Abstract:

The present invention relates to PPAR-α/sparing compounds and pharmaceutical compositions formulated with such compounds that are useful for treating, delaying the onset of, or reducing the symptoms of a neurodegenerative disorder including Huntington's disease, epilepsy, AMS, and MS.
CROSS REFERENCE TO RELATED APPLICATION

[0001] This application claims the benefit of U.S. provisional application serial no. 61/735,634, filed on Dec. 11, 2012. This document is hereby incorporated by reference in its entirety.

TECHNICAL FIELD OF THE INVENTION

[0002] The present invention provides PPARy-sparing compounds and pharmaceutical composition containing thiazolidinedione analogs for use in treating and/or preventing neurodegenerative diseases or other metabolic disease states (e.g., diabetes).

BACKGROUND OF THE INVENTION

[0003] Over the past several decades, scientists have postulated that PPARy is the generally accepted site of action for insulin sensitizing thiazolidinedione compounds.

[0004] Peroxisome Proliferator Activated Receptors (PPARs) are members of the nuclear hormone receptor super family, which are ligand-activated transcription factors regulating gene expression. PPARs have been implicated in autoimmune diseases and other diseases, i.e., diabetes mellitus, cardiovascular and gastrointestinal disease, and Alzheimer’s disease.

[0005] PPARy is a key regulator of adipocyte differentiation and lipid metabolism. PPARy is also found in other cell types including fibroblasts, myocytes, breast cells, human bone-marrow precursors, and macrophages/monocytes. In addition, PPARy has been shown in macrophage foam cells in atherosclerotic plaques.

[0006] Thiazolidinediones, developed originally for the treatment of type-2 diabetes, generally exhibit high-affinity as PPARy ligands. The finding that thiazolidinediones might mediate their therapeutic effects through direct interactions with PPARy helped to establish the concept that PPARy is a key regulator of glucose and lipid homeostasis. However, compounds that involve the activation of PPARy also trigger sodium reabsorption and other unpleasant side effects.

[0007] Surprisingly, it is also noted that PPARy sparing thiazolidinediones also demonstrate beneficial neurological properties such as reducing or slowing plaque build-up on neurons (e.g., brain tissue).
SUMMARY OF THE INVENTION

[0008] The present invention relates to compounds that have reduced binding and/or activation of the nuclear transcription factor PPARy. Contrary to the teachings of the literature, PPARy sparing compounds of the present invention show beneficial neurological properties with reduced incidence of negative side effects occasioned by PPARy activating compounds (e.g., rosiglitazone or pioglitazone).

[0009] The compounds of this invention have reduced binding and/or activation of the nuclear transcription factor PPARy, do not augment sodium re-absorption, and are useful in treating or preventing several neurodegenerative disorders. Advantageously, the compounds having lower PPARy activity exhibit fewer side effects than compounds having higher levels of PPARy activity.

[0010] In one aspect, the present invention provides a method for treating, reducing the symptoms of, or delaying the onset of a neurodegenerative disease selected from Huntington's disease, ALS, MS, or epilepsy comprising administering to a patient in need thereof a compound of Formula I:

\[
\text{Formula I:}
\]

\[
\text{or a pharmaceutically acceptable salt thereof, wherein each of } R_j \text{ and } R_4 \text{ is independently selected from H, halo, aliphatic, and alkoxy, wherein the aliphatic or alkoxy is optionally substituted with 1-3 of halo; } R'_2 \text{ is H; } R_2 \text{ is H, halo, hydroxy, or optionally substituted aliphatic, -O-acyl, -O-aroyl, -O-heteroaroyl, -O-(S)}^2\text{NH}_2, -\text{O-CH}(R_m)\text{OC(O)R}_n, -\text{O-CH}(R_m)\text{OP(O)(OR')}_2, -\text{O-CH}(R_m)\text{OP(O)(OR')}_2, \text{or } R_a, \text{cycloalkyl, or phenyl, each of which is optionally substituted, or } R_2 \text{ and } R'_2 \text{ together form oxo; } R_3 \text{ is H or optionally substituted C}_{i-6} \text{ alkyl; and ring A is a phenyl, pyridin-2-yl, pyridin-3-yl, or pyridin-4-yl, each of which is substituted with an } R_1 \text{ group and an } R_4 \text{ group at any chemically feasible position on ring A.}
\]

[0011] In some methods, } R_3 \text{ is H.}

[0012] In some methods, } R_3 \text{ is CH}_3.
In some methods, \( R_4 \) is H, methyl, methoxy, ethyl, ethoxy, -O-isopropyl, -CF_3, -OCHF_2 or -OCF_3. For example, \( R_4 \) is H.

In some methods, \( R_1 \) is H, alkyl, halo or alkoxy. For example, \( R_1 \) is H. In other examples, \( R_1 \) is halo. In some examples, \( R_1 \) is \( \text{Cl}_{1-3} \) alkyl.

In some methods, ring A is phenyl that is substituted with \( R_i \) and \( R_4 \) groups at any chemically feasible position on ring A. In some examples, ring A is phenyl, and one of \( R_1 \) or \( R_4 \) is attached to the para or meta position of ring A. For instance, \( R_1 \) is alkyl or \( R_4 \) is attached to the para or meta position of ring A. And, in some examples, \( R_i \) is F or Cl, either of which is attached to the para or meta position of ring A. In other examples, \( R_1 \) is alkoxy (e.g., methoxy, ethoxy, propoxy, -O-isopropyl, butoxy, or -O-tertbutyl) that is attached to the para or meta position of ring A. In other examples, ring A is phenyl, and \( R_1 \) is attached to the meta or ortho position of the phenyl ring. For instance, ring A is phenyl, and \( R_i \) is attached to the ortho position of the phenyl ring. In some instances, ring A is phenyl, and \( R_i \) is methoxy, ethoxy, or -O-isopropyl, any of which is attached to the ortho position of ring A. In other instances, \( R_i \) is -CF_3, -OCHF_2 or -OCF_3.

In some methods, ring A is optionally substituted pyridin-2-yl or optionally substituted pyridin-3-yl, either of which is substituted with \( R_i \) and \( R_4 \) groups at any chemically feasible position on ring A. In some examples, ring A is pyridin-2-yl, and one of \( R_1 \) or \( R_4 \) is attached to the 5 position of the ring. In other examples, ring A is pyridin-3-yl, and one of \( R_i \) or \( R_4 \) is attached to the 6 position of the ring. In some examples, ring A is pyridin-2-yl, and \( R_i \) is attached to the 5 position of the ring. For instance, ring A is pyridin-2-yl, and \( R_i \) is alkyl or alkoxy, either of which is attached to the 5 position of ring A. In other instances, ring A is pyridin-2-yl, and \( R_i \) is methyl, ethyl, propyl, isopropyl, butyl, or tertbutyl, any of which are attached to the 5 position of ring A.

In some methods, \( R'_2 \) is H.

In some methods, \( R_2 \) is hydroxy.

In some methods, \( R_2 \) is -O-acyl, -O-arylmethoxy, or -O-heteroaryl.

In some methods, \( R_2 \) and \( R'_2 \) together form oxo.

[0032] In some methods, the compound of Formula I is one selected from:
In some methods, the compound of Formula I is one selected from:

[0033]
In some methods, the neurodegenerative disease is Huntington's disease. In other methods, the neurodegenerative disease is epilepsy.

Some methods further comprise administering to the patient tetrabenazine, haloperidol, clozapine, clonazepam, diazepam, escitalopram, fluoxetine, sertraline, or any combination thereof.

Some methods further comprise administering an anti-convulsive medication. In some examples, the anti-convulsive medication is selected from carbamazepine (Tegretol™), clorazepate (Tranxene™), clonazepam (Klonopin™), ethosuximide (Zarontin™), felbamate (Felbatol™), fosphenytoin (Cerebyx™), gabapentin (Neurontin™), lacosamide (Vimpat™), lamotrigine (Lamictal™), levetiracetam (Keppra™), oxcarbazepine (Trileptal™), phenobarbital (Luminal™), phenytoin (Dilantin™), pregabalin (Lyrica™), primidone (Mysoline™), tiagabine (Gabitril™), topiramate (Topamax™), valproate semisodium (Depakote™), valproic acid (Depakene™), zonisamide (Zonegran™), or any combination thereof.

Some methods further comprise administering diazepam (Valium™, Diastat™) and lorazepam (Ativan™), paraldehyde (Paral™), midazolam (Versed™), pentobarbital (Nembutal™), acetazolamide (Diamox), progesterone, adrenocorticotropic hormone (ACTH, Acthar™), prednisone, bromide, or any combination thereof.

And, some methods further comprise administering LDOPA to the patient.

Some methods further comprise administering a phosphodiesterase inhibitor to the patient.

Some methods further comprise administering to the patient another pharmaceutical agent having an activity that increases cAMP in the patient.

In some methods, the second pharmaceutical agent further comprises a beta-adrenergic agonist. For example, the beta-adrenergic agonist comprises a beta-1- adrenergic agonist, a beta-2-adrenergic agonist, a beta-3-adrenergic agonist, or any combination thereof.
In other examples, the beta-adrenergic agonist comprises noradrenaline, isoprenaline, dobutamine, salbutamol, levsalbutamol, terbutaline, pirbuterol, procaterol, metaproterenol, fenoterol, bitolterol mesylate, salmeterol, formoterol, bambuterol, clenbuterol, indacaterol, L-796568, amibeegron, solabegron, isoproterenol, albuterol, metaproterenol, arbutamine, befunolol, bromoacetylalprenololmenthane, broxaterol, cimaterol, cirazoline, denopamine, dopexamine, epinephrine, etilefrine, hexoprenaline, higenamine, isoetharine, isoxsuprine, mabuterol, methoxyphenamine, nylidrin, oxyfedrine, prenalterol, ractopamine, reproterol, rimiterol, ritodrine, tretoquinol, tulobuterol, xamoterol, zilpaterol, zinterol, or any combination thereof.

[0043] Another aspect of the present invention provides a method of treating, delaying the onset, or reducing the symptoms of a neurodegenerative disorder selected from Huntington's disease, epilepsy, AMS, or MS comprising administering to a patient a pharmaceutical composition comprising a compound of Formula I, as described above, and a phosphodiesterase inhibitor.

[0044] In some methods, the phosphodiesterase inhibitor comprises a non-selective inhibitor. For example, the phosphodiesterase inhibitor comprises caffeine (1,3,7-trimethylxanthine), theobromine (3,7-dimethyl-2,3,6,7-tetrahydro-1H-purine-2,6-dione), theophylline (1,3-dimethyl-7H-purine-2,6-dione), IBMX (3-isobutyl-1-methylxanthine), or any combination thereof.

[0045] In some methods, the phosphodiesterase inhibitor comprises a selective inhibitor. For example, the selective phosphodiesterase inhibitor comprises Milrinone (2-methyl-6-oxo-1,6-dihydro-3,4'-bipyridine-5-carbonitrile), Cilostazol (6-[4-(1-cyclohexyl-1H-tetrazol-5-yl)butoxy]-3,4-dihydro-2(1H)-quinolinone), Cilomilast (4-cyano-4-(3-cyclopentoxy-4-methoxyphenyl)cyclohexane-1-carboxylic acid), Rolipram (4-(3-cyclopentoxy-4-methoxyphenyl)pyrrolidin-2-one), Roflumilast (3-(cyclopropylmethoxy)-N-(3,5-dichloropyridin-4-yl)-4-(difluoromethoxy)benzamide), or any combination thereof.

[0046] Another aspect of the present invention provides a method of treating, delaying the onset, or reducing the symptoms of a neurodegenerative disorder selected from Huntington's disease, epilepsy, AMS, or MS comprising administering to a patient a pharmaceutical composition comprising a co-crystal comprising a compound of Formula I, as described above, and a phosphodiesterase inhibitor, as described above.

[0047] In some methods, the pharmaceutical composition further comprises a pharmaceutical agent having an activity that increases cAMP in the patient, as described above.
Another aspect of the present invention provides a method of treating, delaying the onset, or reducing the symptoms of a neurodegenerative disorder selected from Huntington's disease, epilepsy, AMS, or MS in a patient comprising administering a pharmaceutical composition comprising

```
HN
O
S
O

O
S
O
```

or a co-crystal comprising the compound or a pharmaceutically acceptable salt thereof, and a phosphodiesterase inhibitor; and a second pharmaceutical agent having an activity that increases cAMP in the patient, and a pharmaceutically acceptable carrier.

Another aspect of the present invention provides a method of treating, delaying the onset, or reducing the symptoms of a neurodegenerative disorder selected from Huntington's disease, epilepsy, AMS, or MS in a patient comprising administering a pharmaceutical composition comprising

```
HN

```

or a co-crystal comprising the compound or a pharmaceutically acceptable salt thereof, and a phosphodiesterase inhibitor; and a second pharmaceutical agent having an activity that increases cAMP in the patient, and a pharmaceutically acceptable carrier.

Another aspect of the present invention provides a method for treating, reducing the symptoms of, or delaying the onset of a neurodegenerative disorder selected from Huntington's disease, epilepsy, ALS, or MS comprising administering to a patient an alkali metal salt of a compound of Formula I:

```
<table>
<thead>
<tr>
<th>R1</th>
<th>R2</th>
<th>R3</th>
<th>R4</th>
</tr>
</thead>
</table>
```

wherein each of R1 and R4 is independently selected from H, halo, aliphatic, and alkoxy, wherein the aliphatic or alkoxy is optionally substituted with 1-3 of halo; R’2 is H; R2 is H, halo, hydroxy, or optionally substituted aliphatic, -O-acyl, -O-aroyl, -O-heteroaroyl, -0(S0 2)NH2, -0-CH(R m)OC(0)R n, -0-CH(R m)OP(0)(OR n)2, -0-P(0)(OR n)2, or

```
<table>
<thead>
<tr>
<th>Rn</th>
</tr>
</thead>
</table>
```

wherein each R m is independently an optionally substituted Ci-6 alkyl, each R n
is independently C_{1-2} alkyl, C_{3-8} cycloalkyl, or phenyl, each of which is optionally
substituted, or R_2 and R'\_2 together form o xo; R_3 is H or optionally substituted C_{1-3} alkyl; and
ring A is a phenyl, pyridin-2-yl, pyridin-3-yl, or pyridin-4-yl, each of which is substituted
with an R_1 group and an R_4 group at any chemically feasible position on ring A.

[0051] In some methods, the neurodegenerative disorder comprises Huntington's disease.

[0052] In some methods, the alkali metal is sodium or potassium.

[0053] In some methods, R_3 is H.

[0054] In some methods, R_3 is CH_3.

[0055] In some methods, R_4 is H, methyl, ethoxy, ethyl, ethoxy, -O-isopropyl, -CF_3,
-OCHF_2 or -OCF_3. For example, R_4 is H.

[0056] In some methods, R_i is H, alkyl, halo or alkoxy. For example, R_i is H. In other
examples, R_i is halo. In some examples, R_i is C_{1-3} alkyl.

[0057] In some methods, ring A is phenyl that is substituted with R_1 and R_4 groups at any
chemically feasible position on ring A. In some examples, ring A is phenyl, and one of R_i or
R_4 is attached to the para or meta position of ring A. In other examples, ring A is phenyl, and
one of R_1 or R_4 is attached to the meta position of ring A. In some examples, R_1 is attached
to the para or meta position of ring A. And, in some examples, R \_ is F or Cl, either of which
is attached to the para or meta position of ring A. In other examples, R_1 is alkoxy (e.g.,
methoxy, ethoxy, propoxy, -O-isopropyl, butoxy, or -O-tertbutyl) that is attached to the para
or meta position of ring A. In other examples, ring A is phenyl, and R_1 is attached to the
meta or ortho position of the phenyl ring. For instance, ring A is phenyl, and R_i is attached to
the ortho position of the phenyl ring. In some instances, ring A is phenyl, and R_i is methoxy,
ethoxy, or -O-isopropyl, any of which is attached to the ortho position of ring A. In other
instances, R_i is -CF_3, -OCHF_2 or -OCF_3.

[0058] In some methods, ring A is optionally substituted pyridin-2-yl or optionally
substituted pyridin-3-yl, either of which is substituted with R_1 and R_4 groups at any
chemically feasible position on ring A. In some examples, ring A is pyridin-2-yl, and one of
R_i or R_4 is attached to the 5 position of the ring. In other examples, ring A is pyridin-3-yl,
and one of R_i or R_4 is attached to the 6 position of the ring. In some examples, ring A is
pyridin-2-yl, and R_1 is attached to the 5 position of the ring. For instance, ring A is pyridin-
2-yl, and R_1 is alkyl or alkoxy, either of which is attached to the 5 position of ring A. In other
instances, ring A is pyridin-2-yl, and R_1 is methyl, ethyl, propyl, isopropyl, butyl, or tertbutyl,
any of which are attached to the 5 position of ring A.

[0059] In some methods, R'_2 is H.
In some methods, $R_2$ is hydroxy.

In some methods, $R_i$ is -O-acyl, -O-aroyl, or -O-heteroaroyl.

In some methods, $R_2$ and $R'_2$ together form oxo.

In some methods, the neurodegenerative disease is Huntington's disease.

Some methods further comprise administering to the patient tetrabenazine, haloperidol, clozapine, clonazepam, diazepam, escitalopram, fluoxetine, sertraline, or any combination thereof.

In some methods, the neurodegenerative disease is epilepsy.

Some methods further comprise administering an anti-convulsive medication.

In some methods, the anti-convulsive medication is selected from: carbamazepine (Tegretol™), clorazepate (Tranxene™), clonazepam (Klonopin™), ethosuximide (Zarontin™), felbamate (Felbatol™), fosphenytoin (Cerebyx™), gabapentin (Neurontin™), lacosamide (Vimpat™), lamotrigine (Lamictal™), levetiracetam (Keppra™), oxcarbazepine (Trileptal™), phenobarbital (Lumina™), phenytoin (Dilantin™), pregabalin (Lyrica™), primidone (Mysoline™), tiagabine (Gabitril™), topiramate (Topamax™), valproate semisodium (Depakot™), valproic acid (Depakene™), zonisamide (Zonegran™), or any combination thereof.

Some methods further comprise administering diazepam (Valium™, Diastat™) and lorazepam (Ativan™), paraldehyde (Paral™), midazolam (Versed™), pentobarbital (Nembutal™), acetazolamide (Diamox), progesterone, adrenocorticotropic hormone (ACTH, Acthar™), prednisone, bromide, or any combination thereof.

And, some methods further comprise administering LDOPA to the patient.
Some methods further comprise administering a phosphodiesterase inhibitor.

Some methods further comprise administering to the patient another pharmaceutical agent having an activity that increases cAMP in the patient.

In some methods, wherein the second pharmaceutical agent further comprises a beta-adrenergic agonist. For example, the beta-adrenergic agonist comprises a beta-1-adrenergic agonist, a beta-2-adrenergic agonist, a beta-3-adrenergic agonist, or any combination thereof. In other examples, the beta-adrenergic agonist comprises noradrenaline, isoprenaline, dobutamine, salbutamol, levosalbutamol, terbutaline, pirbuterol, procaterol, metaproterenol, fenoterol, bitolterol mesylate, salmeterol, formoterol, bambuterol, clenbuterol, indacaterol, L-796568, amibegron, solabegron, isoproterenol, albuterol, metaproterenol, arbutamine, befunolol, bromoacetylalprenololmenthane, broxaterol, cimaterol, cirazoline, denopamine, dopexamine, epinephrine, etilefrine, hexoprenaline, higenamine, isoetharine, isoxsuprine, mabuterol, methoxyphenamine, nylidrin, oxyfedrine, prenalterol, ractopamine, reproterol, rimiterol, ritodrine, tetroquinol, tulobuterol, xamoterol, zilpaterol, zinterol, or any combination thereof.

**BRIEF DESCRIPTION OF THE DRAWINGS**

The disclosure will now be described, by way of example, with reference to the accompanying drawings.

Figure 1 is a picture of a Western blot that assayed UCP1 protein in brown adipose tissue precursor cells treated with an exemplary compound of Formula I (Compound A).

Figure 2 is a graphical representation of UCP1 protein in brown adipose tissue precursor cells treated with from 0 to 10 μM concentration of an exemplary compound of Formula I (Compound A), as assayed by Western blot in triplicate.

Figure 3 is a graphical representation of the fold induction of PGC-1α in brown adipose tissue precursor cells after treatment with 3 μM of a compound of Formula I (Compound A) for two days followed by treatment with 1 μM norepinephrine for 2 hours.

Figure 4 is a 1H NMR spectrum for 5-(4-(2-(5-ethylpyridin-2-yl)-2-oxoethoxy)benzyl)-1,3-thiazolidine-2,4-dione.

Figure 5 is a 1H NMR spectrum for caffeine.

Figure 6 is a 1H NMR spectrum for an exemplary co-crystal of 5-(4-(2-(5-ethylpyridin-2-yl)-2-oxoethoxy)benzyl)-1,3-thiazolidine-2,4-dione and caffeine.

Figure 7 provides graphical representations of plaque size and number in a mouse model that was administered an exemplary compound of the present invention (Compound A).
Figure 8 provides a graphical representation of GFAP astrocyte marker assay results in a mouse model that was administered an exemplary compound of the present invention (Compound A).

**DETAILED DESCRIPTION OF THE INVENTION**

The present invention provides methods of treating, reducing the severity of, or delaying the onset of a neurodegenerative disorder selected from Huntington's disease, AMS, MS, or epilepsy in a patient, and pharmaceutical compositions useful for treating, reducing the severity of, or delaying the onset of a neurodegenerative disorder in a patient.

1. DEFINITIONS

As used herein, the following definitions shall apply unless otherwise indicated.

For purposes of this invention, the chemical elements are identified in accordance with the Periodic Table of the Elements, CAS version, Handbook of Chemistry and Physics, 75th Ed. Additionally, general principles of organic chemistry are described in "Organic Chemistry", Thomas Sorrell, University Science Books, Sausalito: 1999, and "March's Advanced Organic Chemistry", 5th Ed., Ed.: Smith, M.B. and March, J., John Wiley & Sons, New York: 2001, the entire contents of which are hereby incorporated by reference.

As described herein, compounds of the invention may optionally be substituted with one or more substituents, such as are illustrated generally above, or as exemplified by particular classes, subclasses, and species of the invention.

As used herein the term "aliphatic" encompasses the terms alkyl, alkenyl, alkynyl, each of which being optionally substituted as set forth below.

As used herein, an "alkyl" group refers to a saturated aliphatic hydrocarbon group containing 1-12 (e.g., 1-8, 1-6, or 1-4) carbon atoms. An alkyl group can be straight or branched. Examples of alkyl groups include, but are not limited to, methyl, ethyl, propyl, isopropyl, butyl, isobutyl, sec-butyl, tert-butyl, n-pentyl, n-heptyl, or 2-ethylhexyl. An alkyl group can be substituted (i.e., optionally substituted) with one or more substituents such as halo, phospho, cycloaliphatic [e.g., cycloalkyl or cycloalkenyl], heterocycloaliphatic [e.g., heterocycloalkyl or heterocycloalkenyl], aryl, heteroaryl, alkoxy, aroyl, heteroaroyl, acyl [e.g., (aliphatic)carbonyl, (cycloaliphatic)carbonyl, or (heterocycloaliphatic)carbonyl], nitro, cyano, amido [e.g., (cycloalkylalkyl)carbonylamino, arylcarbonylamino, aralkylcarbonylamino, (heterocycloalkyl)carbonylamino, (heterocycloalkylalkyl)carbonylamino, heteroarylcarbonylamino, heteroaralkylcarbonylamino, alkylaminocarbonyl, cycloalkylaminocarbonyl, heterocycloalkylaminocarbonyl, arylaminocarbonyl, or heteroarylaminocarbonyl], amino
[e.g., aliphaticamino, cycloaliphaticamino, or heterocycloaliphaticamino], sulfonyl [e.g., aliphatic-SO2-, sulfinyl, sulfanyl, sulfoxy, urea, thiourea, sulfamoyl, sulfamide, o xo, carboxy, carbamoyl, cycloaliphaticoxy, heterocycloaliphaticoxy, aryloxy, heteroaryloxy, aralkyloxy, heteroarylalkoxy, alkoxy carbonyl, alkylcarbonyloxy, or hydroxy. Without limitation, some examples of substituted alkyls include carboxyalkyl (such as HOOC-alkyl, alkoxy carbonylalkyl, and alkylcarbonyloxyalkyl), cyanalkyl, hydroxyalkyl, alkoxyalkyl, acylalkyl, aralkyl, (alkoxyaryl)alkyl, (sulfonylamino)alkyl (such as (alkyl-SO2-amino)alkyl), aminoalkyl, amidoalkyl, (cycloaliphatic)alkyl, or haloalkyl.

[0102] As used herein, an "alkenyl" group refers to an aliphatic carbon group that contains 2-8 (e.g., 2-12, 2-6, or 2-4) carbon atoms and at least one double bond. Like an alkyl group, an alkenyl group can be straight or branched. Examples of an alkenyl group include, but are not limited to allyl, isoprenyl, 2-butenyl, and 2-hexenyl. An alkenyl group can be optionally substituted with one or more substituents such as halo, phospho, cycloaliphatic [e.g., cycloalkyl or cycloalkenyl], heterocycloaliphatic [e.g., heterocycloalkyl or heterocycloalkenyl], aryl, heteroaryl, alkoxy, aroyl, heteroaroyl, acyl [e.g., (aliphatic)carbonyl, (cycloaliphatic)carbonyl, or (heterocycloaliphatic)carbonyl], nitro, cyano, amido [e.g., (cycloalkylalkyl)carbonylamino, arylcarbonylamino, aralkylcarbonylamino, (heterocycloalkyl)carbonylamino, (heterocycloalkylalkyl)carbonylamino, heteroarylcarbonylamino, heteroaralkylcarbonylamino alkylaminocarbonyl, cycloalkylaminocarbonyl, heterocycloalkylaminocarbonyl, arylaminocarbonyl, or heteroarylamino carbonyl], amino [e.g., aliphaticamino, cycloaliphaticamino, heterocycloaliphaticamino, or aliphatic sulfonamino], sulfonyl [e.g., alkyl-SO2-, cycloaliphatic-SO2-, or aryl-SO2-], sulfinyl, sulfanyl, sulfoxy, urea, thiourea, sulfamoyl, sulfamide, o xo, carboxy, carbamoyl, cycloaliphatic oxy, heterocycloaliphaticoxy, aryloxy, heteroaryloxy, aralkyloxy, heteroaralkoxy, alkoxy carbonyl, alkylcarbonyloxy, or hydroxy. Without limitation, some examples of substituted alkenyls include cyanoalkenyl, alkoxyalkenyl, acylalkenyl, hydroxyalkenyl, aralkenyl, (alkoxyaryl)alkenyl, (sulfonylamino)alkenyl (such as (alkyl-SO2-amino)alkenyl), aminoalkenyl, amidoalkenyl, (cycloaliphatic)alkenyl, or haloalkenyl.

[0103] As used herein, an "alkynyl" group refers to an aliphatic carbon group that contains 2-8 (e.g., 2-12, 2-6, or 2-4) carbon atoms and has at least one triple bond. An alkynyl group can be straight or branched. Examples of an alkynyl group include, but are not limited to, propargyl and butynyl. An alkynyl group can be optionally substituted with one or more substituents such as aroyl, heteroaroyl, alkoxy, cycloalkyloxy, heterocycloalkyloxy, aryloxy,
heteroaryloxy, aralkyloxy, nitro, carboxy, cyano, halo, hydroxy, sulfo, mercapto, sulfanyl
[e.g., aliphaticsulfanyl or cycloaliphaticsulfanyl], sulfinyl [e.g., aliphaticsulfinyl or
cycloaliphaticsulfinyl], sulfonyl [e.g., aliphatic-S0 2-, aliphaticamino-S0 2-, or
cycloaliphatic-S0 2-], amido [e.g., aminocarbonyl, alkylaminocarbonyl, alkylcarbonylamino,
cycloalkylaminocarbonyl, heterocycloalkylaminocarbonyl, cycloalkylcarbonylamino,
arylaminocarbonyl, arylcarbonylamino, aralkylcarbonylamino,
(heterocycloalkyl)carbonylamino, (cycloalkylalkyl)carbonylamino,
heteroaralkylcarbonylamino, heteroarylcarbonylamino or heteroarylaninocarbonyl], urea,
thiourea, sulfamoyl, sulfamide, alkoxycarbonyl, alkylcarbonyloxy, cycloaliphatic,
heterocycloaliphatic, aryl, heteroaryl, acyl [e.g., (cycloaliphatic)carbonyl or
(heterocycloaliphatic)carbonyl], amino [e.g., aliphaticamino], sulfoxo, o xo, carboxy,
carbamoyl, (cycloaliphatic)oxy, (heterocycloaliphatic)oxy, or (heteroaryl)alkoxy.

[0104] As used herein, an "amido" encompasses both "aminocarbonyl" and
"carbonylamino". These terms when used alone or in connection with another group refer to
an amido group such as -N(R x)-C(0)-R Y or -C(0)-N(R X) 2, when used terminally, and
-C(0)-N(R x)- or -N(R x)-C(0)- when used internally, wherein R x and R Y can be aliphatic,
cycloaliphatic, aryl, aliphatic, heterocycloaliphatic, heteroaryl or heteroaraliphatic.
Examples of amido groups include alkylamido (such as alkylcarbonylamino or
alkylaminocarbonyl), (heterocycloaliphatic)amido, (heteroaralkyl)amido, (heteroaryl)amido,
(heterocycloalkyl)alkylamido, arylamido, aralkylamido, (cycloalkyl)alkylamido, or
cycloalkylamido.

[0105] As used herein, an "amino" group refers to -NR X R Y wherein each of R X and R Y is
independently hydrogen, aliphatic, cycloaliphatic, (cycloaliphatic)aliphatic, aryl, aliphatic,
heterocycloaliphatic, (heterocycloaliphatic)aliphatic, heteroaryl, carboxy, sulfanyl, sulfinyl,
sulfonyl, (aliphatic)carbonyl, (cycloaliphatic)carbonyl, ((cycloaliphatic)aliphatic)carbonyl,
arlycarbonyl, (araliphatic)carbonyl, (heterocycloaliphatic)carbonyl,
((heterocycloaliphatic)aliphatic)carbonyl, (heteroaryl)carbonyl, or
(heteroaraliphatic)carbonyl, each of which being defined herein and being optionally
substituted. Examples of amino groups include alkylamino, dialkylamino, or arylamino.
When the term "amino" is not the terminal group (e.g., alkylcarbonylamino), it is represented
by -NR X. R X has the same meaning as defined above.

[0106] As used herein, an "aryl" group used alone or as part of a larger moiety as in
"aralkyl", "aralkoxy", or "aryloxyalkyl" refers to monocyclic (e.g., phenyl); bicyclic (e.g.,
indenyl, naphthalenyl, tetrahydronaphthyl, tetrahydroindenyl); and tricyclic (e.g., fluorenly
tetrahydrofluorenyl, or tetrahydroanthracenyl, anthracenyl) ring systems in which the monocyclic ring system is aromatic or at least one of the rings in a bicyclic or tricyclic ring system is aromatic. The bicyclic and tricyclic groups include benzo fused 2-3 membered carbocyclic rings. For example, a benzofused group includes phenyl fused with two or more C₄₈ carbocyclic moieties. An aryl is optionally substituted with one or more substituents including aliphatic [e.g., alkyl, alkenyl, or alkyeny]; cycloaliphatic; (cycloaliphatic)aliphatic; heterocycloaliphatic; (heterocycloaliphatic)aliphatic; aryl; heteroaryl; alkoxy; (cycloaliphatic)oxy; (heterocycloaliphatic)oxy; aryloxy; heteroaryloxy; (araliphatic)oxy; (heteroaraliphatic)oxy; aroyl; heteroaroyl; amino; oxo (on a non-aromatic carbocyclic ring of a benzofused bicyclic or tricyclic aryl); nitro; carboxy; amido; acyl [e.g., (aliphatic)carbonyl; (cycloaliphatic)carbonyl; ((cycloaliphatic)aliphatic)carbonyl; (araliphatic)carbonyl; (heterocycloaliphatic)carbonyl; ((heterocycloaliphatic)aliphatic)carbonyl; (heteroaraliphatic)carbonyl; sulfonf [e.g., aliphatic-SO₂- or amino-SO₂-]; sulfynyl [e.g., aliphatic-S(O)- or cycloaliphatic-S(O)-]; sulfanyl [e.g., aliphatic-S-]; cyano; halo; hydroxy; mercapto; sulfooxy; urea; thiourea; sulfamoyl; sulfamide; or carbamoyl. Alternatively, an aryl can be unsubstituted.

[0107] Non-limiting examples of substituted aryls include haloaryl [e.g., mono-, di (such as /?-,w-dihaloaryl), and (trihalo)aryl]; (carboxy)aryl [e.g., (alkoxycarbonyl)aryl, (arylcarbonyloxy)aryl, and (alkoxy)aryl]; (amido)aryl [e.g., (amino)aryl, (((alkylamino)alkyl)aminocarbonyl)aryl, (alkylamino)aminocarbonyl)aryl, and (((heteroaryl)amino)carbonyl)aryl]; aminoaryl [e.g., ((alkylsulfonyl)amino)aryl or ((dialkyl)amino)aryl]; (cyano)aryl; (alkoxy)aryl; (sulfamoyl)aryl [e.g., (aminosulfonyl)aryl]; (alkylsulfonyl)aryl; (cyano)aryl; (hydroxyalkyl)aryl; (alkoxy)aryl; (hydroxy)aryl, (((carboxy)alkyl)aryl; (((dialkyl)amino)alkyl)aryl; (nitroalkyl)aryl; (((alkylsulfonyl)amino)alkyl)aryl; ((heterocycloaliphatic)carbonyl)aryl; ((alkylsulfonyl)alkyl)aryl; (cyanoalkyl)aryl; (hydroxyalkyl)aryl; (alkylcarbonyl)aryl; alkylaryl; (trihaloalkyl)aryl; p-amino-7-w-alkoxycarbonylaryl; p-amino-w-cyanoaryl; p-halo-w-aminoaryl; or (w-(heterocycloaliphatic)-o-(alkyl)aryl.

[0108] As used herein, an "araliphatic" such as an "aralkyl" group refers to an aliphatic group (e.g., a C₁₄ alkyl group) that is substituted with an aryl group. "Aliphatic", "alkyl", and "aryl" are defined herein. An example of an araliphatic such as an aralkyl group is benzyl.

[0109] As used herein, an "aralkyl" group refers to an alkyl group (e.g., a C₁₄ alkyl group).
that is substituted with an aryl group. Both "alkyl" and "aryl" have been defined above. An example of an aralkyl group is benzyl. An aralkyl is optionally substituted with one or more substituents such as aliphatic [e.g., alkyl, alkenyl, or alkynyl, including carboxyalkyl, hydroxyalkyl, or haloalkyl such as trifluoromethyl], cycloaliphatic [e.g., cycloalkyl or cycloalkenyl], (cycloalkyl)alkyl, heterocycloalkyl, (heterocycloalkyl)alkyl, aryl, heteroaryl, alkoxy, cycloalkyloxy, heterocycloalkyloxy, arloxy, heteroaryloxy, aralkyloxy, heteroaralkyloxy, aroyl, heteroaroyl, nitro, carboxy, alkoxy carbonyl, alkylcarbonyloxy, amido [e.g., aminocarbonyl, alkylcarbonylamino, cycloalkylcarbonylamino, (cycloalkyl)carbonylamino, arylcarbonylamino, aralkylcarbonylamino, (heterocycloalkyl)carbonylamino, (heterocycloalkylalkyl)carbonylamino, heteroarylcycloalkylamino, or heteroaralkylcarbonylamino], cyano, halo, hydroxy, acyl, mercapto, alkylsulfanyl, sulfox, urea, thiourea, sulfamoyl, sulfamide, oxo, or carbamoyl.

[0110] As used herein, a "bicyclic ring system" includes 8-12 (e.g., 9, 10, or 11) membered structures that form two rings, wherein the two rings have at least one atom in common (e.g., 2 atoms in common). Bicyclic ring systems include bicycloaliphatics (e.g., bicycloalkyl or bicycloalkenyl), bicycloheteroaliphatics, bicyclic aryls, and bicyclic heteroaryls.

[0111] As used herein, a "cycloaliphatic" group encompasses a "cycloalkyl" group and a "cycloalkenyl" group, each of which being optionally substituted as set forth below.

[0112] As used herein, a "cycloalkyl" group refers to a saturated carbocyclic mono- or bicyclic (fused or bridged) ring of 3-10 (e.g., 5-10) carbon atoms. Examples of cycloalkyl groups include cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, cycloheptyl, adamantyl, norbornyl, cubyl, octahydro-indenyl, decahydro-naphthyl, bicyclo[3.2.1]octyl, bicyclo[2.2.2]octyl, bicyclo[3.3.1]nonyl, bicyclo[3.3.2.]decal, bicyclo[2.2.2]octyl, adamantyl, or ((aminocarbonyl)cycloalkyl)cycloalkyl.

[0113] A "cycloalkenyl" group, as used herein, refers to a non-aromatic carbocyclic ring of 3-10 (e.g., 4-8) carbon atoms having one or more double bonds. Examples of cycloalkenyl groups include cyclopentenyl, 1,4-cyclohexa-di-enyl, cycloheptenyl, cyclooctenyl, hexahydro-indenyl, octahydro-naphthyl, cyclohexenyl, cyclopentenyl, bicyclo[2.2.2]octenyl, or bicyclo[3.3.1]nonenyl.

[0114] A cycloalkyl or cycloalkenyl group can be optionally substituted with one or more substituents such as phosphor, aliphatic [e.g., alkyl, alkenyl, or alkynyl], cycloaliphatic, (cycloaliphatic) aliphatic, heterocycloaliphatic, (heterocycloaliphatic) aliphatic, aryl, heteroaryl, alkoxy, (cycloaliphatic)oxy, (heterocycloaliphatic)oxy, aryloxy, heteroaryloxy, (araliphatic)oxy, (heteroaraliphatic)oxy, aroyl, heteroaroyl, amino, amido [e.g.,
(aliphatic)carbonylamino, (cycloaliphatic)carbonylamino,
((cycloaliphatic)aliphatic)carbonylamino, (aryl)carbonylamino, (araliphatic)carbonylamino,
(heterocycloaliphatic)carbonylamino, ((heterocycloaliphatic)aliphatic)carbonylamino,
(heteroaryl)carbonylamino, or (heteroaraliphatic)carbonylamino], nitro, carboxy [e.g.,
HOOC-], alkoxycarbonyl, or alkyloxycarbonyloxy], acyl [e.g., (cycloaliphatic)carbonyl,
((cycloaliphatic)aliphatic)carbonyl, (aliphatic)carbonyl, (araliphatic)carbonyl, (aryl)carbonyl,
((heterocycloaliphatic)aliphatic)carbonyl, or (heteroaraliphatic)carbonyl], cyano, halo,
hydroxy, mercapto, sulfonyl [e.g., alkyl-SO₂- and aryl-SCV], sulfinyl [e.g., alkyl-S(O)-],
sulfanyl [e.g., alkyl-S-], sulfoxy, urea, thiourea, sulfamoyl, sulfamide, oxo, or carbamoyl.

[0115] As used herein, the term "heterocycloaliphatic" encompasses a heterocycloalkyl
group and a heterocycloalkenyl group, each of which being optionally substituted as set forth
below.

[0116] As used herein, a "heterocycloalkyl" group refers to a 3-10 membered mono- or
bicyclic (fused or bridged) (e.g., 5- to 10-membered mono- or bicyclic) saturated ring
structure, in which one or more of the ring atoms is a heteroatom (e.g., N, O, S, or
combinations thereof). Examples of a heterocycloalkyl group include piperidyl, piperazyl,
tetrahydropyranyl, tetrahydrofuranyl, 1,4-dioxolanyl, 1,4-dithianyl, 1,3-dioxolanyl, oxazolidyl,
isoxazolidyl, morpholinyl, thiomorpholinyl, octahydrobenzofuryl, octahydrochromenyl,
octahydrothiochromenyl, octahydroindolyl, octahydropropindinyl, decahydroquinolinyl,
octahydrobenzo[6]thiopheneyl, 2-oxa-bicyclo[2.2.2]octyl, 1-aza-bicyclo[2.2.2]octyl,
3-aza-bicyclo[3.2.1]octyl, and 2,6-dioxa-tricyclo[3.3.1.0³⁷]nonyl. A monocyclic
heterocycloalkyl group can be fused with a phenyl moiety to form structures, such as
tetrahydroisoquinoline, which would be categorized as heteroaryls.

[0117] A "heterocycloalkenyl" group, as used herein, refers to a mono- or bicyclic (e.g.,
5- to 10-membered mono- or bicyclic) non-aromatic ring structure having one or more double
bonds, and wherein one or more of the ring atoms is a heteroatom (e.g., N, O, or S).
Monocyclic and bicyclic heterocycloaliphatics are numbered according to standard chemical
nomenclature.

[0118] A heterocycloalkyl or heterocycloalkenyl group can be optionally substituted with
one or more substituents such as phosphor, aliphatic [e.g., alkyl, alkenyl, or alkynyl],
cycloaliphatic, (cycloaliphatic)aliphatic, heterocycloaliphatic, (heterocycloaliphatic)aliphatic,
aril, heteroaryl, alkoxy, (cycloaliphatic)oxy, (heterocycloaliphatic)oxy, aryloxy,
heteroaryloxy, (araliphatic)oxy, (heteroaraliphatic)oxy, aroyl, heteroaroyl, amino, amido
[e.g., (aliphatic)carbonylarnino, (cycloaliphatic)carbonylamino, ((cycloaliphatic)
aliphatic)carbonylamino, (aryl)carbonylamino, (araliphatic)carbonylamino, (heterocycloaliphatic)carbonylamino, ((heterocycloaliphatic) aliphatic)carbonylamino, (heteroaryl)carbonylamino, or (heteroaraliphatic)carbonylamino], nitro, carboxy [e.g., HOOC-, alkoxycarbonyl, or alkyrcarboxyloxy], acyl [e.g., (cycloaliphatic)carbonyl, ((cycloaliphatic) aliphatic)carbonyl, (araliphatic)carbonyl, (heterocycloaliphatic)carbonyl, (heteroaryl)carbonyl, or (heteroaraliphatic)carbonyl], nitro, cyano, halo, hydroxy, mercapto, sulfonyle [e.g., alkylsulfonyle or arylsulfonyle], sulfinyle [e.g., alkylsulfinyle], sulfanyl [e.g., alkylsulfanyl], sulfoxy, urea, thiourea, sulfamoyl, sulfamide, oxo, or carbamoyl.

[0119] A "heteroaryl" group, as used herein, refers to a monocyclic, bicyclic, or tricyclic ring system having 4 to 15 ring atoms wherein one or more of the ring atoms is a heteroatom (e.g., N, O, S, or combinations thereof) and in which the monocyclic ring system is aromatic or at least one of the rings in the bicyclic or tricyclic ring systems is aromatic. A heteroaryl group includes a benzo fused ring system having 2 to 3 rings. For example, a benzo fused group includes benzo fused with one or two 4 to 8 membered heterocycloaliphatic moieties (e.g., indolizyl, indolyl, isoindolyl, 3H-indolyl, indolinyll, benzo[b]furyl, benzo[b]thiophenyl, quinolinyl, or isquinolinyl). Some examples of heteroaryl are azetidinyl, pyridyl, 1H-indazolyl, furyl, pyrrolol, thienyl, thiazolyl, oxazolyl, imidazolyl, tetrazolyl, benzofuryl, isquinolinolyl, benzthiazolyl, xanthene, thioxanthene, phenothiazine, dihydroindole, benzo[1,3]dioxole, benzo[b]furyl, benzo[b]thiophenyl, indazolyl, benzimidazolyl, benzthiazolyl, puryl, cinnolyl, quinolyl, quinazolyl, cinnolyl, pthalayl, quinazolyl, quinoxalyl, isoquinolyl, 4H-quinolizyl, benzo-1,2,5-thiadiazolyl, or 1,8-naphthyridyl.

[0120] Without limitation, monocyclic heteroaryls include furyl, thiophenyl, 2H-pyrrolol, pyrrolol, oxazolyl, thiazolyl, imidazolyl, pyrazolyl, isoxazolyl, isothiazolyl, 1,3,4-thiadiazolyl, 2H-pyranyl, 4-H-pranyl, pyridyl, pyridazyl, pyrimidylyl, pyrazolyl, pyrazyl, or 1,3,5-triazol. Monocyclic heteroaryls are numbered according to standard chemical nomenclature.

A heteroaryl is optionally substituted with one or more substituents such as aliphatic [e.g., alkyl, alkenyl, or alkynyl]; cycloaliphatic; (cycloaliphatic)aliphatic; heterocycloaliphatic; (heterocycloaliphatic)aliphatic; aryl; heteroaryl; alkoxy; (cycloaliphatic)oxy; (heterocycloaliphatic)oxy; arylalkoxy; heteroaryloxy; (aliphatic)oxy; (heteroaryl)oxy; aryl; heteroaryl; amino; oxo (on a non-aromatic carbocyclic or heterocyclic ring of a bicyclic or tricyclic heteroaryl); carboxy; amido; acyl [e.g., aliphaticcarbonyl; (cycloaliphatic)carbonyl; ((cycloaliphatic)aliphatic)carbonyl; (araliphatic)carbonyl; (heterocycloaliphatic)carbonyl; (heterocycloaliphatic)carbonyl; or (heteroaraliphatic)carbonyl]; sulfonyl [e.g., aliphaticsulfonyl or aminosulfonyl]; sulfinyl [e.g., aliphaticsulfinyl]; sulfanyl [e.g., aliphaticsulfanyl]; nitro; cyano; halo; hydroxy; mercapto; sulfoxo; urea; thiourea; sulfamoyl; sulfamide; or carbamoyl. Alternatively, a heteroaryl can be unsubstituted.

Non-limiting examples of substituted heteroaryls include (halo)heteroaryl [e.g., mono- and di-(halo)heteroaryl]; (carboxy)heteroaryl [e.g., (alkoxycarbonyl)heteroaryl]; cyano-heteroaryl; aminoheteroaryl [e.g., ((alkylsulfonyl)amino)heteroaryl and ((dialkyl)amino)heteroaryl]; (amido)heteroaryl [e.g., aminocarbonylheteroaryl, ((alkylcarbonyl)amino)heteroaryl, ((alkylcarbonyl)amino)heteroaryl, (((alkyl)amino)alkyl)carbonylheteroaryl, and (heterocycloaliphatic)heteroaryl; (cyanoalkyl)heteroaryl; (acyl)heteroaryl [e.g., (alkylcarbonyl)heteroaryl, and (haloalkyl)heteroaryl [e.g., trihaloalkylheteroaryl].

"Aliphatic," "alkyl," and "heteroaryl" have been defined above.

A "heteroaralkyl" group, as used herein, refers to an aliphatic group (e.g., a C1-4 alkyl group) that is substituted with a heteroaryl group. A heteroaralkyl is optionally substituted with one or more substituents such as alkyl (including carboxyalkyl, hydroxyalkyl, and haloalkyl such as trifluoromethyl), alkenyl, alkynyl, cycloalkyl, (cycloalkyl)alkyl, heterocycloalkyl, (heterocycloalkyl)alkyl,
aryl, heteroaryl, alkoxy, cycloalkyloxy, heterocycloalkyloxy, aryloxy, heteroaryloxy,
aralkyloxy, heteroaralkyloxy, aroyl, heteroaroyl, nitro, carboxy, alkoxy carbonyl,
alkylcarbonyloxy, aminocarbonyl, alkylcarbonylamino, cycloalkylcarbonylamino,
(cycloalkylalkyl)carbonylamino, arylcarbonylamino, aralkylcarbonylamino,
(heterocycloalkyl)carbonylamino, (heterocycloalkylalkyl)carbonylamino,
heteroarylcarbonylamino, heteroaralkylcarbonylamino, cyano, halo, hydroxy, acyl, mercapto,
alkylsulfanyl, sulfoxy, urea, thiourea, sulfamoyl, sulfamide, oxo, or carbamoyl.

[0126] As used herein, "cyclic moiety" and "cyclic group" refer to mono-, bi-, and tri-cyclic ring systems including cycloaliphatic, heterocycloaliphatic, aryl, or heteroaryl, each of which has been previously defined.

[0127] As used herein, a "bridged bicyclic ring system" refers to a bicyclic heterocycloaliphatic ring system or bicyclic cycloaliphatic ring system in which the rings are bridged. Examples of bridged bicyclic ring systems include, but are not limited to, adamantanyl, norbornanyl, bicyclo[3.2.1]octyl, bicyclo[2.2.2]octyl, bicyclo[3.3.1]nonyl, bicyclo[3.3.2]decal, 2-oxabicyclo[2.2.2]octyl, 1-azabicyclo[2.2.2]octyl, 3-azabicyclo[3.2.1]octyl, and 2,6-dioxo-tricyclo[3.3.1.0^{3,7}]nonyl. A bridged bicyclic ring system can be optionally substituted with one or more substituents such as alkyl (including carboxyalkyl, hydroxyalkyl, and haloalkyl such as trifluoromethyl), alkenyl, alkynyl, cycloalkyl, (cycloalkyl)alkyl, heterocycloalkyl, (heterocycloalkyl)alkyl, aroyl, heteroaryl, alkoxy, cycloalkyloxy, heterocycloalkyloxy, aryloxy, heteroaryloxy, aralkyloxy, heteroaralkyloxy, aroyl, heteroaroyl, nitro, carboxy, alkoxy carbonyl, alkylcarbonyloxy, aminocarbonyl, alkylcarbonylamino, cycloalkylcarbonylamino,
(cycloalkylalkyl)carbonylamino, arylcarbonylamino, aralkylcarbonylamino,
(heterocycloalkyl)carbonylamino, (heterocycloalkylalkyl)carbonylamino,
heteroarylcarbonylamino, heteroaralkylcarbonylamino, cyano, halo, hydroxy, acyl, mercapto,
alkylsulfanyl, sulfoxy, urea, thiourea, sulfamoyl, sulfamide, oxo, or carbamoyl.

[0128] As used herein, an "acyl" group refers to a formyl group or R^-C(0)- (such as alkyl-C(0)-, also referred to as "alkylcarbonyl") where R^ and "alkyl" have been defined previously. Acetyl and pivaloyl are examples of acyl groups.

[0129] As used herein, an "aroyl" or "heteroaroyl" refers to an aryl-C(0)- or a heteroaryl-C(0)-, respectively. The aryl and heteroaryl portion of the aroyl or heteroaroyl is optionally substituted as previously defined.

[0130] As used herein, an "alkoxy" group refers to an alkyl-O- group where "alkyl" has been defined previously.
As used herein, a "carbamoyl" group refers to a group having the structure
-0-CO-NR^x R^y or -NR^x-CO-0 R^z, wherein R^x and R^y have been defined above and R^z can
be aliphatic, aryl, aliphatic, heterocycloaliphatic, heteroaryl, or heteroaraliphatic.

As used herein, a "carboxy" group refers to -COOH, -COOR^x, -OC(0)H,
-OC(0)R^x, when used as a terminal group; or -OC(O)- or -C(0)0- when used as an internal
group.

As used herein, a "haloaliphatic" group refers to an aliphatic group substituted with
1-3 halogen. For instance, the term haloalkyl includes the group -CF3.

As used herein, a "mercapto" group refers to -SH.

As used herein, a "sulfo" group refers to -SO3H or -SO2 R^x when used terminally or
-SO(0) 2- when used internally.

As used herein, a "sulfamide" group refers to the structure -NR^x-S(0) 2-NR^y R^z when
used terminally and -NR^x-S(0) 2-NR^y when used internally, wherein R^x, R^y, and R^z have
been defined above.

As used herein, a "sulfamoyl" group refers to the structure -0-S(0) 2-NR^y R^z wherein
R^y and R^z have been defined above.

As used herein, a "sulfonamide" group refers to the structure -S(0) 2-NR^x R^y or
-NR^x-S(0) 2-R^z when used terminally; or -S(0) 2-NR^x or -NR^x-S(0) 2- when used internally,
wherein R^x, R^y, and R^z are defined above.

As used herein a "sulfanyl" group refers to -S-R^x when used terminally and -S-
when used internally, wherein R^x has been defined above. Examples of sulfanys include
aliphatic-S-, cycloaliphatic-S-, aryl-S-, or the like.

As used herein a "sulfenyl" group refers to -S(0)-R^x when used terminally and
-S(0)- when used internally, wherein R^x has been defined above. Exemplary sulfenyl groups
include aliphatic-S(0)-, aryl-S(0)-, (cycloaliphatic(aliphatic))-S(0)-, cycloalkyl-S(0)-,
heterocycloaliphatic-S(0)-, heteroaryl-S(0)-, or the like.

As used herein, a "sulfonyl" group refers to-S(0) 2-R^x when used terminally and
-S(0) 2- when used internally, wherein R^x has been defined above. Exemplary sulfonyl groups
include aliphatic-S(0) 2-, aryl-S(0) 2-, (cycloaliphatic(aliphatic))-S(0) 2-,
cycloaliphatic-S(0) 2-, heterocycloaliphatic-S(0) 2-, heteroaryl-S(0) 2-,
(cycloaliphatic(amido(aliphatic)))-S(0) 2-or the like.

As used herein, a "sulfoxy" group refers to -O-S0 R^x or -SO-0 R^x, when used
terminally and -O-S(0)- or -S(0)- when used internally, where R^x has been defined above.
As used herein, a "halogen" or "halo" group refers to fluorine, chlorine, bromine or iodine.

As used herein, an "alkoxycarbonyl," which is encompassed by the term carboxy, used alone or in connection with another group refers to a group such as alkyl-O-C(O)-.

As used herein, an "alkoxyalkyl" refers to an alkyl group such as alkyl-O-alkyl-, wherein alkyl has been defined above.

As used herein, a "carbonyl" refer to -C(O)-.

As used herein, an "oxo" refers to =0.

As used herein, the term "phospho" refers to phosphinates and phosphonates. Examples of phosphinates and phosphonates include -P(0)(R )2, wherein R is aliphatic, alkoxy, aryloxy, heteroaryloxy, (cycloaliphatic)oxy, (heterocycloaliphatic)oxy aryl, heteroaryl, cycloaliphatic or amino.

As used herein, an "aminoalkyl" refers to the structure (R )2N-alkyl

As used herein, a "cyanoalkyl" refers to the structure (NC)-alkyl-.

As used herein, a "urea" group refers to the structure -NR X-CO-NR YR Z and a "thiourea" group refers to the structure -NR X-CS-NR YR Z when used terminally and -NR X-CO-NR Y- or -NR X-CS-NR Y- when used internally, wherein R x, R y, and R z have been defined above.

As used herein, a "guanidine" group refers to the structure -N=C(N(R xR y))N(R xR y) or -NR X-C(=NR X)NR XR Y wherein R x and R y have been defined above.

As used herein, the term "amidino" group refers to the structure -C≡(NR X)N(R XR Y) wherein R x and R y have been defined above.

In general, the term "vicinal" refers to the placement of substituents on a group that includes two or more carbon atoms, wherein the substituents are attached to adjacent carbon atoms.

In general, the term "geminal" refers to the placement of substituents on a group that includes two or more carbon atoms, wherein the substituents are attached to the same carbon atom.

The terms "terminally" and "internally" refer to the location of a group within a substituent. A group is terminal when the group is present at the end of the substituent not further bonded to the rest of the chemical structure. Carboxyalkyl, i.e., R XO(0)C-alkyl is an example of a carboxy group used terminally. A group is internal when the group is present in the middle of a substituent of the chemical structure. Alkylcarboxy (e.g., alkyl-C(0)0- or
alkyl-OC(O)-) and alkylcarboxyaryl (e.g., alkyl-C(0)0-aryl- or alkyl-O(CO)-aryl-) are examples of carboxy groups used internally.

[0157] As used herein, an "aliphatic chain" refers to a branched or straight aliphatic group (e.g., alkyl groups, alkenyl groups, or alkynyl groups). A straight aliphatic chain has the structure \([-\text{CH}_2]^v\), where \(v\) is 1-12. A branched aliphatic chain is a straight aliphatic chain that is substituted with one or more aliphatic groups. A branched aliphatic chain has the structure \([-\text{CQQ}]^v\) where \(Q\) is independently a hydrogen or an aliphatic group; however, \(Q\) shall be an aliphatic group in at least one instance. The term aliphatic chain includes alkyl chains, alkenyl chains, and alkynyl chains, where alkyl, alkenyl, and alkynyl are defined above.

[0158] The phrase "optionally substituted" is used interchangeably with the phrase "substituted or unsubstituted". As described herein, compounds of the invention can optionally be substituted with one or more substituents, such as are illustrated generally above, or as exemplified by particular classes, subclasses, and species of the invention. As described herein, the variables \(R_1, R_2, R'_2, R_3,\) and \(R_4,\) and other variables contained in Formula I, described herein, encompass specific groups, such as alkyl and aryl. Unless otherwise noted, each of the specific groups for the variables \(R_v, R_2, R'_2, R_3,\) and \(R_4,\) and other variables contained therein can be optionally substituted with one or more substituents described herein. Each substituent of a specific group is further optionally substituted with one to three of halo, cyano, oxo, alkoxy, hydroxy, amino, nitro, aryl, cycloaliphatic, heterocycloaliphatic, heteroaryl, haloalkyl, and alkyl. For instance, an alkyl group can be substituted with alkylsulfanyl and the alkylsulfanyl can be optionally substituted with one to three of halo, cyano, oxo, alkoxy, hydroxy, amino, nitro, aryl, haloalkyl, and alkyl. As an additional example, the cycloalkyl portion of a (cycloalkyl)carbonylamino can be optionally substituted with one to three of halo, cyano, alkoxy, hydroxy, nitro, haloalkyl, and alkyl. When two alkoxy groups are bound to the same atom or adjacent atoms, the two alkoxy groups can form a ring together with the atom(s) to which they are bound.

[0159] In general, the term "substituted," whether preceded by the term "optionally" or not, refers to the replacement of hydrogen radicals in a given structure with the radical of a specified substituent. Specific substituents are described above in the definitions and below in the description of compounds and examples thereof. Unless otherwise indicated, an optionally substituted group can have a substituent at each substitutable position of the group, and when more than one position in any given structure can be substituted with more than one substituent selected from a specified group, the substituent can be either the same or
different at every position. A ring substituent, such as a heterocycloalkyl, can be bound to another ring, such as a cycloalkyl, to form a spiro-bicyclic ring system, e.g., both rings share one common atom. As one of ordinary skill in the art will recognize, combinations of substituents envisioned by this invention are those combinations that result in the formation of stable or chemically feasible compounds.

The phrase "stable or chemically feasible", as used herein, refers to compounds that are not substantially altered when subjected to conditions to allow for their production, detection, and preferably their recovery, purification, and use for one or more of the purposes disclosed herein. In some methods, a stable compound or chemically feasible compound is one that is not substantially altered when kept at a temperature of 40 °C or less, in the absence of moisture or other chemically reactive conditions, for at least a week.

As used herein, an "effective amount" is defined as the amount required to confer a therapeutic effect on the treated patient, and is typically determined based on age, surface area, weight, and condition of the patient. The interrelationship of dosages for animals and humans (based on milligrams per meter squared of body surface) is described by Freireich et al., Cancer Chemother. Rep., 50: 219 (1966). Body surface area may be approximately determined from height and weight of the patient. See, e.g., Scientific Tables, Geigy Pharmaceuticals, Ardsley, New York, 537 (1970). As used herein, "patient" refers to a mammal, including a human.

Unless otherwise stated, structures depicted herein are also meant to include all isomeric (e.g., enantiomeric, diastereomeric, and geometric (or conformational)) forms of the structure; for example, the R and S configurations for each asymmetric center, (Z) and (E) double bond isomers, and (Z) and (E) conformational isomers. Therefore, single stereochemical isomers as well as enantiomeric, diastereomeric, and geometric (or conformational) mixtures of the present compounds are within the scope of the invention. Unless otherwise stated, all tautomeric forms of the compounds of the invention are within the scope of the invention. Additionally, unless otherwise stated, structures depicted herein are also meant to include compounds that differ only in the presence of one or more isotopically enriched atoms. For example, compounds having the present structures except for the replacement of hydrogen by deuterium or tritium, or the replacement of a carbon by a 13C- or 14C-enriched carbon are within the scope of this invention. Such compounds are useful, for example, as analytical tools or probes in biological assays, or as therapeutic agents.
As used herein, an "adrenergic agonist" refers to any compound having agonistic activity toward any adrenergic receptor (e.g., β₁, β₂, β₃). Note that the terms "beta-adrenergic" and "β-adrenergic" are used interchangeably. This usage also applies to subtypes of beta agonists, (e.g., 'beta-1-adrenergic agonist' is used interchangeable with 'β₁-adrenergic agonist' and/or 'β₁-adrenergic agonist').

As used herein, the term "co-crystal" refers to a substantially crystalline material having two or more distinct molecular components (e.g., a compound of formula I or a salt thereof and a phosphodiesterase inhibitor) within the crystal lattice.

Chemical structures and nomenclature are derived from ChemDraw, version 11.0.1, Cambridge, MA.

II. METHODS OF TREATING SELECT NEURODEGENERATIVE DISEASES

Thiazolidinedione compounds of the present invention are uniquely effective in treating, reducing the symptoms of, or delaying the onset of neurodegenerative diseases selected from Huntington’s disease, MS, ALS, or epilepsy in a patient and possess a reduced interaction with PPARγ. Accordingly, these compounds demonstrate reduced side effects related to PPARγ interaction than PPARγ activating compounds.

A. Compounds of Formula I

The present invention provides pharmaceutical compositions that are useful for treating, reducing the severity of, or delaying the onset of a neurodegenerative disease (e.g., Huntington’s disease, epilepsy, ALS, or MS) in a patient comprising a compound of Formula I:

![Chemical structure](image)

or a pharmaceutically acceptable salt thereof, wherein: each of R₁ and R₄ is independently selected from H, halo, aliphatic, and alkoxy, wherein the aliphatic or alkoxy is optionally substituted with 1-3 of halo; R₂ is H, and R₂ is H, halo, hydroxy, or optionally substituted aliphatic, -O-acyl, -O-aroyl, -O-heteroaroyl, -0(S0₂)₂NH₂, -0-CH(R₉)OC(0)R₉, -0-CH(R₉)OP(0)(OR₉)₂, -0-P(0)(OR₉)₂, or  , wherein each R₉ is independently C₃₋₆ alkyl, each R₉ is independently C₃₋₁₂ alkyl, C₃₋₈ cycloalkyl, or phenyl,
each of which is optionally substituted; or $R_2$ and $R'_2$ together may form oxo; $R_3$ is H or Cl alkyl; and ring A is phenyl, pyridin-2-yl, pyridin-3-yl or pyridin-4-yl, each of which is optionally substituted.

[0170] In several methods, $R_1$ is H. In some methods, $R_1$ is halo, such as F or Cl. In some methods, $R_1$ is an aliphatic optionally substituted with 1-3 halo. For instance, $R_1$ is trifluoromethyl. In some methods, $R_1$ is alkoxy. For instance, $R_1$ is methoxy, ethoxy, or -O-isopropyl. In still other methods, $R_1$ is alkoxy substituted with 1-3 halo. For instance, $R_1$ is -OCHF$_2$ or -OCF$_3$. In each of the foregoing methods, $R_1$ can be substituted at the ortho, meta, or para position of ring A. In certain methods, $R_1$ is substituted at the para or meta position of ring A.

[0171] In several methods, $R_4$ is H. In some methods, $R_4$ is halo, such as F or Cl. In some methods, $R_4$ is an aliphatic optionally substituted with 1-3 halo. For instance, $R_4$ is trifluoromethyl. In some methods, $R_4$ is alkoxy. For instance, $R_4$ is methoxy, ethoxy, or -O-isopropyl. In still other methods, $R_4$ is alkoxy substituted with 1-3 halo. For instance, $R_4$ is -OCHF$_2$ or -OCF$_3$. In each of the foregoing methods, $R_4$ can be substituted at the ortho, meta, or para position of ring A. In certain methods, $R_4$ is substituted at the para or meta position of ring A. In some methods, $R_1$ and $R_4$ are different substituents. In still other methods, $R_1$ and $R_4$ are the same substituent. In some methods when $R_1$ is aliphatic, $R_4$ is other than H.

[0172] In several methods, each of $R_1$ and $R_4$ is independently selected from H, halo, aliphatic, and alkoxy, wherein the aliphatic and alkoxy are optionally substituted with 1-3 of halo.

[0173] In several methods, each of $R_1$ and $R_4$ is independently selected from H, halo, aliphatic, and alkoxy, wherein the aliphatic and alkoxy are optionally substituted with 1-3 of halo.

[0174] In several methods, $R_2$ is halo, hydroxy, aliphatic, -O-acyl, -O-aroyl, -O-heteroaroyl, -O-SO$_2$NH$_2$, -O-CH(R$_m$)OC(0)R$_n$, -O-CH(R$_m$)OP(0)(OR$_n$)$_2$, -O-P(0)(OR$_n$)$_2$, wherein each R$_m$ is C$_1$-$C_6$ alkyl, R$_n$ is C$_1$-$C_2$ alkyl, C$_3$-$C_8$ cycloalkyl, or phenyl and each substituent R$_m$ or R$_n$ is optionally substituted.

[0175] In some methods, $R_2$ is H.

[0176] In some methods, $R_2$ is hydroxy.
In some methods, R₂ is an optionally substituted straight or branched C₅R₆ alkyl, an optionally substituted straight or branched C₂₆ alkenyl, or an optionally substituted straight or branched C₂₆ alkynyl. In other methods, R₂ is a C₁₆ aliphatic optionally substituted with 1-2 hydroxy, carboxy or halo. In some methods, R₂ is a C₁₆ alkyl optionally substituted with hydroxy. In further methods, R₂ is a C₁₆ alkyl optionally substituted with -O-acyl, -O-aryoyl, -O-heteroaryoyl. In several other methods, R₂ is a methyl, ethyl, propyl, isopropyl, butyl, tert-butyl, pentyl, or hexyl, each of which is optionally substituted with hydroxy. In several additional methods, R₂ is methyl or ethyl, each of which is substituted with hydroxy.

In certain methods, R₂ is -O-acyl, -O-aryoyl, or -O-heteroaryoyl.

In other methods, R₂ is -O-acetyl, -O-hexanoyl, -O-benzoyl, -O-pivaloyl, -O-imidazoyl, -O-succinoyl, -O-thiazoloyl or -O-pyrindinyoyl, each optionally substituted.

In some methods, R₂ is -O-C(0)-imidazol-1-yl.

In certain methods, R₂ is -O-CH(Rₘ)O-C(0)-Rₙ.

In some methods, R₂ is -O-CH(Rₘ)OP(0)(ORₙ)₂.

In some methods, R₂ is -O-P(0)(ORₙ)₂.

In other methods, R₂ is -O-S(0)₂NH₂.

In some further methods, R₂ is a 1,3-dioxolan-2-one of the Formula

\[ \text{\textsuperscript{2}O} - \text{O} - \text{O}, \text{wherein } Rₘ \text{ and } Rₙ \text{ are as previously described.} \]

In several methods, R₂' is H.

In some methods, R₂ and R₂' together form oxo.

In some methods, R₂' is H and R₂ has an R configuration.

In some methods, R₂' is H and R₂ has an S configuration.

In some methods, R₂' is H and R₂ is racemic.

In further methods, ring A is phenyl or pyridinyl.

In some methods, ring A is pyridin-2-yl.

In some methods, ring A is pyridin-3-yl.

In some methods, ring A is pyridin-4-yl.

In other methods, R₃ is H or optionally substituted C₁₃ alkyl.

In some methods, R₃ is H.

In some methods, R₃ is CH₃.

In several methods, the composition further comprises a pharmaceutically acceptable carrier.
Another aspect of the present invention provides a pharmaceutical composition to include a compound of Formula II, IIA, or IIB:

II

IIA

IIB

or a pharmaceutically acceptable salt thereof, wherein $R_2'$ is H; and $R_i$, $R_3$, $R_4$, and ring A are defined above in Formula I.

Exemplary compositions according to the present invention include a single unit dosage form having about 1 mg to about 200 mg (e.g., about 10 mg to about 120 mg, about 10 mg to about 100 mg, or about 15 mg to about 60 mg) of a compound of Formula I, II, IIA, IIB, III, IIIA, IIIB, IVA or IVB.

Several exemplary compounds of Formula I, wherein $R_2$ and $R_2'$ together form oxo and Ring A is phenyl are shown in Table 1, below.

Table 1: Exemplary compounds wherein $R_2$ and $R_2'$ form oxo.
Table 2: Exemplary compounds wherein and ring A is phenyl, $R_2$ is -OH having an (R) configuration and $R'_2$ is H.
Table 3: Exemplary compounds wherein R₂ is OH having an (S) configuration and R'_2 is H.
Table 4: Exemplary compounds wherein $R_2$ is racemic -OH and $R'_2$ is H.
Table 5: Exemplary compounds wherein R\(_2\) is -O-acyl, O-Aroyl, or O-heteroyl, and R' is H.
Table 6: Exemplary compounds wherein \( R_2 \) is \(-\text{O-CHfRmVO-CfCnRn}\) and \( R'_5 \) is \( \text{H} \).

Table 7: Exemplary compounds wherein \( R_2 \) is \(-\text{O-CH(R_m)OP(O)(OR_n)}_2\) and \( R'_2 \) is \( \text{H} \).
Table 8: Exemplary compounds wherein R₂ is $\text{O}-\text{P(O)(OR₃)}₂$ and R'₂ is H.

\[
\begin{array}{ll}
\text{CH}_3\text{O} & \text{CF}_3\text{O} \\
\text{O}-\text{SO}_2\text{NH}_2 & \text{O}-\text{SO}_2\text{NH}_2 \\
\text{O}-\text{SO}_2\text{NH}_2 & \text{O}-\text{SO}_2\text{NH}_2 \\
\text{O}-\text{SO}_2\text{NH}_2 & \text{O}-\text{SO}_2\text{NH}_2 \\
\end{array}
\]

Table 9: Exemplary compounds wherein R₂ is $\text{O}-\text{SC}^\text{NH?}$ and R'₂ is H.

\[
\begin{array}{ll}
\text{CH}_3\text{O} & \text{CF}_3\text{O} \\
\text{O}-\text{SO}_2\text{NH}_2 & \text{O}-\text{SO}_2\text{NH}_2 \\
\text{O}-\text{SO}_2\text{NH}_2 & \text{O}-\text{SO}_2\text{NH}_2 \\
\text{O}-\text{SO}_2\text{NH}_2 & \text{O}-\text{SO}_2\text{NH}_2 \\
\end{array}
\]
In a further aspect, the invention provides compounds of Formula III:

wherein $Q$ is acyl, aroyl, heteroaryl, -SO$_2$NH$_2$, -CH(R$_m$)OC(0)R$_n$, -CH(R$_m$)OP(0)(OR$_n$)$_2$, -P(0)(OR$_n$)$_2$, or cycloalkyl, phenyl, wherein each substituent is optionally substituted.

In some methods, $Q$ in formula III is acyl.
In some methods, Q in formula III is -acetyl, -hexanoyl, -benzoyl, -pivaloyl, -succinoyl, each optionally substituted.

In certain methods, Q in formula III is acetyl.

In certain methods, Q in formula III is hexanoyl.

In certain methods, Q in formula III is benzoyl.

In certain methods, Q in formula III is pivaloyl.

In certain methods, Q in formula III is succinoyl.

In some methods, the compound of Formula I has is a compound of Formula IIIA or IIIB:

\[
\begin{align*}
\text{IIIA} & \quad \text{or} \quad \text{IIIB}
\end{align*}
\]

or a pharmaceutically acceptable salt thereof, wherein each of \( R_i, R_2, R'_2, R_3, \) and \( R_4 \) are defined above in Formula I.

In some instances, in the compound of Formula IIIA, one of \( R_1 \) and \( R_4 \) is an alkyl or alkoxy and the other is hydrogen. For instance, one of \( R_j \) and \( R_4 \) is methyl, ethyl, or propyl, and the other is hydrogen. In other instances, one of \( R_i \) and \( R_4 \) is methoxy or ethoxy.

In some instances, in the compound of Formula IIIB, one of \( R_1 \) and \( R_4 \) is an alkyl or alkoxy and the other is hydrogen. For instance, one of \( R_i \) and \( R_4 \) is methyl, ethyl, or propyl, and the other is hydrogen. In other instances, one of \( R_i \) and \( R_4 \) is methoxy or ethoxy.

Several exemplary compounds of Formula I, wherein \( R_2 \) and \( R'_2 \) together form oxo and Ring A is phenyl are shown in Table 1, above.

In another aspect, the invention provides a pharmaceutical composition which includes compounds of the Formula IVA or IVB:

\[
\begin{align*}
\text{IVA} & \quad \text{or} \quad \text{IVB}
\end{align*}
\]

wherein \( R'_2 \) is H, \( R_j \) and \( R_3 \) are as defined above for Formula I, ring A is pyridin-2-yl or pyridin-3-yl, and \( R_2 \) is H, -OH, -O-acyl, -O-aroyl or -O-heteroaryoyl; or \( R_2 \) and \( R'_2 \) together form oxo.
In further methods, Q in formula IVA or IVB is H, -O-acetyl, -O-hexanoyl, -O-benzoyl, -O-pivaloyl, -O-succinoyl, each optionally substituted.

In some methods, Q in formula IVA or IVB is H.

In certain methods, Q in formula IVA or IVB is -O-acetyl.

In certain methods, Q in formula IVA or IVB is -O-hexanoyl.

In certain methods, Q in formula IVA or IVB is -O-benzoyl.

In certain methods, Q in formula IVA or IVB is -O-pivaloyl.

In certain methods, Q in formula IVA or IVB is -O-succinoyl.

Several exemplary compounds of Formulae IVA and IVB are shown in Tables K and L below.

**Table 11: Pyridin-2-yl Compounds.**
[0234] Table 12: Pyridin-3-yl Compounds,
Another aspect of the present invention provides a compound selected from:
Another aspect of the present invention provides a pharmaceutical composition comprising a compound of Formula I, II, IIA, IIB, III, IIIA, IIIB, IVA, or IVB and LDOPA. This composition is useful for the methods described below (e.g., treating Huntington's disease, epilepsy, MS, or AMS).

Another aspect of the present invention provides a pharmaceutical composition comprising a compound of Formula I, II, IIA, IIB, III, IIIA, IIIB, IVA, or IVB and an anti-convulsive medication. In some examples, the anti-convulsive medication is selected from carbamazepine (Tegretol\textsuperscript{TM}), clorazepate (Tranxene\textsuperscript{TM}), clonazepam (Klonopin\textsuperscript{TM}), ethosuximide (Zarontin\textsuperscript{TM}), felbamate (Felbatol\textsuperscript{TM}), fosphenytoin (Cerebyx\textsuperscript{TM}), gabapentin (Neurontin\textsuperscript{TM}), lamotrigine (Lamictal\textsuperscript{TM}), levetiracetam (Keppra\textsuperscript{TM}), oxcarbazepine (Trileptal\textsuperscript{TM}), phenobarbital (Luminal\textsuperscript{TM}), phenytoin (Dilantin\textsuperscript{TM}), pregabalin (Lyrica\textsuperscript{TM}), primidone (Mysoline\textsuperscript{TM}), tiagabine (Gabitril\textsuperscript{TM}), topiramate (Topamax\textsuperscript{TM}), valproate semisodium (Depakote\textsuperscript{TM}), valproic acid (Depakene\textsuperscript{TM}), zonisamide (Zonegran\textsuperscript{TM}), or any combination thereof. This composition is useful for the methods described below (e.g., treating Huntington's disease, epilepsy, MS, or AMS).

In some methods, the compound of Formula I is selected from:
Another aspect of the present invention provides a method of treating, delaying the onset of, or reducing the symptoms of a neurodegenerative disease selected from Huntington’s disease, epilepsy, MS, or ALS comprising administering to a patient a compound of Formula X

or a pharmaceutically acceptable salt thereof, wherein each of R_{1A} and R_{1B} is independently selected from hydrogen, -OH, C_{1-4} alkyl optionally substituted with 1-3 halo, or C_{1-4} alkoxy optionally substituted with 1-3 halo, or -O-aryl, -O-heteroaryl, -0 -CH_{2}-aryl, or -0 -CH_{2}-heteroaryl, wherein either of the aryl or heteroaryl groups are optionally substituted with 1-2 substituents independently selected from halo, alkyl, alkoxy, or cyano; or R_{1A} and R_{1B} taken together form oxo; each of R_{2A} and R_{2B} is independently selected from halo, -H, -OH, -N(R_{6})_{2}, C_{1-4} alkyl optionally substituted with 1-3 halo, or C_{1-4} alkoxy optionally substituted with 1-3 halo, or R_{2A} and R_{2B} taken together form oxo, or R_{2A} and R_{2B} taken together form =N-R^{3}; R^{3} is C_{M} alkyl optionally substituted with 1-3 halo, or C_{M} alkoxy optionally substituted with 1-3 halo; ------ is a single bond, or a double bond when one of R_{1A} and R_{1B} is absent; ring B is selected from
each R⁴ is independently selected from hydrogen, -N(R⁶), C₃₋₅ alkyl optionally substituted with 1-3 halo, or C₁₋₃ alkoxy optionally substituted with 1-3 halo; x is 0-2; each R⁵ is independently selected from hydrogen or C₁₋₄ alkyl; and each R⁶ is independently selected from hydrogen, C₁₋₄ alkyl, -C(0)-R, -C(0)O-R, -S(O)₂-R, wherein the C₁₋₄ alkyl is optionally substituted with a 6-10 membered monocyclic or bicyclic aryl or a 5-10 membered monocyclic or bicyclic heteroaryl having 1-3 heteroatoms independently selected from N, O, or S, and wherein each R⁷ is independently hydrogen or C₁₋₄ alkyl.

[0241] In some methods, each of R¹a and R¹b is independently selected from -H, -OH, C₁₋₄ alkyl optionally substituted with 1-3 halo, or C₁₋₄ alkoxy optionally substituted with 1-3 halo, or -O-aryl, -O-heteroaryl, -O-CH₂-aryl, or -O-CH₂-heteroaryl, wherein either of the aryl or heteroaryl groups are optionally substituted with 1-2 substituents independently selected from halo, alkyl, alkoxy, or cyano; or R¹a and R¹b taken together form oxo; each of R²a and R²b is independently selected from halo, hydrogen, -OH, -NHR, CM alkyl optionally substituted with 1-3 halo, or C₁₋₄ alkoxy optionally substituted with 1-3 halo, or R²a and R²b taken together form oxo, or R²a and R²b taken together form =N-R; R³ is CM alkyl optionally substituted with 1-3 halo, or CM alkoxy optionally substituted with 1-3 halo;  is a single bond, or a double bond when one of R¹a and R¹b is absent; ring B is selected from

\[
x(R⁴) \quad \text{or} \quad x(R⁴)
\]

each R⁴ is independently selected from hydrogen, C₁₋₃ alkyl optionally substituted with 1-3 halo, or C₁₋₃ alkoxy optionally substituted with 1-3 halo; x is 0-2; each R⁵ is independently selected from hydrogen or C₁₋₄ alkyl; and each R⁶ is independently selected from hydrogen, -C(0)-R, -C(0)O-R, -S(O)₂-R, wherein each R⁷ is independently hydrogen or CM alkyl.

[0242] In some methods, each of R¹a and R¹b is independently selected from -H, -OH, CM alkyl optionally substituted with 1-3 halo, or CM alkoxy optionally substituted with 1-3 halo, or -O-aryl, -O-heteroaryl, -O-CH₂-aryl, or -O-CH₂-heteroaryl, wherein either of the aryl or heteroaryl groups are optionally substituted with 1-2 substituents independently selected from halo, alkyl, alkoxy, or cyano; or R¹a and R¹b taken together form oxo.

[0243] In other methods, one of R¹a and R¹b is hydrogen and the other is CM alkoxy optionally substituted with 1-3 halo. For example, one of R¹a and R¹b is hydrogen and the other is -O-CH₂CH₃.
In some methods, ring B is

\[ \text{Ring B} \]

In some of these methods, \( x \) is 1 or 2 and at least one \( R^4 \) is \( C_{1-3} \) alkoxy optionally substituted with 1-3 halo. In other instances, \( x \) is 1 or 2 and at least one \( R^4 \) is selected from \(-\text{OCH}_3 \) or \(-\text{OCH}_2\text{CH}_3 \). For example, \( x \) is 1. In other examples, \( x \) is 1, and \( R^4 \) is \(-\text{OCH}_3 \) that is attached to the meta position on the phenyl group of ring A.

In other methods, \( x \) is 1 or 2 and at least one \( R^4 \) is \(-\text{N}(\text{R}^5)_2 \). For example, \( x \) is 1, \( R^4 \) is \(-\text{N}(\text{R}^5)_2 \), one \( R^6 \) is hydrogen and the other \( R^6 \) is selected from \( \text{C}_{1-4} \) alkyl, \(-\text{C}(\text{O})-\text{R}^7 \), \(-\text{C}(\text{O})0-\text{R}^7 \), \(-\text{S}(\text{O})^2-\text{R}^7 \), wherein the \( \text{C}_{1-4} \) alkyl is optionally substituted with a 6-10 membered monocyclic or bicyclic aryl or a 5-10 membered monocyclic or bicyclic heteroaryl having 1-3 heteroatoms independently selected from N, O, or S, and wherein each \( R^7 \) is independently hydrogen or \( \text{C}_{1-4} \) alkyl. In other examples, \( x \) is 1, and \( R^4 \) is \(-\text{NH}_2 \), \(-\text{NH}(\text{CH} \text{ alkyl}) \), or \(-\text{N}(\text{C}_{1-4} \text{ alkyl})_2 \).

In other methods, one of \( R^{2a} \) and \( R^{2b} \) is hydrogen and the other is selected from hydrogen, halo, \(-\text{OH} \), \(-\text{CH}_3 \), \(-\text{CH}_2\text{CH}_3 \), \(-\text{OCH}_3 \), or \(-\text{OCH}_2\text{CH}_3 \). For instance, one of \( R^{2a} \) and \( R^{2b} \) is hydrogen and the other is \(-\text{OH} \). In other examples, both of \( R^{2a} \) and \( R^{2b} \) are independently selected from hydrogen, halo, \(-\text{CH}_3 \), \(-\text{CH}_2\text{CH}_3 \), \(-\text{OCH}_3 \), or \(-\text{OCH}_2\text{CH}_3 \). In some examples, \( R^{2a} \) and \( R^{2b} \) taken together are oxo. And, in some examples, \( R^{2a} \) and \( R^{2b} \) taken together form \( =\text{N}-\text{R}^3 \), and \( R^3 \) is selected from \( \text{C}_{1-4} \) alkyl optionally substituted with 1-3 halo or \( \text{C}_{1-4} \) alkoxy optionally substituted with 1-3 halo. For instance, \( R^{2a} \) and \( R^{2b} \) taken together form \( =\text{N}-0-\text{CH}_3 \).

In some methods, one of \( R^{2a} \) and \( R^{2b} \) is hydrogen and the other is \(-\text{N}(\text{R}^6)_2 \), wherein each \( R^6 \) is independently selected from hydrogen, \(-\text{C}(\text{O})-\text{R}^7 \), \(-\text{C}(\text{O})0-\text{R}^7 \), \(-\text{S}(\text{O})^2-\text{R}^7 \), wherein each \( R^7 \) is independently hydrogen or \( \text{C}_{1-4} \) alkyl. For example, one of \( R^{2a} \) and \( R^{2b} \) is hydrogen and the other is \(-\text{NHR}^6 \), wherein \( R^6 \) is independently selected from hydrogen, \(-\text{C}(\text{O})-\text{R}^7 \), \(-\text{C}(\text{O})0-\text{R}^7 \), \(-\text{S}(\text{O})^2-\text{R}^7 \), wherein each \( R^7 \) is independently hydrogen or \( \text{C}_{1-4} \) alkyl.

In some methods, ring B is

\[ \text{Ring B} \]

In several of these methods, \( x \) is 1 or 2 and at least one \( R^4 \) is \( \text{C}_{1-3} \) alkyl optionally substituted with 1-3 halo or \( \text{C}_{1-3} \) alkoxy optionally substituted with 1-3 halo. In some examples, at least one \( R^4 \) is selected from \(-\text{CH}_3 \) or \(-\text{CH}_2\text{CH}_3 \). For instance, \( x \) is 1. In other instances, \( R^4 \) is \(-\text{CH}_2\text{CH}_3 \) that is attached to the 5 position on the pyridine-yl group of ring A.
In some of these methods, \( x \) is 1 or 2 and at least one \( R^4 \) is \(-N(R^6)_2\). For example, \( x \) is 1, \( R^4 \) is \(-N(R^6)_2\), one \( R^6 \) is hydrogen and the other \( R^6 \) is selected from \( C_{1-4} \) alkyl, \(-C(0)-R^7\), \(-C(0)0-R^7\), \(-S(0)_2-R^7\), wherein the \( C_{1-4} \) alkyl is optionally substituted with a 6-10 membered monocyclic or bicyclic aryl or a 5-10 membered monocyclic or bicyclic heteroaryl having 1-3 heteroatoms independently selected from N, O, or S, and wherein each \( R^7 \) is independently hydrogen or \( C_{1-4} \) alkyl. In other examples, \( x \) is 1, and \( R^4 \) is \(-NH_2\), \(-NH(Ci_4 \text{ alkyl})\), or \(-N(CM \text{ alkyl})_2\).

In some methods, one of \( R^{2a} \) and \( R^{2b} \) is hydrogen and the other is selected from hydrogen, halo, \(-OH\), \(-CH_3\), \(-CH_2CH_3\), \(-OCH_3\), or \(-OCH_2CH_3\). For example, one of \( R^{2a} \) and \( R^{2b} \) is hydrogen and the other is \(-OH\). In other methods, both of \( R^{2a} \) and \( R^{2b} \) are independently selected from hydrogen, halo, \(-OH\), \(-CH_3\), \(-CH_2CH_3\), \(-OCH_3\), or \(-OCH_2CH_3\). In some methods, \( R^{2a} \) and \( R^{2b} \) taken together are oxo. In other methods, \( R^{2a} \) and \( R^{2b} \) taken together form \( =N-R^3 \), and \( R^3 \) is selected from \( C_{1-4} \) alkyl optionally substituted with 1-3 halo or \( C_{1-4} \) alkoxy optionally substituted with 1-3 halo. For instance, \( R^{2a} \) and \( R^{2b} \) taken together form \( =N-0-CH_3\).

In some methods, one of \( R^{2a} \) and \( R^{2b} \) is hydrogen and the other is \(-N(R^6)_2\), wherein each \( R^6 \) is independently selected from hydrogen, \(-C(0)-R^7\), \(-C(0)0-R^7\), \(-S(0)_2-R^7\), wherein each \( R^7 \) is independently hydrogen or \( C_{1-4} \) alkyl. For example, one of \( R^{2a} \) and \( R^{2b} \) is hydrogen and the other is \(-NHR^6\), wherein \( R^6 \) is independently selected from \(-H\), \(-C(0)-R^7\), \(-C(0)0-R^7\), \(-S(0)_2-R^7\), wherein each \( R^7 \) is independently hydrogen or \( CM \) alkyl.

In some methods, \( R^3 \) is \( C_{1-3} \) alkoxy optionally substituted with 1-3 halo. For example, \( R^3 \) is \(-OCH_3\) or \(-OCF_3\).

In some methods, \(--\) is a double bond and one of \( R^{1a} \) and \( R^{1b} \) is absent. In other methods, \(--\) is a single bond and one of \( R^{1a} \) and \( R^{1b} \) is hydrogen and the other is selected from hydrogen, \(-CH_3\), \(-CH_2CH_3\), \(-OCH_3\), or \(-OCH_2CH_3\).

In some methods, the compound of Formula X is selected from a compound of Formula XA:

![Formula XA](image)

or a pharmaceutically acceptable salt thereof, wherein each of \( R^{1a} \) and \( R^{1b} \) is independently selected from hydrogen, \(-OH\), \( C_{1-4} \) alkyl optionally substituted with 1-3 halo or \( CM \) alkoxy.
optionally substituted with 1-3 halo, or R'^1a and R'^1b taken together form oxo; each of R'^2a and R'^2b is independently selected from halo, hydrogen, -OH, C_{1-4} alkyl optionally substituted with 1-3 halo or C_{1-4} alkoxy optionally substituted with 1-3 halo, or R'^2a and R'^2b taken together form oxo, or R'^2a and R'^2b taken together form =N-R'^3; R'^3 is C_{1-4} alkyl optionally substituted with 1-3 halo, or C_{1-4} alkoxy optionally substituted with 1-3 halo; ------ is a single bond, or a double bond when one of R'^1a and R'^1b is absent; ring B is selected from

\[
\begin{align*}
x(R^4) & \quad \text{or} \quad x(R^4) \\
\end{align*}
\]

each R'^4 is independently selected from hydrogen, C_{1-3} alkyl optionally substituted with 1-3 halo, or C_{1-3} alkoxy optionally substituted with 1-3 halo; and x is 0-2.

[0257] In some methods, the compound of Formula X is selected from a compound of Formula XII, XIII, XIV, or XV:

![Chemical Structures XII, XIII, XIV, XV](image)

wherein each of R'^1a, R'^1b, R'^2a, R'^2b, R'^4, and x are defined above.

[0258] In some methods, the compound of Formula X is selected from a compound of Formula XIVA, XIVB, XIVC, XIVD, or XIVE:

![Chemical Structures XIVA, XIVB, XIVC, XIVD](image)
wherein each of $R^{1a}, R^{2a}, R^4,$ and $x$ are defined above.

[0259] In some methods, the compound of Formula X is selected from a compound of Formula XVA, XVB, XVC, XVD, or XVE:

![Diagram of compounds XVA, XVB, XVC, XVD, and XVE]

wherein each of $R^{1a}, R^{2a}, R^4,$ and $x$ are defined above.

[0260] Examples of compounds of Formula X include those provided in Table 13:

C. Co-Crystals of a Compound of Formula I

In one aspect, the present invention provides a method of treating, delaying the onset, or reducing the symptoms of a neurodegenerative disorder selected from Huntington's disease, epilepsy, MS, or ALS in a patient comprising administering to the patient a pharmaceutical composition comprising a co-crystal comprising a compound of Formula I or a pharmaceutically acceptable salt thereof, as described above, and a phosphodiesterase inhibitor. In several methods, the phosphodiesterase inhibitor is a selective inhibitor or a non-selective inhibitor. In these aspects, the compound of Formula I includes any of the compounds or formulae described in section A, above.

For example, the phosphodiesterase inhibitor is a non-selective inhibitor. In several instances, the non-selective phosphodiesterase inhibitor includes caffeine (1,3,7-trimethylxanthine), theobromine (3,7-dimethyl-2,3,6,7-tetrahydro-1H-purine-2,6-dione), theophylline (1,3-dimethyl-7H-purine-2,6-dione), IBMX (3-isobutyl-1-methylxanthine), combinations thereof, or the like.

In another example, the phosphodiesterase inhibitor is a selective inhibitor. For instance, the selective phosphodiesterase inhibitor includes Milrinone (2-methyl-6-oxo-1,6-dihydro-3,4'-bipyridine-5-carbonitrile), Cilostazol (6-[4-((1-cyclohexyl-1H-tetrazol-5-yl)butoxy]-3,4-dihydro-2(H)-quinolinone), Cilomilast (4-cyano-4-(3-cyclopentyl oxy-4-methoxyphenyl)cyclohexane-1-carboxylic acid), Rolipram (4-(3-cyclopentyl oxy-4-methoxyphenyl)pyrrolidin-2-one), Roflumilast (3-(cyclopropylmethoxy)-N-(3,5-dichloropyridin-4-yl)-4-(difluoromethoxy)benzamide), combinations thereof, or the like.

In some methods, the pharmaceutical composition comprises a co-crystal comprising an acid salt of a compound of Formula I, II, IIA, IIB, III, IIIA, IIIB, IVA, or IVB, and a phosphodiesterase inhibitor (e.g., caffeine, IBMX, or any combination thereof). For example, a co-crystal comprises an HC1 salt of a compound of Formula I, II, IIA, IIB, III, IIIA, IIIB, IVA, or IVB, and a phosphodiesterase inhibitor. In another example, a co-crystal comprises an H₂SO₄ salt of a compound of Formula I, II, IIA, IIB, III, IIIA, IIIB, IVA, or IVB, and a phosphodiesterase inhibitor (e.g., caffeine, IBMX, or any combination thereof).
In several methods, the phosphodiesterase inhibitor is present in the co-crystal according to the ratio from about 1:1 to about 1:5 (e.g., 1:1, 1:2, 1:3, or 1:4) wherein the ratio represents the amount of phosphodiesterase inhibitor relative to the amount of compound of Formula I, i.e., amo of phosphodiesterase inhibitor : amt of compound of Formula I. Note that in some methods, the co-crystal also comprises method artifacts such as weak acids that are used to facilitate crystal formation.

In one embodiment, the co-crystal comprises caffeine and a compound of Formula I, wherein the caffeine is present according to a ratio of from about 1:1.25 to about 1:1.75, wherein the ratio represents the amount of phosphodiesterase inhibitor relative to the amount of compound of Formula I. In one example, the co-crystal comprises caffeine and a compound of Formula I, wherein caffeine is present in according to the ratio 1:1.5, i.e., 40%, relative to the compound of Formula I. In another example, the co-crystal comprises 5-(4-(2-(5-ethylpyridin-2-yl)-2-oxoethoxy)benzyl)-1,3-thiazolidine-2,4-dione and caffeine, wherein the caffeine is present according to the ratio from about 1:1.25 to about 1:1.75 (e.g., about 1:1.5) relative to 5-(4-(2-(5-ethylpyridin-2-yl)-2-oxoethoxy)benzyl)-1,3-thiazolidine-2,4-dione.

In other methods, the present invention provides a method of treating, delaying the onset, or reducing the symptoms of a neurodegenerative disorder in a patient comprising administering a pharmaceutical composition comprising a co-crystal comprising a compound of Formula II, IIA, IIB, III, IIIA, IIB, IVA, or IVB, or a pharmaceutically acceptable salt thereof, and a phosphodiesterase inhibitor.

One embodiment of the present invention provides a method of treating, delaying the onset, or reducing the symptoms of a neurodegenerative disorder selected from Huntington's disease, epilepsy, MS, or ALS in a patient comprising administering to the patient a co-crystal comprising a compound selected from:
Another aspect of the present invention provides a method of treating, delaying the onset, or reducing the symptoms of a neurodegenerative disorder in a patient comprising administering to the patient a co-crystal comprising a compound selected from:

\[ \text{or a pharmaceutically acceptable salt thereof, and a phosphodiesterase inhibitor.} \]

[0270] In several methods, the phosphodiesterase inhibitor is a selective inhibitor or a non-selective inhibitor.

[0271] In several instances, the non-selective phosphodiesterase inhibitor includes caffeine.

[0272] For example, the phosphodiesterase inhibitor is a non-selective inhibitor. In several instances, the non-selective phosphodiesterase inhibitor includes caffeine.
(1,3,7-trimethylxanthine), theobromine (3,7-dimethyl-2,3,6,7-tetrahydro-1H-purine-2,6-dione), theophylline (1,3-dimethyl-7H-purine-2,6-dione), combinations thereof, and the like.

[0273] In another example, the phosphodiesterase inhibitor is a selective inhibitor. For instance, the selective phosphodiesterase inhibitor includes Milrinone (2-methyl-6-oxo-1,6-dihydro-3,4’-bipyridine-5-carbonitrile), Cilostazol (6-[4-(1-cyclohexyl-1H-tetrazol-5-yl)butoxy]-3,4-dihydro-2(1H)-quinolinone), Cilomilast (4-cyano-4-(3-cyclopentyloxy-4-methoxyphenyl)cyclohexane-1-carboxylic acid), Rolipram (4-(3-cyclopentyloxy-4-methoxyphenyl)pyrrolidin-2-one), Roflumilast (3-(cyclopropylmethoxy)-N-(3,5-dichloropyridin-4-yl)-4-(difluoromethoxy)benzamide), combinations thereof, and the like.

[0274] In other examples, the co-crystal comprises the compound

![Chemical Structure]

or a pharmaceutically acceptable salt thereof, and a phosphodiesterase inhibitor.

[0275] In other examples, the co-crystal comprises the compound

![Chemical Structure]

or a pharmaceutically acceptable salt thereof, and a phosphodiesterase inhibitor.

[0276] In other aspects, the present invention provides a pharmaceutical composition comprising a co-crystal, as described above, a second agent that increases the cyclic nucleotide in a patient, and a pharmaceutically acceptable carrier.

[0277] Agents that increase cAMP in a patient include, without limitation, β-adrenergic agonists, hormones (e.g., GLP1), any combination thereof, or the like.

[0278] In some methods, the present invention provides a method of treating, delaying the onset, or reducing the symptoms of a neurodegenerative disorder in a patient comprising administering a pharmaceutical composition comprising a compound of Formula I, a salt thereof, or a co-crystal thereof, and a β-adrenergic agonist (e.g., a β1-adrenergic agonist, a p2-adrenergic agonist, a β3-adrenergic agonist, or any combination thereof). Non-limiting examples of β-adrenergic agonists include noradrenaline, isoprenaline, dobutamine, salbutamol, levosalbutamol, terbutaline, pirbuterol, procaterol, metaproterenol, fenoterol, bitolterol mesylate, salmeterol, formoterol, bambuterol, clenbuterol, indacaterol, L-796568, amibegron, solabegron, isoproterenol, albuterol, metaproterenol, arbutamine, befunolol, bromoacetyladrenaline, broxaterol, cimaterol, cirazoline, denopamine, dopexamine,
epinephrine, etilefrine, hexoprenaline, higenamine, isoetharine, isoxsuprine, mabuterol, methoxyphenamine, nylidrin, oxyfedrine, prenalterol, ractopamine, reproterol, rimiterol, ritodrine, tretoquinol, tulobuterol, xamoterol, zilpaterol, zinterol, or any combination thereof.

[0279] In other methods, the method of treating or preventing a neurodegenerative disorder in a patient comprising administering to a patient a co-crystal comprising a compound of Formula I or a pharmaceutically acceptable salt thereof, and a phosphodiesterase inhibitor; and an agent that increases cAMP levels in a patient (e.g., β-adrenergic agonist or GLP1).

For instance, the composition comprises a co-crystal comprising a compound of Formula II, II A, IIB, II A, IVA or IVB or a pharmaceutically acceptable salt thereof, and a phosphodiesterase inhibitor; and a β-adrenergic agonist. Any of the phosphodiesterase inhibitors or combinations thereof are suitable for use in co-crystals used to formulate pharmaceutical compositions of the present invention that also include one or more agents that increase cyclic nucleotide (e.g., cAMP) levels in a patient (e.g., a β-adrenergic agonist).

[0280] In one particular example, the pharmaceutical composition comprises the compound

![Compound Image]

or a pharmaceutically acceptable salt thereof, and a phosphodiesterase inhibitor (e.g., caffeine and/or IBMX).

[0281] In another particular example, the pharmaceutical composition comprises the

![Compound Image]

compound or a pharmaceutically acceptable salt thereof, and a phosphodiesterase inhibitor (e.g., caffeine and/or IBMX).

[0282] Some of these examples further comprise a β-adrenergic agonist, such as any of those described above.

[0283] III. METHODS

[0284] Another aspect of the present invention provides a method of treating, delaying the onset, or reducing the symptoms of a neurodegenerative disorder (e.g., Huntington’s disease) in a patient comprising administering a pharmaceutical composition comprising a compound of Formula I, II, IIA, IIB, III, IIIA, IIIB, IVA, or IVB.

[0285] Several methods comprise the step of administering to a patient a compound of Formula I and a phosphodiesterase inhibitor. The administration of these ingredients can be sequential (e.g., the compound of Formula I is administered first in time, and the agent is
administered second in time) or simultaneous, i.e., both ingredients are administered at substantially the same time.

[0286] Several methods comprise the step of administering to a patient a pharmaceutical composition comprising a co-crystal comprising a compound of Formula I or a pharmaceutically acceptable salt thereof, and a phosphodiesterase inhibitor. Some methods further comprise administering an agent that increases a cyclic nucleotide level in a patient (e.g., a β-adrenergic agonist).

[0287] Several methods comprise the step of administering to a patient a compound of Formula I and an agent that increases a cyclic nucleotide level in a patient.

[0288] Several methods comprise the step of administering to a patient a pharmaceutical composition comprising a co-crystal comprising a compound of Formula I or a pharmaceutically acceptable salt thereof, and a phosphodiesterase inhibitor; and an agent that increases a cyclic nucleotide level in a patient (e.g., a β-adrenergic agonist).

[0289] Another aspect of the present invention provides a method of treating, delaying the onset, or reducing the symptoms a neurodegenerative disorder in a patient comprising administering a pharmaceutical composition comprising a compound of Formula I, II, IIA, IIB, III, IIIA, IIB, IVA, or IVB wherein said compound has a purity of about 70 e.e.% or more. For example, the method treating or preventing a neurodegenerative comprises administering a pharmaceutical composition comprising a compound of Formula I and a phosphodiesterase inhibitor (e.g., caffeine and/or IBMX) wherein the compound of Formula I has a purity of about 80% e.e. or more (e.g., 90% e.e. or more, 95% e.e. or more, 97% e.e. or more, or 99% e.e. or more).

[0290] According to yet another embodiment, the present invention provides a method of treating, delaying the onset, or reducing the symptoms of a neurodegenerative disease selected from Huntington's disease, epilepsy, ALS, or MS.

[0291] Another aspect of the present invention provides a method of treating, delaying the onset, or reducing the symptoms of a neurodegenerative disorder selected from Huntington's disease, epilepsy, ALS, or MS in a patient comprising administering to the patient a pharmaceutical composition comprising a compound of Formula I, II, IIA, IIB, III, IIIA, IIB, IVA, or IVB, and a phosphodiesterase inhibitor (e.g., caffeine, IBMX, or any combination thereof).

[0292] Another aspect of the present invention a method of treating, delaying the onset, or reducing the symptoms of a neurodegenerative disorder selected from Huntington's disease, epilepsy, ALS, or MS in a patient comprising administering to the patient a compound of
Formula I, II, IIA, IIB, III, IIIA, IIIB, IVA, or IVB, or an alkali metal salt thereof. Some methods further comprise administering LDOPA to the patient. The LDOPA can be administered concurrently with the compound or compound salt, or the LDOPA can be administered before or after the administration of the compound or compound salt. In some instances, the patient is administered a pharmaceutical composition comprising a compound or compound salt of Formula I and LDOPA.

[0293] Another aspect of the present invention a method of treating, delaying the onset, or reducing the symptoms of a neurodegenerative disorder selected from Huntington's disease, epilepsy, ALS, or MS in a patient comprising administering to the patient a compound of Formula I, II, IIA, IIB, III, IIIA, IIIB, IVA, or IVB, or an alkali metal salt thereof. Some methods further comprise administering an anti-convulsive medication. In some examples, the anti-convulsive medication is selected from carbamazepine (Tranxene™), clorazepate (Tranxene™), clonazepam (Klonopin™), ethosuximide (Zarontin™), felbamate (Felbatol™), fosphenytoin (Cerebyx™), gabapentin (Neurontin™), lacosamide (Vimpat™), lamotrigine (Lumina™), levetiracetam (Keppra™), oxcarbazepine (Trileptal™), phenobarbital (Lumina™), phenytoin (Dilantin™), pregabalin (Lyrica™), primidone (Mysoline™), tiagabine (Gabitril™), topiramate (Topamax™), valproate semisodium (Depakote™), valproic acid (Depakene™), zonisamide (Zonegran™), or any combination thereof. The anti-convulsive medication can be administered concurrently with the compound or compound salt, or the anti-convulsive medication can be administered before or after the administration of the compound or compound salt. In some instances, the patient is administered a pharmaceutical composition comprising a compound or compound salt of Formula I and anti-convulsive medication.

[0294] Another aspect of the present invention provides a method of treating, delaying the onset, or reducing the symptoms of a neurodegenerative disorder selected from Huntington's disease, epilepsy, ALS, or MS in a patient comprising administering to the patient a pharmaceutical composition comprising an salt of a compound of Formula I, II, IIA, IIB, III, IIIA, IIIB, IVA, or IVB, and a phosphodiesterase inhibitor (e.g., caffeine, IBMX, or any combination thereof). In some examples, the salt is a sodium salt of a compound of Formula I, II, IIA, IIB, III, IIIA, IIIB, IVA, or IVB, and in other examples, the salt is a potassium salt of a compound of a compound of Formula I, II, IIA, IIB, III, IIIA, IIIB, IVA, or IVB.

[0295] Another aspect of the present invention provides a method of treating, delaying the onset, or reducing the symptoms of a neurodegenerative disorder selected from Huntington's disease, epilepsy, ALS, or MS in a patient comprising administering to the patient a
pharmaceutical composition comprising a compound of Formula I, II, IIA, IIB, III, IIIA, IIIB, IVA, or IVB, wherein the compound has a PPARy activity of 50% or less relative to the activity of rosiglitazone when dosed to produce circulating levels greater than 3 µM or having a PPARy activity of 10 times less than pioglitazone at the same dosage.

Another aspect of the present invention provides a method of treating, delaying the onset, or reducing the symptoms of a neurodegenerative disorder selected from Huntington's disease, epilepsy, ALS, or MS in a patient comprising administering to the patient a pharmaceutical composition comprising a compound of Formula I, a phosphodiesterase inhibitor, and a pharmaceutically acceptable carrier.

Another aspect of the present invention a method of treating, delaying the onset, or reducing the symptoms of a neurodegenerative disorder selected from Huntington's disease, epilepsy, ALS, or MS in a patient comprising administering a pharmaceutical composition comprising a compound of any one of Formulae X, XA, XII, XIII, XIV, XIVA-XIVE, XV, or XVA-XVE.

Several methods comprise the step of administering to a patient a compound of Formula X and a phosphodiesterase inhibitor. The administration of these ingredients can be sequential (e.g., the compound of Formula X is administered first in time, and the agent is administered second in time) or simultaneous, i.e., both ingredients are administered at substantially the same time.

Several methods comprise the step of administering to a patient a pharmaceutical composition comprising a co-crystal comprising a compound of Formula X or a pharmaceutically acceptable salt thereof, and a phosphodiesterase inhibitor. Some methods further comprise administering an agent that increases a cyclic nucleotide level in a patient (e.g., a β-adrenergic agonist).

Several methods comprise the step of administering to a patient a compound of Formula X and an agent that increases a cyclic nucleotide level in a patient.

Another aspect of the present invention provides a method of treating and/or preventing a neurodegenerative disorder in a patient comprising administering a pharmaceutical composition comprising a compound of any one of Formulae X, XIVA-XIVB, or XVA-XVB wherein said compound has a purity of about 70 e.e.% or more. For example, the method treating or preventing a neurodegenerative comprises administering a pharmaceutical composition comprising a compound of Formula X and a phosphodiesterase inhibitor (e.g., caffeine and/or IBMX) wherein the compound of Formula X has a purity of
about 80% e.e. or more (e.g., 90% e.e. or more, 95% e.e. or more, 97% e.e. or more, or 99% e.e. or more).

[0302] Another aspect of the present invention provides a method of treating, delaying the onset, or reducing the symptoms of a neurodegenerative disorder selected from Huntington's disease, epilepsy, ALS, or MS in a patient comprising administering to the patient a pharmaceutical composition comprising a compound of any one of Formulae X, XIVA-XIVB, or XVA-XVB and a phosphodiesterase inhibitor (e.g., caffeine, IBMX, or any combination thereof).

[0303] Another aspect of the present invention provides a method of treating, delaying the onset, or reducing the symptoms of a neurodegenerative disorder selected from Huntington's disease, epilepsy, ALS, or MS in a patient comprising administering to the patient a compound of any one of Formulae X, XIVA-XIVB, or XVA-XVB or an alkali metal salt thereof. Some methods further comprise administering LDOPA to the patient. The LDOPA can be administered concurrently with the compound or compound salt, or the LDOPA can be administered before or after the administration of the compound or compound salt. In some instances, the patient is administered a pharmaceutical composition comprising a compound or compound salt of Formula X and LDOPA.

[0304] Another aspect of the present invention provides a method of treating, delaying the onset, or reducing the symptoms of a neurodegenerative disorder selected from Huntington's disease, epilepsy, ALS, or MS in a patient comprising administering to the patient a compound of any one of Formulae X, XIVA-XIVB, or XVA-XVB or an alkali metal salt thereof. Some methods further comprise administering an anti-convulsive medication to the patient. In some examples, the anti-convulsive medication is selected from carbamazepine (Tegretol™), clorazepate (Tranxene™), clonazepam (Klonopin™), ethosuximide (Zarontin™), felbamate (Felbato™), fosphenytoin (Cerebyx™), gabapentin (Neurontin™), lacosamide (Vimpat™), lamotrigine (Lamictal™), levetiracetam (Keppra™), oxcarbazepine (Trilepta™), phenobarbital (Lumina™), phenytoin (Dilantin™), pregabalin (Lyrica™), primidone (Mysoline™), tiagabine (Gabitril™), topiramate (Topamax™), valproic semisodium (Depakot™), valproic acid (Depakene™), zonisamide (Zonegran™), or any combination thereof. The anti-convulsive medication can be administered concurrently with the compound or compound salt, or the anti-convulsive medication can be administered before or after the administration of the compound or compound salt. In some instances, the patient is administered a pharmaceutical composition comprising a compound or compound salt of Formula X and anti-convulsive medication.
Another aspect of the present invention provides a method of treating, delaying the onset, or reducing the symptoms of a neurodegenerative disorder selected from Huntington's disease, epilepsy, ALS, or MS in a patient comprising administering to the patient a pharmaceutical composition comprising an salt of a compound of any one of Formulae X, XIVA-XIVB, or XVA-XVB, and a phosphodiesterase inhibitor (e.g., caffeine, IBMX, or any combination thereof). In some examples, the salt is a sodium salt of the compound of any one of Formulae X, XIVA-XIVB, or XVA-XVB, and in other examples, the salt is a potassium salt of a compound of any one of Formulae X, XIVA-XIVB, or XVA-XVB.

Another aspect of the present invention provides a method of treating, delaying the onset, or reducing the symptoms of a neurodegenerative disorder selected from Huntington's disease, epilepsy, ALS, or MS in a patient comprising administering to the patient a pharmaceutical composition comprising a compound of any one of Formulae X, XIVA-XIVB, or XVA-XVB, wherein the compound has a PPARγ activity of 50% or less relative to the activity of rosiglitazone when dosed to produce circulating levels greater than 3 µM or having a PPARγ activity of 10 times less than pioglitazone at the same dosage.

Another aspect of the present invention provides a method of treating, delaying the onset, or reducing the symptoms of a neurodegenerative disorder selected from Huntington's disease, epilepsy, ALS, or MS in a patient comprising administering to the patient a pharmaceutical composition comprising a compound of Formula X, a phosphodiesterase inhibitor, and a pharmaceutically acceptable carrier.

IV. GENERAL SYNTHETIC SCHEMES

The compounds of the present invention may be readily synthesized from commercially available or known starting materials by known methods. Exemplary synthetic routes to produce compounds of the present invention are provided in the Schemes below.
Referring to Scheme 1, the starting material 1a is reduced to form the aniline 1b. The aniline 1b is diazotized in the presence of hydrobromic acid, acrylic acid ester, and a catalyst such as cuprous oxide to produce the alpha-bromo acid ester 1c. The alpha-bromo acid ester 1c is cyclized with thiourea to produce racemic thiazolidinedione 1d. Compounds of Formula II can be separated from the racemic mixture using any suitable process such as HPLC.

In Scheme 2 below, R2 and R’2 form an oxo group or -O-Q and R3 is hydrogen.
[0314] Referring to Scheme 2, the starting material 2a is reacted with 4-hydroxybenzaldehyde under basic conditions (e.g., aq. NaOH) to give a mixture of regioisomeric alcohols 2b that were separated by chromatography. The regioisomeric alcohols 2b is reacted with 2,4-thiazolidinedione using pyrrolidine as base to give compound 2c. Cobalt catalyzed reduction with sodium borohydride affords compound 2d, which is oxidized, for example, with phosphorus pentoxide in the presence of dimethyl sulfoxide, to give the ketone 2e. Alternatively, compounds of Formula I wherein R₂ is -O-Q, may be prepared from the hydroxy compound 2d using known methods of alkylation, acylation, sulfonation or phosphorylation.

[0315] Scheme 3:

[0316] Referring to Scheme 3, the hydroxy group of starting material 1-1 is protected with an alcohol protecting group (e.g., benzyl (Bn)) to form the protected intermediate 1-2. The primary amine group of intermediate 1-2 is converted to an R¹b group (e.g., -OH via treatment with NaN₃ under acidic conditions) to form intermediate 1-3. Intermediate 1-3 is deprotected via hydrogenolysis to form intermediate 1-4, and intermediate 1-4 is reacted with reagent 1-5 under basic conditions to form a compound of Formula X.
Referring to Scheme 4, the starting material 2-1 is protected with an alcohol protecting group (e.g., benzyl (Bn)) to form the intermediate 2-2. Intermediate 2-2 is diazotized in the presence of an aqueous acid to generate intermediate 2-3. Intermediate 2-3 is esterified to generate intermediate 2-4. Intermediate 2-4 is deprotected via a hydrogenolysis reaction to generate intermediate 2-5, which is reacted with reagent 2-6 under basic conditions to form intermediate 2-7. Intermediate 2-7 undergoes saponification to form the a-alkoxy acid 2-8. In steps a and b, intermediate 2-7 may undergo chiral reduction, when $R^{2a}$ and $R^{2b}$ form oxo, to generate their corresponding chiral alcohols, 2-9 and 2-10.
Chiral alcohols, 2-9 and 2-10, may then undergo saponification to form their corresponding a-alkoxy acid compounds 2-11 and 2-12, wherein compounds 2-8, 2-11, and 2-12 are compounds of Formula X.

In Scheme 5, below, ring B is an alkyl substituted pyridine, R^{2a} and R^{2b} together form oxo, R^{1a} is absent, R^{2b} is alkoxy, and ------ is a double bond.

Scheme 5:

[0321] Starting material 3-1 is acylated to form ketone 3-2, and ketone 3-2 is alkylated to generate intermediate 3-3. Intermediate 3-3 is halogenated to generate intermediate 3-4, and intermediate 3-4 is converted to the oxime 3-5 (e.g., via a condensation reaction). Oxime 3-5 is reacted with the a-alkoxy ester 3-6 to generate intermediate 3-7, which undergoes saponification to generate the corresponding α-alkoxy acid 3-8, which is a compound of Formula X.

V. USES, FORMULATIONS, AND ADMINISTRATION

As discussed above, the present invention provides compounds and pharmaceutical compositions that are useful as treatments for treating, delaying the onset, or reducing the symptoms of a neurodegenerative disorder selected from Huntington's disease, epilepsy, ALS, or MS in a patient.

Accordingly, in another aspect of the present invention, pharmaceutically acceptable compositions are provided, wherein these compositions comprise any of the compounds as described herein, and optionally comprise a pharmaceutically acceptable
carrier, adjuvant or vehicle. In certain methods, these compositions optionally further comprise one or more additional therapeutic agents (anti-convulsive medication or LDOPA).

[0325] It will also be appreciated that certain of the compounds of present invention can exist in free form for treatment, or where appropriate, as a pharmaceutically acceptable derivative or a prodrug thereof. According to the present invention, a pharmaceutically acceptable derivative or a prodrug includes, but is not limited to, pharmaceutically acceptable salts, esters, salts of such esters, or any other adduct or derivative which upon administration to a patient in need is capable of providing, directly or indirectly, a compound as otherwise described herein, or a metabolite or residue thereof.

[0326] As used herein, the term "pharmaceutically acceptable salt" refers to those salts which are, within the scope of sound medical judgment, suitable for use in contact with the tissues of humans and lower animals without undue toxicity, irritation, allergic response and the like, and are commensurate with a reasonable benefit/risk ratio. A "pharmaceutically acceptable salt" means any non-toxic salt or salt of an ester of a compound of this invention that, upon administration to a recipient, is capable of providing, either directly or indirectly, a compound of this invention or an inhibitorily active metabolite or residue thereof.

[0327] Pharmaceutically acceptable salts are well known in the art. For example, S. M. Berge, et al. describes pharmaceutically acceptable salts in detail in J. Pharmaceutical Sciences, 1977, 66, 1-19, incorporated herein by reference. Pharmaceutically acceptable salts of the compounds of this invention include those derived from suitable inorganic and organic acids and bases. Examples of pharmaceutically acceptable, nontoxic acid addition salts are salts of an amino group formed with inorganic acids such as hydrochloric acid, hydrobromic acid, phosphoric acid, sulfuric acid and perchloric acid or with organic acids such as acetic acid, oxalic acid, maleic acid, tartaric acid, citric acid, succinic acid or malonic acid or by using other methods used in the art such as ion exchange. Other pharmaceutically acceptable salts include adipate, alginate, ascorbate, aspartate, benzenesulfonate, benzoate, bisulfate, borate, butyrate, camphorate, camphorsulfonate, citrate, cyclopentanepropionate, digluconate, dodecylsulfate, ethanesulfonate, formate, fumarate, glucoheptonate, glycerophosphate, gluconate, hemisulfate, heptanoate, hexanoate, hydroiodide, 2-hydroxy-ethanesulfonate, lactobionate, lactate, laurate, lauryl sulfate, malate, maleate, malonate, methanesulfonate, 2-naphthalenesulfonate, nicotinate, nitrate, oleate, oxalate, palmitate, pamoate, pectinate, persulfate, 3-phenylpropionate, phosphate, picrate, pivalate, propionate, stearate, succinate, sulfate, tartrate, thiocyanate, p-toluensulfonate, undecanoate, valerate salts, and the like. Salts derived from appropriate bases include alkali metal, alkaline earth metal, ammonium
and $N^+\text{(C-[4alkyl])}_4$ salts. This invention also envisions the quaternization of any basic nitrogen-containing groups of the compounds disclosed herein. Water or oil-soluble or dispersible products may be obtained by such quaternization. Representative alkali or alkaline earth metal salts include sodium, lithium, potassium, calcium, magnesium, and the like. Further pharmaceutically acceptable salts include, when appropriate, nontoxic ammonium, quaternary ammonium, and amine cations formed using counterions such as halide, hydroxide, carboxylate, sulfate, phosphate, nitrate, lower alkyl sulfonate and aryl sulfonate.

[0328] As described above, the pharmaceutically acceptable compositions of the present invention additionally comprise a pharmaceutically acceptable carrier, adjuvant, or vehicle, which, as used herein, includes any and all solvents, diluents, or other liquid vehicle, dispersion or suspension aids, surface active agents, isotonic agents, thickening or emulsifying agents, preservatives, solid binders, lubricants and the like, as suited to the particular dosage form desired. Remington's Pharmaceutical Sciences, Sixteenth Edition, E. W. Martin (Mack Publishing Co., Easton, Pa., 1980) discloses various carriers used in formulating pharmaceutically acceptable compositions and known techniques for the preparation thereof. Except insofar as any conventional carrier medium is incompatible with the compounds of the invention, such as by producing any undesirable biological effect or otherwise interacting in a deleterious manner with any other component(s) of the pharmaceutically acceptable composition, its use is contemplated to be within the scope of this invention. Some examples of materials which can serve as pharmaceutically acceptable carriers include, but are not limited to, ion exchangers, alumina, aluminum stearate, lecithin, serum proteins, such as human serum albumin, buffer substances such as phosphates, glycine, sorbic acid, or potassium sorbate, partial glyceride mixtures of saturated vegetable fatty acids, water, salts or electrolytes, such as protamine sulfate, disodium hydrogen phosphate, potassium hydrogen phosphate, sodium chloride, zinc salts, colloidal silica, magnesium trisilicate, polyvinyl pyrrolidone, polymers, waxes, polyethylene-polyoxypropylene-block polymers, wool fat, sugars such as lactose, glucose and sucrose; starches such as corn starch and potato starch; cellulose and its derivatives such as sodium carboxymethyl cellulose, ethyl cellulose and cellulose acetate; powdered tragacanth; malt; gelatin; talc; excipients such as cocoa butter and suppository waxes; oils such as peanut oil, cottonseed oil; safflower oil; sesame oil; olive oil; corn oil and soybean oil; glycols; such a propylene glycol or polyethylene glycol; esters such as ethyl oleate and ethyl laurate; agar; buffering agents such as magnesium hydroxide and aluminum hydroxide; alginic acid; pyrogen-free water;
isotonic saline; Ringer's solution; ethyl alcohol, and phosphate buffer solutions, as well as other non-toxic compatible lubricants such as sodium lauryl sulfate and magnesium stearate, as well as coloring agents, releasing agents, coating agents, sweetening, flavoring and perfuming agents, preservatives and antioxidants can also be present in the composition, according to the judgment of the formulator.

According to the invention an "effective amount" of the compound or pharmaceutically acceptable composition is that amount effective for treating, preventing, or lessening the severity of metabolic diseases such as neurodegenerative disorders, e.g., Alzheimer's Disease, Parkinson's Disease, ALS, MS, MCI, any combination thereof, or the like.

The pharmaceutical compositions, according to the method of the present invention, may be administered using any amount and any route of administration effective for treating or lessening the severity of neurodegenerative disorders.

The exact amount required will vary from subject to subject, depending on the species, age, and general condition of the subject, the particular agent, its mode of administration, and the like. The compounds of the invention are preferably formulated in dosage unit form for ease of administration and uniformity of dosage. The expression "dosage unit form" as used herein refers to a physically discrete unit of agent appropriate for the patient to be treated. It will be understood, however, that the total daily usage of the compounds and compositions of the present invention will be decided by the attending physician within the scope of sound medical judgment. The specific effective dose level for any particular patient or organism will depend upon a variety of factors including the disorder being treated and the severity of the disorder; the activity of the specific compound employed; the specific composition employed; the age, body weight, general health, sex and diet of the patient; the time of administration, route of administration, and rate of excretion of the specific compound employed; the duration of the treatment; drugs used in combination or coincidental with the specific compound employed, and like factors known in the medical arts. The term "patient", as used herein, means an animal, for example, a mammal, and more specifically a human.

The pharmaceutically acceptable compositions of this invention can be administered to humans and other animals orally, rectally, parenterally, intracisternally, intravaginally, intraperitoneally, topically (as by powders, ointments, or drops), bucally, as an oral or nasal spray, or the like, depending on the severity of the infection being treated. In certain methods, the compounds of the invention may be administered orally or parenterally at
dosage levels of about 0.01 mg/kg to about 50 mg/kg and preferably from about 1 mg/kg to
about 25 mg/kg, of subject body weight per day, one or more times a day, to obtain the
desired therapeutic effect. Alternatively, the compounds of the invention may be
administered orally or parenterally at dosage levels of between 10 mg/kg and about
120 mg/kg.

[0333] Liquid dosage forms for oral administration include, but are not limited to,
pharmaceutically acceptable emulsions, microemulsions, solutions, suspensions, syrups and
elixirs. In addition to the active compounds, the liquid dosage forms may contain inert
diluents commonly used in the art such as, for example, water or other solvents, solubilizing
agents and emulsifiers such as ethyl alcohol, isopropyl alcohol, ethyl carbonate, ethyl acetate,
benzyl alcohol, benzyl benzoate, propylene glycol, 1,3-butylen glycol, dimethylformamide,
oils (in particular, cottonseed, groundnut, corn, germ, olive, castor, and sesame oils),
glycerol, tetrahydrofurfuryl alcohol, polyethylene glycols and fatty acid esters of sorbitan,
and mixtures thereof. Besides inert diluents, the oral compositions can also include adjuvants
such as wetting agents, emulsifying and suspending agents, sweetening, flavoring, and
perfuming agents.

[0334] Injectable preparations, for example, sterile injectable aqueous or oleaginous
solutions may be formulated according to the known art using suitable dispersing or
wetting agents and suspending agents. The sterile injectable preparation may also be a sterile
injectable solution, suspension or emulsion in a nontoxic parenterally acceptable diluent or
solvent, for example, as a solution in 1,3-butanediol. Among the acceptable vehicles and
solvents that may be employed are water, Ringer's solution, U.S.P. and isotonic sodium
chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or
suspending medium. For this purpose any bland fixed oil can be employed including
synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid are used in the
preparation of injectables.

[0335] The injectable formulations can be sterilized, for example, by filtration through a
bacterial-retaining filter, or by incorporating sterilizing agents in the form of sterile solid
compositions which can be dissolved or dispersed in sterile water or other sterile injectable
medium prior to use.

[0336] In order to prolong the effect of a compound of the present invention, it is often
desirable to slow the absorption of the compound from subcutaneous or intramuscular
injection. This may be accomplished by the use of a liquid suspension of crystalline or
amorphous material with poor water solubility. The rate of absorption of the compound then
depends upon its rate of dissolution that, in turn, may depend upon crystal size and crystalline form. Alternatively, delayed absorption of a parenterally administered compound form is accomplished by dissolving or suspending the compound in an oil vehicle. Injectable depot forms are made by forming microencapsulated matrices of the compound in biodegradable polymers such as polylactide-polyglycolide. Depending upon the ratio of compound to polymer and the nature of the particular polymer employed, the rate of compound release can be controlled. Examples of other biodegradable polymers include poly(orthoesters) and poly(anhydrides). Depot injectable formulations are also prepared by entrapping the compound in liposomes or microemulsions that are compatible with body tissues.

Compositions for rectal or vaginal administration are preferably suppositories which can be prepared by mixing the compounds of this invention with suitable non-irritating excipients or carriers such as cocoa butter, polyethylene glycol or a suppository wax which are solid at ambient temperature but liquid at body temperature and therefore melt in the rectum or vaginal cavity and release the active compound.

Solid dosage forms for oral administration include capsules, tablets, pills, powders, and granules. In such solid dosage forms, the active compound is mixed with at least one inert, pharmaceutically acceptable excipient or carrier such as sodium citrate or dicalcium phosphate and/or a) fillers or extenders such as starches, lactose, sucrose, glucose, mannitol, and silicic acid, b) binders such as, for example, carboxymethylcellulose, alginates, gelatin, polyvinylpyrrolidinone, sucrose, and acacia, c) humectants such as glycerol, d) disintegrating agents such as agar-agar, calcium carbonate, potato or tapioca starch, alginic acid, certain silicates, and sodium carbonate, e) solution retarding agents such as paraffin, f) absorption accelerators such as quaternary ammonium compounds, g) wetting agents such as, for example, cetyl alcohol and glycerol monoostearate, h) absorbents such as kaolin and bentonite clay, and i) lubricants such as talc, calcium stearate, magnesium stearate, solid polyethylene glycols, sodium lauryl sulfate, and mixtures thereof. In the case of capsules, tablets and pills, the dosage form may also comprise buffering agents.

Solid compositions of a similar type may also be employed as fillers in soft and hard-filled gelatin capsules using such excipients as lactose or milk sugar as well as high molecular weight polyethylene glycols and the like. The solid dosage forms of tablets, dragees, capsules, pills, and granules can be prepared with coatings and shells such as enteric coatings and other coatings well known in the pharmaceutical formulating art. They may optionally contain opacifying agents and can also be of a composition that they release the active ingredient(s) only, or preferentially, in a certain part of the intestinal tract, optionally,
in a delayed manner. Examples of embedding compositions that can be used include polymeric substances and waxes. Solid compositions of a similar type may also be employed as fillers in soft and hard-filled gelatin capsules using such excipients as lactose or milk sugar as well as high molecular weight polyethylene glycols and the like.

[0340] The active compounds can also be in microencapsulated form with one or more excipients as noted above. The solid dosage forms of tablets, dragees, capsules, pills, and granules can be prepared with coatings and shells such as enteric coatings, release controlling coatings and other coatings well known in the pharmaceutical formulating art. In such solid dosage forms the active compound may be admixed with at least one inert diluent such as sucrose, lactose or starch. Such dosage forms may also comprise, as is normal practice, additional substances other than inert diluents, e.g., tableting lubricants and other tableting aids such as magnesium stearate and macrocrystalline cellulose. In the case of capsules, tablets and pills, the dosage forms may also comprise buffering agents. They may optionally contain opacifying agents and can also be of a composition that they release the active ingredient(s) only, or preferentially, in a certain part of the intestinal tract, optionally, in a delayed manner. Examples of embedding compositions that can be used include polymeric substances and waxes.

[0341] Dosage forms for topical or transdermal administration of a compound of this invention include ointments, pastes, creams, lotions, gels, powders, solutions, sprays, inhalants or patches. The active component is admixed under sterile conditions with a pharmaceutically acceptable carrier and any needed preservatives or buffers as may be required. Ophthalmic formulation, eardrops, and eye drops are also contemplated as being within the scope of this invention. Additionally, the present invention contemplates the use of transdermal patches, which have the added advantage of providing controlled delivery of a compound to the body. Such dosage forms are prepared by dissolving or dispensing the compound in the proper medium. Absorption enhancers can also be used to increase the flux of the compound across the skin. The rate can be controlled by either providing a rate controlling membrane or by dispersing the compound in a polymer matrix or gel.

[0342] As described generally above, the compounds of the invention are useful as treatments for metabolic diseases.

[0343] The activity, or more importantly, reduced PPARγ activity of a compound utilized in this invention as a treatment or prevention of neurodegenerative disorders may be assayed according to methods described generally in the art and in the examples provided herein.
It will also be appreciated that the compounds and pharmaceutically acceptable compositions of the present invention can be employed in combination therapies, that is, the compounds and pharmaceutically acceptable compositions can be administered concurrently with, prior to, or subsequent to, one or more other desired therapeutics or medical procedures. The particular combination of therapies (therapeutics or procedures) to employ in a combination regimen will take into account compatibility of the desired therapeutics and/or procedures and the desired therapeutic effect to be achieved. It will also be appreciated that the therapies employed may achieve a desired effect for the same disorder (for example, an inventive compound may be administered concurrently with another agent used to treat the same disorder), or they may achieve different effects (e.g., control of any adverse effects). As used herein, additional therapeutic agents that are normally administered to treat or prevent a particular disease, or condition, are known as "appropriate for the disease, or condition, being treated".

The amount of additional therapeutic agent present in the compositions of this invention will be no more than the amount that would normally be administered in a composition comprising that therapeutic agent as the only active agent. Preferably the amount of additional therapeutic agent in the presently disclosed compositions will range from about 50% to 100% of the amount normally present in a composition comprising that agent as the only therapeutically active agent.

The compounds of this invention or pharmaceutically acceptable compositions thereof may also be incorporated into compositions for coating an implantable medical device, such as prostheses, artificial valves, vascular grafts, stents and catheters. Accordingly, the present invention, in another aspect, includes a composition for coating an implantable device comprising a compound of the present invention as described generally above, and in classes and subclasses herein, and a carrier suitable for coating said implantable device. In still another aspect, the present invention includes an implantable device coated with a composition comprising a compound of the present invention as described generally above, and in classes and subclasses herein, and a carrier suitable for coating said implantable device. Suitable coatings and the general preparation of coated implantable devices are described in US Patents 6,099,562; 5,886,026; and 5,304,121, each of which is incorporated by reference. The coatings are typically biocompatible polymeric materials such as a hydrogel polymer, polymethyldisiloxane, polycaprolactone, polyethylene glycol, polylactic acid, ethylene vinyl acetate, and mixtures thereof. The coatings may optionally be further covered by a suitable topcoat of fluorosilicone, polysaccarides, polyethylene glycol,
phospholipids or combinations thereof to impart controlled release characteristics in the composition.

[0347] Another aspect of the invention relates to treating metabolic diseases in a biological sample or a patient (e.g., in vitro or in vivo), which method comprises administering to the patient, or contacting said biological sample with a pharmaceutical composition comprising a compound of Formula I, II, IIA, IIB, III, IIIA, IIIB, IVA or IVB. The term "biological sample", as used herein, includes, without limitation, cell cultures or extracts thereof; biopsied material obtained from a mammal or extracts thereof; and blood, saliva, urine, feces, semen, tears, or other body fluids or extracts thereof.

[0348] In order that the invention described herein may be more fully understood, the following examples are set forth. It should be understood that these examples are for illustrative purposes only and are not to be construed as limiting this invention in any manner.

[0349] VI. EXAMPLES

[0350] Example 1: 5-[4-(2-oxo-2-phenylethoxy)benzyl]-1,3-thiazolidine-2,4-dione.

[0352] To 2-(4-fluorophenyl)oxirane (6.50 g, 54.0 mmol) was added toluene (85 mL), 4-hydroxybenzaldehyde (9.89 g, 81.0 mmol), PEG4000 (polyethylene glycol, 1.15 g) and 1M NaOH (85 mL) and the stirring mixture was heated at 78 °C overnight. After cooling to RT the reaction mixture was extracted with EtOAc, and the organic phase was washed with brine, dried (Na₂SO₄), filtered and evaporated in vacuo. The resulting yellow oil was chromatographed on a medium silica gel column eluting with 0-10% EtOAc/DCM. Fractions containing predominantly the higher Rₙ spot were combined and evaporated in vacuo to give 1.85 g (14%) of the title compound as a yellow oil. Fractions containing predominantly the lower Rₙ spot were combined and evaporated in vacuo to give 0.64 g of the regioisomer as a colorless, viscous oil. Mixed fractions were combined and rechromatographed eluting with 30% EtOAc/hexanes. Fractions containing the higher Rₙ material were combined and evaporated in vacuo to give an additional 2.64 g (20%) of the title compound as a colorless oil. Fractions containing the lower Rₙ material were combined and evaporated in vacuo to give an additional 1.82 g of the regioisomer as a colorless viscous oil.

[0353] Step 2: Preparation of 5-[4-(2-hydroxy-2-phenylethoxy)benzylidene]-1,3-thiazolidine-2,4-dione.
To a stirring solution of 4-[(2S)-2-hydroxy-2-phenylethoxy]benzaldehyde (2.63 g, 10.8 mmol) in absolute EtOH (75 mL) was added 2,4-thiazolidinedione (1.27 g, 10.8 mmol) and piperidine (0.54 mL, 5.4 mmol), and the resulting solution was heated to reflux. The reaction was refluxed overnight. The reaction mixture was allowed to cool to RT. No precipitate formed. The pH of reaction mixture was ca. 5. Acetic acid (20 drops) was added, and the reaction was evaporated in vacuo. The material was adsorbed onto silica gel and chromatographed eluting with 25-35% EtOAc/hexanes. Fractions containing product were combined and evaporated in vacuo to give 3.18 g (86%) of the title compound as a light yellow solid. MS (ESI-) for C_{19}H_{19}NO_{4}S m/z 340.1 (M-H)^-.

Step 3: Preparation of 5-[4-(2-hydroxy-2-phenylethoxy)benzyl]-1,3-thiazolidine-2,4-dione.

To a mixture of 5-[4-(2-hydroxy-2-phenylethoxy)benzylidene]-1,3-thiazolidine-2,4-dione (1.50 g, 4.39 mmol) in THF (20 mL) was added H_2O (20 mL), 1M NaOH (3 mL), cobalt (II) chloride hexahydrate (0.60 mg, 0.003 mmol) and dimethylglyoxime (15 mg, 0.13 mmol). A solution of sodium tetrahydroborate (240 mg, 6.33 mmol) in 0.2M NaOH (3.6 mL) was added. The reaction mixture immediately turned dark but very soon assumed a clear yellow appearance. Acetic acid was added dropwise until the solution turned dark (3 drops). After ca. one hour, the reaction lightened. Additional NaBH_4, CoCl_2 and HOAc were added to produce a deep blue-purple color. When that color faded, more NaBH_4 was added. When HPLC analysis indicated that the reaction was complete, it was partitioned between H_2O and EtOAc, and the organic phase was washed with brine, dried (Na_2SO_4), filtered and evaporated in vacuo. The resulting foamy solid was chromatographed, eluting with 50% EtOAc/hexanes. Fractions containing product were combined and evaporated in vacuo to give 1.15 g (76%) of the title compound as a white solid. MS (ESI-) for C_{18}H_{17}NO_{4}S m/z 342.1 (M-H)^-.

Step 4: Preparation of 5-[4-(2-oxo-2-phenylethoxy)benzyl]-1,3-thiazolidine-2,4-dione.

To a stirring solution of 5-[4-(2-hydroxy-2-phenylethoxy)benzyl]-1,3-thiazolidine-2,4-dione (1.00 g, 2.91 mmol) in DCM (35 mL) was added DMSO (2 mL) and the solution was cooled to 0 °C. Phosphorus pentoxide (0.83 g, 2.91 mmol) was added followed by triethylamine (1.8 mL, 13.1 mmol). The reaction was allowed to slowly warm to RT. After 2 hours, the reaction mixture was partitioned between DCM and water and the organic phase was washed with brine, dried (Na_2SO_4), filtered and evaporated in vacuo. The resulting yellow oil was chromatographed on silica gel eluting with 25-35% EtOAc/hexanes.
Fractions containing product were combined and evaporated in vacuo to give 0.40 g (40%) of the title compound as a white solid. Trituration with ether afforded 245 mg of clean product. MS (ESI-) for C_{18}H_{15}N0_{4}S m/z 340.1 (M-H)

Example 2: Preparation of 5-{4-[2-(4-fluorophenyl)-2-oxoethoxy]benzyl}-1,3-thiazolidine-2,4-dione.

[0359]

Step 1: Preparation of 4-[2-(fluorophenyl)-2-hydroxyethoxy]benzaldehyde.

To a stirring solution of 2-(4-fluorophenyl)oxirane (5.60 g, 40.0 mmol) in toluene (65 mL) was added 4-hydroxybenzaldehyde (7.40 g, 61.0 mmol), 1M NaOH (65 mL) and PEG4000 (polyethylene glycol, 0.85 g) and the reaction was heated at 78 °C overnight. After cooling to RT, the reaction was extracted with EtOAc (2 x 150 mL) and the combined extracts were washed with brine, dried (Na_{2}SO_{4}), filtered and evaporated in vacuo. The resulting light brown oil was chromatographed on silica gel eluting with 30-40% EtOAc/hexanes. Fractions containing the higher R_{f} spot were combined and evaporated in vacuo to give 2.38 g of the regioisomer of the product as a white solid. Fractions containing the lower R_{f} spot were combined and evaporated in vacuo to give 1.54 g (22%) of the title compound as a colorless viscous oil.

Step 2: Preparation of 5-{4-[2-(4-fluorophenoy)-2-hydroxyethoxy]benzyldiene}-1,3-thiazolidine-2,4-dione.

To a stirring solution of the aldehyde (2.36 g, 10.8 mmol) in absolute EtOH (75 mL) was added 2,4-thiazolidinedione (1.06 g, 9.07 mmol) and piperidine (0.45 mL, 4.50 mmol), and the resulting solution was heated to reflux. After refluxing overnight, the reaction was allowed to cool to RT, and then evaporated in vacuo. The residue was adsorbed onto silica gel and chromatographed, eluting with 30-40% EtOAc/hexanes. Fractions containing product were combined and evaporated in vacuo to give 0.88 g (27%) of the title compound as a yellow solid. MS (ESI-) for C_{18}H_{14}FNO_{4}S m/z 358.1 (M-H)

Step 3: Preparation of 5-{4-[2-(4-fluorophenyl)-2-hydroxyethoxy]benzyl}-1,3-thiazolidine-2,4-dione.

To a stirring mixture of 5-{4-[2-(4-fluorophenyl)-2-hydroxyethoxy]benzyldiene}-1,3-thiazolidine-2,4-dione (0.87 g, 2.40 mmol) in THF/H_{2}O (1:1, 20 mL) was added 1M NaOH (2 mL), cobalt (II) chloride hexahydrate (0.30 g, 0.001 mmol), dimethylglyoxime
(8.4 mg, 0.073 mmol), and finally sodium tetrahydroborate (0.13 g, 3.53 mmol). The reaction turned a deep blue/purple color. After a short time, the dark color began to fade and HOAc was added dropwise to regenerate the darker color. When the color faded and addition of HOAc failed to regenerate it, NaB₉ was added to regenerate the darker color. The reaction was left to stir at RT overnight. The reaction was partitioned between water and EtOAc. The organic phase was washed with brine, dried (Na₂S₀₄), filtered and evaporated in vacuo. The resulting light brown oil was chromatographed, eluting with 35% EtOAc/hexanes. Fractions containing compound were combined and evaporated in vacuo to give 0.77 g (88%) of a light yellow solid. The yellow solid was dissolved in THF (8 mL) and H₂O (8 mL), and the resulting solution was treated with CoCl₂ (a small crystal), and 2,2'-dipyridyl (5 mg). Finally, NaBH₄ was added in small portions until the deep blue color persisted. The reaction mixture was partitioned between EtOAc and H₂O, and the aqueous phase was extracted with EtOAc. The combined organic phases were washed with brine, dried (Na₂S₀₄), filtered and evaporated in vacuo. The resulting slightly tinted oil was chromatographed on a small silica gel column eluting with 25-35% EtOAc/hexanes. Fractions containing product were combined and evaporated in vacuo to afford 527 mg (60%) of the title compound as a white solid. MS (ESI-) for C₁₈H₁₆FNₐS m/z 360.1 (M-H)

[0366] Step 4: Preparation of 5-{4-[2-(4-fluorophenyl)-2-oxoethoxy]benzyl}-1,3-thiazolidine-2,4-dione.

[0367] To a stirring solution of 5-{4-[2-(4-fluorophenyl)-2-hydroxyethoxy]benzyl}-1,3-thiazolidine-2,4-dione (0.52 g, 1.40 mmol) in DCM (15 mL) was added DMSO (0.5 mL) and the solution was cooled to 0 °C. Phosphorus pentoxide (0.41 g, 1.44 mmol) was added followed by triethylamine (0.90 mL, 6.48 mmol). The reaction was allowed to slowly warm to RT and then stirred for 5 hours. The reaction mixture was partitioned between DCM and H₂O, and the aqueous phase was extracted with DCM. The combined organic phases were washed with brine, dried (Na₂S₀₄), filtered and evaporated in vacuo. The resulting white solid was chromatographed on a small silica gel column eluting with 10% EtOAc/DCM. Fractions containing product were combined and evaporated in vacuo to give 0.25 g (48%) of the title compound as a white solid. MS (ESI+) for C₁₈H₁₆FNₐS m/z 359.9 (M+H)⁺. MS (ESI⁻) for C₁₈H₁₆FNₐS m/z 358.0 (M-H)⁻.
Example 3: Preparation of 5-{4-[2-(2-fluorophenyl)-2-oxethoxy]benzyl}-1,3-thiazolidine-2,4-dione.

Step 1: Preparation of 2-(2-fluorophenyl)oxirane.

To a solution of o-fluorostyrene (5.0 g, 41.0 mmol) and acetic acid (2.33 mL, 40.9 mmol) in dioxane (33 mL) and H₂O (78 mL) at 0 °C was added N-bromosuccinimide (8.02 g, 45.0 mol) in three portions. The reaction was allowed to warm to RT and stirred overnight. Sodium carbonate (8.68 g, 81.9 mmol) was added in portions and then 1M NaOH (ca. 10 mL) was added and the reaction was stirred at RT overnight. The reaction mixture was partitioned between water and EtOAc, and the aqueous phase was extracted with EtOAc. The combined organic phases washed with brine, dried (Na₂SO₄), filtered and evaporated in vacuo to give 5.31 g (94%) of the title compound as a slightly tinted oil which was used without further purification. MS (ESI+) for C₃H₇FO m/z 138.1 (M+H)⁺.

To a stirring solution of 2-(2-fluorophenyl)oxirane (5.30 g, 38.4 mmol) in toluene (65 mL) was added 4-hydroxybenzaldehyde (7.0 g, 58.0 mmol), 1M NaOH (65 mL) and PEG4000 (polyethylene glycol, 0.85 g) and the stirring mixture was heated at 78 °C overnight. The reaction was allowed to cool to RT and then extracted with EtOAc (2 x 150 mL). The combined extracts were washed with brine, dried (Na₂SO₄), filtered and evaporated in vacuo. The resulting light brown oil was adsorbed onto silica gel and chromatographed, eluting with 30-40% EtOAc/hexanes to give 2 major spots. Fractions containing the higher Rₜ spot were combined and evaporated in vacuo to give 1.10 g (11%) of the title compound as a colorless oil. Fractions containing the lower Rₜ spot were combined and evaporated in vacuo to give 0.67 g (7%) of the regioisomer as a colorless oil.

Step 3: Preparation of 5-{4-[2-(2-fluorophenyl)-2-hydroxyethoxy]benzylidene}-1,3-thiazolidine-2, 4-dione.

To a stirring solution of the aldehyde (2.36 g, 10.8 mmol) in absolute EtOH (40 mL) was added 2,4-thiazolidinedione (0.495 g, 4.23 mmol) and piperidine (0.21 mL, 2.10 mmol), and the resulting solution was heated to reflux. After refluxing overnight, the reaction mixture was cooled to RT and then evaporated in vacuo. The residue was dissolved in EtOAc and this solution was washed with dilute aqueous HOAc, brine, dried (Na₂SO₄), evaporated overnight. The residue was dissolved in EtOAc and this solution was washed with dilute aqueous HOAc, brine, dried (Na₂SO₄), evaporated overnight. The residue was dissolved in EtOAc and this solution was washed with dilute aqueous HOAc, brine, dried (Na₂SO₄), evaporated overnight.
filtered and evaporated in vacuo. The resulting yellow solid was washed with DCM and acetone and the filtrate was evaporated in vacuo. This material was adsorbed onto silica gel and chromatographed using 10-25% EtOAc/DCM. Fractions containing compound were combined and evaporated in vacuo to give 0.51 g of the title compound as a yellow solid. MS (ESI-) for C_{18}H_{14}FNO_{4}S m/z 358.0 (M-H)^-.

[0375] **Step 4:** Preparation of 5-[4-[2-(2-fluorophenyl)-2-hydroxyethoxy]benzyl]-1,3-thiazolidine-2,4-dione.

[0376] To a stirring mixture of 5-[4-[2-(2-fluorophenyl)-2-hydroxyethoxy]benzylidene]-1,3-thiazolidine-2,4-dione (0.52 g, 1.40 mmol) in THF/H_2O (1:1, 16 mL) was added 1M NaOH (2 mL), cobalt (II) chloride hexahydrate (0.2 mg, 0.0009 mmol), 2,2'-bipyridine (50.8 mg, 0.33 mmol), and finally sodium tetrahydroborate (0.1 g, 2.90 mmol). The reaction turned a deep blue/purple color. After a short time, the dark color began to fade and HOAc was added dropwise to regenerate the darker color. When the color faded and addition of HOAc failed to regenerate it, NaB\(\text{III}\) was added to regenerate the darker color. Added small portions of NaB\(\text{III}\) and HOAc dropwise until deep blue color persisted. After repeating this several times, HPLC indicated that the reaction was complete despite the fact that the deep blue color has given way to a light brown solution. The reaction was partitioned between water and EtOAc. The organic phase was washed with brine, dried (Na\(_2\)SO\(_4\)), filtered and evaporated in vacuo. The resulting light brown oil was chromatographed, eluting with 35% EtOAc/hexanes. Fractions containing compound were combined and evaporated in vacuo to give 0.32 g of the title compound as a white solid. MS (ESI-) for C_{18}H_{14}FNO_{4}S m/z 360.1 (M-H)^-.

[0377] **Step 5:** Preparation of 5-[4-[2-(2-fluorophenyl)-2-oxoethoxy]benzyl]-1,3-thiazolidine-2,4-dione.

[0378] To a stirring solution of 5-[4-[2-(2-fluorophenyl)-2-hydroxyethoxy]benzyl]-1,3-thiazolidine-2,4-dione (0.29 g, 0.80 mmol) in DCM (15 mL) was added DMSO (0.5 mL) and the solution was cooled to 0°C. Phosphorus pentoxide (0.23 g, 0.80 mmol) was added, followed by triethylamine (0.50 mL, 3.6 mmol). The reaction was allowed to slowly warm to RT. After 3 hours, water was added and the phases were separated. The pH of the aqueous phase was adjusted to ca. 7 and the aqueous phase was extracted with DCM. The combined organic phases were washed with brine, dried (Na\(_2\)SO\(_4\)), filtered and evaporated in vacuo. The resulting white solid was chromatographed on a small silica gel column eluting with 10% EtOAc/DCM. Fractions containing product were combined and evaporated in vacuo to give
0.19 g (66%) of the title compound as a white solid. MS (ESI-) for C_{18}H_{14}FN_{0.4}S m/z 358.0 (M-H)\)

Example 4: Preparation of 5-\{4-[2-(3-fluorophenyl)\-2-oxoethoxy] benzyl\}-1,3-thiazolidine-2,4-dione.

\[\text{\includegraphics{example4.png}}\]

[0380] **Step 1:** Preparation of 2-(3-fluorophenyl)oxirane.

[0381] To a solution of m-fluorostyrene (5.00 g, 41.0 mmol) and acetic acid (2.33 mL, 40.9 mmol) in dioxane (33 mL) and H_{2}O (78 mL) at 0 °C was added N-bromosuccinimide (8.02 g, 45.0 mmol) in three portions. The reaction was allowed to warm to RT. After 4 hours, 2N NaOH (60 mL) was added and the reaction was left to stir at RT overnight. The reaction mixture was partitioned between water and EtOAc, and the aqueous phase was extracted with EtOAc. The combined organic phases were washed with brine, dried (Na_{2}SO_{4}), filtered and evaporated in vacuo to give 6.30 g of the title compound as a slightly tinted oil which was used without further purification.

[0382] **Step 2:** Preparation of 4-[2-(3-fluorophenyl)\-2-hydroxyethoxy\]benzaldehyde.

[0383] To a stirring solution of 2-(3-fluorophenyl)oxirane (5.60 g, 40.5 mmol) in toluene (65 mL) was added 4-hydroxybenzaldehyde (7.40 g, 61.0 mmol), 1M NaOH (65 mL) and PEG4000 (polyethylene glycol, 0.85 g) and the stirring mixture was heated at 78 °C overnight. The reaction mixture was allowed to cool to RT and then extracted with EtOAc (2 x 150 mL). The combined extracts were washed with brine, dried (Na_{2}SO_{4}), filtered and evaporated in vacuo. The resulting light brown oil was chromatographed eluting with 30-40% EtOAc/hexanes to give 2 major spots. Fractions containing the higher R_f spot were combined and evaporated in vacuo to give 1.78 g (17%) of the title compound as a white solid. Fractions containing the lower R_f spot were combined and evaporated in vacuo to give 0.90 g (9%) of the regioisomer as a nearly colorless oil.

[0384] **Step 3:** Preparation of 5-\{4-[2-(3-fluorophenyl)\-2-hydroxyethoxy\]benzylidene\}-1,3-thiazolidine-2, 4-dione.

[0385] To a stirring solution of the aldehyde (2.36 g, 10.8 mmol) in absolute EtOH (40 mL) was added 2,4-thiazolidinedione (0.90 g, 7.69 mmol) and piperidine (0.76 mL, 7.7 mmol), and the resulting solution was heated to reflux. After 6 hours, the reaction mixture was allowed to cool to RT. The mixture was evaporated in vacuo and the residue was dissolved
in EtOAc. This solution was washed with a dilute aqueous HOAc, brine, dried (Na₂SO₄), filtered and evaporated in vacuo. The resulting yellow solid was dissolved in MeOH/DCM adsorbed onto silica gel and chromatographed eluting with 30% EtOAc/DCM. Fractions containing compound were combined and evaporated in vacuo to afford 2.17 g (86%) of the title compound as a yellow solid. MS (ESI-) for C₁₈H₁₄FN₂O₄S m/z 358.1 (M-H).  

[0386] Step 4: Preparation of 5-[4-2-(3-fluorophenyl)-2-hydroxyethoxy]benzyl]-1,3-thiazolidine-2,4-dione.  

[0387] 5-[4-2-(3-fluorophenyl)-2-hydroxyethoxy]benzylidene]-1,3-thiazolidine-2,4-dione (1.00 g, 2.78 mmol) was suspended in THF (15 mL) and H₂O (10 mL). To this solution was added a small crystal of cobalt chloride followed by 2,2'-bipyridine (98 mg, 0.63 mmol). NaBH₄ was added in portions until blue color persisted. The color gradually faded and was regenerated repeatedly by small additions of borohydride and HOAc. When HPLC analysis indicated that the reaction was complete, the reaction mixture was partitioned between EtOAc and H₂O. HOAc was added until the pH of the aqueous phase was ca. 6. The aqueous phase was extracted with EtOAc. The combined organic phases were washed with brine, dried (Na₂SO₄), filtered and evaporated in vacuo. The residue was chromatographed on a small silica gel column eluting with 20% EtOAc/DCM. Fractions containing product were combined and evaporated in vacuo to give 0.72 g (72%) of the title compound as a white solid. This material was rechromatographed on a small silica column eluting with 10-20% EtOAc/DCM. MS (ESI-) for C₁₈H₁₆FN₂O₄S m/z 360.1 (M-H)⁻.  

[0388] Step 5: Preparation of 5-[4-2(3-fluorophenyl)-2-oxoethoxy]benzyl]-1,3-thiazolidine-2,4-dione.  

[0389] To a stirring solution of 5-[4-2(3-fluorophenyl)-2-hydroxyethoxy]benzyl]-1,3-thiazolidine-2,4-dione (0.62 g, 1.70 mmol) in DCM (15 mL) was added DMSO (0.5 mL) and the solution was cooled to 0 °C. Added phosphorus pentoxide (0.49 g, 1.72 mmol) followed by triethylamine (1.1 mL, 7.72 mmol). The reaction mixture was allowed to slowly warm to RT. After 2 hours, HPLC shows that the reaction was complete. Added water and separated phases. The pH of the aqueous phase was adjusted to ca. 7 with 2M NaOH and the aqueous phase was then extracted with EtOAc. The combined extracts were washed with brine, dried (Na₂SO₄), filtered and evaporated in vacuo. The resulting white solid was chromatographed on a small silica gel column eluting with 10% EtOAc/DCM. Fractions containing product were combined and evaporated in vacuo to give 0.25 g (40%) of the title compound as a white solid. MS (ESI-) for C₁₈H₁₆FN₂O₄S m/z 358.0 (M-H)⁻.
[0390] Example 5: Preparation of 5-{4-[2-(3-methoxyphenyl) -2-oxoethoxy] benzyl} -1,3 -thiazolidine-2,4-dione.

\[ \text{O} \quad \text{O} \quad \text{S} \quad \text{NH} \]

[0391] **Step 1:** 2-(3-methoxyphenyl)oxirane.

[0392] To a solution of 3-vinylanisole (5.0 g, 37.0 mmol) and acetic acid (2.1 mL, 37.0 mmol) in dioxane (33 mL) and H₂O (78 mL) at 0 °C was added N-bromosuccinimide (7.30 g, 41.0 mmol) in three portions. The reaction was allowed to warm to RT and then 2M NaOH (50 mL) was added. The reaction was left to stir at RT overnight. The reaction mixture was then partitioned between water and EtOAc, and the aqueous phase was extracted with EtOAc. The combined organic phases were washed with brine, dried (Na₂SO₄), filtered and evaporated in vacuo to give 5.60 g (100%) of the title compound as a slightly tinted oil.

[0393] **Step 2:** 4-[2-hydroxy-2-(3-methoxyphenyl)ethoxy]benzaldehyde.

[0394] To a stirring solution of 2-(3-methoxyphenyl)oxirane (5.60 g, 37.0 mmol) in toluene (65 mL) was added 4-hydroxybenzaldehyde (6.80 g, 5.60 mmol), 1M NaOH (65 mL) and PEG4000 (polyethylene glycol, 0.85 g) and the stirring mixture was heated at 78 °C overnight. The reaction mixture was allowed to cool to RT and extracted with EtOAc (2 x 150 mL). The combined extracts were washed with brine, dried (Na₂SO₄), filtered and evaporated in vacuo. The resulting light brown oil was chromatographed, eluting with 30-40% EtOAc/hexanes. Fractions containing the higher Rf spot were combined and evaporated in vacuo to give 1.86 g (18%) of the title compound as a clear colorless oil. Fractions containing the lower Rf spot were combined and evaporated in vacuo to give 0.90 g (9%) the regioisomer as a nearly colorless oil.

[0395] **Step 3:** 5-{4-[2-hydroxy-2-(3-methoxyphenyl)ethoxy]benzylidene}-1,3-thiazolidine-2,4-dione.

[0396] To a stirring solution of 4-[2-hydroxy-2-(3-methoxyphenyl)ethoxy]benzaldehyde (1.76 g, 6.46 mmol) in absolute EtOH (50 mL) was added 2,4-thiazolidinedione (0.83 g, 7.11 mmol) and piperidine (0.70 mL, 7.11 mmol), and the resulting solution was heated to reflux. The reaction was refluxed overnight and then evaporated in vacuo. The residue was dissolved in EtOAc and this solution was washed with water (pH adjusted to ca. 5-6 with HOAc), brine, dried (Na₂SO₄), filtered and adsorbed onto silica gel. After chromatography with 20-30% EtOAc/DCM, the fractions containing compound were combined and
evaporated in vacuo to give 1.38 g (58%) of the title compound as a yellow solid. MS (ESI-) for C_{19}H_{17}N_{0.5}S m/z 370.1 (M-H)\)

[0397] **Step 4:** Preparation of 5-{4-[2-hydroxy-2-(3-methoxyphenyl)ethoxy]benzyl}-1,3-thiazolidine-2,4-dione.

[0398] 5-{4-[2-hydroxy-2-(3-methoxyphenyl)ethoxy]benzyldiene}-1,3-thiazolidine-2,4-dione (1.15 g, 3.10 mmol) was dissolved in THF (15 mL). Added H_{2}O (15 mL) and sufficient THF to give a clear solution. A small crystal of cobalt chloride was added, followed by 2,2'-bipyridine (109 mg, 0.70 mmol). NaBH_{4} was added in portions until the blue color persisted. The color gradually faded, but was regenerated repeatedly by small additions of borohydride and HOAc. When HPLC indicated that the reaction was complete the reaction mixture was partitioned between EtOAc and H_{2}O. HOAc was added until the pH of the aqueous phase was ca. 6, and then the aqueous phase was extracted with EtOAc. The combined organic phases were washed with brine, dried (Na_{2}SO_{4}), filtered and evaporated in vacuo. The residue was chromatographed on a small silica gel column eluting with 20% EtOAc/DCM. Fractions containing product were combined and evaporated in vacuo to give 0.82 g (74%) of the title compound as a white solid. MS (ESI-) for C_{19}H_{17}N_{0.5}S m/z 372.0 (M-H)\)

[0399] **Step 5:** Preparation of 5-{4-[2-(3-methoxyphenyl)-2-oxoethoxy]benzyl}-1,3-thiazolidine-2,4-dione.

[0400] To a stirring solution of 5-{4-[2-hydroxy-2-(3-methoxyphenyl)ethoxy]benzyl}-1,3-thiazolidine-2,4-dione (0.62 g, 1.7 mmol) in DCM (15 mL) was added DMSO (0.5 mL) and the solution was cooled to 0 °C. Added phosphorus pentoxide (0.52 g, 1.8 mmol) followed by triethylamine (1.2 mL, 8.3 mmol). The reaction was allowed to slowly warm to RT. After 2 hours water was added and the phases were separated. The pH of the aqueous phase was adjusted to ca. 7 with 2M NaOH. The aqueous phase was extracted with EtOAc. The combined extracts were washed with brine, dried (Na_{2}SO_{4}), filtered and evaporated in vacuo. The resulting white solid was chromatographed on a small silica gel column eluting with 10% EtOAc/DCM. Fractions containing product were combined and evaporated in vacuo to give 0.33 g (54%) of the title compound as a white solid. MS (ESI+) for C_{19}H_{17}N_{0.5}S m/z 372.0 (M+H)^{+}. MS (ESI-) for C_{19}H_{17}N_{0.5}S m/z 370.1 (M-H)^{-}. 
Example 6: Preparation of 5-{4-[2-(2-methoxyphenyl)-2-oxoethoxy]benzyl}-1,3-thiazolidine-2,4-dione.

Step 1: Preparation of 2-(2-methoxyphenyl)oxirane.
To a solution of 2-vinyl anisole (5.0 g, 0.037 mol) and acetic acid (2.1 mL, 37 mmol) in dioxane (33 mL) and H$_2$O (78 mL) at 0 °C was added N-bromosuccinimide (7.30 g, 40.1 mmol) in three portions. The reaction was allowed to warm to RT and after 1 hour, 2M NaOH (50 mL) was added. The reaction was left to stir at RT overnight. The reaction mixture was partitioned between water and EtOAc, and the aqueous phase was extracted with EtOAc. The combined organic phases were washed with brine, dried (Na$_2$SO$_4$), filtered and evaporated in vacuo to give 7.56 g slightly tinted oil. This was dissolved in dioxane, 2N NaOH was added and the reaction was stirred at RT overnight. Repeated aqueous work-up gave 5.60 g of the title compound as a nearly colorless oil.

To a stirring solution of 2-(2-methoxyphenyl)oxirane (5.60 g, 37.3 mmol) in toluene (65 mL) was added 4-hydroxybenzaldehyde (6.80 g, 56.0 mmol), 1M NaOH (65 mL) and PEG4000 (polyethylene glycol, 0.85 g) and the stirring mixture was heated at 78 °C overnight. The reaction was allowed to cool to RT and it was then extracted with EtOAc (2 x 150 mL). The combined extracts were washed with brine, dried (Na$_2$SO$_4$), filtered and evaporated in vacuo. The resulting light oil was adsorbed onto silica gel and chromatographed eluting with 30-40% EtOAc/hexanes to give 2 major spots. Fractions containing the higher Rf spot were combined and evaporated in vacuo to give 1.71 g (17%) the regioisomer as a brown oil. Fractions containing the lower Rf spot were combined and evaporated in vacuo to give 2.05 g (20%) of the title compound as a yellow solid.

Step 3: Preparation of (5Z)-5-{4-[2-hydroxy-2-(2-methoxyphenyl)ethoxy]benzylidene}-1,3-thiazolidine-2,4-dione.
To a stirring solution of 4-[2-hydroxy-2-(2-methoxyphenyl)ethoxy]benzaldehyde (1.71 g, 6.28 mmol) in absolute EtOH (50 mL) was added 2,4-thiazolidinedione (0.81 g, 6.91 mmol) and piperidine (0.68 mL, 6.9 mmol), and the resulting solution was heated to reflux. The reaction was refluxed overnight and then evaporated in vacuo. The residue was dissolved in EtOAc and this solution was washed with aqueous HOAc (pH 5-6), brine, dried
(Na2SC>4), filtered and evaporated in vacuo. The residue was adsorbed onto silica gel and chromatographed on silica gel eluting with 20-40% EtOAc/DCM. Fractions containing product were combined and evaporated in vacuo to give 1.87 g (80%) of the title compound as a light yellow solid. MS (ESI-) for C19H19NO5S m/z 370.1 (M-H).

**Step 4:** 5-{4-[2-hydroxy-2-(2-methoxyphenyl)ethoxy]benzyl}-1,3-thiazolidine-2,4-dione.

**Step 5:** Preparation of 5-{4-[2-(2-methoxyphenyl)-2-oxoethoxy]benzyl}-1,3-thiazolidine-2,4-dione.

To a stirring solution of phosphorus pentoxide (0.30 g, 1.10 mmol) in DCM (8 mL) at 0 °C was added a solution of 5-{4-[2-hydroxy-2-(2-methoxyphenyl)ethoxy]benzyl}-1,3-thiazolidine-2,4-dione (0.20 g, 0.54 mmol) in DCM (8 mL) followed by dimethyl sulfoxide (0.20 mL, 2.80 mmol). After stirring for 15 minutes, N,N-diisopropylethylamine (0.28 mL, 1.60 mmol) was added. After 45 minutes, the reaction mixture was cast into cold saturated NaHCO3 and extracted with EtOAc (x2). The combined extracts were washed with brine, dried (Na2SO4), filtered and evaporated in vacuo. The residue was chromatographed on a small silica gel column eluting with 0-10% EtOAc/DCM. Fractions containing product were combined and evaporated in vacuo to give 175 mg (88%) of the title compound as a light yellow solid. MS (ESI-) for C19H19NO5S m/z 370.1 (M-H)

102
Example 7: Preparation of 5-{4-[2-(3-chlorophenyl)-2-oxoethoxy]benzyl}-1,3-thiazolidine-2,4-dione.

[0413] Step 1: 2-(3-chlorophenyl)oxirane.

[0414] To a solution of m-chlorostyrene (5.70 g, 41.0 mmol) and acetic acid (2.33 mL, 40.9 mmol) in dioxane (33 mL) and H₂O (78 mL) at 0 °C was added N-bromosuccinimide (8.02 g, 45.0 mmol) in three portions. The reaction was allowed to warm to RT. After 4 hours, 2N NaOH (60 mL) was added and the reaction was allowed to stir at RT overnight. The reaction mixture was partitioned between water and EtOAc, and the aqueous phase was extracted with EtOAc. The combined organic phases were washed with brine, dried (Na₂SO₄), filtered and evaporated in vacuo to give 6.20 g of a slightly tinted oil which was used without further purification.

[0416] To a stirring solution of 2-(3-chlorophenyl)oxirane (6.20 g, 40.0 mmol) in toluene (65 mL) was added 4-hydroxybenzaldehyde (7.30 g, 60.0 mmol), 1M NaOH (65 mL) and PEG4000 (polyethylene glycol, 0.85 g) and the stirring mixture was heated at 78 °C for three hours. The reaction was allowed to cool to RT and then extracted with EtOAc (2 x 150 mL). The combined extracts were washed with brine, dried (Na₂SO₄), filtered and evaporated in vacuo. The resulting light brown oil was adsorbed onto silica gel and chromatographed eluting with 25-40% EtOAc/hexanes. There are 2 major spots. Fractions containing the higher Rf spot were combined and evaporated in vacuo to give 1.08 g (10%) of the desired product as a colorless oil. Fractions containing the lower Rf spot were combined and evaporated in vacuo to give 0.95 g (8%) of the regioisomer as a colorless oil, 44B. Some starting epoxide (2.85 g) was also recovered.

[0417] Step 3: 5-{4-[2-(3-chlorophenyl)-2-hydroxyethoxy]benzylidene}-1,3-thiazolidine-2,4-dione.

[0418] To a stirring solution of 4-[2-(3-chlorophenyl)-2-hydroxyethoxy]benzaldehyde (1.08 g, 3.90 mmol) in absolute EtOH (50 mL) was added 2,4-thiazolidinedione (0.50 g, 4.29 mmol) and piperidine (0.42 mL, 4.3 mmol), and the resulting solution was heated to reflux and then stirred overnight at room temperature. The reaction mixture was evaporated in vacuo and the residue was dissolved in EtOAc. This solution was washed with aqueous
HOAc (pH 5-6), brine, dried (Na₂S₀₄), filtered and evaporated in vacuo. The residue was adsorbed onto silica gel and chromatographed eluting with 10-20% EtOAc/DCM. Fractions containing product were combined and evaporated in vacuo to give 1.31 g (89%) of the product as a light yellow solid. MS (ESI+) for C₁₈H₄₂ClN₄S m/z 375.0 (M+H)⁺. MS (ESI-) for C₈H₁₄ClN₀₄S m/z 374.1 (M-H)⁻.

[0419] Step 4: Preparation of 5-{4-[2-(3-chlorophenyl)-2-hydroxyethoxy]benzyl}-1,3-thiazolidine-2,4-dione.

[0420] 5-{4-[2-(3-chlorophenyl)-2-hydroxyethoxy]benzylidene}-1,3-thiazolidine-2,4-dione (0.74 g, 2.00 mmol) was dissolved in THF (20 mL). Water (20 mL) was added and more THF was added until all solids dissolved. A small crystal of cobalt chloride was added, followed by 2,2'-bipyridine (69 mg, 0.44 mmol). The reaction mixture was cooled to 0 °C. NaBH₄ was added in portions until the blue color persisted. The color gradually faded and was regenerated repeatedly by small additions of borohydride and HOAc. When HPLC indicated that the reaction was complete, the reaction mixture was partitioned between EtOAc and 3/70. HOAc was added until the pH of the aqueous phase was ca. 6, and then the aqueous phase was extracted with EtOAc. The combined organic phases were washed with brine, dried (Na₂S₀₄), filtered and evaporated in vacuo. The residue was chromatographed on a small silica gel column eluting with 0-10% EtOAc/DCM. Fractions containing product were combined and evaporated in vacuo to give 0.44 g (59%) of a sticky yellow solid. MS (ESI-) for C₁₈H₂₆ClN₀₄S m/z 376.1 (M-H)⁻.

[0421] Step 5: Preparation of 5-{4-[2-(3-chlorophenyl)-2-oxoethoxy]benzyl}-1,3-thiazolidine-2,4-dione.

[0422] To a stirring solution of phosphorus pentoxide (0.38 g, 1.30 mmol) in DCM (8 mL) at 0 °C was added to a solution of 5-{4-[2-(3-chlorophenyl)-2-hydroxyethoxy]benzyl}-1,3-thiazolidine-2,4-dione (0.25 g, 0.66 mmol) in DCM (8 mL) followed by dimethyl sulfoxide (0.23 mL, 3.30 mL). After stirring for 15 minutes N,N-diisopropylethylamine (0.34 mL, 2.00 mmol) was added. After 45 minutes the reaction was poured into cold saturated NaHCO₃ and the mixture was extracted with EtOAc (x2). The combined extracts were washed with brine, dried (Na₂S₀₄), filtered and evaporated in vacuo. The residue was chromatographed on a small silica gel column eluting with 0-15% EtOAc/DCM. Fractions containing product were combined and evaporated in vacuo to give 117 mg (47%) of a white solid. MS (ESI-) for C₁₈H₁₄ClN₀₄S m/z 374.1 (M-H)⁻.

[0423] Example 8: Preparation of 5-{4-[2-(2-chlorophenyl)-2-oxoethoxy]benzyl}-1,3-thiazolidine-2,4-dione.
The title compound can be prepared as described in Example 7 using appropriate starting materials, such as 2-(2-chlorophenyl)oxirane.

Example 9: Preparation of 5-{4-[2-(4-methoxyphenyl)-2-oxoethoxy]benzyl}-1,3-thiazolidine-2,4-dione.

The title compound was prepared as described in Examples 5 and 6 using appropriate starting materials, such as 2-(4-methoxyphenyl)oxirane. MS (ESI-) for C_{9}H_{17}NO_{5}S 370.2 m/z (M-1).

[0430] Example 10: Synergy between PPAR-sparing compounds and norepinephrine on the expression of PGC-la.

[0431] Another example of the ability of augmented signaling between cyclic nucleotides and compounds of Formula I is shown by the effect on expression of PGC-la, a known regulator of mitochondrial biogenesis. Increased numbers of mitochondria are predictive of utility for the reduction of body weight. Figure 3 shows that three compounds of Formula I augment the ability of norepinephrine to increase the expression of PGC-la.

[0432] Precursor BAT cells were isolated as described above and treated with or without 3 µM compounds: 1] Compound A: 5-(4-(2-(5-ethylpyridin-2-yl)-2-oxoethoxy)benzyl)-1,3-thiazolidine-2,4-dione; 2] Compound B: 5-(4-(2R)-2-(5-ethylpyridin-2-yl)-2-hydroxyethoxy)benzyl)-1,3-thiazolidine-2,4-dione; or 3] Compound C: 5-(4-(2-(3-methoxyphenyl)-2-oxoethoxy)benzyl)-1,3-thiazolidine-2,4-dione for seven days followed by treatment with 1 µM norepinephrine for 2 hours. Total RNA was isolated from the cells and the RNA message (mRNA) for PGC-la was measured by quantitative polymerase chain
reactions. In the absence of compound (control), norepinephrine alone did not produce an increase in the PGC-1 α mRNA; however, in the presence of Compounds A, B, or C, an increase in PGC-1 α message was observed in the presence of norepinephrine (solid bars) supporting the utility of compounds of Formula I, salts of compounds of formula I, co-crystals of compounds of Formula I, or combinations thereof.

[0433] Example 11: Preparation of Acid Salts.
[0434] A compound of Formula I may be converted to a salt by dissolving the compound in a solvent in which the acid salt of the organic compound is insoluble or is only sparingly soluble; adding one or more molar equivalents of an acid, such as HCl, HBr, acetic acid, trifluoroacetic acid, or H₂SO₄, methane sulfonic acid, p-toluene sulfonic acid, trifluoromethanesulfonic acid, or the like, to the solvent containing the dissolved compound of Formula I to form a precipitate of the organic compound salt; and collecting the precipitate using filtration, decanting or some similar method to produce the salt of the organic compound of Formula I in a pure form.

[0435] Alternatively, a compound of Formula I may be converted to a salt by dissolving the compound in a solvent in which the salt of the organic compound is also soluble; adding one or more molar equivalents of an acid with a relatively low boiling point, such as HCl, H₂SO₄, acetic acid, trifluoroacetic acid, or the like, to the solvent containing the dissolved compound of Formula I; and then evaporating the solvent and any excess acid contained in the solution to produce the salt of the organic compound in a pure form.

[0437] Co-Crystal A:
[0438] To caffeine (0.194g, 1mmol) and 5-(4-(2-(5-ethylpyridin-2-yl)-2-oxoethoxy)benzyl)-1,3-thiazolidine-2,4-dione (0.370g, 1mmol) was added acetonitrile (20mL). The mixture was warmed in a 75 °C oil bath until the solids dissolved. Warming was continued for about 10 minutes, then the solution was filtered and allowed to cool to room temperature. The solvent was allowed to evaporate until crystallization was complete. Co-crystalline solid was isolated by filtration and was dried in vacuo. The melting point of the resulting crystalline material was measured to be from about 123 °C to about 131 °C. Note that melting point for pure caffeine is reported to be from about 234 °C to about 236 °C, and the melting point for pure 5-(4-(2-(5-ethylpyridin-2-yl)-2-oxoethoxy)benzyl)-1,3-thiazolidine-2,4-dione was measured to be from about 140 °C to about 142 °C.

[0439] The ¹H NMR spectra of 5-(4-(2-(5-ethylpyridin-2-yl)-2-oxoethoxy)benzyl)-1,3-thiazolidine-2,4-dione, caffeine, and the co-crystal are provided in Figures 4-6. These spectra
were obtained using a Bruker 400 mHz NMR spectrometer, wherein the analyte was dissolved in D6-DMSO.

[0440] Co-Crystal B:

[0441] To caffeine (0.194g, 1mmol) and 5-(4-(2-(3-methoxyphenyl)-2-oxoethoxy)benzyl)thiazolidine-2,4-dione having the structure:

(0.371g, 1mmol) is added acetonitrile (20mL). The mixtures is warmed in a 75 °C oil bath until the solids dissolve. Warming continues for about 10 minutes, then the solution is filtered and cooled to room temperature. The solvent is evaporated until crystallization is complete. Co-crystalline solid is isolated by filtration and dries in vacuo.

[0442] Example 13: Preparation of (Z)-ethyl 2-ethoxy-3-(4-(2-(3-methoxyphenyl)-2-oxoethoxy)phenyl)dacrylate

[0443] To a stirring solution of ethyl (2Z)-2-ethoxy-3-(4-hydroxyphenyl)acrylate (1.20 g, 5.08 mmol; Supplier = Kalexsyn; Lot = 903-TTP-179) in acetone (25ml) was added 2-Bromo-3'-methoxyacetophenone (1.1 g, 4.9 mmol; Supplier = Aldrich) and potassium carbonate (0.700 g, 5.06 mmol). After stirring at RT for 4 hours, LCMS indicated that the desired product was the major component. The reaction mixture was evaporated in vacuo. The residue was partitioned between EtOAc and water, and the aqueous phase was extracted with EtOAc. The combined organic phases were washed with brine, dried (Na2SO4), filtered and evaporated in vacuo. The residue was chromatographed eluting with 10-30% EtOAc/hexanes to afford (Z)-ethyl 2-ethoxy-3-(4-(2-(3-methoxyphenyl)-2-oxoethoxy)phenyl)acrylate (1.41 g) as a clear, colorless oil.

[0444] Example 14: Preparation of ethyl 2-ethoxy-3-(4-(2-hydroxy-2-(3-methoxyphenyl)propanoate

121
To a solution of the olefin (0.68g) in EtOAc (15ml) was added 10% Pd/C (0.7g) and the mixture was shaken on a Parr apparatus under 50 psi hydrogen. After 4 hours, the reaction mixture was filtered through a pad of Celite and evaporated in vacuo. The residue was chromatographed eluting with 10-50% ether/hexanes. Fractions containing product were combined and evaporated in vacuo to give ethyl 2-ethoxy-3-(4-(2-hydroxy-2-(3-methoxyphenyl)ethoxy)phenyl)propanoate (0.716 g) as a clear, colorless oil.

**Example 15: Preparation of ethyl 2-ethoxy-3-(4-(2-(3-methoxyphenyl)-2-oxoethoxy)phenyl)propanoate**

![Chemical Structure]

To a stirring solution of ethyl 2-ethoxy-3-(4-(2-hydroxy-2-(3-methoxyphenyl)ethoxy)phenyl)propanoate (0.71 g, 1.8 mmol) in EtOAc (25 ml) was added 1-hydroxy-1,2-benziodoxol-3(1H)-one 1-oxide (1.5 g, 5.5 mmol) and the mixture was refluxed for 4 hours, then allowed to cool to RT. The reaction mixture was concentrated in vacuo and the crude product was purified by chromatography eluting 0-20% acetone:DCM to afford ethyl-2-ethoxy-3-(4-(2-(3-methoxyphenyl)-2-oxoethoxy)phenyl)propanoate (0.69 g).

**Example 16: Preparation of 2-ethoxy-3-(4-(2-(3-methoxyphenyl)-2-oxoethoxy)phenyl)propanoic acid**

![Chemical Structure]

To a stirring solution of ethyl ester (0.56g, 1.4mmol) in THF (4ml) was added 1.0 M of lithium hydroxide monohydrate in water (4.3 mL, 4.3 mmol), and the solution was heated to reflux. After 2 hours at reflux, the reaction is complete and cooled to RT, and concentrated in vacuo. EtOAc was added and the biphasic mixture stirred as 1M KHSO$_4$ was added until pH of aqueous phase was ca. 4. The aqueous phase was extracted with EtOAc. The combined organic phases were dried (Na$_2$SO$_4$), filtered and evaporated in vacuo. The residue was chromatographed eluting with 0-5% MeOH/DCM. Fractions containing product were combined and evaporated in vacuo to give 2-ethoxy-3-(4-(2-(3-methoxyphenyl)-2-oxoethoxy)phenyl)propanoic acid (0.363 g) as a yellow oil/glass.
Example 17: Preparation of \(\text{rR)-2-ethoxy-3-f4-(2-hydroxy-2-(3-methoxyphenyl)ethoxy)phenyl)propanoic acid}\)

A mixture of dichloro(p-cymene)ruthenium(II) dimer (1.3 mg, 0.0000021 mol), (lS,2S)-(+)N-p-tosyl-1,2-diphenylethylenediamine (1.5 mg, 0.0000042 mol) and triethylamine (0.003 mL, 0.00002 mol) in isopropyl alcohol (0.8 mL, 0.01 mol) was refluxed for 30 minutes. The reaction mixture was allowed to cool to RT and then evaporated \textit{in vacuo}. To the residue was added a solution of 2-ethoxy-3-(4-(2-(3-methoxyphenyl)-2-oxoethoxy)phenyl)propanoic acid (85 mg, 0.00024 mol; Supplier = Kalexsyn; Lot = 903-TTP-193) in DMF (2 ml) followed by formic acid triethylamine complex (89 mg, 0.00060 mol), and the reaction mixture was left to stir at RT overnight. LCMS indicated that the reaction was complete. The reaction mixture was partitioned between DCM and saturated NaHCO\(_3\), and the aqueous phase was extracted with DCM. The combined organic phases were dried (Na\(_2\)S\(_2\)O\(_4\)), filtered and evaporated \textit{in vacuo} (w/ heat). The residue was chromatographed on a small Biotage column eluting with 0-20\% ether/DCM then 5\% MeOH/DCM. Fractions containing product were combined and evaporated \textit{in vacuo} to give 22 mg of \(\text{(R)-2-ethoxy-3-(4-(2-hydroxy-2-(3-methoxyphenyl)ethoxy)phenyl)propanoic acid}\) as a tinted oil.

Example 18: Preparation of \(\text{(S)-2-ethoxy-3-(4-(2-hydroxy-2-(3-methoxyphenyl)ethoxy)phenyl)propanoic acid}\)

A stirring mixture of (1R,2R)-(--)N-p-tosyl-1,2-diphenylethylenediamine (1.8 mg, 0.0000049 mol), dichloro(p-cymene)ruthenium(II) dimer (1.5 mg, 0.0000025 mol) and triethylamine (3 \(\mu\)L, 0.00002 mol) in isopropyl alcohol (1.0 mL, 0.013 mol) was heated at reflux for 30 minutes, allowed to cool to RT, and then evaporated \textit{in vacuo}. To the residue was added a solution of 2-ethoxy-3-{4-[2-(3-methoxyphenyl)-2-oxoethoxy]phenyl} propanoic acid (98 mg, 0.00027 mol; Supplier = Kalexsyn; Lot = 903-TTP-193) in DMF (2 ml) followed by formic acid triethylamine complex (0.10 g, 0.00071 mol), which was left to stir at RT overnight. The reaction mixture was partitioned between DCM and saturated aq. NaHCO\(_3\). The organic phase was dried (Na\(_2\)S\(_2\)O\(_4\)), filtered and evaporated \textit{in vacuo} (w/ heat). The
residue was chromatographed on the PrepStar. Fractions showing correct mass were combined and evaporated in vacuo. The residue was partitioned between DCM and saturated NaHC0₃, and the organic phase was extracted with saturated NaHC0₃. The combined aqueous phases were treated with 1M KHSO₄ until pH ca. 5 when it was extracted with DCM. Added 1M KHSO₄ until pH ca. 1 and it was extracted with DCM. Combined organic phases dried (Na₂S₀₄), filtered and evaporated to give 15 mg dark brown oil. Chromatographed on a small pipette column, eluting with 0-10% acetone/DCM. Fractions containing product were combined and evaporated to give 15mg of (S)-2-ethoxy-3-(4-(2-hydroxy-2-(3-methoxyphenyl)ethoxy)phenyl)propanoic acid as a tinted oil.

Example 19: Preparation of (S)-ethyl 3-(4-(benzyloxy)phenyl)-2-ethoxypropanoate

To a stirring solution of (S)-3-[4-(benzyloxy)phenyl]-2-hydroxypropanoic acid (0.98 g, 0.0036 mol; Supplier = Kalexsyn; Lot = 1103-TTP-140; Zeng, Q.L.; Wang, H.Q.; Liu, Z.R.; Li, B.G.; Zhou, Y.F. Amino Acids 2007, 33, 537-541) in DMSO (2ml) was added crushed potassium hydroxide (0.606 g, 0.0108 mol) followed by sulfuric acid, and diethyl ester (1.41 mL, 0.0108 mol). After 3 hours, 0.3g KOH and 0.6ml Et₂S₀₄ was added to the reaction mixture, which was left to stir at RT overnight. The reaction mixture was partitioned between EtOAc and water, and the aqueous phase was extracted with EtOAc. The combined organic phases were washed with water, brine, dried (Na₂S₀₄), filtered and evaporated in vacuo. The light yellow oil was chromatographed eluting with 10-20% EtOAc/hex. Fractions containing product were combined and evaporated in vacuo to give (S)-ethyl 3-(4-(benzyloxy)phenyl)-2-ethoxypropanoate (0.78g) as a clear, colorless oil.

Example 19: Preparation of (S)-ethyl 2-ethoxy-3-(4-hydroxyphenyl)propanoate

A mixture of (S)-ethyl 3-(4-(benzyloxy)phenyl)-2-ethoxypropanoate (0.78 g, 2.4 mmol; Supplier = Kalexsyn; Lot = 1103-TTP-150) and 10% Pd/C (200mg) in absolute EtOH (8ml) was shaken on a Parr apparatus under 30 PSI of hydrogen. After 2 hours, the reaction was complete. The reaction mixture was filtered through a pad of Celite and
evaporated *in vacuo* to give (S)-ethyl-2-ethoxy-3-(4-hydroxyphenyl)propanoate (0.56g) as a slightly brown oil.

**Example 20: Preparation of (S)-ethyl 2-ethoxy-3-(4-(2-(3-methoxyphenyl)-2-oxoethoxy)phenyl)propanoate**

![Chemical Structure Image]

**Example 21: Preparation of (S)-2-ethoxy-3-(4-(2-(3-methoxyphenyl)-2-oxoethoxy)phenyl)propanoic acid**

![Chemical Structure Image]

To a stirring solution of (S)-ethyl 2-ethoxy-3-(4-hydroxyphenyl)propanoate (560 mg, 2.4 mmol; Supplier = Kalexsyn; Lot = 1103-TTP-153), 2-bromo-3'-methoxyacetophenone (590 mg, 2.6 mmol), in acetone (5ml) was added potassium carbonate (390 mg, 2.8 mmol), which was left to stir at RT overnight. The reaction mixture was partitioned between EtOAc and water, and the aq. phase was extracted with EtOAc. The combined organic phases were dried (Na$_2$SO$_4$), filtered and evaporated *in vacuo*. The resulting yellow oil was chromatographed on eluting with 0-20% acetone/DCM. Fractions containing product were combined and evaporated *in vacuo* to give (S)-ethyl 2-ethoxy-3-(4-(2-(3-methoxyphenyl)-2-oxoethoxy)phenyl)propanoate (347 mg) as an oil.

To a stirring solution of (S)-ethyl 2-ethoxy-3-(4-(2-(3-methoxyphenyl)-2-oxoethoxy)phenyl)propanoate (70 mg, 0.2 mmol; Supplier = Kalexsyn; Lot = 1103-TTP-155) in MeOH (2ml) was added 2M LiOH until pH ca. 10. After 3 hours, HPLC indicates that the reaction is complete. Added 6M HCl dropwise until pH ca. 3-4. Extracted 2x with EtOAc, and the combined extracts were dried (Na$_2$SO$_4$), filtered and evaporated in vacuo. The yellow oil was chromatographed on a small pipette eluting with 0-5% acetone/DCM. Fractions containing product were combined and evaporated *in vacuo* to give 38 mg of (S)-2-ethoxy-3-(4-(2-(3-methoxyphenyl)-2-oxoethoxy)phenyl)propanoic acid as a tinted oil.
[0462] **Example 22: Preparation of (R)-ethyl 3-(4-(benzyloxy)phenyl)-2-ethoxypropanoate**

[0463] To a stirring solution of (R)-3-[4-(benzyloxy)phenyl]-2-hydroxypropanoic acid (1.56 g, 0.00573 mol; Supplier = Kalexsyn; Lot = 1103-TTP-141; Zeng, Q.L.; Wang, H.Q.; Liu, Z.R.; Li, B.G.; Zhou, Y.F. Amino Acids 2007, 33, 537-541; Parmenon, C.; Guillard, J.; Caignard, D-H.; Hennuyer, N.; Staels, B.; Audinot-Bouchez, V.; Boutin, J-A.; Dacquet, C.; Ktorza, A.; Viaud-Massuard, M-C. Bioorg. Med. Chem. Lett. 2008, 18, 1617-1622) in DMSO (2ml) was added potassium hydroxide (2.15 g, 0.0384 mol) followed by sulfuric acid, diethyl ester (5.0 mL, 0.038 mol), which was left to stir at RT overnight. The reaction mixture was partitioned between EtOAc and water, and the aqueous phase was extracted with EtOAc. The combined organic phases were washed with water, brine, dried (Na₂SO₄), filtered and evaporated in vacuo. The light yellow oil was chromatographed eluting with 0-20% EtOAc/hex. Fractions containing the higher Rf spot (desired) were combined and evaporated in vacuo to give (R)-ethyl 3-(4-(benzyloxy)phenyl)-2-ethoxypropanoate (0.937 g) as an oil.

[0464] **Example 23: Preparation of (R)-ethyl 2-ethoxy-3-(4-hydroxyphenyl)propanoate**

[0465] A mixture of (R)-ethyl 3-(4-(benzyloxy)phenyl)-2-ethoxypropanoate (0.93 g, 2.8 mmol; Supplier = Kalexsyn; Lot = 1103-TTP-149) and 10% Pd/C (60mg) in absolute EtOH (8ml) was shaken on a Parr apparatus under 20 PSI of hydrogen. After 2 hours, there has been little to no reaction. Added 10% Pd/C (70mg) and increased pressure to 30 PSI. After 2 hours, SM has been consumed. The reaction mixture was filtered through a pad of Celite and evaporated in vacuo to give (R)-ethyl 2-ethoxy-3-(4-hydroxyphenyl)propanoate (0.67 g) as an oil.
Example 24: Preparation of (R)-ethyl 2-ethoxy-3-(4-(2-(3-methoxyphenyl)-2-oxoethoxy)phenyl)propanoate

To a stirring solution of (R)-ethyl 2-ethoxy-3-(4-hydroxyphenyl)propanoate (205 mg, 0.860 mmol; Supplier = Kalexsyn; Lot = 1103-TTP-151), 2-bromo-3'-methoxyacetophenone (220 mg, 0.950 mmol), in acetone (5 ml) was added potassium carbonate (140 mg, 1.0 mmol). Stirred at RT overnight. The reaction mixture was partitioned between EtOAc and water, and the aq. phase was extracted with EtOAc. The combined organic phases were dried (Na₂SO₄), filtered and evaporated in vacuo to afford (R)-ethyl 2-ethoxy-3-(4-(2-(3-methoxyphenyl)-2-oxoethoxy)phenyl)propanoate (234 mg).

Example 25: Preparation of (R)-2-ethoxy-3-(4-(2-(3-methoxyphenyl)-2-oxoethoxy)phenyl)propanoic acid

To a stirring solution of (R)-ethyl 2-ethoxy-3-(4-(2-(3-methoxyphenyl)-2-oxoethoxy)phenyl)propanoate (70 mg, 0.2 mmol; Supplier = Kalexsyn; Lot = 1103-TTP-152) in MeOH (2 ml) was added 2 M LiOH until pH ca. 10. After 3 hours, HPLC indicates that the reaction is complete. Added 6 M HCl dropwise until pH ca. 3-4. Extracted 2x with EtOAc, and the combined extracts were dried (Na₂SO₄), filtered and evaporated in vacuo. The yellow oil was chromatographed on a small pipette eluting with 0-5% acetone/DCM. Fractions containing product were combined and evaporated in vacuo to give 38 mg of (R)-2-ethoxy-3-(4-(2-(3-methoxyphenyl)-2-oxoethoxy)phenyl)propanoic acid (58%) as a tinted oil.

Example 26: Preparation of (S)-2-ethoxy-3-(4-(R)-2-hydroxy-2-(3-methoxyphenyl)ethoxy)phenyl)propanoic acid

To a stirring solution of (S)-ethyl 2-ethoxy-3-(4-(R)-2-hydroxy-2-(3-methoxyphenyl)ethoxy)phenyl)propanoate (112 mg, 0.000287 mol; Supplier = Kalexsyn; Lot = 1103-TTP-160) in MeOH (2 ml) was added 2 N LiOH until pH ca. 10-12. After 2 hours,
HPLC showed reaction was complete. Evaporated in vacuo. The residue was partitioned between water and EtOAc and the aqueous phase was extracted with EtOAc. The combined organic phases were dried (Na₂SO₄), filtered and evaporated in vacuo. The resulting pale pink oil was chromatographed on a small pipette column eluting with 0-10% acetone/DCM. Fractions containing product were combined and evaporated in vacuo to give 68 mg of (S)-2-ethoxy-3-(4-((R)-2-hydroxy-2-(3-methoxyphenyl)ethoxy)phenyl)propanoic acid as a tinted oil.

**Example 27: Preparation of (R)-2-ethoxy-3-(4-((R)-2-hydroxy-2-(3-methoxyphenyl)ethoxy)phenyl)propanoic acid**

![Chemical structure of (R)-2-ethoxy-3-(4-((R)-2-hydroxy-2-(3-methoxyphenyl)ethoxy)phenyl)propanoic acid]

To a stirring solution of (R)-ethyl 2-ethoxy-3-(4-((R)-2-hydroxy-2-(3-methoxyphenyl)ethoxy)phenyl)propanoate (90 mg, 0.2 mmol) in MeOH (2ml) was added 2N LiOH until pH ca. 10. Stirred at RT for 2 hours at which time HPLC indicated the reaction was complete. Evaporated in vacuo. The residue was partitioned between water and EtOAc and formic acid was added until pH ca. 3. The organic phase was separated and the aqueous phase was extracted with EtOAc. The combined organic phases were dried (Na₂SO₄), filtered and evaporated in vacuo. The residue was chromatographed on a small pipette column eluting with 0-10% acetone/DCM. Fractions containing product were combined and evaporated in vacuo to give 53 mg of (R)-2-ethoxy-3-(4-((R)-2-hydroxy-2-(3-methoxyphenyl)ethoxy)phenyl)propanoic acid as a slightly tinted oil.

**Example 28: Preparation of (S)-2-ethoxy-3-(4-((S)-2-hydroxy-2-(3-methoxyphenyl)ethoxy)phenyl)propanoic acid**

![Chemical structure of (S)-2-ethoxy-3-(4-((S)-2-hydroxy-2-(3-methoxyphenyl)ethoxy)phenyl)propanoic acid]

To a stirring solution of (S)-ethyl 2-ethoxy-3-(4-((S)-2-hydroxy-2-(3-methoxyphenyl)ethoxy)phenyl)propanoate (50 mg, 0.1 mmol) in MeOH (2ml) was added 2N LiOH until pH ca. 12. After 2 hours, HPLC indicated that the reaction was complete. Evaporated in vacuo. The residue was partitioned between water and EtOAc and HCO₂H was added until pH ca. 3. The phases were separated and the aqueous phase was extracted with EtOAc. The combined organic phases were combined, dried (Na₂SO₄), filtered and evaporated in vacuo. The residue was partitioned on a small pipette column eluting with
0-10% ether/DCM. Fractions containing product were combined and evaporated in vacuo to
give 26 mg of
(S)-2-ethoxy-3-(4-(S)-2-hydroxy-2-(3-methoxyphenyl)ethoxy)phenyl)propanoic acid.

[0476] Example 29: Preparation of (Z)-2-ethoxy-3-(4-(2-(3-methoxyphenyl)-2-
oxoethoxy)phenyl)acrylic acid

To a stirring solution of (Z)-ethyl 2-ethoxy-3-(4-(2-(3-methoxyphenyl)-2-
oxoethoxy)phenyl)acrylate (83 mg, 0.22 mmol; Supplier = Kalexsyn; Lot = 1103-TTP-67) in
EtOH (1ml) was added 2M NaOH (1ml). Left to stir at RT overnight. Reaction is a deep
magenta color, appears to be complete by HPLC. Evaporated in vacuo. Partitioned between
water and EtOAc. Added aq. HCl until pH ca. 3. EtOAc phase dried (Na$_2$S$_0_4$), filtered and
evaporated in vacuo. Chromatographed on a pipette column to give 45 mg off-white solid.
There is a contaminant (HPLC, 1H-NMR). Rechromatographed and triturated with ether/hexanes to give 14 mg of (Z)-2-ethoxy-3-(4-(2-(3-methoxyphenyl)-2-
oxoethoxy)phenyl)acrylic acid as a tinted oil.

[0477] Example 30: Preparation of 2-ethoxy-3-(4-(2-(methoxyimino)-2-(3-
methoxyphenyl)ethoxy)phenyl)propanoic acid

To a stirring solution of ethyl 2-ethoxy-3-(4-(2-(methoxyimino)-2-(3-
methoxyphenyl)ethoxy)phenyl)propanoate (185 mg, 0.446 mmol; Supplier = Kalexsyn; Lot =
1103-TTP-62) in EtOH (2ml) was added 1M NaOH dropwise until pH ca. 10. Left to stir at
RT overnight. HPLC shows reaction is complete. LCMS shows mass for desired and also
mass for the corresponding ketone. HPLC suggests that the material is not the ketone.
Added 1M NaOH until pH ca. 3. Extracted with EtOAc. Extracts dried (Na$_2$S$_0_4$), filtered and
evaporated in vacuo to give 160 mg crude material. Chromatographed on a pipette
column eluting with 10% EtOAc/DCM to give 105 mg of 2-ethoxy-3-(4-(2-(methoxyimino)-
2-(3-methoxyphenyl)ethoxy)phenyl)propanoic acid as a clear, colorless oil.
Example 31; Preparation of (2Z)-2-ethoxy-3-(4-(2-(methoxyimino)-2-(3-methoxyphenyl)ethoxy)phenyl)acrylic acid

To a stirring solution of (2Z)-ethyl 2-ethoxy-3-(4-(2-(methoxyimino)-2-(3-methoxyphenyl)ethoxy)phenyl)acrylate (191 mg, 0.463 mmol; Supplier = Kalexsyn; Lot = 1103-TTP-57) in EtOH (2ml) was added 5 drops of 2M NaOH ~ pH ca. 10. Left to stir at RT overnight. Reaction is only ca. 75% complete. Added 2 drops 2M NaOH. After 5 hours, only a trace of SM remains. Evaporated in vacuo. Partitioned between water and EtOAc; added HOAc until pH ca. 3. The organic phase was separated, dried (Na$_2$SO$_4$), filtered and evaporated in vacuo to give an off-white solid. Chromatographed on a small MM column eluting with 0-10% EtOAc/DCM, then 10% acetone/DCM. Fractions containing product were combined and evaporated in vacuo to give 90 mg of (2Z)-2-ethoxy-3-(4-(2-(methoxyimino)-2-(3-methoxyphenyl)ethoxy)phenyl)acrylic acid as a tinted oil.

Example 32; Preparation of 2-ethoxy-3-(4-(2-(3-methoxyphenyl)-2-oxoethoxy)phenyl)propanoic acid

A stirring solution of ethyl 2-ethoxy-3-(4-(2-(methoxyimino)-2-(3-methoxyphenyl)ethoxy)phenyl)propanoate (150 mg, 0.36 mmol; Supplier = Kalexsyn; Lot = 1103-TTP-62) in 6M HCl (2ml) was added acetic acid, oxo- (107 mg, 0.724 mmol) and the solution was heated at 75 °C. Heated for one hour. Product has definitely been formed as evidenced by LCMS. LCMS also shows a mass for SM, but it appears that little or no SM remains by HPLC. Adjusted pH to 3-4 with aq. NaOH and extracted 2x with EtOAc. The combined extracts were dried (Na$_2$SO$_4$), filtered and evaporated in vacuo to give a yellow/brown solid/oil. Chromatographed on a pipette column to give 65 mg of 2-ethoxy-3-(4-(2-(3-methoxyphenyl)-2-oxoethoxy)phenyl)propanoic acid as a white solid.

Example 33; Preparation of (SVethyl 2-ethoxy-3-r4-(2-(5-ethylpyridin-2-vn-2-oxoethoxy)phenyl)propanoate
To a stirring solution of 2-bromo-1-(5-ethylpyridin-2-yl)ethanone hydrobromide (1.49 g, 4.83 mmol) and ethyl-(2S)-2-ethoxy-3-(4-hydroxyphenyl)propanoate (1.15 g, 4.83 mmol) in N,N-dimethylformamide (62 mL, 8.0E2 mmol) was added cesium carbonate (3.93 g, 12.1 mmol). The mixture was left to stir at RT overnight and partitioned between EtOAc and water, and the aqueous phase was extracted with EtOAc. The extracts were combined and washed 2× with water, brine. The resulting mixture was dried (MgSO₄), filtered, evaporated in vacuo, and chromatographed on silica with 0-20% ethylacetate in hexane. The chromatograph showed a single UV peak. ¹H-NMR showed a couple of substantial impurities. The product was used without further attempts at purification.

Example 34: Preparation of (S)-2-ethoxy-3-(4-(2-(5-ethylpyridin-2-yl)-2-oxoethoxy)phenyl)propanoic acid

To a stirring mixture of ethyl-(2S)-2-ethoxy-3-{4-[2-(5-ethylpyridin-2-yl)-2-oxoethoxy]phenyl}propanoate (220 mg, 0.57 mmol; Supplier = Kalexsyn; Lot = 1103-MPA-94) in MeOH (3ml) was added 2M LiOH until pH ca. 10-12. Left to stir at RT overnight. HPLC shows the reaction is complete. Evaporated in vacuo. Partitioned between EtOAc and water. Added HCO₂H until pH ca. 3. Separated phases and extracted the aqueous phase with EtOAc. Combined organic phases dried (MgSO₄), filtered and evaporated in vacuo. Chromatographed on a small pipette column eluting with 0-10% Et₂O/DCM. Fractions containing product were combined and evaporated in vacuo to afford 65mg of the product.

Example 35: Preparation of (R)-ethyl 2-ethoxy-3-(4-(2-(5-ethylpyridin-2-yl)-2-oxoethoxy)phenyl)propanoate

To a stirring solution of 2-bromo-1-(5-ethylpyridin-2-yl)ethanone hydrobromide (1.04g, 3.35mmol) and ethyl-(2R)-2-ethoxy-3-(4-hydroxyphenyl)propanoate (799mg, 3.35mmol) in DMF (43ml) was added cesium carbonate (2.73g, 8.38mmol) and the mixture was left to stir at RT overnight. Partitioned between EtOAc and water and the aqueous phase was extracted with EtOAc. Combined extracts dried (MgSO₄), filtered and evaporated in vacuo. ¹H-NMR showed very clean product. Used without further purification.
Example 36: Preparation of (R)-2-ethoxy-3-(4-[2-(5-ethylpyridin-2-yl)-2-oxoethoxy]phenyl)propanoic acid

To a stirring solution of ethyl (2R)-2-ethoxy-3-(4-[2-(5-ethylpyridin-2-yl)-2-oxoethoxy]phenyl)propanoate (540mg, 1.4mmol) in methanol (30ml) was added a 1.0M solution of lithium hydroxide in water (10ml, 10mmol). Left to stir at RT overnight. HPLC shows reaction is complete. Primary product is the desired. Neutralized to pH ~3 with 2.0 M HCl. Extracted with EtOAc (2x), washed with brine. Extracts dried (Na₂SO₄), filtered and evaporated in vacuo. Chromatographed on silica, eluting with 0-5% MeOH:CHCl₃ to give a light yellow oil. Contained some impurities by HPLC. Trituration with MTBE failed to produce a nice solid, so the material was chromatographed via rotary chromatography in the same solvent system and the desired material was isolated, 57mg (11%).

Example 37: Assays.

Assays for Measuring Reduced PPARy Receptor Activation

Whereas activation of the PPARy receptor is generally believed to be a selection criteria to select for molecules that may have anti-diabetic and insulin sensitizing pharmacology, this invention finds that activation of this receptor should be a negative selection criterion. Molecules will be chosen from this chemical space because they have reduced, not just selective, activation of PPARy. The optimal compounds have at least a 10-fold reduced potency as compared to pioglitazone and less than 50% of the full activation produced by rosiglitazone in assays conducted in vitro for transactivation of the PPARy receptor. The assays are conducted by first evaluation of the direct interactions of the molecules with the ligand binding domain of PPARy. This can be performed with a commercial interaction kit that measures the direct interaction by florescence using rosiglitazone as a positive control.

PPARy binding is measured by a TR-FRET competitive binding assay using Invitrogen LanthaScreen™ TR-FRET PPARy Competitive Binding Assay (Invitrogen #4894). This assay uses a terbium-labeled anti-GST antibody to label the GST tagged human PPARy ligand binding domain (LBD). A fluorescent small molecule pan-PPAR ligand tracer binds to the LBD causing energy transfer from the antibody to the ligand resulting in a high TR-FRET ratio. Competition binding by PPARy ligands displace the tracer from the LBD causing a lower FRET signal between the antibody and tracer. The TR-FRET ratio is
determined by reading the fluorescence emission at 490 and 520nm using a Synergy2 plate reader (BioTek). The ability of several exemplary compounds of the present invention to bind to PPARy was also measured using a commercial binding assay (Invitrogen Corporation, Carlsbad, CA) that measures the test compounds ability to bind with PPAR-LBD/Fluormone PPAR Green complex. These assays were performed on three occasions with each assay using four separate wells (quadruplicate) at each concentration of tested compound. The data are mean and SEM of the values obtained from the three experiments. Rosiglitazone was used as the positive control in each experiment. Compounds were added at the concentrations shown, which ranged from 0.1-100 micromolar.

[0496] PPARy activation in intact cells may be measured by a cell reporter assay using Invitrogen GeneBLAzer PPARy Assay (Invitrogen #1419). This reporter assay uses the human PPARy ligand binding domain (LBD) fused to the GAL4 DNA binding domain (DBD) stably transfected into HEK 293H cells containing a stably expressed beta-lactamase reporter gene under the control of an upstream activator sequence. When a PPARy agonist binds to the LBD of the GAL4/PPAR fusion protein, the protein binds to the upstream activator sequence activating the expression of beta-lactamase. Following a 16 hour incubation with the agonists the cells are loaded with a FRET substrate for 2 hours and fluorescence emission FRET ratios are obtained at 460 and 530 nm in a Synergy2 plate reader (BioTek).

[0497] In addition to showing the reduced activation of the PPARy receptor in vitro, the compounds will not produce significant activation of the receptor in animals. Compounds dosed to full effect for insulin sensitizing actions in vivo (see below) will be not increase activation of PPARy in the liver as measured by the expression of a P2, a biomarker for ectopic adipogenesis in the liver [Matsusue K, Haluzik M, LambertG, Yim S-H, Oksana Gavrilova O, Ward JM, Brewer B, Reitman ML, Gonzalez FJ. (2003) Liver-specific disruption of PPAR in leptin-deficient mice improves fatty liver but aggravates diabetic phenotypes. J. Clin. Invest.; 111: 737] in contrast to pioglitazone and rosiglitazone, which do increase a P2 expression under these conditions.

[0498] Mitochondrial Membrane Competitive Binding Crosslinking Assay

[0499] A photoaffinity crosslinker was synthesized by coupling a carboxylic acid analog of pioglitazone to a p-azido-benzyl group containing ethylamine as in Amer. J. Physiol 256:E252-E260. The crosslinker was iodinated carrier free using a modification of the Iodogen (Pierce) procedure and purified using open column chromatography (PerkinElmer). Specific crosslinking is defined as labeling that is prevented by the presence of competing
drug. Competitive binding assays are conducted in 50 mM Tris, pH 8.0. All crosslinking reactions are conducted in triplicate using 8 concentrations of competitor ranging from 0-25 μM. Each crosslinking reaction tube contains 20 μg of crude mitochondrial enriched rat liver membranes, 0.1 μCi of [125I-MSDC- 1101, and -/+ competitor drug with a final concentration of 1% DMSO. The binding assay reaction is nutated at room temperature in the dark for 20 minutes and stopped by exposure to 180,000 μJoules. Following crosslinking, the membranes are pelleted at 20,000 × g for 5 minutes, the pellet is resuspended in Laemmli sample buffer containing 1% BME and run on 10-20% Tricine gels. Following electrophoresis the gels are dried under vacuum and exposed to Kodak BioMax MS film at -80 °C. The density of the resulting specifically labeled autoradiography bands are quantitated using ImageJ software (NIH) and IC₅₀ values determined by non-linear analysis using GraphPad Prism™. Selected compounds in this assay demonstrated an IC₅₀ of less than 20 μM, less than 5 μM or less than 1 μM. The crosslinking to this protein band is emblematic of the ability of the ability of the PPAR-sparing compounds to bind to the mitochondria, the key organelle responsible for the effectiveness of these compounds for this utility.

[0500] Example 14: Additional Biological Properties.

[0501] 5XFAD mice harbor 5 familial mutations (3 in the amyloid precursor protein; 2 in presenilin 1) and develop robust plaque pathology as early as 6 weeks. These mice were treated beginning at 2 months of age for a period of 4 weeks with control chow or chow containing Compound A to deliver 390 mg/kg for 4 weeks.

[0502] Referring to Figure 7, thioflavin S stained plaques were counted in the hippocampus of the 5XFAD mice. The data indicates that the size and number of plaques in the mice administered Compound A is less than the control group. Note that the plaques having less than 100 micron size were excluded from the graph, and those amounted to about 70% of all the plaques in both Control and Compound A treated groups.

[0503] Referring to Figure 8, sections from control and Mitoglitazone treated mice were stained for astrocyte marker GFAP; Data shows average number of GFAP positively stained cells per section. P = 0.012.
Data for each of the assays performed on compounds of Formula X is provided below in Table 14:

</table>

¹ This data is provided as T/C wherein the control compound is 5-(4-(2-(5-ethylpyridin-2-yl)-2-oxoethoxy)benzyl)thiazolidine-2,4-dione for each of the concentrations tested.

² T/C data is test compound activity that is normalized with respect to the vehicle activity.

It is noted that "-", in Table 14, indicates that no data is available.

OTHER METHODS

It is to be understood that while the invention has been described in conjunction with the detailed description thereof, the foregoing description is intended to illustrate and not limit the scope of the invention, which is defined by the scope of the appended claims. Other aspects, advantages, and modifications are within the scope of the following claims.
WHAT IS CLAIMED IS:

1. A method for treating, reducing the symptoms of, or delaying the onset of a neurodegenerative disease selected from Huntington's disease, ALS, MS, or epilepsy comprising administering to a patient in need thereof a compound of Formula I:

   \[
   \begin{align*}
   &R_1, R_2, R_4, R_3, R_4: \\
   &\text{independently selected from H, halo, aliphatic, and alkoxy, wherein the aliphatic or alkoxy is optionally substituted with 1-3 of halo;}
   \end{align*}
   \]

   or a pharmaceutically acceptable salt thereof, wherein:

   Each of \( R_1 \) and \( R_4 \) is independently selected from H, halo, aliphatic, and alkoxy, wherein the aliphatic or alkoxy is optionally substituted with 1-3 of halo;

   \( R_2 \) is H;

   \( R_2 \) is H, halo, hydroxy, or optionally substituted aliphatic, -O-acyl, -O-aroyl, -O-heteroaroyl, -0(SO\(_2\))NH\(_2\), -0-CH\((R_m)OC(0)R_n\), -0-CH(R\(_m\))OP(0)(OR\(_n\)), -0-P(0)(OR\(_n\))\(_2\), or \( R_2 \) and \( R_2' \) together form oxo;

   \( R_3 \) is H or optionally substituted C\(_{1-3}\) alkyl; and

   Ring A is a phenyl, pyridin-2-yl, pyridin-3-yl, or pyridin-4-yl, each of which is substituted with an \( R_1 \) group and an \( R_4 \) group at any chemically feasible position on ring A.

2. The method of claim 1, wherein the compound of Formula I is selected from:

   \[
   \begin{align*}
   &\text{selected from:}
   \end{align*}
   \]
3. The method of claim 1 or 2, wherein the neurodegenerative disease is Huntington's disease.

4. The method of claim 3, further comprising administering to the patient tetrabenazine, haloperidol, clozapine, clonazepam, diazepam, escitalopram, fluoxetine, sertraline, or any combination thereof.

5. The method of claim 1 or claim 2, wherein the neurodegenerative disease is epilepsy.

6. The method of claim 5, further comprising administering an anti-convulsive medication.

7. The method of claim 6, wherein the anti-convulsive medication is selected from: carbamazepine (Tegretol™), clorazepate (Tranxene™), clonazepam (Klonopin™), ethosuximide (Zarontin™), felbamate (Felbatol™), fosphenytoin (Cerebyx™), gabapentin (Neurontin™), lacosamide (Vimpat™), lamotrigine (Lamictal™), levetiracetam (Keppra™), oxcarbazepine (Trileptal™), phenobarbital (Lumina™), phenytoin (Dilantin™), pregabalin (Lyrica™), primidone (Mysoline™), tiagabine (Gabitril™), topiramate (Topamax™),
valproate semisodium (Depakot™e), valproic acid (Depakene™), zonisamide (Zonegran™), or any combination thereof.

8. The method of claim 5, further comprising administering diazepam (Valium™, Diastat™) and lorazepam (Ativan™), paraldehyde (Paral™), midazolam (Versed™), pentobarbital (Nembutal™), acetazolamide (Diamox), progesterone, adrenocorticotropic hormone (ACTH, Actha™), prednisone, bromide, or any combination thereof.

9. The method of claim 1 or 2, further comprising administering LDOPA to the patient.

10. A method for treating, reducing the symptoms of, or delaying the onset of a neurodegenerative disease selected from Huntington's disease, ALS, MS, or epilepsy comprising administering to a patient an alkali metal salt of a compound of Formula I:

\[
\text{I}
\]

or a pharmaceutically acceptable salt thereof, wherein:
- Each of \( R_1 \) and \( R_4 \) is independently selected from H, halo, aliphatic, and alkoxy, wherein the aliphatic or alkoxy is optionally substituted with 1-3 of halo;
- \( R'_2 \) is H;
- \( R_2 \) is H, halo, hydroxy, or optionally substituted aliphatic, -O-acyl, -O-aroyl, -O-heteroaroyl, -O(SO\(_2\))NH\(_2\), -O(CH(R\(_m\)))OC(0)R\(_n\), -O(CH(R\(_m\)))OP(0)(OR\(_n\))\(_2\), -O-P(0)(OR\(_n\))\(_2\), or \( R_3 \) is H or optionally substituted \( C_{1-6} \) alkyl; and
- \( R_2 \) and \( R'_2 \) together form oxo;
- Ring A is a phenyl, pyridin-2-yl, pyridin-3-yl, or pyridin-4-yl, each of which is substituted with an \( R_1 \) group and an \( R_4 \) group at any chemically feasible position on ring A.

11. The method of claim 10, wherein the alkali metal is potassium or sodium.
12. The method of claim 10 or 11, wherein the compound of Formula I is selected from:

13. The method of any one of claims 10-12, wherein the neurodegenerative disease is Huntington's disease.

14. The method of claim 13, further comprising administering to the patient tetrabenazine, haloperidol, clozapine, clonazepam, diazepam, escitalopram, fluoxetine, sertraline, or any combination thereof.

15. The method of any one of claims 10-12, wherein the neurodegenerative disease is epilepsy.

16. The method of claim 15, further comprising administering an anti-convulsive medication.
17. The method of claim 16, wherein the anti-convulsive medication is selected from:
carbamazepine (Tegretol™), clorazepate (Tranxene™), clonazepam (Klonopin™),
ethosuximide (Zarontin™), felbamate (Felbatol™), fosphenytoin (Cerebyx™), gabapentin
(Neurontin™), lacosamide (Vimpat™), lamotrigine (Lamictal™), levetiracetam (Keppra™),
oxcarbazepine (Trileptal™), phenobarbital (Luminal™), phenytoin (Dilantin™), pregabalin
(Lyrica™), primidone (Mysoline™), tiagabine (Gabitril™), topiramate (Topamax™),
valproate semisodium (Depakote™), valproic acid (Depakene™), zonisamide (Zonegran™),
or any combination thereof.

18. The method of claim 15, further comprising administering diazepam (Valium™,
Diastat™) and lorazepam (Ativan™), paraldehyde (Paral™), midazolam (Versed™),
pentobarbital (Nembutal™), acetazolamide (Diamox), progesterone, adrenocorticotropic
hormone (ACTH, Acthar™), prednisone, bromide, or any combination thereof.

19. The method of any one of claims 10-12, further comprising administering LDOPA to
the patient.
Sections from control and Compound A-treated mice were stained for astrocyte marker GFAP; Data shows average # of GFAP positively stained cells per section $P = 0.012$

INTERNATIONAL SEARCH REPORT

Box No. II  Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. □ Claims Nos.:
   because they relate to subject matter not required to be searched by this Authority, namely:

2. □ Claims Nos.:
   because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:

3. □ Claims Nos.:
   because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box No. III  Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

see additional sheet

1. □ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.

2. □ As all searchable claims could be searched without effort justifying an additional fees, this Authority did not invite payment of additional fees.

3. □ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:

4. □ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

□ The additional search fees were accompanied by the applicant’s protest and, where applicable, the payment of a protest fee.

□ The additional search fees were accompanied by the applicant’s protest but the applicable protest fee was not paid within the time limit specified in the invitation.

□ No protest accompanied the payment of additional search fees.

Form PCT/ISA/21 0 (continuation of first sheet (2)) (April 2005)
This International Searching Authority found multiple (groups of) inventions in this international application, as follows:

1. claims: 3, 4, 13, 14 (completely) ; 1, 2, 9-12, Impartially)
   Compounds of formula I for use in the treatment, in the reduction of the symptoms of or in delaying the onset of Huntington's disease

2. claims: 1, 2, 9-12, 19 (all partially)
   Compounds of formula I for use in the treatment, in the reduction of the symptoms of or in delaying the onset of ALS

3. claims: 1, 2, 9-12, 19 (all partially)
   Compounds of formula I for use in the treatment, in the reduction of the symptoms of or in delaying the onset of MS

4. claims: 5-8, 15-18 (completely) ; 1, 2, 9-12, 19 (partially)
   Compounds of formula I for use in the treatment, in the reduction of the symptoms of or in delaying the onset of epilepsy
