the tosyl group, the mesyl group and halogen groups among others; through a nucleophilic substitution reaction, in the presence of an adequate base and solvent, wherein the fragments that have the functional groups not involved in the N-C bond formation are suitably protected with temporary or permanent protective groups.

Optionally and/or additionally, the R₂ radicals can be introduced by the reaction of a compound HR₂ wherein R₂ is -OR₃, -NR₃R₄ or -SR₃, with a complementary fragment which corresponds to the peptide of formula (I) in which R₂ is -OH in the presence of an adequate solvent and a base such as, N,N-diisopropylethylamine (DIEA) or triethylamine or an additive such as 1-hydroxybenzotriazole (HOBT) or 1-hydroxyazabenzotriazole (HOAt) and a dehydrating agent, such as a carbodiimide, a uronium salt, a phosphonium salt or amidinium salt, among others, or by prior formation of an acyl halide with, for example, thionyl chloride, and thereby obtaining a
peptide according to the general formula (I) invention, wherein the fragments that have the functional groups not involved in the N-C bond formation are suitably protected with temporary or permanent protective groups, or alternatively other R₂ radicals may be introduced by simultaneous incorporation to the peptide cleavage process from the polymeric support.

A person skilled in the art would easily understand that the deprotection/cleavage steps of the C-terminal and N-terminal ends and their subsequent derivatization can be performed in a different order, according to the processes known in the prior art [Smith M. B. and March J. (1999) "March's Advanced Organic Chemistry Reactions, Mechanisms and Structure", 5th Edition, John Wiley & Sons, 2001].

The term “protective group” relates to a group which blocks a functional organic group and can be removed in controlled conditions. The protective groups, their relative reactivities and the conditions in which they remain inert are known to the person skilled in the art.

Examples of representative protective groups for the amino group are amides, such as amide acetate, amide benzoate, amide pivalate; carbamates such as benzyloxy carbonyl (Cbz or Z), 2-chlorobenzyl (ClZ), para-nitrobenzyloxy carbonyl (pNZ), tert-butyloxy carbonyl (Boc), 2,2,2-trichloroethoxy carbonyl (Troc), 2-(trimethylsilyl)ethoxy carbonyl (Teoc), 9-fluorenlymethoxy carbonyl (Fmoc) or allyloxy carbonyl (Alloc), Trityl (Trt), methoxytrityl (Mtt), 2,4-dinitrophenyl (Dnp), N-[1-(4,4-dimethyl-2,6-dioxocyclohex-1-ylidene)ethyl] (Dde), 1-(4,4-dimethyl-2,6-dioxocyclohexylidene)-3-methylbutyl (ivDde), 1-(1-adamantyl)-1-methylethoxycarbonyl (Adpoc), among others, preferably Boc or Fmoc.

Examples of representative protective groups for the carboxyl group are esters, such as the tert-butyl ester (tBu), allyl ester (All), triphenylmethyl ester (trityl ester, Trt), cyclohexyl ester (cHx), benzyl ester (Bzl), ortho-nitrobenzyl ester, para-nitrobenzyl ester, para-methoxybenzyl ester, trimethylsilyl ester, 2-phenylisopropyl ester, fluorenlymethyl ester (Fm), 4-(N-[1-(4,4-dimethyl-2,6-dioxocyclohexylidene)-3-methylbutyl]amino) benzyl ester (Dmab), among others; preferred protective groups of the invention are the All, tBu, cHx, Bzl and Trt esters.

The side chains of the trifunctional amino acids can be protected during the synthetic process with temporary or permanent protective groups orthogonal to the protective groups of the N-terminal and C-terminal ends.
The guanidine group of the arginine side chain can be protected with the nitro group, allyloxycarbonyl (Alloc), para-toluenesulfonyl (tosyl, Tos), 2,2,5,7,8-pentamethylchroman-6-sulfonyl (Pmc), 2,2,4,6,7-pentamethyldihydrobenzofuran-5-sulfonyl (Pbf) or 4-methoxy-2,3,6-trimethylbenzenesulfonyl (Mtr), among others. The hydroxyl group of the tyrosine side chain can be protected with the 2-bromobenzylloxycarbonyl group (2-BrZ), tert-butyl (tBu), allyl (All), benzyl (Bzl) or 2,6-dichlorobenzyl (2,6-diCIz) among others. For the protection of amino group of the lysine side chain amides can used, such as amide acetate, amide benzoate, amide pivalate, carbonates such as benzoxycarbonyl (Cbz or Z), 2-chlorobenzyl (Clz), para-nitrobenzyloxycarbonyl (pNZ), tert-butyloxycarbonyl (Boc), 2,2,2-trichloroethylloxycarbonyl (Trocl), 2-(trimethylsilyl)ethyloxycarbonyl (Teocl), 9-fluorenymethylloxycarbonyl (Fmoc) or allyloxycarbonyl (Alloc), trityl (Trt), methoxynitityl (Mtt), 2,4-dinitrophenyl (Dnp), N-[1-(4,4-dimethyl-2,6-dioxycyclohex-1-ylidene)ethyl (Dde), 1-(4,4-dimethyl-2,6-dioxo-cyclohexylidene)-3-methylbutyl (ivDde), or 1-(1-adamantyl)-1-methylethoxycarbonyl (Adpoc), among others. For the protection of the carboxyl group of the aspartic acid and glutamic acid side chains esters can be used, such as the tert-butyl ester (tBu), allyl ester (All), triphenylmethyl ester (trityl ester, Trt), cyclohexyl ester (cHx), benzyl ester (Bzl), ortho-nitrobenzyl ester, para-nitrobenzyl ester, para-methoxybenzyl ester, trimethylsilyl ethyl ester, 2-phenylisopropyl ester, fluorenlymethy ester (Fm), 4-(N-[1-(4,4-dimethyl-2,6-dioxycyclohexylidene)-3-methylbutyl]amino) benzyl ester (Dmab), among others. The methionine side chain is protected with sulfoxide or is used unprotected.

In a preferred embodiment, the protective group strategy used is the strategy wherein the amino groups are protected by Boc, the carboxyl groups are protected by Bzl, cHx or All, the arginine side chain is protected with Tos, the lysine side chain is protected with Clz, Fmoc or Alloc, the aspartic acid and glutamic acid side chain is protected with Bzl, cHx or All, the tyrosine side chain is protected with 2-BrZ or Bzl and the methionine side chain is used unprotected.

In another preferred embodiment, the protective group strategy used is the strategy wherein the amino groups are protected by Fmoc, the carboxyl groups are protected by tBu, All or Trt, the arginine side chain is protected with Pbf or Pmc, the lysine side chain is protected with Boc or Mtt, the aspartic acid and glutamic acid side chain are protected with tBu or All, the tyrosine side chain is protected with tBu and the methionine side chain is used unprotected.
Examples of these and other additional protective groups, their introduction and removal, can be found in the literature [Greene T.W. and Wuts P.G.M., (1999) "Protective groups in organic synthesis" John Wiley & Sons, New York; Atherton B. and Sheppard R.C. (1989) "Solid Phase Peptide Synthesis: A practical approach" IRL Oxford University Press]. The term "protective groups" also includes the polymeric supports used in solid phase synthesis.

**Comestic or Pharmaceutical Compositions**

The peptides of the invention can be administered to inhibit AChR clustering by any means which produces the peptides' contact with their site of action in the body of a
mammal, preferably a human being, and in the form of a composition that contains them.

To this regard, another aspect of the invention is a cosmetic or pharmaceutical composition which comprises at least a peptide of general formula (I), its stereoisomers, mixtures thereof, and/or its cosmetically or pharmaceutically acceptable salts together with at least one cosmetically or pharmaceutically acceptable adjuvant. These compositions can be prepared by conventional means known to persons skilled in the art ('Harry's Cosmetology', Eight edition (2000) Rieger M.M., ed., New York Chemical Pub., NY, US; "Remington: The Science and Practice of Pharmacy", Twentieth edition (2003) Genaro A.R., ed., Lippincott Williams & Wilkins, Philadelphia, US).

The peptides of this invention have variable solubility in water, according to the nature of their sequence or any possible modifications in the N-terminal and/or C-terminal ends. Therefore, the peptides of this invention can be incorporated into the compositions by aqueous solution, and those which are not soluble in water can be solubilized in cosmetically or pharmaceutically acceptable conventional solvents for example, and not restricted to, ethanol, propanol, isopropanol, propylene glycol, glycerine, butylene glycol or polyethylene glycol or any combination thereof.

The cosmetically or pharmaceutically effective amount of the peptides of the invention which should be administered, as well as their dosage, will depend on numerous factors, including age, state of the patient, the nature or severity of the condition, disorder or disease to be treated, cared for or prevented, the route and frequency of administration and, in the particular, nature of the peptides to be used.

"Cosmetically and pharmaceutically effective amount" is understood to mean a non-toxic but sufficient amount of the peptide or peptides of the invention to provide the desired effect. The peptides of the invention are used in the cosmetic or pharmaceutical composition of this invention in cosmetically or pharmaceutically effective concentrations to achieve the desired effect; in a preferred form versus the total weight of the composition, between 0.0000001% (in weight) and 20% (in weight); preferably between 0.000001% (in weight) and 20% (in weight), more preferably between 0.0001% (in weight) and 10% (in weight) and even more preferably between 0.0001% (in weight) and 5% (in weight).

The peptides of the invention can also be incorporated into cosmetic or pharmaceutical delivery systems and/or sustained release systems.
The term “delivery systems” relates to a diluent, adjuvant, excipient or carrier with which the peptide of the invention is administered. These cosmetic or pharmaceutical carriers can be liquids, such as water, oils or surfactants, including those of petroleum, animal, vegetable or synthetic origin, for example, and not restricted to, peanut oil, soybean oil, mineral oil, sesame oil, castor oil, polysorbates, sorbitan esters, ether sulfates, sulfates, betaines, glycosides, maltooses, fatty alcohols, nonoxynols, poloxamers, polyoxyethylenes, polyethylene glycols, dextrose, glycerol, digitonin and similar. In "Remington’s Pharmaceutical Sciences" by E.W. Martin diluents, adjuvants or excipients are described as appropriate carriers.

The term “sustained release” is used in a conventional sense relating to a delivery system of a compound which provides the gradual release of this compound during a period of time and preferably, although not necessarily, with relatively constant compound release levels over a period of time.

Examples of delivery or sustained release systems are liposomes, mixed liposomes, oleosomes, niosomes, ethosomes, milliparticles, microparticles, nanoparticles and solid lipid nanoparticles, nanostructured lipid carriers, sponges, cyclodextrins, vesicles, micelles, mixed micelles of surfactants, mixed micelles of surfactant-phospholipid, millispheres, microspheres and nanospheres, lipospheres, millicapsules, microcapsules and nanocapsules, as well as microemulsions and nanoemulsions, which can be added to achieve a greater penetration of the active principle and/or improve its pharmacokinetic and pharmacodynamic properties. Preferred delivery or sustained release systems are liposomes, mixed micelles of surfactant-phospholipid and microemulsions, more preferably water-in-oil microemulsions with an internal structure of inverse micelle.

The sustained release systems can be prepared by methods known in the prior art, and the compositions which contain them can be administered, for example, by topical or transdermal administration, including adhesive patches, non-adhesive patches, occlusive patches and microneurotic patches, or by systemic administration, for example, and not restricted to, orally or parenterally, including nasal, rectal, subcutaneous implantation or injection, or direct implantation or injection into a specific body part, and preferably should release a relatively constant quantity of the peptides of the invention. The amount of peptide contained in the sustained release system will depend, for example, on where the composition is to be administered, the kinetics and duration of the release of the peptide of the invention, as well as the nature of the condition, disorder and/or disease to be treated, cared for or prevented.
The peptides of this invention can also be adsorbed on solid organic polymers or solid mineral supports for example, and not restricted to, talc, bentonite, silica, starch or maltodextrin among others.

The compositions which contain the peptides of the invention can also be incorporated into fabrics, non-woven fabrics and medical devices which are in direct contact with the skin, thus releasing the peptides of the invention whether by biodegradation of the binding system to the fabric, non-woven fabric or medical device, or by the friction between them and the body, due to body moisture, the skin’s pH or body temperature. Furthermore, the fabrics and non-woven fabrics can be used for making garments that are in direct contact with the body. Preferably, the fabrics, non-woven fabrics and medical devices containing the peptides of the invention are used for the treatment and/or care of those conditions, disorders and/or diseases that are a consequence of AChR clustering, preferably a consequence of muscle contraction.

The cosmetic or pharmaceutical compositions which contain the peptides of this invention, their stereoisomers, mixtures thereof and/or their cosmetically or pharmaceutically acceptable salts, can be used in different types of compositions of topical or transdermal application, optionally including cosmetically or pharmaceutically acceptable excipients necessary for formulating the desired administration form [Fauli i Trillo C. (1993) in "Tratado de Farmacia Galénica", Luzán 5, S.A. Ediciones, Madrid].
The compositions of topical or transdermal application can be produced in any solid, liquid or semisolid formulation, for example, and not restricted to, creams, multiple emulsions for example, and not restricted to, oil and/or silicone in water emulsions, water-in-oil and/or silicone emulsions, water/oil/water or water/silicone/water type emulsions, and oil/water/oil or silicone/water/silicone type emulsions, anhydrous compositions, aqueous dispersions, oils, milks, balsams, foams, lotions, gels, cream gels, hydroalcoholic solutions, hydroglycolic solutions, hydrogels, liniments, sera, soaps, shampoo, conditioners, sera, polysaccharide films, ointments, mousses, pomades, powders, bars, pencils and sprays or aerosols (sprays), including leave-on and rinse-off formulations. These topical or transdermal application formulations can be incorporated using techniques known by the person skilled in the art into different types of solid accessories for example, and not restricted to bandages, gauzes, t-shirts, socks, tight, underwear, girdles, gloves, diapers, sanitary napkins, dressings, bedspreads, wipes, adhesive patches, non-adhesive patches, occlusive patches, microelectric patches or face masks; or they can be incorporated into different make-up products such as make-up foundation, such as fluid foundations and compact foundations, make-up removal lotions, make-up removal milks, under-eye concealers, eye shadows, lipsticks, lip protectors, lip gloss and powders among others.

The cosmetic and pharmaceutical compositions of the invention may include agents which increase the percutaneous absorption of the peptides of this invention, for example, and not restricted to, dimethylsulfoxide, dimethylacetamide, dimethylformamide, surfactants, azone (1-dodecylazacycloheptan-2-one), alcohol, urea, ethoxydiglycol, acetone, propylene glycol or polyethylene glycol, among others. Furthermore, the cosmetic or pharmaceutical compositions of this invention can be applied to local areas to be treated by means of iontophoresis, sonophoresis, electroporation, microelectric patches, mechanical pressure, osmotic pressure gradient, occlusive cure, microinjections or needle-free injections by means of pressure, such as injections by oxygen pressure, or any combination thereof, to achieve a greater penetration of the peptide of the invention. The application area will be determined by the nature of the condition, disorder and/or disease to be treated and/or cared for.

Furthermore, the cosmetic or pharmaceutical compositions containing the peptides of this invention, their stereoisomers and/or their cosmetically or pharmaceutically acceptable salts can be used in different types of formulations for oral administration, preferably in the form of oral cosmetics or drugs, for example, and not restricted to,
capsules, including gelatin capsules, soft capsules, hard capsules, tablets, including sugar coated tablets, powders, granules, chewing gum, solutions, suspensions, emulsions, syrups, polysaccharide films, jellies or gelatins, and any other form known by the person skilled in the art. In particular, the peptides of the invention can be incorporated into any form of functional food or fortified food, for example, and not restricted to, dietary bars or compact or non-compact powders. These powders can be dissolved in water, soda, dairy products, soybean derivatives or can be incorporated into dietary bars. The peptides of this invention can be formulated with common excipients and adjuvants for oral compositions or food suppleiments, for example, and not restricted to, fat components, aqueous components, humectants, preservatives, texturizing agents, flavors, aromas, antioxidants and colorants common in the food industry.

Cosmetic or pharmaceutical compositions containing the peptides of the invention, their stereoisomers, mixtures thereof and/or their cosmetically or pharmaceutically acceptable salts can also be administered by topical or transdermal route, as well as by any other appropriate route, as for example oral or parenteral route, for which they will include the pharmaceutically acceptable excipients necessary for the formulation of the desired administration form. In the context of this invention, the term "parenteral" includes nasal, auricular, ophthalmic, rectal, urethral, vaginal route, subcutaneous, intradermal, intravascular injections, such as intravenous, intramuscular, intraocular, intravitreal, intracorneal, intraspinal, intramedullary nailing, intracranial, intracervical, intracerebral, intrameningeal, intraarticular, intrahepatic, intrathoracic, intratracheal, intrathecal and intraperitoneal, and any another similar injection or infusion technique. A review of the different pharmaceutical forms of administration of the active ingredients and excipients necessary for obtaining them can be found, for example, in the "Tratado de Farmacia Galénica", C. Fauli i Trillo, 1993, Luzán 5, S.A. Ediciones, Madrid.

Among the cosmetically or pharmaceutically acceptable adjuvants contained in the cosmetic or pharmaceutical compositions described in this invention include additional ingredients commonly used in compositions for the treatment and/or care of the skin for example, and not restricted to, other agents inhibiting AChR clustering, other agents inhibiting muscle contraction, anticholinergic agents, elastase inhibiting agents, matrix metalloproteinases inhibiting agents, melanin synthesis stimulating or inhibiting agents, whitening or depigmenting agents, pro-pigmenting agents, self-tanning agents, anti-aging agents, NO-synthase inhibiting agents, 5α-reductase inhibiting agents, lysyl-
and/or prolyl hydroxylase inhibiting agents, antioxidants, free radical scavengers and/or agents against atmospheric pollution, reactive carbonyl species scavengers, anti-glycation agents, antihistamine agents, antiemetic agents, antiviral agents, antiparasitic agents, emulsifiers, emollients, organic solvents, liquid propellants, skin conditioners such as humectants, substances that retain moisture, alpha hydroxyacids, beta hydroxyacids, moisturizers, epidermal hydrolytic enzymes, vitamins, pigments or colorants, dyes, gelling polymers, thickeners, surfactants, softening agents, anti-wrinkle agents, agents able to reduce or treat bags under the eyes, exfoliating agents, antimicrobial agents, antifungal agents, fungistatic agents, bactericidal agents, bacteriostatic agents, agents stimulating the synthesis of dermal or epidermal macromolecules and/or capable of inhibiting or preventing their degradation, such as collagen synthesis-stimulating agents, elastin synthesis-stimulating agents, decorin synthesis-stimulating agents, laminin synthesis-stimulating agents, defensin synthesis-stimulating agents, chaperone synthesis-stimulating agents, aquaporin synthesis-stimulating agents, hyaluronic acid synthesis-stimulating agents, fibronectin synthesis-stimulating agents, sirtuin synthesis-stimulating agents, agents stimulating the synthesis of lipids and components of the stratum corneum (ceramides, fatty acids, etc.), agents that inhibit collagen degradation, other agents that inhibit elastin degradation, agents that inhibit serine proteases such as cathepsin G, agents stimulating fibroblast proliferation, agents stimulating keratinocyte proliferation, agents stimulating adipocyte proliferation, agents stimulating melanocyte proliferation, agents stimulating keratinocyte differentiation, agents stimulating adipocyte differentiation, agents that inhibit acetylcholinesterase, skin relaxant agents, glycosaminoglycan synthesis-stimulating agents, antihyperkeratosis agents, comedolytic agents, antipsoriasis agents, DNA repair agents, DNA protecting agents, stabilizers, anti-itching agents, agents for the treatment and/or care of sensitive skin, firming agents, anti-stretch mark agents, binding agents, agents regulating sebum production, lipolytic agents or agents stimulating lipolysis, anti-cellulite agents, antiperspirant agents, agents stimulating healing, coadjuvant healing agents, agents stimulating reepithelialization, coadjuvant reepithelialization agents, cytokine growth factors, calming agents, anti-inflammatory agents and/or analgesics, anesthetic agents, agents acting on capillary circulation and/or microcirculation, agents stimulating angiogenesis, agents that inhibit vascular permeability, venotonic agents, agents acting on cell metabolism, agents to improve the dermal-epidermal junction, agents inducing hair growth, hair growth inhibiting or retardant agents, preservatives, perfumes, chelating agents, vegetable extracts, essential oils, marine extracts, agents obtained from a
biofermentation process, mineral salts, cell extracts and sunscreens (active organic or mineral photoprotective agents against ultraviolet A and/or B rays) among others, provided they are physically and chemically compatible with the other components of the composition and especially with the peptides of general formula (I) contained in the composition of this invention. Furthermore, the nature of these additional ingredients should not unacceptably alter the benefits of the peptides of this invention. The nature of these additional ingredients can be synthetic or natural, such as vegetable extracts, or obtained from a biotechnological process or obtained from a combination of a synthetic process and a biotechnological process. Additional examples can be found in the CTFA International Cosmetic Ingredient Dictionary & Handbook, 12th Edition (2008). In the context of this invention, biotechnological process is understood to be any process which produces the active principal, or part of it, in an organism, or in a part of it.

An additional aspect of this invention relates to a cosmetic or pharmaceutical composition containing a cosmetically or pharmaceutically effective amount of at least one peptide according to the general formula (I), its stereoisomers, mixtures thereof and/or its cosmetically or pharmaceutically acceptable salts, and also a cosmetically or pharmaceutically effective amount of at least one extract which is an anti-wrinkle agent and/or anti-aging agent for example, and not restricted to, the extracts Vitis vinifera, Rosa canina, Curcuma longa, Iris pallida, Theobroma cacao, Ginkgo biloba, Leontopodium Alpinum or Dunaliella salina among others, or at least a synthetic compound or bio-fermentation product which is an anti-wrinkle agent and/or anti-aging agent for example, and not restricted to, Matrixyl® [INCI: Palmitoyl Pentapeptide-4], Matrixyl 3000® [INCI: Palmitoyl Tetrapeptide-7, Palmitoyl Oligopeptide], Essenskin™ [INCI: calcium hydroxymethionine], Renovage® [INCI: teprenone] or Dermaxyl® [INCI: Palmitoyl Oligopeptide] marketed by Sederma, Vialox® [INCI: Pentapeptide-3], Syn®-Ake® [INCI: Dipeptide Diaminobutyroyl Benzylamide Diacetate], Syn®-Coll [INCI: Palmitoyl Tripeptide-5], Phytaluronate [INCI: Locust Bean (Ceratonia Siliqua) Gum] or Preregen® [INCI: Glycine Soja (Soybean) Protein, Oxido Reductases] marketed by Pentapharm/DSM, Myoxinol™ [INCI: Hydrolyzed Hibiscus Esculentus Extract], Syniorage™ [INCI: Acetyl Tetrapeptide-11], Dermican™ [INCI: Acetyl Tetrapeptide-9] or DN-AGE™ LS [INCI: Cassia Alata leaf Extract] marketed by Laboratoires SérobioLogiques/Cognis, Algismum C® [INCI: Methylsilanol Mannuronate] or Hydroxyprolisilane CN® [INCI: Methylsilanol Hydroxyproline Aspartate] marketed by Exsymol, Argireline® [INCI: Acetyl Hexapeptide-8], SNAP-7 [INCI: Acetyl Heptapeptide-4], SNAP-8 [INCI: Acetyl Octapeptide-3], Leuphasyl® [INCI: Pentapéptide-18],
An additional aspect of this invention relates to a cosmetic or pharmaceutical composition which comprises a cosmetically or pharmaceutically effective amount of at least one peptide according to the general formula (1), its stereoisomers, mixtures thereof and/or its cosmetically or pharmaceutically acceptable salts, and in addition, a pharmaceutically effective amount of at least one extract which is an agent inhibiting AChR clustering and/or muscle contraction inhibiting agent and/or anticholinergic agent for example, and not restricted to, the extracts of *Atropa belladonna*, *Hyoscyamus niger*, *Mandragora officinarum*, *Chondrodendron tomentosum*, plants of the *Brugmansia* genus, or *Datura* genus among others and or at least one synthetic compound or bio-fermentation product which is an agent inhibiting AChR clustering and/or muscle contraction inhibiting agent and/or anticholinergic agent for example, and not restricted to *Clostridium botulinum* toxin, peptides derived from SNAP-25 protein, baclofen, carbidopa, levodopa, bromocriptine, chlorphenesin, chlorzoxazone, donepezil, mephenoxalone, reserpine, tetrabenazine, dantrolene, thiocolchicoside, tizanidine, clonidine, procyclidine, glycopyrrolate, atropine, hyoscyamine, benztoprine, scopalamine, promethazine, diphenhydramine, dimenhydrinate, dicyclomine, cyclobenzaprine, orphenadrine, flavoxate, cyclopentolate, ipratropium, oxybutynin, pirenzepine, tiotropium, trihexyphenidy1, tolterodine, tropicamide, solifenacin, darifenacin, mebeverine, trimethaphan, atracurium, cisatracurium, doxacurium, fazadinium, metocurine, mivacurium, pancuronium, pipecuronium, rapacuronium, tubocurarine, dimethyl tubocurarine, rocuronium, vecuronium, suxamethonium, 18-methoxycoronaridine, carisoprodol, febarbamate, meprobamate, metocarbamol, phenprobamate, tibamate, anticonvulsant agents such as levetiracetam, stiripentol, phenobarbital, methylphenobarbital, pentobarbital, metharbital, barbexaclone, primidone, carbamazepine, oxcarbazepine, benzodiazepines for example, and not restricted to, clonazepam, cloxazolam, clorazepate, diazepam, fluprazepam, lorazepam, midazolam, nitrazepam, nimetazepam, phenazepam, temazepam, tetrazepam or clobazam among others.

An additional aspect of this invention relates to a pharmaceutical composition which comprises a pharmaceutically effective amount of at least one peptide according to the general formula (1), its stereoisomers, mixtures thereof and/or its pharmaceutically acceptable salts, and a pharmaceutically effective amount of at least one natural extract or essential oil which is an anti-inflammatory agent and/or analgesic for example, and not restricted to, madecassoside, echinacea, amaranth oil, sandalwood oil, peach leaf extract, *Aloe vera* extract, *Arnica montana*, *Artemisia vulgaris*, *Asarum maximum*, *Calendula officinalis*, *Capsicum*, *Centipeda cunninghamii*, *Chamomilla*
recutita, Crinum asiaticum, Hamamelis virginiana, Harpagophytum procumbens, Hypericum perforatum, Lilium candidum, Malva sylvestris, Melaleuca alternifolia, Origanum majorana, Origanum vulgare, Prunus laurocerasus, Rosmarinus officinalis, Salix alba, Silybum marianum, Tanacetum parthenium, Thymus vulgaris, Uncaria guianensis or Vaccinium myrtillus among others or at least one synthetic compound or bio-fermentation product which is an anti-inflammatory agent and/or analgesic for example, and not restricted to, mometasone furoate and prednisolone, nonsteroidal anti-inflammatory drugs including cyclooxygenase or lipoxgenase inhibitors, benzydamine, acetyl salicylic acid, rosmarinic acid, ursolic acid, derivatives of glycyrrhizinate, α-bisabolol, azulene and analogues, sericoside, ruscogenin, escin, scoline, rutin and analogues, hydrocortisone, clobetasol, dexamethasone, prednisone, paracetamol, amoxiprin, benorilate, choline salicylate, diflunisal, faislamine, methyl salicylate, magnesium salicylate, salsalate, diclofenac, acetylsalicylic, bromfenac, etodolac, indometacin, oxametacin, proglumetacin, sulindac, tolfmetin, ibuprofen, dexibuprofen, carprofen, fenbufen, fenoprofen, flurbiprofen, ketoprofen, dexketoprofen, ketorolac, loxoprofen, naproxen, miprofen, oxaprozin, pranoprofen, tiaprofenic acid, suprofen, mefenamic acid, meclofenamate, meclofenamic acid, flufenamic acid, tolfenamic acid, nabumetone, phenylbutazone, azapropazone, clofezone, kebuzone, metamizol, mofebutazone, oxyphenbutazone, phenazone, sulfinpyrazone, piroxicam, lornoxicam, meloxicam, tenoxicam, celecoxib, etoricoxib, lumiracoxib, parecoxib, rofecoxib, valdecoxib, nimesulide, naproxinod, fluoroquazone or licofoleone; morphine, codeine, oxycodone, hydrocodone, diamorphine, pethidine, tramadol, buprenorphine, benzocaine, lidocaine, chlorprocaine, tetracaine, procaine, tricyclic antidepressants, amitriptyline, carbamazepine, gabapentin, pregabalin, pantenol, biotin, disodium laurimino dpropionate tocopheryl phosphate, ciclopirox olamine, nordihydroguaiaretic acid, Neutrazen™ [INCl: Water, Butylene Glycol, Dextran, Palmitoyl Tripeptide-8] marketed by Atrium Innovations/Unipex Group, Meliprene® [INCl: Dextran, Acetyl Heptapeptide-1] marketed by Institut Européen de Biologie Cellulaire/Unipex Group, Skinase nyl™ [INCl: Acetyl Tetrapeptide-15] marketed by Laboratoires Sérobiologiques/Cognis, coenzyme Q10 or alkyl glyceryl ethers among others.

Applications

Another aspect of this invention relates to the use of at least one of the peptides of general formula (I), its stereoisomers, mixtures thereof and/or its cosmetically or
pharmaceutically acceptable salts in the preparation of a cosmetic or pharmaceutical composition for the treatment and/or care of those conditions, disorders and/or diseases which are a consequence of muscle contraction, preferably a consequence of acetylcholine receptor clustering.

Another aspect of this invention relates to the use of at least one of the peptides of general formula (I), its stereoisomers, mixtures thereof and/or its cosmetically or pharmaceutically acceptable salts in the preparation of a cosmetic or pharmaceutical composition for the inhibition of muscle contraction, preferably for the inhibition of acetylcholine receptor clustering.

Preferably, among the disorders and/or diseases to be treated which are caused by muscle contraction are dystonias, and more particularly focal dystonia for example, and not restricted to, blepharospasm, torsion dystonia, cervical dystonia or torticollis, laryngeal dystonia or spasmodic dysphonia, oromandibular dystonia, dystonia of limbs such as writer's or musician's cramp or dystonia of the feet, bruxism, hemifacial spasm, tics and/or strabismus; segmental dystonia, Meige's syndrome, multifocal dystonias, hemidystonias, dopamine-responsive dystonias and Segawa dystonia.

Another aspect of this invention relates to the use of at least one of the peptides of general formula (I), its stereoisomers, mixtures thereof and/or its cosmetically or pharmaceutically acceptable salts in the preparation of a cosmetic or pharmaceutical composition for the treatment and/or care of skin, preferably facial skin.

According to a preferred embodiment, the treatment and/or care of the skin is a treatment and/or prevention of the signs of aging and/or photoaging.

According to another preferred embodiment, this invention relates to the use of at least one of the peptides of general formula (I), its stereoisomers, mixtures thereof and/or its cosmetically or pharmaceutically acceptable salts in the preparation of a cosmetic or pharmaceutical composition for the treatment and/or care of skin affected by wrinkles and/or expression lines.

Examples of cosmetic or pharmaceutical compositions for the treatment and/or care of the skin and/or body include creams, multiple emulsions for example, and not restricted to, oil and/or silicone in water emulsions, water in oil and/or silicone emulsions, water/oil/water or water/silicone/water type emulsions and oil/water/oil or silicone/water/silicone type emulsions, anhydrous compositions, aqueous dispersions, oils, milks, balsams, foams, lotions, gels, cream gels, hydroalcoholic solutions,
hydroglycolic solutions, liniments, sera, soaps, shampoo, conditioners, serums, polysaccharide films, ointments, mousses, pomades, powders, bars, pencils and sprays or aerosols (sprays), including leave-on and rinse-off formulations, bandages, gauzes, t-shirts, socks, tights, underwear, girdles, gloves, diapers, sanitary napkins, dressings, bedspreads, wipes, adhesive patches, non-adhesive patches, occlusive patches, microelectric patches or face masks, make-up products such as make-up foundation, for example fluid foundation and compact foundation, make-up removal lotions, make-up removal milks, under-eye concealers, eye shadows, lipsticks, lip protectors, lip gloss and powders, among others.

The compositions containing the peptides of this invention can be applied to the skin or can be administered orally or parenterally as necessary to treat and/or care for a condition, disorder and/or disease.

The cosmetic or pharmaceutical compositions of this invention can be applied to the skin by iontophoresis, sonophoresis, electroporation, microelectric patches, mechanical pressure, osmotic pressure gradient, occlusive cure, microinjections, needle-free injections by means of pressure, such as injections by oxygen pressure, or any combination thereof, to achieve a greater penetration of the peptide of the invention.

An additional aspect of this invention relates to a method of treatment and/or care of those conditions, disorders and/or diseases of mammals, preferably humans, which are a consequence of muscle contraction, preferably a consequence of AChR clustering, which comprises administering an effective amount of at least one peptide of general formula (I), its stereoisomers, mixtures thereof and/or its cosmetically or pharmaceutically acceptable salts, preferably in the form of a cosmetic or a pharmaceutical composition containing them.

Another aspect of this invention relates to method of treatment and/or care of those conditions, disorders and/or diseases of mammals, preferably humans, which inhibit muscle contraction, preferably inhibit acetylcholine receptor clustering, which comprises administering an effective amount of at least one peptide of general formula (I), its stereoisomers, mixtures thereof and/or its cosmetically or pharmaceutically acceptable salts, preferably in the form of a cosmetic or a pharmaceutical composition containing them.

According to a particular embodiment the disorders and/or diseases to be treated are selected from the group of dystonias, and more particularly focal dystonia for example, and not restricted to, blepharospasm, torsion dystonia, cervical dystonia or torticollis,
laryngeal dystonia or spasmodic dysphonia, oromandibular dystonia, dystonia of limbs such as writer’s or musician’s cramp or dystonia of the feet, bruxism, hemifacial spasm, tics and/or strabismus; segmental dystonia, Meige’s syndrome, multifocal dystonias, hemidystonias, dopamine-responsive dystonias and Segawa dystonia.

Another aspect of this invention provides a method of treatment and/or care of the skin, preferably facial skin, which comprises administering a cosmetically or pharmaceutically effective amount of at least one peptide of general formula (I), its stereoisomers, mixtures thereof and/or its cosmetically or pharmaceutically acceptable salts, preferably in the form of a cosmetic or a pharmaceutical composition containing them.

According to a particular embodiment, the treatment and/or care of the skin is a treatment and/or prevention of the signs of aging and/or photoaging of the skin.

According to another particular embodiment, this invention provides a method for the treatment and/or care of skin affected by wrinkles and/or expression lines which comprises administering a cosmetically or pharmaceutically effective amount of at least one peptide of general formula (I), its stereoisomers, mixtures thereof and/or its cosmetically or pharmaceutically acceptable salts, preferably in the form of a cosmetically or a pharmaceutically composition containing them.

According to another particular embodiment, this invention provides a method of treatment and/or care of those conditions, disorders and/or diseases which are a consequence of muscle contraction, which comprises the topical or transdermal application onto the skin or oral or parental administration of a cosmetic or pharmaceutical composition containing at least one peptide of the invention, its stereoisomers, mixtures thereof and/or its cosmetic or pharmaceutical acceptable salts.

In another particular aspect, the treatment and/or care of this invention is carried out by topical or transdermal application, preferably, the topical or transdermal application is carried out by iontophoresis, sonophoresis, electroporation, mechanical pressure, osmotic pressure gradient, occlusive cure, microinjections, needle-free injections by means of pressure, microelectric patches or any combination thereof.

In another particular aspect, the treatment and/or care is carried out by oral administration.

In another particular aspect, the treatment and/or care is performed by parenteral application.
The frequency of application or administration can vary greatly, depending on the needs of each subject and the seriousness of the condition, disorder or disease to be treated or cared for, with a recommendation of an application or administration range from once a month to ten times a day, preferably from once a week to four times a day, more preferably from three times a week to three times a day, even more preferably once or twice a day.

The following specific examples provided here illustrate the nature of this invention. These examples are included for illustrative purposes only and should not be construed as limitations on the invention claimed herein.

EXAMPLES

General Methodology

All reagents and solvents are of synthesis quality and are used without additional treatment.

Abbreviations

®, resin; 2,6-diClZ, 2,6-dichlorobenzyl; 2-BrZ, 2-bromobenzylxoycarbonyl; Ac, acetyl; ACh, acetylcholine; AChRs, acetylcholine receptors; Adpoc, 1-(1-adamantyl)-1-methylethoxycarbonyl; All, allyl; Alloc, allyloxyxycarbonyl; AM, 2-[4-aminomethyl-(2,4-dimethoxyphenyl)] phenoxyacetic acid; DNA, deoxyribonucleic acid; Arg, arginine; Asp, aspartic acid; Boc, tert-butyloxycarbonyl; Bzl, benzyl; Cbz, benzoxycarbonyl; chx, cyclohexyl; CItRt-®, 2-chlorotrityl resin; ClZ, 2-chlorobenzyl; cps, centipoise; C-terminal, carboxy-terminal; DCM, dichloromethane; Dde, N-[1-(4,4-dimethyl-2,6-dioxocyclohex-1-ylidene)ethyl] DIEA, N,N-diisopropylethylamine; DIPCDI, N,N'-diisopropylcarbodiimide; Dmab, 4-(N-[1-(4,4-dimethyl-2,6-dioxocyclohexyridene)-3-methylbutyl]amino)benzyl; DMF, N,N-dimethylformamide; DMSO, dimethyl sulfoxide; Dnp, 2,4-dinitrophenol; DPPC, dipalmitylophosphatidylycerine; EDTA, ethylenediaminetetraacetic acid; equiv, equivalent; ES-MS, electrospray ionization mass spectrometry; Fm, fluorenylethyl; Fmoc, 9-fluorenylethylcarbonyl; Glu, glutamic acid; HOAt, 1-hydroxyazabenzotriazole; HOBt, 1-hydroxybenzotriazole; HPLC, high performance liquid chromatography; INCI, International Nomenclature of Cosmetic Ingredients; ivDde, 1-(4,4-dimethyl-2,6-dioxocyclohexyridene)-3-methyl-butyl;
Leu, leucine; Lys, lysine; mAChR, muscarinic acetylcholine receptors; MASC, MuSK-accessory specificity component; MBHA, p-methylbenzhydrylamine; MeCN, acetonitrile; MeOH, methanol; Met, methionine; MLV, multilaminar vesicles; Mtr, 4-methoxy-2,3,6-trimethylbenzenesulfonyl; Mt, methoxytrityl or methyltrityl; MuSK, muscle specific kinase; nAChR, nicotinic acetylcholine receptors; NMJ, neuromuscular junction; N-terminal, amino-terminal; PAL, 5-(4-aminomethyl-3,5-dimethoxyphenoxy) valeric acid; Palm, palmitoyl; Pbf, 2,2,4,6,7-pentamethyldihydrobenzofuran-5-sulfonyl; PBS, phosphate buffered saline; Phe, phenylalanine; Pmc, 2,2,5,7,8-pentamethylchroman-6-sulfonyl; pNZ, p-nitrobenzoxycarbonyl; Pro, proline; q.s., quantity sufficient; q.s.p., quantity sufficient for; RATL, rapsyn-associated transmembrane linking molecule; SNARE, soluble NSF attachment protein receptors; tBu, tert-butyl; Teoc, 2-(trimethylsilyl)ethoxycarbonyl; TFA, trifluoroacetic acid; THF, tetrahydrofuran; TIS, triisopropylsilane; Tos, p-toluenesulfonyl or tosyl; Troc, 2,2,2-trichloroethoxycarbonyl; Trt, trityl; Tyr, tyrosine; ULV, unilaminar vesicles; UV, ultraviolet; Z, benzoyloxycarbonyl.

**Chemical Synthesis**

All synthetic processes were carried out in polypropylene syringes fitted with porous polyethylene discs or Pyrex® reactors fitted with porous plates. Solvents and soluble reagents were removed by suction. The Fmoc group was removed with piperidine-DMF (2:8, v/v) (1 x 1 min, 1 x 5 min, 5 mL/g resin) [Lloyd-Williams P., Albericio F. and Giralt E. (1997) "Chemical Approaches to the Synthesis of Peptides and Proteins" CRC, Boca Raton, FL, USA]. Washes between stages of deprotection, coupling, and, again, deprotection, were carried out with DMF (3 x 1 min) each time using 10 mL solvent/g resin. Coupling reactions were performed with 3 mL solvent/g resin. The control of the couplings was performed by carrying out the ninhydrin trial [Kaiser E., Colescott R.L., Bossinger C.D. and Cook P.I. (1970) "Color test for detection of free terminal amino groups in the solid-phase synthesis of peptides" Anal. Biochem. 34:595-598] or chloranil trial [Christensen T. (1979) "A qualitative test for monitoring coupling completeness in solid-phase peptide synthesis using chloranil" Acta Chem. Scand. 33B:763-766]. All synthetic reactions and washes were carried out at room temperature.

HPLC chromatographic analysis was carried out with Shimadzu equipment (Kyoto, Japan) using a reversed-phase column thermostatted at 30°C (250 x 4.0 mm, Kromasil C₈, 5 μm, Akzo Nobel, Sweden). The elution was carried out using a gradient
of acetonitrile (+0.07% TFA) in water (+0.1% TFA) at a flow rate of 1 mL/min and detection was carried out at 220 nm.

**EXAMPLE 1**

*Obtaining Fmoc-WₙXₙ-AA₁-AA₂-AA₃-AA₄-AA₅-AA₆-Yₚ-Zₚ-O-2-ClTrt®, wherein AA₁ is -L-Asp-, -L-Glu- or -L-Pro-; AA₂ is -L-Asp-; AA₃ is -L-Tyr- or -L-Arg-; AA₄ is -L-Phe- or -L-Tyr-; AA₅ is -L-Arg- or -L-Lys-; AA₆ is -L-Leu- or -L-Met-; y, n, m, p and s are 0.*

3.11g of Fmoc-L-Leu-OH or 3.27g of Fmoc-L-Met-OH (8.8mmol; 1equiv) dissolved in 55mL of DCM to which was added 1.3mL of DIEA (7.6mmol; 0.86equiv) were coupled onto the dry 2-chlorotrityl (5.5g; 8.8mmol). They were stirred for 5min, after which 2.5mL of DIEA were added (14.6mmol; 1.66equiv). The mixture was allowed to react for 40min. The remaining chloride groups were blocked by treatment with 4.4mL of MeOH.

The N-terminal Fmoc group was deprotected as described in the general methods and 14.27g of Fmoc-L-Arg(Pbf)-OH or 10.31g of Fmoc-L-Lys(Boc)-OH (22mmol; 2.5equiv) were coupled onto the peptidyl resin in the presence of DIPC DI (3.39mL; 22mmol; 2.5equiv) and HOBt (3.37g; 22mmol; 2.5equiv) using DMF as a solvent for 1 hour. The resin was then washed as described in the general methods and the deprotection treatment of the Fmoc group was repeated to couple onto the next amino acid. Following the protocols described the following was sequentially coupled: 8.52g of Fmoc-L-Phe-OH or 10.11g of Fmoc-L-Tyr(tBu)-OH (22mmol; 2.5equiv); 14.27g of Fmoc-L-Arg(Pbf)-OH or 10.11g of Fmoc-L-Tyr(tBu)-OH (22mmol; 2.5equiv); 9.05g of Fmoc-L-Asp(OtBu)-OH (22mmol; 2.5equiv) and subsequently 7.43g of Fmoc-L-Pro-OH, 9.75g of Fmoc-L-Glu(OtBu)-OH or 9.05g of Fmoc-L-Asp(OtBu)-OH (22mmol; 2.5equiv) in the presence in each coupling of 3.37g of HOBt (22mmol; 2.5equiv) and 3.39mL of DIPC DI (22mmol; 2.5equiv).

After the synthesis, the peptidyl resins were washed with DCM (5 x 3 min) and dried by nitrogen stream.

**EXAMPLE 2**

*Obtaining Fmoc-WₙXₙ-AA₁-AA₂-AA₃-AA₄-AA₅-Yₚ-Zₚ-AM-MBHA-®, wherein AA₁ is -L-Asp-, -L-Glu- or -L-Pro-; AA₂ is -L-Asp-; AA₃ is -L-Tyr- or -L-Arg-; AA₄ is -L-Phe- or -L-Tyr-; AA₅ is -L-Arg- or -L-Lys-; AA₆ is -L-Leu- or -L-Met-; and n, m, p and s are 0.*
6.85 g of the Fmoc-AM-MBHA resin with a functionalization of 0.73 mmol/g (5 mmol) were treated with piperidine-DMF according to the described general protocol in order to remove the Fmoc group. 8.84 g of Fmoc-L-Leu-OH or 9.29 g of Fmoc-L-Met-OH (25 mmol; 5 equiv) were incorporated onto the deprotected resin in the presence of DIPCDI (3.85 mL, 25 mmol; 5 equiv) and HOBt (3.85 g, 25 mmol; 5 equiv) using DMF as a solvent for 1 hour.

The resin was then washed as described in the general methods and the deprotection treatment of the Fmoc group was repeated to couple the next amino acid. Following the previously described protocols 11.72 g of Fmoc-L-Lys(Boc)-OH or 16.22 g of Fmoc-L-Arg(Pbf)-OH (25 mmol; 5 equiv); 11.49 g of Fmoc-L-Tyr(tBu)-OH or 9.69 g of Fmoc-L-Phe-OH (25 mmol; 5 equiv); 11.49 g of Fmoc-L-Tyr(tBu)-OH or 16.22 g of Fmoc-L-Arg(Pbf)-OH (25 mmol; 5 equiv); 10.29 g of Fmoc-L-Asp(OtBu)-OH (25 mmol; 5 equiv); and subsequently 8.44 g of Fmoc-L-Pro-OH, 10.29 g of Fmoc-L-Asp(OtBu)-OH or 11.09 g of Fmoc-L-Glu(OtBu)-OH (25 mmol; 5 equiv) were coupled sequentially each coupling in the presence of 3.85 g of HOBt (25 mmol; 5 equiv) and 3.85 mL of DIPCDI (25 mmol; 5 equiv).

After the synthesis, the peptidyl resins were washed with DCM (5 x 3 min) and dried by nitrogen stream.

EXAMPLE 3

General process for removal of Fmoc N-terminal protective group.

The N-terminal Fmoc group of the peptidyl resins obtained in Examples 1 and 2 was deprotected as described in the general methods (20% piperidine in DMF, 1 x 5 min + 1 x 20 min). The peptidyl resins were washed with DMF (5 x 1 min), DCM (4 x 1 min), diethyl ether (4 x 1 min) and dried under vacuum.

EXAMPLE 4

Process for introducing the R1 palmitoyl group onto the peptidyl resins obtained in Example 3.

2.56 g of palmitic acid (10 mmol; 10 equiv) pre-dissolved in DMF (1 mL) were added onto 1 mmol of the peptidyl resins obtained in Example 3, in the presence of 1.53 g of HOBt (10 mmol; 10 equiv) and 1.54 mL of DIPCDI (10 mmol; 10 equiv). They were allowed to react for 15 hours, after which the resins were washed with THF (5 x 1 min), DCM (5 x 1 min), DMF (5 x 1 min), MeOH (5 x 1 min), DMF (5 x 1 min) THF (5 x 1
min), DMF (5 x 1 min), DCM (4 x 1 min), ether (3 x 1 min), and were dried under vacuum.

**EXAMPLE 5**

*Process for introducing the R$_1$ acetyl group onto the peptidyl resins obtained in Example 3.*

1 mmol of the peptidyl resins obtained in Example 3 was treated with 25 equiv of acetic anhydride in the presence of 25 equiv of DIEA using 5 mL of DMF as a solvent. They were allowed to react for 30 mins, after which the peptidyl resins were washed with DMF (5 x 1 min), DCM (4 x 1 min), diethyl ether (4 x 1 min) and were dried under vacuum.

**EXAMPLE 6**

*Cleavage process from the polymeric support of the peptidyl resins obtained in Examples 3, 4 and 5.*

200 mg of the dried peptidyl resins obtained in Examples 3, 4 and 5 were treated with 5 mL of TFA:TiS:H$_2$O (90:5:5) for 2 hours at room temperature under stirring. Filtrates were collected onto 50 mL cold diethyl ether, they were filtered through polypropylene syringes fitted with porous polyethylene discs and washed 5 times with 50 mL diethyl ether. The final precipitates were dried under vacuum.

HPLC analysis of the obtained peptides in gradients of MeCN (+0.07% TFA) in H$_2$O (+0.1% TFA) showed a purity exceeding 80% in all cases. The identity of the peptides obtained was confirmed by ES-MS.

**EXAMPLE 7**

*Cleavage process of the polymeric support and functionalization with R$_2$ substituted amine: Obtaining: Ac-W$_n$-X$_m$-AA$_1$-AA$_2$-AA$_3$-AA$_4$-AA$_5$-Y$_p$-Z$_q$-NH-(CH$_2$)$_r$-CH$_s$,

wherein AA$_6$ is -L-Leu- or -L-Met--; AA$_5$ is -L-Arg- or -L-Lys--; AA$_4$ is -L-Phe- or -L-Tyr--; AA$_3$ is -L-Tyr- or -L-Arg--; AA$_2$ is -L-Asp--; AA$_1$ is -L-Asp-, -L-Glu- or -L-Pro--; and n, m, p and s are 0.

The peptides Ac-W$_n$-X$_m$-AA$_1$-AA$_2$-AA$_3$-AA$_4$-AA$_5$-Y$_p$-Z$_q$-OH with fully protected side chains were obtained by treating 150 mg of the peptidyl resins Ac-W$_n$-X$_m$-AA$_1$-AA$_2$-AA$_3$-AA$_4$-AA$_5$-Y$_p$-Z$_q$-O-2-CITr-® of Example 5, previously desiccated under vacuum in the presence of KOH, with 3 mL of a 3% solution of TFA
DCM for 5 min. The filtrates were collected onto 50 mL of cold diethyl ether and the treatment was repeated three times. Ethereal solutions were evaporated to dryness at reduced pressure and room temperature, the precipitates were redissolved in 50% MeCN in H₂O and lyophilized. 10 mg of the obtained crude peptides were weighed in a flask and 3 equiv of hexadecylamine and 25 mL of anhydrous DMF were added. 2 equiv of DIPCDI were added, and left to react being magnetically stirred at 47°C. The reactions were monitored by HPLC until disappearance of the initial products, which were complete after 24-48 hours. The solvents were evaporated to dryness and co-evaporated twice with DCM. The obtained residues [Ac-W₁-Xₐ₁-Xₐ₂-AA₃-AA₄-AA₅-AA₆-Yₐ₁-Z₁-NH-(CH₂)₁₅-CH₃ with fully protected side chains] were redissolved in 25 mL of a mixture of TFA:DCM:anisole (49:49:2) and left to react for 30 min at room temperature. 250 mL of cold diethyl ether were added, the solvents were evaporated under reduced pressure and two additional co-evaporations with ether were carried out. The residues were dissolved in a mixture of 50% MeCN in H₂O and lyophilized.

HPLC analysis of the obtained peptides in gradients of MeCN (+0.07% TFA) in H₂O (+0.1% TFA) showed a purity exceeding 60% in all cases. The identity of the peptides obtained was confirmed by ES-MS.

EXAMPLE 8

ACHR clustering inhibition trial.

The peptides were resuspended in water in the presence of 0.5% DMSO. 10⁴ mouse myoblasts were seeded in a 12-well plate and cultured in differentiation medium for 4-6 days until myotubes formed. The differentiation medium was removed and the cells were incubated for 16 hours with 5M NaCl, after which the medium was removed and the cells were incubated with the peptides at 0.1mM for 24 hours. After this period, 5µg/mL of the C-terminal agrin fragment dissolved in PBS (+0.1% BSA) were added and were incubated for 5 hours at 37°C.

The cells were fixed and an immunocytochemistry was performed with α-bungarotoxin conjugated to tetramethylrhodamine to visualize the AChRs. The myotubes were incubated with a 10nM solution of the toxin for 30min at room temperature without light. After this time the toxin was removed, they were washed, dried and placed on the slides with mounting medium.
Photographs were taken with a confocal microscope, using a 40X immersion objective and the number of AChR clusters was quantified using the image treatment software.

Table 2 provides details of the peptides which showed cluster inhibition values greater than 20%. Inhibition values were normalized with regards to the basal values of inhibition of the medium.

Table 2. Percentage of AChR cluster inhibition

Dipalmitoylethanolamine (DPPC) was weighed and dissolved in chloroform. The solvent was evaporated under vacuum until a fine layer of phospholipid was obtained, and this layer was hydrated by treatment at 55°C with an aqueous solution of the peptide at the desired concentration (containing the preservative Phenonip™), and the MLV liposomes were obtained. The ULV liposomes were obtained by submerging the MLV liposomes in an ultrasound bath at 55°C for 8 cycles of 2min at 5min intervals. The size of the ULV liposomes was reduced by putting them through a high-pressure extrusion system.

EXAMPLE 14

The ingredients of phase A were weighed and warmed slightly to about 30°C to help to dissolve some of the preservatives in a vessel suitable for the complete sample. Next, phase B components were added and homogenized under light stirring.

Phase C was then added under continuous stirring, after which phase D was added with slow stirring to avoid foaming.

The pH was adjusted to 5.5-6.5.

EXAMPLE 16

Effect of the composition from Example 15 in the reduction of wrinkles.

To assess the effectiveness of the composition from Example 15 of the invention, a panel of 20 volunteers with an average age of 45 years applied the composition from Example 15 twice a day to the periorbital area of one eye for a month, whilst a placebo cream, with the same composition as the cream in Example 15 but without the peptide of the invention, was applied to the periorbital area of the other eye. The depth of the wrinkles was assessed before and after the treatment using the Primos optical 3D technique, and the wrinkle reduction effectiveness was calculated in relation to the
effectiveness shown by the placebo cream. A 44.7% increase in the average reduction of the depth of the wrinkles on the volunteers was obtained with regards to the placebo cream values.
1. A peptide of general formula (I)

\[ R_1-W_n-X_m-AA_1-AA_2-AA_3-AA_4-AA_5-AA_6-Y_p-Z_s-R_2 \]

(I)

its stereoisomers, mixtures thereof and/or its cosmetic or pharmaceutical acceptable salts, characterized in that:

AA\(_1\) is selected from the group consisting of -Asp-, -Glu- and -Pro-;

AA\(_2\) is -Asp-;

AA\(_3\) is selected from the group consisting of -Tyr- and -Arg-;

AA\(_4\) is selected from the group consisting of -Phe- and -Tyr-;

AA\(_5\) is selected from the group consisting of -Arg- and -Lys-;

AA\(_6\) is selected from the group consisting of -Leu- and -Met-;

W, X, Y and Z are independently selected from amongst themselves from the group consisting of coded amino acids and non-coded amino acids;

n, m, p and s are independently selected from amongst themselves and have a value of between 0 and 1;

R\(_1\) is selected from the group consisting of H, substituted or unsubstituted non-cyclic aliphatic group, substituted or unsubstituted alicyclyl, substituted or unsubstituted heterocycllyl, substituted or unsubstituted heteroarylyalkyl, substituted or unsubstituted aryl, substituted or unsubstituted aralkyl and R\(_5\)-CO- wherein R\(_5\) is selected from the group consisting of H, substituted or unsubstituted non-cyclic aliphatic group, substituted or unsubstituted alicyclyl, substituted or unsubstituted aryl, substituted or unsubstituted aralkyl, substituted or unsubstituted heterocycllyl, substituted and unsubstituted heteroarylyalkyl; and

R\(_2\) is selected from the group consisting of -NR_3R_4, -OR_3 and -SR_3, wherein R\(_3\) and R\(_4\) are independently selected from the group consisting of H, substituted or unsubstituted non-cyclic aliphatic group, substituted or unsubstituted alicyclyl, substituted or unsubstituted heterocycllyl, substituted or unsubstituted
heteroarylalkyl, substituted or unsubstituted aryl, substituted or unsubstituted aralkyl.

2. The peptide according to claim 1, characterized in that R₁ is selected from the group consisting of H and R₅-COₐ, wherein R₅ is selected from the group consisting of substituted or unsubstituted alkyl C₁-C₂₄, substituted or unsubstituted alkenyl C₂-C₂₄, substituted or unsubstituted alkynyl C₂-C₂₄, substituted or unsubstituted cycloalkyl C₃-C₂₄, substituted or unsubstituted cycloalkenyl C₅-C₂₄, substituted or unsubstituted cycloalkynyl C₅-C₂₄, substituted or unsubstituted aralkyl C₇-C₂₄, substituted or unsubstituted heterocyclyl with 3-10 ring members, and substituted or unsubstituted heteroarylalkyl of 2 to 24 carbon atoms and 1 to 3 atoms other than carbon and an alkyl chain of 1 to 6 carbon atoms.

3. The peptide according to claim 2, characterized in that R₁ is selected from the group consisting of H, acetyl, tert-butanoxy, hexanoyl, 2-methylhexanoyl, cyclohexancarboxyl, octanoyl, decanoyl, lauroyl, myristoyl, palmitoyl, stearoyl, oleoyl and linoleoyl.

4. The peptide according to claim 1, characterized in that R₂ is -NR₃R₄ or -OR₃, wherein R₃ and R₄ are independently selected from the group consisting of H, substituted or unsubstituted alkyl C₁-C₂₄, substituted or unsubstituted alkenyl C₂-C₂₄, substituted or unsubstituted alkynyl C₂-C₂₄, substituted or unsubstituted cycloalkyl C₃-C₂₄, substituted or unsubstituted cycloalkenyl C₅-C₂₄, substituted or unsubstituted cycloalkynyl C₅-C₂₄, substituted or unsubstituted aryl C₆-C₃₀, substituted or unsubstituted aralkyl C₇-C₂₄, substituted or unsubstituted heterocyclyl with 3-10 ring members, and substituted or unsubstituted heteroarylalkyl of 2 to 24 carbon atoms and 1 to 3 atoms other than carbon and an alkyl chain of 1 to 6 carbon atoms.

5. The peptide according to claim 4, characterized in that R₃ and R₄ are independently selected from the group consisting of H, methyl, ethyl, hexyl, dodecyl and hexadecyl.

6. The peptide according to claim 1, characterized in that R₁ is selected from the group consisting of H, acetyl, lauroyl, myristoyl and palmitoyl, AA₁ is -L-Glu-, AA₂ is -L-Asp-, AA₃ is -L-Tyr-, AA₄ is -L-Tyr-, AA₅ is -L-Arg-, AA₆ is -L-Leu-, and R₂ is -NR₃R₄ or -OR₃ wherein R₃ and R₄ are independently selected from H, methyl, ethyl, hexyl, dodecyl and hexadecyl.
7. The peptide according to claim 1, characterized in that R₁ is selected from the group consisting of H, acetyl, lauroyl, myristoyl and palmitoyl, AA₁ is -L-Pro-, AA₂ is -L-Asp-, AA₃ is -L-Tyr-, AA₄ is -L-Tyr-, AA₅ is -L-Lys-, AA₆ is -L-Leu-, and R₂ is -NR₃R₄ or -OR₃ wherein R₃ and R₄ are independently selected from H, methyl, ethyl, hexyl, dodecyl and hexadecyl.

8. The peptide according to claim 1, characterized in that R₁ is selected from the group consisting of H, acetyl, lauroyl, myristoyl and palmitoyl, AA₁ is -L-Glu-, AA₂ is -L-Asp-, AA₃ is -L-Arg-, AA₄ is -L-Phe-, AA₅ is -L-Arg-, AA₆ is -L-Met- and R₂ is -NR₃R₄ or -OR₃ wherein R₃ and R₄ are independently selected from H, methyl, ethyl, hexyl, dodecyl and hexadecyl.

9. The peptide according to claim 1, characterized in that R₁ is selected from the group consisting of H, acetyl, lauroyl, myristoyl and palmitoyl, AA₁ is -L-Glu-, AA₂ is -L-Asp-, AA₃ is -L-Tyr-, AA₄ is -L-Tyr-, AA₅ is -L-Arg-, AA₆ is -L-Met- and R₂ is -NR₃R₄ or -OR₃ wherein R₃ and R₄ are independently selected from H, methyl, ethyl, hexyl, dodecyl and hexadecyl.

10. The peptide according to claim 1, characterized in that R₁ is selected from the group consisting of H, acetyl, lauroyl, myristoyl and palmitoyl, AA₁ is -L-Pro-, AA₂ is -L-Asp-, AA₃ is -L-Tyr-, AA₄ is -L-Tyr-, AA₅ is -L-Arg-, AA₆ is -L-Met- and R₂ is -NR₃R₄ or -OR₃ wherein R₃ and R₄ are independently selected from H, methyl, ethyl, hexyl, dodecyl and hexadecyl.

11. The peptide according to claim 1, characterized in that R₁ is selected from the group consisting of H, acetyl and palmitoyl and R₂ is selected from the group consisting of -OH and -NH₂.

12. The peptide according to claim 1, characterized in that n, m, p and s are 0.

13. The peptide according to any of the previous claims for the treatment and/or care of those conditions, disorders and/or diseases which are a consequence of muscle contraction.

14. The peptide according to claim 13 in which said conditions, disorders and/or diseases are a consequence of acetylcholine receptor clustering.

15. The peptide according to any of claims 1 to 12, for the treatment and/or care of skin.
16. The peptide according to claim 15 in which said treatment and/or care of the skin is the treatment and/or prevention of the signs of aging and/or photoaging.

17. The peptide according to any of claims 13 to 16, for the treatment and/or care of the skin affected by wrinkles and/or expression lines.

18. The peptide according to any of claims 13 to 14 in which said disorders and/or diseases are dystonias.

19. The peptide according to any of claims 13 to 18 in which the treatment and/or care is performed by topical, transdermal, oral or parenteral application of said peptide.

20. The peptide according to claim 19 in which the topical or transdermal application is performed via iontophoresis, sonophoresis, electroporation, mechanical pressure, osmotic pressure gradient, occlusive cure, microinjections, needle-free injections by means of pressure, by means of microelectric patches or any combination thereof.

21. Process for preparation of a peptide of general formula (I), its stereoisomers, mixtures thereof and/or its cosmetically or pharmaceutically acceptable salts, according to any of claims 1 to 12, characterized in that it is carried out in solid phase or in solution.

22. Process for preparation of a peptide of general formula (I), its stereoisomers, mixtures thereof and/or its cosmetically or pharmaceutically acceptable salts, according to any of claims 1 to 12, characterized in that the protective groups of the free amino groups are selected from the group consisting of Boc, Fmoc, Trt, Troc, Teoc, Alloc, Mtt, Z, ClZ, Dnp, Dde, ivDde and Adpoc, the protective groups of the free carboxyl groups are selected from the group consisting of tBu, Bzl, cHx, All, Dmb, 2-phenylisopropyl, Fm and Trt esters, the arginine side chain is protected with a protective group selected from the group consisting of Tos, Pbf and Pmc, the lysine side chain is protected with a protective group selected from the group consisting of ClZ, Fmoc, Boc, Mtt and Alloc, the aspartic acid and glutamic acid side chains are protected with a protective group selected from the group consisting of Bzl, cHx, tBu and All, the tyrosine side chain is protected with a protective group selected from the group consisting of 2-BrZ, Bzl and tBu and the methionine side chain is used unprotected.

23. Cosmetic or pharmaceutical composition which comprises a cosmetically or pharmaceutically effective amount of at least one peptide of general formula (I), its stereoisomers, mixtures thereof and/or its cosmetically or pharmaceutically
acceptable salts, according to any of claims 1 to 12, and at least one cosmetically or pharmaceutically acceptable excipient or adjuvant.

24. Composition according to claim 23, characterized in that the peptide of general formula (I), its stereoisomers, mixtures thereof and/or its cosmetically or pharmaceutically acceptable salts, is found in a concentration between 0.000001% and 20% in weight, with regards to the total weight of the composition.

25. Composition according to claim 24, characterized in that said peptide of general formula (I), its stereoisomers, mixtures thereof and/or its cosmetically or pharmaceutically acceptable salts, is found in a concentration between 0.0001% and 5% in weight, with regards to the total weight of the composition.

26. The composition according to any of claims 23 to 25, characterized in that said peptide of general formula (I), its stereoisomers, mixtures thereof and/or its cosmetically or pharmaceutically acceptable salts, is incorporated into a cosmetical or pharmaceutical delivery system and/or sustained release system selected from the group consisting of liposomes, mixed liposomes, oleosomes, niosomes, ethosomes, millicapsules, microcapsules, nanocapsules, sponges, cyclodextrins, vesicles, micelles, mixed micelles of surfactants, mixed micelles of surfactant-phospholipid, millisphere, microspheres, nanospheres, lipospheres, microemulsions, nanoemulsions, miniparticles, milliparticles, microparticles, nanoparticles, solid lipid nanoparticles and nanostructured lipid carrier.

27. Composition according to any of claims 23 to 26, characterized in that said peptide of general formula (I), its stereoisomers, mixtures thereof and/or its cosmetically or pharmaceutically acceptable salts, is found adsorbed on a cosmetically or pharmaceutically acceptable solid organic polymer or solid mineral support selected from the group consisting of talc, bentonite, silica, starch and maltodextrin.

28. Composition according to claim 26, characterized in that said microemulsions are water-in-oil microemulsions with an internal structure of reverse micelle.

29. Composition according to any of claims 23 to 28, characterized in that it is presented in a formulation selected from the group consisting of creams, multiple emulsions, anhydrous compositions, aqueous dispersions, oils, milks, balsams, foams, lotions, gels, cream gels, hydroalcoholic solutions, hydroglycolic solutions, hydrogels, liniments, sera, soaps, shampoos, conditioners, serums, ointments, mousses, pomades; powders, bars, pencils; sprays, aerosols, capsules, gelatin
capsules, soft capsules, tablets, sugar coated tablets, granules, chewing gum, solutions, suspensions, emulsions, syrups, polysaccharide films, jellies and gelatins.

30. Composition according to any of claims 23 to 29, characterized in that said composition is found incorporated into a product selected from the group consisting of under-eye concealers, make-up foundation, make-up removing lotions, make-up removing milks, eye shadows, lipsticks, lip gloss, lip protectors and powders.

31. Composition according to any of claims 23 to 27, characterized in that the peptide of general formula (I), its stereoisomers, mixtures thereof and/or its cosmetically or pharmaceutically acceptable salts, is incorporated into a fabric, a non-woven fabric or a medical device.

32. Composition according to claim 31, characterized in that the fabric, non-woven fabric or medical device is selected from the group consisting of bandages, gauzes, t-shirts, tights, socks, underwear, girdles, gloves, diapers, sanitary napkins, dressings, bedspreads, wipes, adhesive patches, non-adhesive patches, occlusive patches, microelectric patches and/or face masks.

33. Composition according to any of claims 23 to 32, characterized in that it further comprises a cosmetically or pharmaceutically effective amount of at least one adjuvant selected from the group of other agents inhibiting acetylcholine receptor clustering, other agents inhibiting muscle contraction, anticholinergic agents, elastase inhibiting agents, matrix metalloproteinase inhibiting agents, melanin synthesis stimulating and inhibiting agents, whitening or depigmenting agents, pro-pигmenting agents, self-tanning agents, anti-aging agents, NO-synthase inhibiting agents, 5α-reductase inhibiting agents, lysyl- and/or prolyl hydroxylase inhibiting agents, antioxidants, free radical scavengers and/or agents against atmospheric pollution, reactive carbonyl specie scavengers, anti-glycation agents, antihistamine agents, antiemetic agents, antiviral agents, antiparasitic agents, emulsifiers, emollients, organic solvents, liquid propellants, skin conditioners, humectants, substances which retain moisture, alpha hydroxy acids, beta hydroxy acids, moisturizers, epidermal hydrolytic enzymes, vitamins, pigments or colorants, dyes, gelling polymers, thickeners, surfactants, softening agents, anti-wrinkle agents, agents able to reduce or treat bags under the eyes, exfoliating agents, antimicrobial agents, antifungal agents, fungicidal agents, bactericidal agents, bacteriostatic agents, agents stimulating the synthesis of dermal or epidermal macromolecules.
and/or capable of inhibiting or preventing their degradation, collagen synthesis-stimulating agents, elastin synthesis-stimulating agents, decorin synthesis-stimulating agents, laminin synthesis-stimulating agents, defensin synthesis-stimulating agents, chaperone synthesis-stimulating agents, aquaporin synthesis-stimulation agents, hyaluronic acid synthesis-stimulating agents, fibronectin synthesis-stimulating agents, sirtuin synthesis-stimulating agents, agents stimulating the synthesis of lipids and components of the stratum corneum, agents stimulating the synthesis of ceramides, agents that inhibit collagen degradation, agents that inhibit elastin degradation, agents that inhibit serine proteases such as cathepsin G, agents stimulating fibroblast proliferation, agents stimulating keratinocyte proliferation, agents stimulating adipocyte proliferation, agents stimulating melanocyte proliferation, agents stimulating keratinocyte differentiation, agents stimulating adipocyte differentiation, agents that inhibit acetylcholinesterase, skin relaxant agents, glycosaminoglycan synthesis-stimulating agents, anti-hyperkeratosis agents, comedolytic agents, antipsoriasis agents, DNA repair agents, DNA protecting agents, stabilizers, anti-itching agents, agents for the treatment and/or care of sensitive skin, firming agents, anti-stretch mark agents, astringent agents, agents regulating sebum production, lipolytic agents or agents stimulating lipolysis, anti-cellulite agents, antiperspirant agents, agents stimulating healing, coadjuvant healing agents, agents stimulating reepithelialization, coadjuvant reepithelialization agents, cytokine growth factors, calming agents, anti-inflammatory agents and/or analgesics, anesthetic agents, agents acting on capillary circulation and/or microcirculation, agents stimulating angiogenesis, agents that inhibit vascular permeability, venotonic agents, agents acting on cell metabolism, agents to improve dermal-epidermal junction, agents inducing hair growth, hair growth inhibiting or retardant agents, preservatives, perfumes, chelating agents, vegetable extracts, essential oils, marine extracts, agents obtained from a biofermentation process, mineral salts, cell extracts and sunscreens, active organic or mineral. Photoprotective agents against ultraviolet A and/or B rays, or combinations thereof.

34. Composition according to claim 33, characterized in that the adjuvant is synthetic in origin or is a vegetable extract or is obtained from a bio-technological process or from a combination of a synthetic process and a bio-technological process.
35. Composition according to any of claims 33 and 34, characterized in that the adjuvant is selected from the group consisting of anti-wrinkle agents and/or antiaging agents.

36. Composition according to claim 35, characterized in that the anti-wrinkle agents and/or antiaging agents are selected from the group consisting of Pentapeptide-18, Acetyl Hexapeptide-8, Acetyl Heptapeptide-4, Acetyl Octapeptide-3, Acetyl Tetrapeptide-5, Tripeptide-10 Citrulline, Acetyl Tripeptide-30 Citrulline, Dimethylmethoxy Chromanol, Dimethylmethoxy Chromanyl Palmitate, Diaminopropionyl Tripeptide-33, Pseudoalteromonas ferment extract, acetyl-arginyl-phenylglycyl-tryptophyl-phenylglycine, acetyl-arginyl-phenylglycyl-valylglycine, acetyl-arginyl-phenylglycyl-valyl-phenylglycine, the mixture of Hydrolyzed Wheat Protein, Hydrolyzed Soy Protein and Tripeptide-1, the mixture of Lysine HCl, Lecithin and Tripeptide-10 Citrulline and the mixture of Pseudoalteromonas Ferment Extract, Hydrolyzed Wheat Protein, Hydrolyzed Soy Protein, Tripeptide-10 Citrulline and Tripeptide-1.
