SASH HOLDER AND FASTENER.

Application filed April 13, 1889. Serial No. 712,927. (No model.)

To all whom it may concern:

Be it known that we, ALLEN PERRY GUYNES, residing at Appleby, in the county of Nacogdoches, and EMMERY ARLINGTON FLORES, residing at Center, in the county of Shelby, State of Texas, citizens of the United States, have invented certain new and useful improvements in Sash Holders and Fasteners; and we do hereby declare the following to be a full, clear, and exact description of the invention, such as will enable others skilled in the art to which it appertains to make and use the same.

This invention relates to combined sash holders and fasteners, the object hereinafter described being to provide a simple article of finishing that may be readily and quickly applied to any window frame and sash, the construction referred to adapting the sash to be raised and lowered and held at any desired point and also providing for locking the sash when it is slid down or closed.

The detailed objects and advantages of the invention will appear more fully in the course of the subjoined description.

The invention consists in a combined sash holder and fastener embodying certain novel features and details of construction and arrangement of parts, as hereinafter fully described, illustrated in the drawings, and incorporated in the claim.

In the accompanying drawings, Figure 1 is a perspective view of a portion of a window frame and sash, showing the improved holder and fastener thereto. Fig. 2 is an enlarged detail perspective view of the sash holder and fastener detached. Fig. 3 is a horizontal cross-section through the same, taken in line with the catch and spring. Fig. 4 is a detail perspective view of the toothed wheel. Fig. 5 is a detail perspective view of a portion of the rack-bar.

Similar numerals of reference designate corresponding parts in all the figures of the drawings.

Referring to the drawings, 1 designates the casing or housing of the improved holder and fastener. In its outer side the said casing is provided with a semicircular recess 2, in which is revolvably mounted a peripherally-toothed wheel 3. In addition to the peripheral teeth indicated at 4 the wheel 3 is provided in its outer face with a circular series of notches or depressions 5, having inclined surfaces 6 and abrupt transverse surfaces 7, forming shoulders in connection with which the pawl or dog 8 hereinafter described cooperates.

Arranged outside of the wheel 3 is a hanger-plate 8, which partially covers the recess 2 and protects the wheel 3, and also forms a bearing for the shaft or spindle 9, upon which the wheel 3 revolves. The shaft or spindle 9 is also mounted at one end in the rear wall of the casing. The plate 8 is provided with an obliquely-projecting extension or tongue 10, which is let into a correspondingly-disposed groove or facial recess 11 in the casing, being held by a suitable fastening device 12.

Cooperating with the shoulders 7 of the wheel 3 is a pawl or dog 13, which is fulcrumed at a point intermediate its ends, as indicated at 14. The free end of the dog is pointed and deflected slightly inward toward the wheel 3, so as to readily engage the shoulders 7. Upon the opposite side of its fulcrum the dog 13 is provided with a recess 15, forming a seat for one end of a coil-spring 16, the opposite end of which is seated in a socket or recess 17 in the casing. This serves to retain the spring in place, between the dog and the casing, and the spring acts to constantly keep the dog in engagement with the toothed wheel. The casing is also provided with horizontally-disposed open slots 18 for the reception of screws or other fasteners 19, said construction enabling the casing and the parts attached thereto to be advanced toward or retracted from the window-sash for bringing the teeth of the wheel 3 into proper mesh with and relation to correspondingly-formed teeth on a rack-bar 20, extending along one of the vertical edges of the sash, as shown in Fig. 1. The rack-bar 20 is provided with laterally-projecting ears 21, through which suitable fastenings may be passed into the sash for securing the rack-bar thereto. The casing is also provided with a slot or recess 22, in which is pivotally mounted one extremity of a swinging sash lock or fastener 23, the opposite end of which is provided with a knob 24, by means of which the fastener can be conveniently swung on its pivot.

In operation as the sash is lifted the rack-
bar 20 meshes with the wheel 3 and revolves the same. When the sash has been adjusted to the proper height, it may be released and will be held in such position by reason of the immediate engagement which ensues between the dog and the wheel in a manner readily understood. In order to lower the sash, pressure is brought to bear upon the outer end of the dog or pawl, which serves to throw the pointed end thereof out of engagement with the shoulders 7, thus allowing the wheel to revolve freely and enabling the sash to be lowered. When the sash is in its lowest position, it may be locked or fastened by swinging the part 23 over the upper edge of the sash in a manner also readily understood.

It will of course be obvious that changes in the form, proportion, and minor details of construction may be resorted to without departing from the principle or sacrificing any of the advantages of the invention.

Having thus described the invention, what is claimed as new, and desired to be secured by Letters Patent, is—

A combined sash holder and fastener embodying a rack-bar for attachment to a sliding sash, a toothed wheel meshing therewith and mounted in a suitable casing applied to the window-frame, a spring-pressed dog engaged with a circular series of shoulders on one side of the wheel, and a sash fastener or lock pivotally mounted at one end within a recess in the casing and provided at its opposite swinging end with an operating knob or handle adapting it to be swung into engagement with the lower sash for locking it in its closed position, substantially as described.

In testimony whereof we affix our signatures in presence of witnesses.

ALLEN PERRY GUYNES.
