UNITED STATES PATENT OFFICE.

DAVID N. SELLEG, OF NEWBURG, NEW YORK.

IMPROVEMENT IN FOLDING CHAIRS.

Specification forming part of Letters Patent No. **143,721**, dated October 14, 1873; application filed October 3, 1873.

To all whom it may concern:

Be it known that I, DAVID N. SELLEG, of Newburg, New York, have invented certain Improvements in Folding Chairs, of which the following is a specification:

My invention consists in a folding chair constructed as shown in the accompanying drawing, in which—

Figure 1 is a side view. Fig. 2 is a front view. Fig. 3 shows the chair folded.

A A are the front legs, which, together with the cross-bars H and T, form the frame for the back of the chair. B B are the back legs, which are connected with the front legs by the pivot C. O and P are stretchers, bracing the legs A A and B B. The seat S S is suspended from the back by the pivots K K and the metal pieces V, which are screwed to the seat S S at R. The object of this connection is that when the chair is folded the back of the seat S is thrown outside the frame of the back of the chair, and the seat allowed to fold closely against the same. When the chair is extended

for use, the seat S S is supported and held in place by the hook L clasping the pin J in the leg B. The arm is composed of the three pieces N, M, and G. The pieces N and M are hinged together at E. The piece G is screwed to the piece N, projecting over the joint E, forming an essential part of the arm, and at the same time being a base on which to build the upholstery, and for this purpose may be made any length desirable, its extending over the joint E and the part of the arm M not interfering with the folding of the chair. The whole arm is hinged at F and D.

I claim as my invention, and desire to secure by Letters Patent—

The folding chair constructed with pivoted legs A B, hinges V, seat S, hooks L, pins J, and the hinged arms M N G, substantially as shown and described.

D. N. SELLEG.
