Title of the invention

Triazine-Oxadiazoles

Field of the invention

5 The present invention relates to new triazine-oxadiazoles; processes for the preparation of such triazine-oxadiazoles; pharmaceutical compositions comprising such triazine-oxadiazoles optionally in combination with one or more other pharmaceutically active compounds; such triazine-oxadiazoles optionally in combination with one or more other pharmaceutically active compounds as a medicament; such triazine-oxadiazoles
10 optionally in combination with one or more other pharmaceutically active compounds for the treatment of chronic pain, such as positive symptoms of chronic pain e.g. paresthesias, dyesthesias, hyperalgesia, allodynia and spontaneous pain (also including a method for the treatment of such diseases in mammals, especially in humans); and the use of such triazine-oxadiazoles for the preparation of a pharmaceutical composition
15 (medicament) for the treatment of chronic pain, such as positive symptoms of chronic pain e.g. paresthesias, dyesthesias, hyperalgesia, allodynia and spontaneous pain as well as negative symptoms e.g. loss of sensation.

Background of the invention

20 The compounds of the present invention are sodium channel blockers, in particular selective inhibitors of the voltage-gated sodium channel 1.7 (Nav1.7) which is involved in pain. Since other sodium channel subtypes are involved in different essential physiological processes such as heart activity (Nav1.5), muscle contraction (Nav1.4) and CNS neurotransmission (Nav1.1, 1.2 and 1.6), selectivity for Nav1.7 is believed to be
25 associated with the potential elimination of side effects.

Several Nav1.7 blockers are described: The tarantula venom peptide Pro-TX-II is a potent inhibitor of Nav1.7 (Schmalhofer et al, Molecular Pharmacology 2008, 74, 1476-1484). A series of Benzazepinone Nav1.7 blockers are described to show activity in pre-
30 clinical pharmacological models of pain (Williams et al, Biochemistry, 2007, 46(50), 14693-14703; McGowan et al., Anesth Analg, 2009, 109, 951-958). Amino-thiazoles and amino-pyridines are described as Nav1.7 inhibitors (WO2007109324) and isoxazoles are described as Nav1.7 inhibitors (WO2009010784).

35 Nonsense mutations in SCN9A, the gene coding Nav1.7, appear to be linked to Congenital Indifference to Pain (CIP) (Cox et al, Nature, 2006, 444(7121), 894-898). Patients with CIP are essentially completely indifferent to sensations that would cause

pain in most individuals e.g. bone fractures, burns, dental abscesses, appendicitis and childbirth. Concurrently, they are able to distinguish between other sensations, such as thermal (hot/cold) and tactile (sharp/dull) stimuli (Goldberg et al, Clinical Genetics, 2007, 71(4), 311-319).

5

Recent clinical reports indicate that gain of function mutations in human Nav1.7 are typically associated with severe pathological conditions. Primary Erythralgia has been associated with mutations T2573A and T2543C in Nav1.7 (Yang et al, Journal of Medical Genetics, 2004, 41(3), 171-4). Paroxysmal Extreme Pain Disorder is described in association with mutations M1627K, T1464I and I1461T located in the inactivation gate area of Nav1.7 (Fertleman et al, Neuron, 2006, 52(5), 767-774).

10

Thus selective inhibition of Nav1.7 channels may provide comprehensive analgesia.

15

Hence, there is a continuing need for compounds which may be useful for treating and preventing disorders or diseases which respond to inhibition of Nav1.7, particularly for compounds with improved efficacy, tolerability and / or selectivity.

20

Related, but structurally distinct triazines have been reported, e.g. as kinase inhibitors by Janssen (WO2004009562); as integrin inhibitors by Biochem Pharma (WO2000075129).

Compounds of the formula (I) may have different isomeric forms. As used herein, the term "an optical isomer" or "a stereoisomer" refers to any of the various stereo isomeric configurations which may exist for a given compound of the present invention and includes geometric isomers. It is understood that a substituent may be attached at a chiral center of a carbon atom. Therefore, the invention includes enantiomers, diastereomers, rotamers, atropisomers or racemates of the compound. "Enantiomers" are a pair of stereoisomers that are non-superimposable mirror images of each other. A 1:1 mixture of a pair of enantiomers is a "racemic" mixture. The term is used to designate a racemic mixture where appropriate. "Diastereoisomers" are stereoisomers

that have at least two asymmetric atoms, but which are not mirror-images of each other. The absolute stereochemistry is specified according to the Cahn-Ingold-Prelog R-S system. When a compound is a pure enantiomer the stereochemistry at each chiral carbon may be specified by either R or S. Resolved compounds whose absolute
5 configuration is unknown can be designated (+) or (-) depending on the direction (dextro- or levorotatory) which they rotate plane polarized light at the wavelength of the sodium D line. Certain of the compounds described herein contain one or more asymmetric centers or axes and may thus give rise to enantiomers, diastereomers, and other stereoisomeric forms that may be defined, in terms of absolute stereochemistry, as (R)-
10 or (S)-. The present invention is meant to include all such possible isomers, including racemic mixtures, optically pure forms and intermediate mixtures. Optically active (R)- and (S)- isomers may be prepared using chiral synthons or chiral reagents, or resolved using conventional techniques. If the compound contains a double bond, the substituent may be E or Z configuration. If the compound contains a disubstituted cycloalkyl, the
15 cycloalkyl substituent may have a cis- or trans-configuration. If the compound contains an axis of chirality, it might be present in form of atropisomers, which are conformational isomers, where rotation around a single bond is restricted. Atropisomers may be specified either as the (*R_a*)- or (*S_a*)-enantiomer. All rotameric forms are also intended to be included. All tautomeric forms are also intended to be included.

20

As used herein, the term "pharmaceutically acceptable salts" refers to salts that retain the biological effectiveness and properties of the compounds of this invention and, which typically are not biologically or otherwise undesirable. In many cases, the compounds of the present invention are capable of forming acid and/or base salts by virtue of the
25 presence of amino and/or carboxyl groups or groups similar thereto.

Pharmaceutically acceptable acid addition salts can be formed with inorganic acids and organic acids, e.g., acetate, aspartate, benzoate, besylate, bromide/hydrobromide, bicarbonate/carbonate, bisulfate/sulfate, camphorsulfonate, chloride/hydrochloride, chlorotheophyllonate, citrate, ethandisulfonate, fumarate, gluceptate, gluconate,
30 glucuronate, hippurate, hydroiodide/iodide, isethionate, lactate, lactobionate, laurylsulfate, malate, maleate, malonate, mandelate, mesylate, methylsulfate, naphthoate, napsylate, nicotinate, nitrate, octadecanoate, oleate, oxalate, palmitate, pamoate, phosphate/hydrogen phosphate/dihydrogen phosphate, polygalacturonate, propionate, stearate, succinate, sulfosalicylate, tartrate, tosylate and trifluoroacetate
35 salts.

Inorganic acids from which salts can be derived include, for example, hydrochloric acid, hydrobromic acid, sulfuric acid, nitric acid, phosphoric acid, and the like.

- 5 Pharmaceutically acceptable base addition salts can be formed with inorganic and organic bases.

Inorganic bases from which salts can be derived include, for example, ammonium salts and metals from columns 1 to 12 of the periodic table. In certain embodiments, the salts
10 are derived from sodium, potassium, ammonium, calcium, magnesium, iron, silver, zinc, and copper; particularly suitable salts include ammonium, potassium, sodium, calcium and magnesium salts.

Organic bases from which salts can be derived include, for example, primary, secondary,
15 and tertiary amines, substituted amines including naturally occurring substituted amines, cyclic amines, basic ion exchange resins, and the like. Certain organic amines include isopropylamine, benzathine, choline, diethanolamine, diethylamine, lysine, meglumine, piperazine and tromethamine.

20 The pharmaceutically acceptable salts of the present invention can be synthesized from a parent compound, a basic or acidic moiety, by conventional chemical methods. Generally, such salts can be prepared by reacting free acid forms of these compounds with a stoichiometric amount of the appropriate base (such as Na, Ca, Mg, or K hydroxide, carbonate, bicarbonate or the like), or by reacting free base forms of these
25 compounds with a stoichiometric amount of the appropriate acid. Such reactions are typically carried out in water or in an organic solvent, or in a mixture of the two. Generally, use of non-aqueous media like ether, ethyl acetate, ethanol, isopropanol, or acetonitrile is desirable, where practicable. Lists of additional suitable salts can be found, e.g., in "Remington's Pharmaceutical Sciences", 20th ed., Mack Publishing
30 Company, Easton, Pa., (1985); and in "Handbook of Pharmaceutical Salts: Properties, Selection, and Use" by Stahl and Wermuth (Wiley-VCH, Weinheim, Germany, 2002). For isolation or purification purposes it is also possible to use pharmaceutically unacceptable salts, for example picrates or perchlorates. For therapeutic use, only pharmaceutically acceptable salts or free compounds are employed.

35 In view of the close relationship between the novel compounds of the formula (I) in free form and those in the form of their salts, including those salts that can be used as intermediates, for example in the purification or identification of the novel compounds,

any reference to the compounds or a compound of the formula (I) hereinbefore and hereinafter is to be understood as referring to the compound in free form and/or also to one or more salts thereof, as appropriate and expedient, as well as to one or more solvates, e.g. hydrates.

5

Any formula given herein is also intended to represent unlabeled forms as well as isotopically labeled forms of the compounds. Isotopically labeled compounds have structures depicted by the formulas given herein except that one or more atoms are replaced by an atom having a selected atomic mass or mass number. Examples of isotopes that can be incorporated into compounds of the invention include isotopes of hydrogen, carbon, nitrogen, oxygen, phosphorous, fluorine, and chlorine, such as ^2H , ^3H , ^{11}C , ^{13}C , ^{14}C , ^{15}N , ^{18}F , ^{31}P , ^{32}P , ^{35}S , ^{36}Cl , ^{125}I respectively. The invention includes various isotopically labeled compounds as defined herein, for example those into which radioactive isotopes, such as ^3H and ^{14}C or those into which non-radioactive isotopes, such as ^{13}C , are present. Such isotopically labeled compounds are useful in metabolic studies (with ^{14}C), reaction kinetic studies (with, for example ^2H or ^3H), detection or imaging techniques, such as positron emission tomography (PET) or single-photon emission computed tomography (SPECT) including drug or substrate tissue distribution assays, or in radioactive treatment of patients. In particular, an ^{18}F or labeled compound may be particularly desirable for PET or SPECT studies. Isotopically labeled compounds of this invention and prodrugs thereof can generally be prepared by carrying out the procedures disclosed in the schemes or in the examples and preparations described below by substituting a readily available isotopically labeled reagent for a non-isotopically labeled reagent.

25

Further, substitution with heavier isotopes, particularly deuterium (i.e., ^2H or D) may afford certain therapeutic advantages resulting from greater metabolic stability, for example increased in vivo half-life or reduced dosage requirements or an improvement in therapeutic index. It is understood that deuterium in this context is regarded as a substituent of a compound of the formula (I). The concentration of such a heavier isotope, specifically deuterium, may be defined by the isotopic enrichment factor. The term "isotopic enrichment factor" as used herein means the ratio between the isotopic abundance and the natural abundance of a specified isotope. If a substituent in a compound of this invention is denoted deuterium, such compound has an isotopic enrichment factor for each designated deuterium atom of at least 3500 (52.5% deuterium incorporation at each designated deuterium atom), at least 4000 (60% deuterium incorporation), at least 4500 (67.5% deuterium incorporation), at least 5000 (75%

35

deuterium incorporation), at least 5500 (82.5% deuterium incorporation), at least 6000 (90% deuterium incorporation), at least 6333.3 (95% deuterium incorporation), at least 6466.7 (97% deuterium incorporation), at least 6600 (99% deuterium incorporation), or at least 6633.3 (99.5% deuterium incorporation).

5

Isotopically-labeled compounds of the formula (I) can generally be prepared by conventional techniques known to those skilled in the art or by processes analogous to those described in the accompanying Examples and Preparations using an appropriate isotopically-labeled reagents in place of the non-labeled reagent previously employed.

10 Pharmaceutically acceptable solvates in accordance with the invention include those wherein the solvent of crystallization may be isotopically substituted, e.g. D₂O, d₆-acetone, d₆-DMSO.

Compounds of the invention, i.e. compounds of the formula (I) that contain groups
15 capable of acting as donors and/or acceptors for hydrogen bonds may be capable of forming co-crystals with suitable co-crystal formers. These co-crystals may be prepared from compounds of the formula (I) by known co-crystal forming procedures. Such procedures include grinding, heating, co-subliming, co-melting, or contacting in solution
20 compounds of the or (I) I) with the co-crystal former under crystallization conditions and isolating co-crystals thereby formed. Suitable co-crystal formers include those described in WO 2004/078163. Hence the invention further provides co-crystals comprising a compound of the formula (I).

As used herein, the term "pharmaceutically acceptable carrier" includes any and all solvents, dispersion media, coatings, surfactants, antioxidants, preservatives (e.g.,
25 antibacterial agents, antifungal agents), isotonic agents, absorption delaying agents, salts, preservatives, drugs, drug stabilizers, binders, excipients, disintegration agents, lubricants, sweetening agents, flavoring agents, dyes, and the like and combinations thereof, as would be known to those skilled in the art (see, for example, Remington's Pharmaceutical Sciences, 18th Ed. Mack Printing Company, 1990, pp. 1289- 1329).

30 Except insofar as any conventional carrier is incompatible with the active ingredient, its use in the therapeutic or pharmaceutical compositions is contemplated.

By "combination", there is meant either a fixed combination in one dosage unit form, or a
35 kit of parts for the combined administration where a compound of the formula (I) and a combination partner may be administered independently at the same time or separately within time intervals that especially allow that the combination partners show a cooperative, e.g. synergistic effect.

The term "a therapeutically effective amount" of a compound of the present invention refers to an amount of the compound of the present invention that will elicit the biological or medical response of a subject, for example, reduction or inhibition of an enzyme or a protein activity, or ameliorate symptoms, alleviate conditions, slow or delay disease progression, or prevent a disease, etc. In one non-limiting embodiment, the term "a therapeutically effective amount" refers to the amount of the compound of the present invention that, when administered to a subject, is effective to (1) at least partially alleviating, inhibiting, preventing and/or ameliorating a condition, or a disorder or a disease (i) selected from chronic pain, such as positive symptoms of chronic pain e.g. paresthesias, dyesthesias, hyperalgesia, allodynia and spontaneous pain as well as negative symptoms e.g. loss of sensation, or (ii) mediated by the dysregulation of Nav1.7, or (iii) associated with the dysregulation of Nav1.7, or (iv) characterized by the dysregulation of Nav1.7; or (2) reducing or inhibiting the activity of Nav1.7.

In another non-limiting embodiment, the term "a therapeutically effective amount" refers to the amount of the compound of the present invention that, when administered to a cell, or a tissue, or a non-cellular biological material, or a medium, is effective to at least partially reducing or inhibiting Nav1.7.

As used herein, the term "subject" refers to an animal. Typically the animal is a mammal. A subject also refers to for example, primates (e.g., humans), cows, sheep, goats, horses, dogs, cats, rabbits, rats, mice, fish, birds and the like. In certain embodiments, the subject is a primate. In yet other embodiments, the subject is a human.

As used herein, the term "inhibit", "inhibition" or "inhibiting" refers to the reduction or suppression of a given condition, symptom, or disorder, or disease, or a significant decrease in the baseline activity of a biological activity or process.

As used herein, the term "treat", "treating" or "treatment" of any disease or disorder refers in one embodiment, to ameliorating the disease or disorder (i.e., slowing or arresting or reducing the development of the disease or at least one of the clinical symptoms thereof). In another embodiment "treat", "treating" or "treatment" refers to alleviating or ameliorating at least one physical parameter including those which may not be discernible by the patient. In yet another embodiment, "treat", "treating" or "treatment" refers to modulating the disease or disorder, either physically, (e.g., stabilization of a discernible symptom), physiologically, (e.g., stabilization of a physical parameter), or both. In yet another embodiment, "treat", "treating" or "treatment" refers to preventing or delaying the onset or development or progression of the disease or disorder.

As used herein, a subject is "in need of" a treatment if such subject would benefit biologically, medically or in quality of life from such treatment.

As used herein, the term "a," "an," "the" and similar terms used in the context of the present invention (especially in the context of the claims) are to be construed to cover both the singular and plural unless otherwise indicated herein or clearly contradicted by the context.

All methods described herein can be performed in any suitable order unless otherwise indicated herein or otherwise clearly contradicted by context. The use of any and all examples, or exemplary language (e.g. "such as") provided herein is intended merely to better illuminate the invention and does not pose a limitation on the scope of the invention otherwise claimed.

Compounds of the present invention are either obtained in the free form, as a salt thereof, or as prodrug derivatives thereof.

When both a basic group and an acid group are present in the same molecule, the compounds of the present invention may also form internal salts, e.g., zwitterionic molecules.

The present invention also provides pro-drugs of the compounds of the present invention that converts in vivo to the compounds of the present invention. A pro-drug is an active or inactive compound that is modified chemically through in vivo physiological action, such as hydrolysis, metabolism and the like, into a compound of this invention following administration of the prodrug to a subject. The suitability and techniques involved in making and using pro-drugs are well known by those skilled in the art. Prodrugs can be conceptually divided into two non-exclusive categories, bioprecursor prodrugs and carrier prodrugs. See *The Practice of Medicinal Chemistry*, Ch. 31-32 (Ed. Wermuth, Academic Press, San Diego, Calif., 2001). Generally, bioprecursor prodrugs are compounds, which are inactive or have low activity compared to the corresponding active drug compound that contain one or more protective groups and are converted to an active form by metabolism or solvolysis. Both the active drug form and any released metabolic products should have acceptably low toxicity.

35

Carrier prodrugs are drug compounds that contain a transport moiety, e.g., that improve uptake and/or localized delivery to a site(s) of action. Desirably for such a carrier

prodrug, the linkage between the drug moiety and the transport moiety is a covalent bond, the prodrug is inactive or less active than the drug compound, and any released transport moiety is acceptably non-toxic. For prodrugs where the transport moiety is intended to enhance uptake, typically the release of the transport moiety should be rapid.

5 In other cases, it is desirable to utilize a moiety that provides slow release, e.g., certain polymers or other moieties, such as cyclodextrins. Carrier prodrugs can, for example, be used to improve one or more of the following properties: increased lipophilicity, increased duration of pharmacological effects, increased site-specificity, decreased toxicity and adverse reactions, and/or improvement in drug formulation (e.g., stability, water
10 solubility, suppression of an undesirable organoleptic or physiochemical property). For example, lipophilicity can be increased by esterification of (a) hydroxyl groups with lipophilic carboxylic acids (e.g., a carboxylic acid having at least one lipophilic moiety), or (b) carboxylic acid groups with lipophilic alcohols (e.g., an alcohol having at least one lipophilic moiety, for example aliphatic alcohols).

15

Exemplary prodrugs are, e.g., esters of free carboxylic acids and S-acyl derivatives of thiols and O-acyl derivatives of alcohols or phenols, wherein acyl has a meaning as defined herein. Suitable prodrugs are often pharmaceutically acceptable ester derivatives convertible by solvolysis under physiological conditions to the parent
20 carboxylic acid, e.g., lower alkyl esters, cycloalkyl esters, lower alkenyl esters, benzyl esters, mono- or di-substituted lower alkyl esters, such as the omega-(amino, mono- or di-lower alkylamino, carboxy, lower alkoxy carbonyl)-lower alkyl esters, the alpha-(lower alkanoyloxy, lower alkoxy carbonyl or di-lower alkylaminocarbonyl)-lower alkyl esters, such as the pivaloyloxymethyl ester and the like conventionally used in the art. In
25 addition, amines have been masked as arylcarbonyloxymethyl substituted derivatives which are cleaved by esterases in vivo releasing the free drug and formaldehyde (Bundgaard, J. Med. Chem. 2503 (1989)). Moreover, drugs containing an acidic NH group, such as imidazole, imide, indole and the like, have been masked with N-acyloxymethyl groups (Bundgaard, Design of Prodrugs, Elsevier (1985)). Hydroxy
30 groups have been masked as esters and ethers. EP 039,051 (Sloan and Little) discloses Mannich-base hydroxamic acid prodrugs, their preparation and use.

Furthermore, the compounds of the present invention, including their salts, can also be obtained in the form of their hydrates, or include other solvents used for their crystallization.

35

All starting materials, building blocks, reagents, acids, bases, dehydrating agents, solvents and catalysts utilized to synthesize the compounds of the present invention are either commercially available or can be produced by organic synthesis methods known
15 to one of ordinary skill in the art.

In the methods describe above, functional groups which are present in the starting materials and are not intended to take part in the reaction, are present in protected form if necessary, and protective groups that are present are cleaved, whereby said starting
20 compounds may also exist in the form of salts provided that a salt-forming group is present and a reaction in salt form is possible. In additional process steps, carried out as desired, functional groups of the starting compounds which should not take part in the reaction may be present in unprotected form or may be protected for example by one or more protective groups. The protective groups are then wholly or partly removed
25 according to one of the known methods. protective groups, and the manner in which they are introduced and removed are described, for example, in "Protective Groups in Organic Chemistry", Plenum Press, London, New York 1973, and in "Methoden der Organischen Chemie", Houben-Weyl, 4th edition, Vol. 15/1, Georg-Thieme-Verlag, Stuttgart 1974 and in Theodora W. Greene, "Protective Groups in Organic Synthesis",
30 John Wiley & Sons, New York 1981. A characteristic of protective groups is that they can be removed readily, i.e. without the occurrence of undesired secondary reactions, for example by solvolysis, reduction, photolysis or alternatively under physiological conditions.

The invention relates in a fifth aspect to pharmaceutical compositions comprising a compound of the present invention. The pharmaceutical composition can be formulated for particular routes of administration such as oral administration, parenteral administration, and rectal administration, etc. In addition, the pharmaceutical compositions of the present invention can be made up in a solid form (including without limitation capsules, tablets, pills, granules, powders or suppositories), or in a liquid form (including without limitation solutions, suspensions or emulsions). The pharmaceutical compositions can be subjected to conventional pharmaceutical operations such as sterilization and/or can contain conventional inert diluents, lubricating agents, or buffering agents, as well as adjuvants, such as preservatives, stabilizers, wetting agents, emulsifiers and buffers, etc.

Typically, the pharmaceutical compositions are tablets or gelatin capsules comprising the active ingredient together with

- a) diluents, e.g., lactose, dextrose, sucrose, mannitol, sorbitol, cellulose and/or glycine;
- 15 b) lubricants, e.g., silica, talcum, stearic acid, its magnesium or calcium salt and/or polyethyleneglycol; for tablets also
- c) binders, e.g., magnesium aluminum silicate, starch paste, gelatin, tragacanth, methylcellulose, sodium carboxymethylcellulose and/or polyvinylpyrrolidone; if desired
- d) disintegrants, e.g., starches, agar, alginic acid or its sodium salt, or effervescent
- 20 mixtures; and/or
- e) absorbents, colorants, flavors and sweeteners.

Tablets may be either film coated or enteric coated according to methods known in the art.

25 Suitable compositions for oral administration include an effective amount of a compound of the invention in the form of tablets, lozenges, aqueous or oily suspensions, dispersible powders or granules, emulsion, hard or soft capsules, or syrups or elixirs. Compositions intended for oral use are prepared according to any method known in the art for the manufacture of pharmaceutical compositions and such compositions can contain one or

30 more agents selected from the group consisting of sweetening agents, flavoring agents, coloring agents and preserving agents in order to provide pharmaceutically elegant and palatable preparations. Tablets may contain the active ingredient in admixture with nontoxic pharmaceutically acceptable excipients which are suitable for the manufacture of tablets. These excipients are, for example, inert diluents, such as calcium carbonate, sodium carbonate, lactose, calcium phosphate or sodium phosphate; granulating and

35 disintegrating agents, for example, corn starch, or alginic acid; binding agents, for example, starch, gelatin or acacia; and lubricating agents, for example magnesium

stearate, stearic acid or talc. The tablets are uncoated or coated by known techniques to delay disintegration and absorption in the gastrointestinal tract and thereby provide a sustained action over a longer period. For example, a time delay material such as glyceryl monostearate or glyceryl distearate can be employed. Formulations for oral use
5 can be presented as hard gelatin capsules wherein the active ingredient is mixed with an inert solid diluent, for example, calcium carbonate, calcium phosphate or kaolin, or as soft gelatin capsules wherein the active ingredient is mixed with water or an oil medium, for example, peanut oil, liquid paraffin or olive oil.

10 Certain injectable compositions are aqueous isotonic solutions or suspensions, and suppositories are advantageously prepared from fatty emulsions or suspensions. Said compositions may be sterilized and/or contain adjuvants, such as preserving, stabilizing, wetting or emulsifying agents, solution promoters, salts for regulating the osmotic pressure and/or buffers. In addition, they may also contain other therapeutically valuable
15 substances. Said compositions are prepared according to conventional mixing, granulating or coating methods, respectively, and contain about 0.1-75%, or contain about 1-50%, of the active ingredient.

Suitable compositions for transdermal application include an effective amount of a
20 compound of the invention with a suitable carrier. Carriers suitable for transdermal delivery include absorbable pharmacologically acceptable solvents to assist passage through the skin of the host. For example, transdermal devices are in the form of a bandage comprising a backing member, a reservoir containing the compound optionally with carriers, optionally a rate controlling barrier to deliver the compound of the skin of
25 the host at a controlled and predetermined rate over a prolonged period of time, and means to secure the device to the skin.

Suitable compositions for topical application, e.g., to the skin and eyes, include aqueous solutions, suspensions, ointments, creams, gels or sprayable formulations, e.g., for
30 delivery by aerosol or the like. Such topical delivery systems will in particular be appropriate for dermal application, e.g., for the treatment of skin cancer, e.g., for prophylactic use in sun creams, lotions, sprays and the like. They are thus particularly suited for use in topical, including cosmetic, formulations well-known in the art. Such
35 may contain solubilizers, stabilizers, tonicity enhancing agents, buffers and preservatives.

As used herein a topical application may also pertain to an inhalation or to an intranasal application. They may be conveniently delivered in the form of a dry powder (either alone, as a mixture, for example a dry blend with lactose, or a mixed component particle, for example with phospholipids) from a dry powder inhaler or an aerosol spray presentation from a pressurized container, pump, spray, atomizer or nebulizer, with or without the use of a suitable propellant.

The present invention further provides anhydrous pharmaceutical compositions and dosage forms comprising the compounds of the present invention as active ingredients, since water may facilitate the degradation of certain compounds.

Anhydrous pharmaceutical compositions and dosage forms of the invention can be prepared using anhydrous or low moisture containing ingredients and low moisture or low humidity conditions. An anhydrous pharmaceutical composition may be prepared and stored such that its anhydrous nature is maintained. Accordingly, anhydrous compositions are packaged using materials known to prevent exposure to water such that they can be included in suitable formulary kits. Examples of suitable packaging include, but are not limited to, hermetically sealed foils, plastics, unit dose containers (e. g., vials), blister packs, and strip packs.

The invention further provides pharmaceutical compositions and dosage forms that comprise one or more agents that reduce the rate by which the compound of the present invention as an active ingredient will decompose. Such agents, which are referred to herein as "stabilizers," include, but are not limited to, antioxidants such as ascorbic acid, pH buffers, or salt buffers, etc.

NMR Methods

NMR Spectroscopy was determined using either a Bruker DPX 250 MHz NMR or a
15 Bruker DRX 500 MHz NMR. Values are reported as shifts (in ppm), with zero corresponding to tetramethylsilane as an internal standard. Chemical shifts are reported in ppm (Δ). Splitting patterns are designed as s, singlet; d, doublet; t, triplet; q, quartet; m, multiplet; b, broad. The NMR spectra were recorded at a temperature ranging from 25 to 90 C. When more than one conformer was detected the chemical shifts for the
20 most abundant one are reported.

All compounds are named either using ACD Labs 10.0 naming software and ChemAxon Marvin sketch 5.5.1.0 naming tool (which conforms to IUPAC naming protocols) or by analogy to conventional nomenclature familiar to a skilled practitioner. Some compounds are isolated as TFA salts, which is not reflected by the chemical name.

15 Within the meaning of the present invention the chemical name represents the compound in neutral form as well as its TFA salt or any other salt, especially pharmaceutically acceptable salt, if applicable.

Flash silica gel chromatography was carried out on silica gel 230-400 mesh or on pre-
20 packed silica cartridges.

20 All used acid chlorides were either commercially available or prepared according to the following general method:
4-Chlorobenzoic acid (67 mg, 425 μmol), DCM (2 ml) and DMF (1 drop) were charged to a RBF under nitrogen. The mixture was cooled to 0 C then treated with oxalyl chloride (70 μL, 811 μmol) while stirring. The mixture was allowed to warm to room temperature
25 and stirred for 1 h. The mixture was concentrated under vacuum and used without further purification.

Example 1: 6-(5-Furan-2-yl-[1,2,4]oxadiazol-3-yl)-N-methyl-N-phenyl-[1,3,5]triazine-2,4-diamine

30 6-(5-Furan-2-yl-[1,2,4]oxadiazol-3-yl)-N-methyl-N-phenyl-[1,3,5]triazine-2,4-diamine is commercially available ((CAS-899373-19-4) e.g. Ambinter, Aurora Fine Chemicals, Tim Tec Inc., Interchim). Alternatively it may be prepared according to the following procedure (**Method 1**):

To a suspension of 4-amino-N-hydroxy-6-(methyl-phenyl-amino)-[1,3,5]triazine-2-
35 carboxamide (Intermediate 1, 95 mg, 0.37 mmol) in anhydrous toluene (3 mL) and anhydrous pyridine (1 mL) was added 2-furoyl chloride (53 mg, 0.41 mmol) in a solution of anhydrous toluene (3 mL) at 0 C in a sealed tube under an atmosphere of nitrogen.

The mixture was stirred at room temperature for 2 h. After this time the mixture was heated at 115 C for 18 h, allowed to cool to room temperature and concentrated under reduced pressure. The crude product was diluted with DCM (10 mL), extracted with water (5 mL) and dried over anhydrous sodium sulfate. After concentration under
5 reduced pressure the crude product was purified by Preparative HPLC, Method A to give Example 1 (62 mg, 50%).

Example 39: N-Phenyl-6-(pyridin-2-yl-[1,2,4]oxadiazol-3-yl)-[1,3,5]triazine-2,4-diamine
(Method 2)

10 A mixture of picolinic acid (90 mg, 0.73 mmol) and carbonyl di-imidazole (0.12 g, 0.73 mmol) in pyridine (1 ml) was stirred for 2 h. N-Phenyl-6-(5-thiazol-2-yl-[1,2,4]oxadiazol-3-yl)-[1,3,5]triazine-2,4-diamine (prepared in an analogous manner to Intermediate 4, 100 mg, 0.41 mmol) was added and the resulting mixture was heated to 100 C and stirred for 24 h. In a separate vessel, a second mixture of picolinic acid (90 mg, 0.73
15 mmol) and carbonyl di-imidazole (0.12 g, 0.73 mmol) in pyridine (1 ml) was stirred for 90 minutes and added to the first mixture, which was stirred for a further 24 h at 100 C. The mixture was cooled to room temperature, concentrated under vacuum and suspended in aqueous sodium hydrogencarbonate solution. The solid was filtered off, washed with water, ethyl acetate and methanol and dried under vacuum to give the title compound
20 (73 mg, 54%).

Example 42: N-Methyl-N-phenyl-6-{5-[3-(2,2,2-trifluoro-ethoxy)-pyridin-2-yl]-[1,2,4]oxadiazol-3-yl}-[1,3,5]triazine-2,4-diamine (Method 3)

To a solution of 2-{3-[4-amino-6-(methyl-phenyl-amino)-[1,3,5]triazin-2-yl]-[1,2,4]oxadiazol-5-yl}-pyridin-3-ol (prepared in an analogous manner to Intermediate 58,
25 85 mg, 0.23 mmol) in DMSO (5 mL) was added potassium hydroxide (77 mg, 138 µmol) and 1,1,1-trifluoro-2-iodo-ethane (159 mg, 760 µmol). The resultant solution was heated at 120 C for 12 h, allowed to cool to room temperature, diluted with ethyl acetate (10 mL) and washed with brine (3 x 10 mL). The organic layer was dried over anhydrous sodium sulfate, filtered and concentrated under reduced pressure. The crude product was
30 purified by prep HPLC (Method A) to give the title compound as a cream solid (58 mg, 57%).

Example 46: N-Methyl-N-phenyl-6-(5-piperidin-1-yl-[1,2,4]oxadiazol-3-yl)-[1,3,5]triazine-2,4-diamine (Method 4)

35 Piperidine (51 µL, 518 µmol), was added to N-methyl-N-phenyl-6-(5-trichloromethyl-[1,2,4]oxadiazol-3-yl)-[1,3,5]triazine-2,4-diamine (Intermediate 60, 100 mg, 259 µmol) in

anhydrous DMF (1 mL) which had previously been charged to a RBF under nitrogen. The mixture was stirred at room temperature for 18 h. The mixture was then diluted with 35 mL EtOAc. The solution was then extracted with sat. aq. ammonium chloride solution (3 x 6 ml), brine (6 mL), dried over sodium sulfate, and concentrated in vacuo. After
5 purification by preparative HPLC, Method A and subsequent free basing with sat. aq. sodium hydrogencarbonate solution, the title compound was obtained (17 mg, 19%).

Example 67: N-Methyl-N-phenyl-6-{5-[6-(2,2,2-trifluoroethoxy)-pyridin-3-yl]-[1,2,4]oxadiazol-3-yl}-[1,3,5]triazine-2,4-diamine

10 In a sealed tube under nitrogen was placed 4-amino-N-hydroxy-6-(methyl-3-methylphenyl-amino)-[1,3,5]triazine-2-carboximidine (Intermediate 1, 100 mg, 380 μ mol). Then 5 mL anhydrous pyridine was added followed by 6-(2,2,2-trifluoroethoxy)-nicotinoyl chloride (prepared in an analogous manner to Intermediate 57, 91 mg, 380 μ mol). The mixture was stirred at room temperature for 48 hrs. After this time the mixture

DIPEA (165 µL, 0.945 mmol) was added, followed by a solution of N-methyl-N-phenyl-6-(5-trichloromethyl-[1,2,4]oxadiazol-3-yl)-[1,3,5]triazine-2,4-diamine (prepared in an analogous manner to Intermediate 60, 37 mg, 0.095 mmol) in DMF (1.5 mL). The reaction was stirred at room temperature for approximately 42 h. The mixture was diluted with EtOAc (15 mL) then washed with saturated aq. ammonium chloride (3 x 5 mL), saturated aq. sodium carbonate (3 x 5 mL), brine (5 mL), dried over sodium sulfate and evaporated under vacuum. The crude residue was purified by flash chromatography (0-2% MeOH in DCM) and then further purified by preparative HPLC, Method D, to afford the title compound (6 mg, 7 %).

5 **Intermediate 1:** 4-Amino-N-hydroxy-6-(methyl-phenyl-amino)-[1,3,5]triazine-2-carboxamide

A solution of 4-amino-6-(methyl-phenyl-amino)-[1,3,5]triazine-2-carbonitrile (Intermediate 2, 138 mg, 0.6 mmol) in EtOH (4 mL) was added to a solution of hydroxylamine

hydrochloride (51 mg, 0.7 mmol) and sodium hydrogencarbonate (61 mg, 0.73 mmol) in water (2 mL). The mixture was heated at 70 C for 2 h, allowed to cool to room temperature and the solvent evaporated. The crude solid residue was slurried with water (4 mL) before filtering under reduced pressure to afford Intermediate 1 (95 mg, 60%).

Alternatively, 4-amino-6-(methyl-phenyl-amino)-[1,3,5]triazine-2-carbonitrile was prepared according to the following method:

To a stirring solution of 6-chloro-N-methyl-N-phenyl-[1,3,5]triazine-2,4-diamine (Intermediate 41, 360 mg, 2.67 mmol) in DMF (25 ml) was added potassium cyanide (435 mg, 6.68 mmol). The reaction was stirred at 120 C under nitrogen for 2 h. The reaction mixture was diluted with EtOAc (80 ml); the solution was then extracted with 5% aq. sodium hydrogencarbonate solution (2 x 20 mL), and saturated brine (2 x 5 mL). After evaporation of the solvent, the crude residue was purified by FCC over silica gel eluting with heptane:EtOAc 1:0 to 8:2 to 6:4 to furnish the desired product (380 mg,

Whole-cell voltage clamp electrophysiology assay

- 10 Patch-clamp electrophysiology is considered the gold standard technique for investigation of ion channel function and pharmacology. Using this method, sodium channel currents can be measured in cells, which stably (or transiently) express the sodium channel subtype of interest. Application of compounds during such experiments provides a functional measure of the activity and potency of compounds affecting the ion
15 channel of interest.

- Electrophysiological studies can be performed using automated or manual patch-clamp techniques. Automated patch-clamp instruments suitable for this work include the Ion Works HT (MDS), Ion Works Quattro (MDS), PatchLiner (Nanion technologies), Port-A-
20 Patch (Nanion technologies), QPatch (Sophion) or any other suitable platform. For recording in automated patch-clamp instruments, cells expressing the voltage-gated sodium channel subtype of interest are dispensed in appropriate chips (plates with more than one recording chambers each containing one or more apertures to generate whole-cell patches), as provided by the manufacturer. Typically, the whole-cell perforated patch
25 configuration is used for probing the pharmacology of compounds in automated patch-clamp electrophysiology on sodium channels. Extracellular and intracellular buffers for such experiments are composed according to the literature, or according to the instructions provided by the manufacturer of the instruments. Test solutions, which contain the compounds to be tested, are applied to the cells expressing the sodium
30 channel of interest by a pipetting system, typically integrated into the robots.

- Electrophysiological studies can also be performed using the whole cell configuration of the standard manual patch clamp technique as described in the literature (e.g. Pflugers Arch., 1981, 391(2), 85-100). In this assay, cells that express the voltage-gated sodium channel protein of interest are exposed to the drugs by conventional microperfusion
35 systems, or by a home-built perfusion system. A suitable voltage stimulus protocol is used to activate the voltage-gated sodium channels.

A suitable voltage stimulus protocol is used to activate voltage-gated sodium channel proteins of interest. A typical stimulus protocol may consist of sweeps of sequential voltage pulses starting from a holding potential (i.e. -65 mV), to a more positive and depolarising test pulse potential (i.e. -10 mV) and finally to a more negative and hyperpolarising potential (i.e. -100 mV). According to the biophysics of the voltage-gated ion channel of interest and interest in channel configuration the voltages and durations of the pulses as well as the overall frequency of sweeps applied might vary. Accordingly, a stimulus protocol was designed to assess compounds due to their potential to block NaV1.7 channels primarily in inactivated state. Selectivity over other voltage-gated sodium channel members was assessed by protocols that reflect the native function of the channels (i.e. heart rate or firing of neurons).

Electrophysiological studies can also be performed using the whole cell configuration of the standard manual patch clamp technique as described in the literature (e.g. Pflugers Arch., 1981, 391(2), 85-100). In this assay, cells that express the human voltage-gated sodium channel protein of interest are exposed to the drugs by conventional microperfusion systems, or by a home-built perfusion system. A suitable voltage stimulus protocol is used to activate the voltage-gated sodium channels. A suitable voltage stimulus protocol may consist of sequential voltage pulses from a holding potential, each first hyperpolarizing the cell, then depolarizing the channels for a brief period. A particularly suitable holding potential may be a voltage allowing a fraction of channels to remain in an inactivated state, like -60 mV. A suitable hyperpolarizing voltage and duration may be -120 mV for 100 ms, and depolarization voltage and duration may be -20 mV for 25 ms, and a suitable frequency of pulses may be 0.1 Hz, but may also have other parameters. Accordingly, a stimulus protocol was designed to assess compounds due to their potential to block NaV1.7 channels primarily in inactivated state. Selectivity over other voltage-gated sodium channel members was assessed by protocols that reflect the native function of the channels (i.e. heart rate or firing of neurons).

Pharmacological Model

5

Compounds of formula (I) may show analgesic activity in the FCA (Freund's Complete Adjuvant) test in the rat, a model of inflammatory pain which is induced by intraplantar injection of Complete Freund's Adjuvant (Stein et al. Pharmac. Biochem. Behav., 1988, 31, 445-451). The analgesic effects in the model may be obtained at doses that do not produce tissue concentrations leading to conduction block in nerve fibres. Thus, the local anesthetic effect may not mask the analgesic properties of the compounds (Scott et al., British Journal of Anaesthesia, 1988, 61, 165-8). Examples 125 and 130 were shown to be efficacious at a dose of 1 mg/kg (p.o.) and Example 67 was shown to be efficacious at a dose of 3 mg/kg (p.o.). All compounds were tested 72 h post FCA injection.
