Appendix C3

SVM Model Weights

(340; Early/Late)

SVM-light Version V6.01
0 # kernel type
3 # kernel parameter -d
1 # kernel parameter -g
1 # kernel parameter -s
1 # kernel parameter -r
empty# kernel parameter -u
340 # highest feature index
59 # number of training documents
47 # number of support vectors plus 1
-0.46078775 # threshold b, each following line is a SV (starting with alpha*y)

CLAIMS

1. A method of generating a classification model capable of distinguishing between two biological states, the method comprising the steps of:

(a) providing a training dataset, *X*, comprising concentrations of a plurality of lipids in a biological sample in a first state and a biological sample in a second state;

(b) subjecting the training dataset *X* to Principal Components Analysis (PCA), in which the PCA analysis generates a transformation matrix, *C*, and a transformed dataset, Y_l;

(c) subjecting the transformed dataset Y_l to Support Vector Machines (SVM) analysis, in which the SVM analysis generates a SVM model, *S*;

(d) forming a classification model comprising (i) the transformation matrix *C*, and (ii) the corresponding SVM model *S*.

2. A method according to Claim 1, in which the plurality of lipids includes a plurality of choline lipids, such as phosphatidylcholine (GPCho) or sphingomyelin (SM) or both, and further optionally comprises phosphatidic acid (GPA), phosphatidylglycerol (GPGro), phosphatidylserine acid (GPSer), sulfatides, cardiolipin, phosphatidylethanolamine (GPEtn), phosphatidylinositol (GPIns), phosphatidylinositol phosphates (GPInsPs), ceramide (Cer), mono hexosyl ceramide (MonoHexCer) and di hexosyl ceramide (DiHexCer).

3. A method according to Claim 1 or 2, in which the plurality of lipids comprises the lipids set out in Table D1, Table D2, Table D3, Table E4 or Table E6.

4. A method according to Claim 1, 2 or 3, in which the two biological states comprise a normal state and a diseased state, such as a cancerous or tumour state, for example ovarian cancer.

5. A method according to Claim 4, in which the classification model is capable of achieving one or more, such as all, of the following: a sensitivity of 98.99% or more, a specificity of 92.31% or more, a PPV of 97.03% or more, a NPV of 97.30% or more or an accuracy of 97.10% or more.

6. A method according to any of Claims 1, 2 or 3, in which the two biological states comprise a benign state and a malignant state, such as of ovarian cancer.

7. A method according to Claim 6, in which the classification model is capable of achieving one or more, such as all, of the following: a sensitivity of 94.92% or more, a specificity of 82.50% or more, a PPV of 88.89% or more, a NPV of 91.67% or more or an accuracy of 89.90% or more.

8. A method according to any of Claims 1, 2 or 3, in which the two biological states comprise an early tumour stage and a late tumour stage, such as of ovarian cancer.

9. A method according to Claim 8, in which the classification model is capable of achieving one or more, such as all, of the following: a sensitivity of 100%, a specificity of 81.82% or more, a PPV of 90.24% or more, a NPV of 100% or an accuracy of 93.22% or more.

10. A method according to any preceding claim, which further comprises a step (c1) between step (c) and step (d), comprising repeating steps (b) and (c) and selecting principal components which enable optimal classification in step (c).

11. A method according to Claim 10, in which optimal classification in step (c1) is determined by assessing the output of the SVM for sensitivity, specificity and accuracy at each iteration.

12. A method according to Claim 10 or 11, in which the classification model further comprises (iii) the number of selected principal components enabling optimal classification in step (c).

13. A method according to Claim 10, 11 or 12, in which step (c1) comprises any one or more of the following:

(a) retaining principal components that perform at least 55%, 65%, 75%, 85%, 90%, 95%, 96%, 97%, 98%, 99%, 99.5%, 99.6%, 99.7%, 99.8%, 99.9% or 100% as well as the full dataset, after step (e), as assessed by any combination of sensitivity, specificity, PPV, NPV, accuracy, true negatives (TN), false negatives (FN), false positives (FP) and true positives (TP);

(b) removing factors which do not significantly affect the performance of the SVM model;

(c) retaining principal components whose eigenvalues are greater than or equal to 1;

(d) retaining principal components that explain at least 55%, 65%, 75%, 85%, 90%, 95%, 96%, 97%, 98%, 99%, 99.5%, 99.6%, 99.7%, 99.8% or 99.9% of the variance in the dataset;

(e) retaining principal components that in a scree plot of eigenvalues show a smooth decrease of eigenvalues or which are to the left of a levelling off or significant decrease in gradient or elbow in the plot (scree test).

14. A method according to any preceding claim, in which SVM is implemented using a default linear kernel, such as using SVM_{light}.

15. A method according to any preceding claim, in which the biological sample comprises a serum sample of or from an individual.

16. A method according to any preceding claim, in which the lipids are identified by mass spectroscopy, such as electrospray ionization mass spectrometry (ESI-MS), or quantified by multiple reaction monitoring (MRM), or both.

17. A method according to any preceding claim, in which the concentration of each lipid is normalized by obtaining $Lipid_i = \frac{x_i}{[Std].\sum_{i=1}^{n} x_i}$, where x_i is the intensity of a $lipid_i$ and Std is the ratio of the intensity to the amount in pmoles of a lipid standard.

18. A classification model obtained by a method according to any preceding claim.

19. A classification model capable of distinguishing between a normal sample and an ovarian cancer sample, the classification model comprising:

(a) a 340 x 340 transformation matrix as shown in Appendix B1 and an SVM model as shown in Appendix C1;

(b) a 340 x 85 transformation matrix comprising the first 85 columns of the matrix as shown in Appendix B1 and an SVM model as shown in Appendix C4;

(c) a 340 x 10 transformation matrix comprising the first 10 columns of the matrix as shown in Appendix B1 and an SVM model as shown in Appendix C7;

(d) a 82 x 82 transformation matrix as shown in Appendix B4 and an SVM model as shown in Appendix C10; or

(e) a 77 x 77 transformation matrix as shown in Appendix B7 and an SVM model as shown in Appendix C13.

20. A classification model capable of distinguishing between a benign cancer sample and an malignant cancer sample, the classification model comprising:

(a) a 340 x 340 transformation matrix as shown in Appendix B2 and an SVM model as shown in Appendix C2;

(b) a 340 x 87 transformation matrix comprising the first 87 columns of the matrix as shown in Appendix B2 and an SVM model as shown in Appendix C5;

(c) a 340 x 29 transformation matrix comprising the first 29 columns of the matrix as shown in Appendix B2 and an SVM model as shown in Appendix C8;

(d) a 82 x 82 transformation matrix as shown in Appendix B5 and an SVM model as shown in Appendix C11; or

(e) a 77 x 77 transformation matrix as shown in Appendix B8 and an SVM model as shown in Appendix C14.

21. A classification model capable of distinguishing between an early stage cancer sample and a late stage cancer sample, the classification model comprising:

(a) a 340 x 340 transformation matrix as shown in Appendix B3 and an SVM model as shown in Appendix C3;

(b) a 340 x 44 transformation matrix comprising the first 44 columns of the matrix as shown in Appendix B3 and an SVM model as shown in Appendix C6;

(c) a 340 x 9 transformation matrix comprising the first 9 columns of the matrix as shown in Appendix B3 and an SVM model as shown in Appendix C9;

(d) a 82 x 82 transformation matrix as shown in Appendix B6 and an SVM model as shown in Appendix C12; or

(e) a 77 x 77 transformation matrix as shown in Appendix B9 and an SVM model as shown in Appendix C15.

22. A computer readable medium comprising a classification model according to any of Claims 18 to 21.

23. A method of determining the status of a sample, the method comprising (i) providing a dataset comprising concentrations of a plurality of lipids in the sample and (ii) applying a classification model according to any of Claims 18 to 21.

24. A method according to Claim 23, in which the plurality of lipids includes a plurality of choline lipids, such as phosphatidylcholine (GPCho) or sphingomyelin (SM) or both, and further optionally comprises phosphatidic acid (GPA), phosphatidylglycerol (GPGro), phosphatidylserine acid (GPSer), sulfatides, cardiolipin, phosphatidylethanolamine (GPEtn), phosphatidylinositol (GPIns), phosphatidylinositol phosphates (GPInsPs), ceramide (Cer), mono hexosyl ceramide (MonoHexCer) and di hexosyl ceramide (DiHexCer).

25. A method according to Claim 23 or 24, in which the plurality of lipids comprises the lipids set out in Table D1, Table D2, Table D3, Table E4 or Table E6.

26. A method according to Claim 23, 24 or 25 for determining whether a sample is a normal sample or an ovarian cancer sample, the method comprising (i) transforming the dataset with a transformation matrix of a classification model according to Claim 19 to generate a transformed dataset, and (ii) subjecting the transformed dataset to Support Vector Machines (SVM) analysis with an SVM model of the classification model, in which an output of > 0 indicates a normal sample and an output of < 0 indicates an ovarian cancer sample.

27. A method of obtaining an indication useful in the diagnosis of ovarian cancer in an individual, the method comprising conducting a method according to Claim 26 on a sample of

or from a patient, in which an output of < 0 indicates that the individual is suffering from ovarian cancer.

28. A method according to Claim 23, 24 or 25 for determining whether a sample is a benign or malignant ovarian cancer sample, the method comprising (i) transforming the dataset with a transformation matrix of a classification model according to Claim 20 to generate a transformed dataset, and (ii) subjecting the transformed dataset to Support Vector Machines (SVM) analysis with an SVM model of the classification model, in which an output of > 0 indicates a benign sample and an output of < 0 indicates a malignant sample.

29. A method of obtaining an indication useful in the diagnosis of an individual suffering from a malignant ovarian cancer, the method comprising conducting a method according to Claim 28 on a sample of or from a patient, in which an output of > 0 indicates that the individual is suffering from a benign ovarian cancer and an output of < 0 indicates that the individual is suffering from a malignant ovarian cancer.

30. A method according to Claim 23, 24 or 25 for determining whether a sample is an early stage cancer or a late stage ovarian cancer sample, the method comprising (i) transforming the dataset with a transformation matrix of a classification model according to Claim 21 to generate a transformed dataset, and (ii) subjecting the transformed dataset to Support Vector Machines (SVM) analysis with an SVM model of the classification model, in which an output of > 0 indicates an early stage cancer sample and an output of < 0 indicates a late stage cancer sample.

31. A method of obtaining an indication useful in the diagnosis of an individual suffering from a late stage ovarian cancer, the method comprising conducting a method according to Claim 30 on a sample of or from a patient, in which an output of > 0 indicates that the individual is suffering from an early stage ovarian cancer and an output of < 0 indicates that the individual is suffering from a late stage ovarian cancer.

32. A method of detecting, and optionally classing, ovarian cancer in an individual, the method comprising:

(a) providing a dataset comprising concentrations of the lipids set out in Table D1, Table D2, Table D3, Table E4 or Table E6 in a sample from or of the individual;

(b) transforming the dataset with a transformation matrix of a classification model according to Claim 19 to generate a transformed dataset, and subjecting the transformed dataset to Support Vector Machines (SVM) analysis with an SVM model of the classification model, in which an output of > 0 indicates a normal sample and an output of < 0 indicates an ovarian cancer sample; and

(c) in the case of the latter, further transforming the dataset with a transformation matrix of a classification model according to Claim 20 to generate a transformed dataset and subjecting the transformed dataset to Support Vector Machines (SVM) analysis with an SVM model of the classification model; in which an output of < 0 indicates a benign sample and an output of < 0 indicates a malignant sample;

(d) in the case of the latter, further transforming the dataset with a transformation matrix of a classification model according to Claim 21 to generate a transformed dataset and subjecting the transformed dataset to Support Vector Machines (SVM) analysis with an SVM model of the classification model; in which an output of > 0 indicates an early stage sample and an output of < 0 indicates a late stage sample.

33. A method according to any of Claims 23 to 32, which is a computer implemented method.

34. A method of treatment or prevention of cancer, such as ovarian cancer, in an individual, the method comprising any one or more of detecting or diagnosing the cancer and optionally classing the cancer, in an individual by a method according to any of Claims 23 to 32, and administering a suitable treatment or prophylactic, such as a drug known or suspected to be useful for treating cancer, to the individual.

35. A method of generating a classification model capable of distinguishing between two biological states, the method comprising the steps of:

(a) providing a training dataset, *X*, comprising concentrations of a plurality of lipids in a biological sample in a first state and a biological sample in a second state;

(b) subjecting the training dataset *X* to Principal Components Analysis (PCA) to generate a transformation matrix, *C*, comprising principal component coefficients; and a representation, *Y*, of the dataset *X* in the principal component space;

(c) forming an input vector, Y_l, comprising the l most significant row vectors of Y;

(d) subjecting the input vector Y_l to Support Vector Machines (SVM) analysis;

(e) repeating steps (c) and (d) with varying l to determine a minimum dimension, l_{min}, of the principal component space sufficient to obtain optimal classification;

(f) forming a classification model comprising (i) the transformation matrix C, (ii) the minimum dimension l_{min}, and (ii) the SVM model comprising SVM weights corresponding to the minimum dimension l_{min}.

36. A combination of lipids selected from the group consisting of: (a) lipids shown in Table D1; (b) lipids shown in Table D2; (c) lipids shown in Table D3; (d) lipids shown in Table E4; and (e) lipids shown in Table E6.

37. A combination of lipids comprising two or more, such as at least 5, lipids selected from Table D1, Table D2, Table D3, Table E4 or Table E6.

38. A classification model selected from the group consisting of:

(a) a classification model capable of distinguishing between a normal sample and a diseased (ovarian cancer) sample comprising:

(i) an n x m transformation matrix, where $n < 340$ and $1 \leq m \leq n$, comprising the first m columns of the matrix shown in Appendix B1; and

(ii) an SVM model generated from applying SVM analysis on a transformed dataset, the transformed dataset being generated by transforming a dataset comprising concentrations of the first n lipids shown in Table D3 in a normal sample and a diseased (ovarian cancer) sample with an n x m transformation of (a)(i);

(b) a classification model capable of distinguishing between a benign sample and a malignant sample comprising:

(i) an n x m transformation matrix, where $n < 340$ and $1 \leq m \leq n$, comprising the first m columns of the matrix shown in Appendix B2; and

(ii) an SVM model generated from applying SVM analysis on a transformed dataset, the transformed dataset being generated by transforming a dataset

comprising concentrations of the first *n* lipids shown in Table D3 in a benign sample and a malignant sample with an *n* x *m* transformation matrix of (b)(i);

(c) a classification model capable of distinguishing between an early stage sample and a late stage sample comprising:

(i) an *n* x *m* transformation matrix, where $n < 340$ and $1 \leq m \leq n$, comprising the first *m* columns of the matrix shown in Appendix B3; and

(ii) an SVM model generated from applying SVM analysis on a transformed dataset, the transformed dataset being generated by transforming a dataset comprising concentrations of the first *n* lipids shown in Table D3 in an early stage sample and a late stage sample with an *n* x *m* transformation matrix of (c)(i).

39. A method or classification model substantially as hereinbefore described with reference to and as shown in Figures 1 to 14 of the accompanying drawings.

INTERNATIONAL SEARCH REPORT

International application No.
PCT/SG2009/000035

A. CLASSIFICATION OF SUBJECT MATTER

Int. Cl.

C40B 50/02 (2006.01) *G06N 3/08* (2006.01)
G06N 3/02 (2006.01) *G06N 5/00* (2006.01)

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)
EPODOC, WPI, TXT FULL TEXT DATABASES, INSPEC, GOOGLE keywords: CLASSIFICATION MODEL, SUPPORT VECTOR MACHINE, MATRIX, TRANSFORM, CONCENTRATION, PRINCIPAL COMPONENT ANALYSIS, DATASET and other terms and phrases

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
A	IVANCIUC, O ET AL:"APPLICATIONS OF SUPPORT VECTOR MACHINES IN CHEMISTRY", Reviews in Computational Chemistry, Vol.23, p.291-400, (2007)	
A	LIN, H.H. ET AL:" PREDICTION OF THE FUNCTIONAL CLASS OF LIPID BINDING PROTEINS FROM SEQUENCE-DERIVED PROPERTIES IRRESPECTIVE OF SEQUENCE SIMILARITY", Journal of Lipid Research, vol.47, p.824-831, April 2006.	
A	DING, C.H.Q., DUBCHAK, I.:" MULTI-CLASS PROTEIN FOLD RECOGNITION USING SUPPORT VECTOR MACHINES AND NEURAL NETWORKS", Bioinformatics Vol.17, no.4, p.349-358, (2001)	

☐ Further documents are listed in the continuation of Box C ☐ See patent family annex

* Special categories of cited documents:

"A" document defining the general state of the art which is not considered to be of particular relevance

"E" earlier application or patent but published on or after the international filing date

"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)

"O" document referring to an oral disclosure, use, exhibition or other means

"P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art

"&" document member of the same patent family
