(54) Title: IV-vi-DISUBSTITUTEDAMINOALKYLBI PHENYL ANTAGONISTS OF PROSTAGLANDIN D2 RECEPTORS

(57) Abstract: Described herein are compounds that are antagonists of PGD2 receptors. Also described are pharmaceutical compositions and medicaments that include the compounds described herein that are antagonists of PGD2 receptors. Also described herein are methods of using such antagonists of PGD2 receptors, alone and in combination with other compounds, for treating respiratory, cardiovascular, and other PGD2-dependent or PGD2-mediated conditions or diseases.
**AyV-DISUBSTITUTED AMINOALKYLBIPHENYL ANTAGONISTS OF PROSTAGLANDIN D₂ RECEPTORS**

**RELATED APPLICATIONS**

[001] This application claims the benefit of U.S provisional patent application no. 61/025,597 entitled "N,N-disubstituted aminoalkylbiphenyl antagonists of prostaglandin D2 receptors" filed on February 1, 2008 and U.S provisional patent application no. 61/10,496 entitled "N,N-disubstituted aminoalkylbiphenyl antagonists of prostaglandin D2 receptors" filed on October 31, 2008, all of which are incorporated by reference in their entirety.

**FIELD OF THE INVENTION**

[002] Described herein are compounds, methods of making such compounds, pharmaceutical compositions and medicaments comprising such compounds, and methods of using such compounds to treat, prevent or diagnose diseases, disorders or conditions associated with prostaglandin D₂.

**BACKGROUND OF THE INVENTION**

[003] Prostaglandins are acidic lipids derived from the metabolism of arachidonic acid by the action of cyclooxygenase enzymes and downstream synthases. Prostaglandins have a diverse range of activities and have a well recognized role in pain and inflammation. Prostaglandin D₂ (PGD₂) is an acidic lipid mediator derived from the metabolism of arachidonic acid by cyclooxygenases and PGD₂ synthases. PGD₂ is produced by mast cells, macrophages and T_{H2} lymphocytes in response to local tissue damage as well as allergic inflammation in diseases such as asthma, rhinitis, and atopic dermatitis. Exogenous PGD₂ applied to bronchial airways elucidates many characteristics of an asthmatic response suggesting that PGD₂ plays an important pro-inflammatory role in allergic diseases.

[004] PGD₂ binds to a number of receptors, which include the thromboxane-type prostanoid (TP) receptor, PGD₂ receptor (DP, also known as DP₁) and chemoattractant receptor-homologous molecule expressed on Th2 cells (CRTH2; also known as DP₂). DP₂ is associated with promoting chemotaxis and activation of T_{H2} lymphocytes, eosinophils and basophils. In particular, PGD₂ binds to DP₂, and mediates its effects through a Gi-dependant elevation in calcium levels and reduction of intracellular cyclic AMP. In T_{H2} lymphocytes, IL4, IL5 and IL13 cytokine production is stimulated. These cytokines have been implicated in numerous biological actions including, by way of example only, immunoglobulin E production, airway response, mucous secretion, and eosinophil recruitment.

**SUMMARY OF THE INVENTION**

[005] Presented herein are compounds, pharmaceutical compositions and medicaments, methods, for (a) diagnosing, preventing, or treating allergic and non-allergic inflammation, (b)
mitigating adverse signs and symptoms that are associated with inflammation, and/or (c) controlling immunological, proliferative disorders. These disorders may arise from one or more of a genetic, iatrogenic, immunological, infectious, oncological, toxic, surgical, and/or traumatic etiology. In one aspect, the methods, compounds, pharmaceutical compositions, and medicaments described herein comprise antagonists of PGD$_2$ receptors. In one aspect, the methods, compounds, pharmaceutical compositions, and medicaments described herein comprise antagonists of DP$_2$

**DETAILED DESCRIPTION OF THE INVENTION**

Prostaglandin D₂ (PGD₂) is an acidic lipid derived from the metabolism of arachidonic acid by cyclooxygenases and PGD₂ synthases. PGD₂ is produced by mast cells, macrophages and T₁₂ lymphocytes in response to local tissue damage as well as in response allergic inflammation observed in diseases such as asthma, rhinitis, and atopic dermatitis. More specifically, exogenous PGD₂ applied to bronchial airways elicits many responses that are characteristic of acute asthma.

PGD₂ is a major mast cell product that acts via two receptors, the D-type prostanoid (DP, also known as DP₁) and the chemoattractant receptor-homologous molecule expressed on Th2 cells (CRTH2, also known as DP₂) receptors. DP₁ mediates the chemotaxis of eosinophils, basophils, and Th2 lymphocytes, and DP₁ receptor plays an important role in eosinophil trafficking. DP₁ antagonists do not inhibit the release of eosinophils when induced by the DP₂ selective agonists. However, eosinophils in human bone marrow specimens express DP₁ and DP₂ receptors at similar levels and human peripheral blood expresses both DP₁ and DP₂, but the DP₁ receptor is expressed at lower levels. In agreement with this, the chemotaxis of human peripheral blood eosinophils is inhibited by both DP₁ and DP₂ antagonists. Accordingly, DP₁, DP₂ and dual DP₁/DP₂ antagonists are useful in the treatment of allergic inflammation.

Activation of DP₂ is associated with chemotaxis and activation of T₁₂ lymphocytes, eosinophils and basophils. In particular, PGD₂ binds to DP₂ and mediates many of its effects.
through a Gj-dependent elevation of intracellular calcium levels and reduction of cyclic AMP. In T\textsubscript{H}2 lymphocytes, IL4, IL5 and IL13 cytokine production are also stimulated by DP\textsubscript{2} activation. These cytokines have been implicated in numerous biological actions including, by way of example only, immunoglobulin E production, airway response, mucous secretion, and eosinophil recruitment.

The terms CRTH2 and DP\textsubscript{2} refer to the same receptor and are used interchangeably herein. Likewise, another common name for DP is DP\textsubscript{1}; and the two terms are used interchangeably herein.

**Illustrative Biological Activity**

Prostaglandins (PGs) are recognized physiological lipid acid mediators produced by the release of arachidonic acid from cell membrane phospholipids and converted to prostaglandins by the action of COX\textsubscript{i} and COX\textsubscript{2} cyclooxygenases and PG synthases. The cyclooxygenases sequentially convert arachidonic acid to cyclic endoperoxide prostaglandin G\textsubscript{2} (PGG\textsubscript{2}) and subsequently, prostaglandin H\textsubscript{2} (PGH\textsubscript{2}). Depending on the tissue, physiological signal, and/or synthase type, PGH\textsubscript{2} can be converted to numerous different prostaglandins, such as PGE\textsubscript{2}, PGD\textsubscript{2}, PGF\textsubscript{2α}, and PGI\textsubscript{2} as well as thromboxane A\textsubscript{2}, another eicosanoid signaling molecule. These mediators then elicit a wide variety of physiological responses including vasoconstriction or dilation, platelet aggregation, calcium transport, pain sensitization, hormone release, inflammatory and immune response, and cellular growth.

Prostaglandin D\textsubscript{2} is a major metabolite produced from the PGH\textsubscript{2} intermediate via hematopoietic PGD\textsubscript{2} synthase or lipocalin PGD\textsubscript{2} synthase, hi the brain and central nervous system, PGD\textsubscript{2} is produced and thought to Junction in pain perception and sleep regulation. In other tissues, PGD\textsubscript{2} is produced primarily in immunoglobulin E (IgE) activated mast cells and to a lesser extent, in macrophages, dendritic cells, T helper 2 (T\textsubscript{H}2) lymphocytes and other leukocytes. In the cell, PGD\textsubscript{2} is rapidly metabolized and converted to other downstream effectors including Δ\textsuperscript{12}PGJ\textsubscript{2}, 9αLPGF\textsubscript{2}, 13,14-dihydro-15-keto-PGD\textsubscript{2}, and 15-deoxy-Δ\textsuperscript{12,14}PGD\textsubscript{2}.

Mast-cell-derived PGD\textsubscript{2} is produced in high concentrations in response to an allergen challenge. Studies in preclinical species have observed the following features when PGD\textsubscript{2} is applied to in vivo preparations, or its overproduction is engineered by genetic manipulation:

- Vasodilatation leading to erythema (flare) and potentiation of oedema (wheal).
- Recruitment of eosinophils and TH2 lymphocytes.
- Modulation of TH2-cytokine production.
- Bronchoconstriction.

Injection of PGD\textsubscript{2} into human skin has been shown to produce a long lasting erythema, to potentiate the effects of other mediators on induration and leukocyte infiltration in human skin and to enhance oedema formation in rat skin. It is most likely that these effects of PGD\textsubscript{2}, like those of
other vasodilator prostaglandins, are due to an increased blood flow to the inflamed lesion and are, therefore, most likely to be mediated predominantly by the DPj receptor. Although these observations make it clear that DP1 mediates the vascular effects of PGD2, the capacity of PGD2 to promote the cellular changes associated with inflammation is not due to an action on DPi.

[0168] The main receptors that are activated by PGD2 or its metabolites and mediate its effects are DP1, CRTH2 (or DP2) and TP.

[0169] DPi (or DP) is a G-protein coupled seven-transmembrane receptor that, upon activation by PGD2 binding, leads to an increase in intracellular cAMP levels. DP1 is expressed in the brain, bronchial smooth muscle, vascular and airway smooth muscle, dendritic cells, and platelets and induces PGD2 dependent bronchodilation, vasodilation, platelet aggregation inhibition, and suppression of cytokine production. Genetic analysis of DPj function using knock-out mice has shown that mice lacking DP do not develop asthmatic responses in an ovalbumin-induced asthma model. Analysis of selective DP antagonists in guinea pig allergic rhinitis models demonstrated dramatic inhibition of early nasal responses, as assessed by sneezing, mucosal plasma exudation and eosinophil infiltration. DP antagonism alleviates allergen-induced plasma exudation in the conjunctiva in a guinea pig allergic conjunctivitis model and antigen-induced eosinophil infiltration into the lung in a guinea pig asthma model.

[0170] Much of the pro-inflammatory activity of PGD2 is through interaction with DP2 (or CRTH2). DP2 is a G-protein coupled receptor and is typically highly expressed in T_{H2} lymphocytes, eosinophils and basophils. DP2 activation functions to directly activate and recruit T_{H2} lymphocytes and eosinophils. Activated T_{H2} lymphocytes produce and secrete inflammatory cytokines including RA, IL5, and IL13. Despite binding PGD2 with a similar affinity as DPi, DP2 is not structurally related to DPi and signals through a different mechanism– the effects of DP2 are mediated through Gi-dependent elevation in intracellular calcium levels and reduction in intracellular levels of cyclic AMP. DP2 activation is important in eosinophil recruitment in response to allergen challenge in such tissues as nasal mucosa, bronchial airways, and skin. The application of either PGD2 or selective DP2 agonists both exacerbate and enhance allergic responses in lung and skin. DP2 activation appears to have a crucial role in mediating allergic responses, and thus the use of antagonists of PGD2 activation of the DP2 receptor are an attractive approach to treat the inflammatory component of allergic diseases such as asthma, rhinitis, and dermatitis.

[0171] TP receptors primarily function to antagonize DP1 receptor's effects such as promoting bronchoconstriction, vasoconstriction, and platelet aggregation. While TP receptor's main ligand is thromboxane A2, it also binds and is activated by the PGD2 derivative, 9α[1βPGF2]. TP is a Gq-coupled prostanoid receptor that binds thromboxane with high affinity, promoting platelet aggregation and constriction of both vascular and airway smooth muscle. PGD2 activates the TP
receptor in human bronchial muscle, probably through the formation of the 11-ketoreductase metabolite 9α,1βPGF2. The bronchoconstrictor effects of TP dominate over the bronchodilator effects of DPi in the airways.

[0172] DP1 and DP2 have crucial, and complementary, roles in the physiological response of animals to PGD2 and blockade of either one or both of these receptors may prove beneficial in alleviating allergic diseases or conditions triggered by PGD2, such as, but not limited to, allergic rhinitis, asthma, dermatitis, and allergic conjunctivitis.

Synthesis of Compounds

Compounds described in the prior section are synthesized using standard synthetic
techniques or using methods known in the art in combination with methods described herein. In
additions, solvents, temperatures and other reaction conditions presented herein may vary.

The starting material used for the synthesis of the compounds described in the prior
section are either synthesized or obtained from commercial sources, such as, but not limited to,
Sigma-Aldrich, Fluka, Acros Organics, Alfa Aesar, and the like. The compounds described
herein, and other related compounds having different substituents are synthesized using known
techniques and materials, including those found in March, ADVANCED ORGANIC CHEMISTRY 4th
(Plenum 2000, 2001), and Green and Wuts, PROTECTIVE GROUPS IN ORGANIC SYNTHESIS 3rd Ed.,
(Wiley 1999). General methods for the preparation of compounds can be modified by the use of
appropriate reagents and conditions for the introduction of the various moieties found in the
formulae as provided herein.

In certain embodiments, compounds described herein are prepared according to Scheme 1.
Scheme 1:

In one aspect, esters of phenyl acetic acids of structure I that have a halide group are reacted with a borylating agent using transition metal mediated reaction conditions to form boronate compounds of structure II. Boronate compounds of structure II are reacted with 2-halobenzaldehydes of structure III under palladium mediated coupling conditions to form biaryl aldehydes of structure IV. Biaryl aldehydes of structure IV are reacted with amines of structure V under reductive amination conditions to form amines of structure VI. Amines of structure VI are then reacted with acid chlorides of structure VII to form amides of structure VIII. The ester group of amides of structure VIII is then hydrolyzed to form carboxylic acid compounds of structure IX.

In some embodiments, amines of structure VI are reacted with, but not limited to, a carboxylic acid and coupling reagent such as EDC, DCC, BOP, HATU or the like, or a carboxylic acid activated ester or an acid halide, alkylchloroformate, arylchloroformate, benzylchloroformate, alkylisocyanate, benzylisocyanate, arylisocyanate, alkylsulfonyl chloride, arylsulfonyl chloride,
heteroarylsulfonyl chloride, or the like in dichloromethane, dichloroethane, tetrahydrofuran, dimethoxyethane or the like in the presence of a hindered base such as triethylamine, diisopropylethylamine, N-methylmorpholine, pyridine or the like, to afford compounds of Formula (I).

[0250] Carbamates of structure XI are prepared as outlined in Scheme 2:

Scheme 2:

[0251] Reaction of amines of structure VI with chloroformates of structure X provide carbamates, which after hydrolysis of the ester moiety, provide carbamates of structure XI. Methods for the preparation of carbamates include those found in, e.g., Greene, T.W. and Wuts, P.G.M "Protective Groups in Organic Synthesis", 3rd Edition, p.549, New York: Wiley, 1999. In one aspect, alkylamines (compounds of structure VI) are treated with phosgene or a phosgene equivalent, such as, for example, trichloromethyl chloroformate or carbonyldiimidazole, to yield an intermediate, which is then treated with a hydroxy containing compound R15-OH to provide carbamates of structure XI.

[0252] The synthesis of ureas of structure XIII is depicted in Scheme 3:

Scheme 3:

[0253] Reaction of benzylamines of structure XII with isocyanates or carbamoyl chlorides provides ureas of structure XII after hydrolysis of the ester group. Common methods for the synthesis of isocyanates include the Curtius rearrangement of acyl azides and the Lossen rearrangement of hydroxamic acids.

[0254] The synthesis of sulfonamides of structure XIII is depicted in Scheme 3:
Reaction of amines of structure VI with sulfonyl chlorides of structure XIV provides sulfonamides that are then treated with NaOH to provide sulfonamides of structure XIH.

In the reactions described, it is necessary in certain embodiments to protect reactive functional groups, for example hydroxy, amino, imino, thio or carboxy groups, where these are desired in the final product, to avoid their unwanted participation in the reactions. Protecting groups are used to block some or all reactive moieties and prevent such groups from participating in chemical reactions until the protective group is removed. In one embodiment, each protective group is removable by a different means. A detailed description of protecting groups and techniques applicable to the creation of protecting groups and their removal are described in Greene and Wuts, Protective Groups in Organic Synthesis, 3rd Ed., John Wiley & Sons, New York, NY, 1999, and Kocienski, Protective Groups, Thieme Verlag, New York, NY, 1994, which are incorporated herein by reference for such disclosure.

relatively nontoxic, i.e., the material may be administered to an individual without causing undesirable biological effects or interacting in a deleterious manner with any of the components of the composition in which it is contained.

[0259] The term "pharmaceutically acceptable salt" refers to a formulation of a compound that does not cause significant irritation to an organism to which it is administered and does not abrogate the biological activity and properties of the compound. In some embodiments, pharmaceutically acceptable salts are obtained by reacting a compound of any of Formula (I), Formula (II), Formula (HI), Formula (IV), Formula (V), Formula (VI), Formula (VS), or Formula (Vπi) with acids such as hydrochloric acid, hydrobromic acid, sulfuric acid, nitric acid, phosphoric acid, methanesulfonyl acid, ethanesulfonyl acid, p-toluenesulfonyl acid, salicylic acid and the like. Pharmaceutically acceptable salts are also obtained by reacting a compound of any of Formula (I), Formula (D), Formula (HI), Formula (IV), Formula (V), Formula (VI), Formula (VII), or Formula (VIII) with a base to form a salt such as an ammonium salt, an alkali metal salt, such as a sodium or a potassium salt, an alkaline earth metal salt, such as a calcium or a magnesium salt, a salt of organic bases such as dicyclohexylamine, N-methyl-D-glucamine, tris(hydroxymethyl)methylamine, and salts with amino acids such as arginine, lysine, and the like.

[0260] In other embodiments, compounds of any of Formula (I), Formula (H), Formula (DI), Formula (IV), Formula (V) Formula (VI), Formula (VII), or Formula (Vm) are prepared as a pharmaceutically acceptable salts by reacting the free acid form of the compound with a pharmaceutically acceptable inorganic or organic base, including, but not limited to organic bases such as ethanolamine, diethanolamine, triethanolamine, tromethamine, N-methylglucamine, and the like, or with an inorganic base such as aluminum hydroxide, calcium hydroxide, potassium hydroxide, sodium carbonate, sodium hydroxide, and the like.

[0261] It should be understood that a reference to a pharmaceutically acceptable salt includes the solvent addition forms or crystal forms thereof, particularly solvates or polymorphs. Solvates contain either stoichiometric or non-stoichiometric amounts of a solvent, and are optionally formed during the process of crystallization with pharmaceutically acceptable solvents such as water, ethanol, and the like. Hydrates are formed when the solvent is water, or alcoholsates are formed when the solvent is alcohol. Solvates of compounds of any of Formula (I), Formula (H), Formula (JE), Formula (IV), Formula (V) Formula (VI), Formula (VII), or Formula (VIII) are conveniently prepared or formed during the processes described herein. By way of example only, hydrates of compounds of any of Formula (I), Formula (H), Formula (III), Formula (TV), Formula (V) Formula (VI), Formula (VII), or Formula (VIII) are conveniently prepared by recrystallization from an aqueous/organic solvent mixture, using organic solvents including, but not limited to, dioxane, tetrahydrofuran, ethanol, or methanol. In addition, the compounds provided herein can exist in unsolvated as well as solvated forms. In general, the solvated forms are considered
equivalent to the unsolvated forms for the purposes of the compounds and methods provided herein.

[02621] In yet other embodiments, the compounds of any of Formula (I), Formula (II), Formula (III), Formula (TV), Formula (V) Formula (VI), Formula (VII), or Formula (VIII) are prepared in various forms, including but not limited to, amorphous forms, milled forms and nano-particulate forms. In addition, compounds of any of Formula (I), Formula (II), Formula (III), Formula (IV), Formula (V) Formula (VI), Formula (VII), or Formula (VIII) include crystalline forms, also known as polymorphs. Polymorphs include the different crystal packing arrangements of the same elemental composition of a compound. Polymorphs usually have different X-ray diffraction patterns, infrared spectra, melting points, density, hardness, crystal shape, optical and electrical properties, stability, and solubility. Various factors such as the recrystallization solvent, rate of crystallization, and storage temperature may cause a single crystal form to dominate.

[0263] In some embodiments, compounds of any of Formula (I), Formula (II), Formula (III), Formula (IV), Formula (V) Formula (VI), Formula (VIT), or Formula (VIH) are prepared as prodrugs. A "prodrug" refers to an agent that is converted into the parent drug in vivo. Prodrugs are often useful because, in some situations, they may be easier to administer than the parent drug. They may, for instance, be bioavailable by oral administration whereas the parent is not. The prodrug may also have improved solubility in pharmaceutical compositions over the parent drug. An example, without limitation, of a prodrug would be a compound of any of Formula (I), Formula (II), Formula (III), Formula (IV), Formula (V), Formula (VI), Formula (VII), or Formula (VET) which is administered as an ester (the "prodrug") to facilitate transmittal across a cell membrane where water solubility is detrimental to mobility but which then is metabolically hydrolyzed to the carboxylic acid, the active entity, once inside the cell where water-solubility is beneficial. A further example of a prodrug might be a short peptide (polyaminoacid) bonded to an acid group where the peptide is metabolized to reveal the active moiety.

[0264] Prodrugs are generally drug precursors that, following administration to a subject and subsequent absorption, are converted to an active, or a more active species via some process, such as conversion by a metabolic pathway. Some prodrugs have a chemical group present on the prodrug that renders it less active and/or confers solubility or some other property to the drug. Once the chemical group has been cleaved and/or modified from the prodrug the active drug is generated. Prodrugs are often useful because, in some situations, they are easier to administer than the parent drug. In certain embodiments, the prodrug of a compound described herein is bioavailable by oral administration whereas the parent is not. Furthermore, in some embodiments, the prodrug of a compound described herein has improved solubility in pharmaceutical compositions over the parent drug.

Additionally, prodrug derivatives of compounds of any of Formula (T), Formula (II), Formula (HI), Formula (IV), Formula (V) Formula (VI), Formula (VII), or Formula (VIII) are prepared, if desired (e.g., for further details see Saulnier et al., (1994), Bioorganic and Medicinal Chemistry Letters, Vol. 4, p. 1985). By way of example only, in one aspect appropriate prodrugs are prepared by reacting a non-derivatized compound of any of Formula (I), Formula (II), Formula (IU), Formula (IV), Formula (V), Formula (VI), Formula (V5), or Formula (VIII) with a suitable carbamyting agent, such as, but not limited to, 1,1-acyloxyalkyccarbonochloridate, paranitrophenyl carbonate, or the like. Prodrug forms of the herein described compounds, wherein the prodrug is metabolized in vivo to produce a derivative as set forth herein are included within the scope of the claims. Indeed, some of the herein-described compounds are a prodrug for another derivative or active compound.

In some embodiments, sites on the aromatic ring portion of compounds of any of Formula (I), Formula (II), Formula (111), Formula (IV), Formula (V) Formula (VI), Formula (VII), or Formula (VIII) are susceptible to various metabolic reactions Therefore incorporation of appropriate substituents on the aromatic ring structures will reduce, minimize or eliminate this metabolic pathway. In specific embodiments, the appropriate substituent to decrease or eliminate the susceptibility of the aromatic ring to metabolic reactions is, by way of example only, a halogen, or an alkyl group.

In another embodiment, the compounds described herein are labeled isotopically (e.g. with a radioisotope) or by another other means, including, but not limited to, the use of chromophores or fluorescent moieties, bioluminescent labels, or chemiluminescent labels.

In yet another embodiment, the compounds of any of Formula (I), Formula (II), Formula (in), Formula (IV), Formula (V) Formula (VI), Formula (VII), or Formula (VIII) possess one or more stereocenters and each center exists independently in either the R or S configuration. The compounds presented herein include all diastereomeric, enantiomeric, and epimeric forms as well as the appropriate mixtures thereof. In certain embodiments, compounds of any of Formula (I),
Formula (II), Formula (HI), Formula (IV), Formula (V) Formula (VI), Formula (VII), or Formula
(Vπi) are prepared as their individual stereoisomers by reacting a racemic mixture of the
compound with an optically active resolving agent to form a pair of diastereoisomeric compounds,
separating the diastereomers and recovering the optically pure enantiomers. In some embodiments,
resolution of enantiomers is carried out using covalent diastereomeric derivatives of the
compounds described herein. In other embodiments, dissociable complexes are utilized (e.g.,
crystalline diastereomeric salts). Diastereomers have distinct physical properties (e.g., melting
points, boiling points, solubilities, reactivity, etc.) and are, in specific embodiments, separated by
taking advantage of these dissimilarities. In these embodiments, the diastereomers are separated by
chiral chromatography or by separation/resolution techniques based upon differences in solubility.
The optically pure enantiomer is then recovered, along with the resolving agent, by any practical
means that does not result in racemization. Jean Jacques, Andre Collet, Samuel H. Wilen,

Additionally, in certain embodiments, the compounds provided herein exist as geometric
isomers. The compounds and methods provided herein include all cis, trans, syn, anti, entgegen
(E), and zusammen (Z) isomers as well as the appropriate mixtures thereof. In some embodiments,
the compounds described herein exist as tautomers. All tautomers are intended to be within the
scope of the molecular formulas described herein. In additional embodiments of the compounds
and methods provided herein, mixtures of enantiomers and/or diastereoisomers, resulting from a
single preparative step, combination, or interconversion are envisioned.

Certain Chemical Terminology

Unless otherwise stated, the following terms used in this application, including the
specification and claims, have the definitions given below. It must be noted that, as used in the
specification and the appended claims, the singular forms "a," "an" and "the" include plural
referents unless the context clearly dictates otherwise. Unless otherwise indicated, conventional
methods of mass spectroscopy, NMR, HPLC, protein chemistry, biochemistry, recombinant DNA
techniques and pharmacology are employed. In this application, the use of "or" or "and" means

alkyl moiety, which means that it contains at least one unit of unsaturation. The alkyl moiety,
whether saturated or unsaturated, may be branched, straight chain, or cyclic. The point of
attachment of an alkyl is at a sp3 carbon atom that is not part of a ring.
The "aUcyl" moiety may have 1 to 10 carbon atoms (whenever it appears herein, a numerical range such as "1 to 10" refers to each integer in the given range; e.g., "1 to 10 carbon atoms" means that the alkyl group may consist of 1 carbon atom, 2 carbon atoms, 3 carbon atoms, etc., up to and including 10 carbon atoms, although the present definition also covers the occurrence of the term "alkyl" where no numerical range is designated). Certain Pharmaceutical and Medical Terminology

[0297] The term "acceptable" with respect to a formulation, composition or ingredient, as used herein, means having no persistent detrimental effect on the general health of the subject being treated.

[0298] The term "modulate," as used herein, means to interact with a target either directly or indirectly so as to alter the activity of the target, including, by way of example only, to enhance the activity of the target, to inhibit the activity of the target, to limit the activity of the target, or to extend the activity of the target.

[0299] The term "modulator," as used herein, refers to a molecule that interacts with a target either directly or indirectly. The interactions include, but are not limited to, the interactions of an agonist, partial agonist, an inverse agonist and antagonist. In one embodiment, a modulator is an antagonist.

[0300] The term "agonist," as used herein, refers to a molecule such as a compound, a drug, an enzyme activator or a hormone modulator that binds to a specific receptor and triggers a response in the cell. An agonist mimics the action of an endogenous ligand (such as prosttaglandin, hormone or neurotransmitter) that binds to the same receptor.

[0301] The term "antagonist," as used herein, refers to a molecule such as a compound, which diminishes, inhibits, or prevents the action of another molecule or the activity of a receptor site. Antagonists include, but are not limited to, competitive antagonists, non-competitive antagonists, uncompetitive antagonists, partial agonists and inverse agonists.
[0302] Competitive antagonists reversibly bind to receptors at the same binding site (active site) as the endogenous ligand or agonist, but without activating the receptor.

[0303] Non-competitive antagonists (also known as allosteric antagonists) bind to a distinctly separate binding site from the agonist, exerting their action to that receptor via the other binding site. Non-competitive antagonists do not compete with agonists for binding. The bound antagonists may result in a decreased affinity of an agonist for that receptor, or alternatively may prevent conformational changes in the receptor required for receptor activation after the agonist binds.

[0304] Uncompetitive antagonists differ from non-competitive antagonists in that they require receptor activation by an agonist before they can bind to a separate allosteric binding site.

[0305] Partial agonists are defined as drugs which, at a given receptor, might differ in the amplitude of the functional response that they elicit after maximal receptor occupancy. Although they are agonists, partial agonists can act as a competitive antagonist if co-administered with a full agonist, as it competes with the full agonist for receptor occupancy and producing a net decrease in the receptor activation observed with the full agonist alone.

[0306] An inverse agonist can have effects similar to an antagonist, but causes a distinct set of downstream biological responses. Constitutively active receptors which exhibit intrinsic or basal activity can have inverse agonists, which not only block the effects of binding agonists like a classical antagonist, but inhibit the basal activity of the receptor.

[0364] In certain embodiments, the compositions containing the compound(s) described herein are administered for prophylactic and/or therapeutic treatments. In certain therapeutic applications, the compositions are administered to a patient not already suffering from a disease or condition, in an amount sufficient to cure or at least partially arrest the symptoms of the disease or condition. Amounts effective for this use depend on the severity and course of the disease or condition, previous therapy, the patient's health status, weight, and response to the drugs, and the judgment of the treating physician. Therapeutically effective amounts are optionally determined by methods including, but not limited to, a dose escalation clinical trial.

[0365] In prophylactic applications, compositions containing the compounds described herein are administered to a patient susceptible to or otherwise at risk of a particular disease, disorder or condition. Such an amount is defined to be a "prophylactically effective amount or dose." In this use, the precise amounts also depend on the patient's state of health, weight, and the like. When used in a patient, effective amounts for this use will depend on the severity and course of the disease, disorder or condition, previous therapy, the patient's health status and response to the drugs, and the judgment of the treating physician.

[0366] In certain embodiments wherein the patient's condition does not improve, upon the doctor's discretion the administration of the compounds are administered chronically, that is, for an extended period of time, including throughout the duration of the patient's life in order to ameliorate or otherwise control or limit the symptoms of the patient's disease or condition.

[0367] In certain embodiments wherein a patient's status does improve, administration of the compounds is given continuously; or, alternatively, the dose of drug being administered may be
temporarily reduced or temporarily suspended for a certain length of time (i.e., a "drug holiday"). The dose reduction during a drug holiday is, by way of example only, by 10%-100%, including by way of example only 10%, 15%, 20%, 25%, 30%, 35%, 40%, 45%, 50%, 55%, 60%, 65%, 70%, 75%, 80%, 85%, 90%, 95%, and 100%.

[0368] Once improvement of the patient's conditions has occurred, a maintenance dose is administered if necessary. Subsequently, in specific embodiments, the dosage or the frequency of administration, or both, is reduced, as a function of the symptoms, to a level at which the improved disease, disorder or condition is retained. In certain embodiments, however, the patient requires intermittent treatment on a long-term basis upon any recurrence of symptoms.

[0369] The amount of a given agent that corresponds to such an amount varies depending upon factors such as the particular compound, disease condition and its severity, the identity (e.g., weight) of the subject or host in need of treatment, but can nevertheless be determined according to the particular circumstances surrounding the case, including, e.g., the specific agent being administered, the route of administration, the condition being treated, and the subject or host being treated. In general, however, doses employed for adult human treatment are typically in the range of 0.02-5000 mg per day. In one aspect, the dose is in the range of 1-1500 mg per day, 1-500 mg per day, 1-250 mg per day, or 1-100 mg per day. In one embodiment, the desired dose is conveniently presented in a single dose or in divided doses administered simultaneously (or over a short period of time) or at appropriate intervals, for example as two, three, four or more sub-doses per day.

[0370] In certain embodiments, the pharmaceutical composition described herein is in unit dosage forms suitable for single administration of precise dosages. In unit dosage form, the formulation is divided into unit doses containing appropriate quantities of one or more compound. In certain embodiments, suitable unit dosage forms for oral administration comprise from about 1 to 500 mg active ingredient, from about 1 to 250 mg active ingredient, or from about 1 to 100 mg active ingredient. In other embodiments, the daily dosage or the amount of active in the dosage form are lower or higher than the ranges indicated herein, based on a number of variables in regard to an individual treatment regime. In various embodiments, the daily and unit dosages are altered depending on a number of variables including, but not limited to, the activity of the compound used, the disease or condition to be treated, the mode of administration, the requirements of the individual subject, the severity of the disease or condition being treated, and the judgment of the practitioner.

[0372] Toxicity and therapeutic efficacy of such therapeutic regimens are determined by standard pharmaceutical procedures in cell cultures or experimental animals, including, but not limited to, the determination of the LD₅₀ (the dose lethal to 50% of the population) and the ED₅₀ (the dose therapeutically effective in 50% of the population). The dose ratio between the toxic and therapeutic effects is the therapeutic index and it is expressed as the ratio between LD₅₀ and ED₅₀. In certain embodiments, the data obtained from cell culture assays and animal studies are used in formulating the therapeutically effective daily dosage range and/or the therapeutically effective unit dosage amount for use in mammals, including humans. In some embodiments, the daily dosage amount of the compounds described herein lies within a range of circulating concentrations that include the ED₅₀ with minimal toxicity. In certain embodiments, the daily dosage range and/or the unit dosage amount varies within this range depending upon the dosage form employed and the route of administration utilized.

Combination Treatments

In certain instances, it is appropriate to administer at least one DP₂ antagonist described herein, in combination with another therapeutic agent. By way of example only, if one of the side effects experienced by a patient upon receiving one of the compounds herein is inflammation, then it may be appropriate to administer an anti-inflammatory agent in combination with the initial therapeutic agent. Or, in one embodiment, the therapeutic effectiveness of one of the compounds described herein is enhanced by administration of an adjuvant (i.e., by itself the adjuvant may have minimal therapeutic benefit, but in combination with another therapeutic agent, the overall therapeutic benefit to the patient is enhanced). Or, in some embodiments, the benefit of experienced by a patient is increased by administering one of the compounds described herein with another therapeutic agent (which also includes a therapeutic regimen) that also has therapeutic benefit. In one specific embodiment, the therapeutic benefit of treating asthma by administering at least one of the compounds described herein is increased by also providing the patient with other therapeutic agents or therapies for asthma. In any case, regardless of the disease, disorder or condition being treated, the overall benefit experienced by the patient may simply be additive of the two therapeutic agents or the patient may experience a synergistic benefit.

In certain embodiments, different therapeutically-effective dosages of the compounds disclosed herein will be utilized in formulating pharmaceutical composition and/or in treatment regimens when the compounds disclosed herein are administered in combination with one or more additional agent, such as an additional therapeutically effective drug, an adjuvant or the like. Therapeutically-effective dosages of drugs and other agents for use in combination treatment regimens can be determined by means similar to those set forth hereinabove for the actives themselves. Furthermore, the methods of prevention/treatment described herein encompasses the use of metronomic dosing, i.e., providing more frequent, lower doses in order to minimize toxic side effects. In some embodiments, a combination treatment regimen encompasses treatment regimens in which administration of a DP₂ antagonist described herein is initiated prior to, during, or after treatment with a second agent described above, and continues until any time during treatment with the second agent or after termination of treatment with the second agent. It also
includes treatments in which a DP₂ antagonist described herein and the second agent being used in combination are administered simultaneously or at different times and/or at decreasing or increasing intervals during the treatment period. Combination treatment further includes periodic treatments that start and stop at various times to assist with the clinical management of the patient. For example, in one embodiment, a DP₂ antagonist described herein in the combination treatment is administered weekly at the onset of treatment, decreasing to biweekly, and decreasing further as appropriate.

[0402] Compositions and methods for combination therapy are provided herein. In accordance with one aspect, the pharmaceutical compositions disclosed herein are used to treat PGD₂dependent or PGD₂ mediated conditions. In accordance with another aspect, the pharmaceutical compositions disclosed herein are used to treat respiratory diseases (e.g., asthma), where treatment with a DP₂ antagonist is indicated and to induce bronchodilation in a subject. In one embodiment, the pharmaceutical compositions disclosed herein are used to treat airways or nasal inflammation diseases such as asthma and rhinitis.

[0403] In one embodiment, pharmaceutical compositions disclosed herein are used to treat a subject suffering from a vascular inflammation-driven disorder. In one embodiment, the pharmaceutical compositions disclosed herein are used to treat skin inflammation diseases such as atopic dermatitis.

[0404] In certain embodiments, combination therapies described herein are used as part of a specific treatment regimen intended to provide a beneficial effect from the co-action of a DP₂ described herein and a concurrent treatment. It is understood that the dosage regimen to treat, prevent, or ameliorate the condition⁴ for which relief is sought, is modified in accordance with a variety of factors. These factors include the type of respiratory disorder and the type of bronchoconstriction or inflammation from which the subject suffers, as well as the age, weight, sex, diet, and medical condition of the subject. Thus, in some instances, the dosage regimen actually employed varies and, in some embodiments, deviates from the dosage regimens set forth herein.

[0405] For combination therapies described herein, dosages of the co-administered compounds vary depending on the type of co-drug employed, on the specific drug employed, on the disease or condition being treated and so forth. In additional embodiments, when co-administered with one or more biologically active agents, the compound provided herein is administered either simultaneously with the biologically active agent(s), or sequentially. If administered sequentially, the attending physician decides on the appropriate sequence of administering protein in combination with the biologically active agent(s).

[0406] In combination therapies, the multiple therapeutic agents (one of which is one of the compounds described herein) are administered in any order or even simultaneously. If
administration is simultaneous, the multiple therapeutic agents are, by way of example only, provided in a single, unified form, or in multiple forms (e.g., as a single pill or as two separate pills). In one embodiment, one of the therapeutic agents is given in multiple doses, and in another, two (or more if present) are given as multiple doses. In some embodiments of non-simultaneous administration, the timing between the multiple doses vary from more than zero weeks to less than four weeks. In addition, the combination methods, compositions and formulations are not to be limited to the use of only two agents; the use of multiple therapeutic combinations is also envisioned.

In additional embodiments, the DP$_2$ antagonist described herein are used in combination with procedures that provide additional or synergistic benefit to the patient. By way of example only, patients are expected to find therapeutic and/or prophylactic benefit in the methods described herein, wherein DP$_2$ antagonists described herein, and/or combinations with other therapeutics are combined with genetic testing to determine whether that individual is a carrier of a mutant gene that is known to be correlated with certain diseases or conditions.

The DP$_2$ antagonist described herein, and combination therapies, are administered before, during or after the occurrence of a disease or condition, and the timing of administering the composition containing a compound varies. Thus, in one embodiment, the compounds described herein are used as a prophylactic and are administered continuously to subjects with a propensity to develop conditions or diseases in order to prevent the occurrence of the disease or condition. In another embodiment, the compounds and compositions are administered to a subject during or as soon as possible after the onset of the symptoms. The administration of the compounds are initiated within the first 48 hours of the onset of the symptoms, preferably within the first 48 hours of the onset of the symptoms, more preferably within the first 6 hours of the onset of the symptoms, and most preferably within 3 hours of the onset of the symptoms. The initial administration is accomplished via any practical route, such as, for example, by intravenous injection, a bolus injection, infusion over 5 minutes to about 5 hours, a pill, a capsule, transdermal patch, buccal delivery, and the like, or combination thereof. In specific embodiments, a compound described herein is administered as soon as is practicable after the onset of a disease or condition is detected or suspected, and for a length of time necessary for the treatment of the disease, such as, for example, from about 1 month to about 3 months. In some embodiments, the length required for effective treatment varies, and the treatment length is adjusted to suit the specific needs of each subject. For example, in specific embodiments, a compound described herein or a formulation containing the compound is administered for at least 2 weeks, about 1 month to about 5 years, or from about 1 month to about 3 years.

By way of example, therapies which combine DP$_2$ antagonists described herein with inhibitors of PGD$_2$ synthesis or PGD$_2$ receptor antagonists, either acting at the same or other points
in the PGD₂ synthesis pathway, are encompassed herein for treating PGD₂-dependent or PGD₂-mediated diseases or conditions. In addition, by way of example, encompassed herein are therapies that combine DP₂ antagonists described herein with inhibitors of inflammation for treating PGD₂-dependent or PGD₂-mediated diseases or conditions.

[0410] In another embodiment described herein, methods for treatment of PGD₂-dependent or PGD₂-mediated conditions or diseases include administration to a patient compounds, pharmaceutical compositions, or medicaments described herein in combination with an anti-inflammatory agent including, but not limited to, non-steroidal anti-inflammatory drugs (NSAIDs) and corticosteroids (glucocorticoids). Anti-inflammatory agents include, but are not limited to: arthrotec, mesalamine, auralglan, sulfasalazine, daypro, etodolac, ponstan, and soludemrol; non-steroidal anti-inflammatory agents; corticosteroids; and leukotriene pathway modulators (e.g. montelukast, zilueon).

[0411] By way of example only, asthma is a chronic inflammatory disease characterized by pulmonary eosinophilia and airway hyperresponsiveness. In patients with asthma, PGD₂ is released from mast cells, eosinophils, and basophils. PGD₂ is involved in contraction of airway smooth muscle, an increase in vascular permeability and mucus secretions, and has been reported to attract and activate inflammatory cells in the airways of asthmatics. Thus, in another embodiment described herein, the methods for treatment of respiratory diseases include administration to a patient compounds, pharmaceutical compositions, or medicaments described herein in combination with an anti-inflammatory agent.

[0412] NSAIDs include, but are not limited to: aspirin, salicylic acid, gentisic acid, choline magnesium salicylate, choline salicylate, choline magnesium salicylate, choline salicylate, magnesium salicylate, sodium salicylate, diflunisal, carprofen, fenoprofen, fenoprofen calcium, flurobiprofen, ibuprofen, ketoprofen, nabutone, ketoralac, ketorolac tromethamine, naproxen, oxaprozin, diclofenac, etodolac, indomethacin, sulindac, tolmetin, meclofenamate, meclofenamate sodium, mefenamic acid, piroxicam, meloxicam, COX-2 specific inhibitors (such as, but not limited to, celecoxib, rofecoxib, valdecoxib, parecoxib, etoricoxib, lumiracoxib, CS-502, JTE-522, L-745,337 andNS398).

For some patients, the most appropriate formulation or method of use of such combination treatments depends on the type OfPGD$_2$- dependent or PGD$_2$ mediated disorder, the time period in which the DP$_2$ antagonist acts to treat the disorder and/or the time period in which the DP$_i$ receptor antagonist acts to prevent DP$_i$ receptor activity. By way of example only, some embodiments described herein provide for such combination treatments that are used for treating a patient suffering from respiratory disorders such as asthma and rhinitis.

[0417] In one embodiment, the co-administration of a DP$_2$ receptor antagonist with a DP$_i$ receptor antagonist or a TP receptor antagonist has therapeutic benefit over and above the benefit derived from the administration of a either a DP$_2$ antagonist, DP$_i$ antagonist or a TP antagonist alone. In the case that substantial inhibition OfPGD$_2$ activity has undesired effects, partial inhibition of this
pathway through the amelioration of the effects of the proinflammatory agonists combined with the block of the DPi receptor, TP receptor and/or DP₂ receptor may afford substantial therapeutic benefits, particularly for respiratory diseases.

Example 230: CRTH2 Assays

Example 230a: DP2/CRTH2 binding assay

[01112] The ability of a compound to bind to the human DP2 receptor is assessed via a radioligand binding assay using [3H]PGD2. HEK293 cells stably expressing recombinant human DP2 are resuspended in 10 mM Hepes, 7.4 containing 1 mM DTT, lysed and centrifuged at 75,000 xg to pellet the membranes. The membranes are resuspended in 10 mM Hepes, 7.4 containing 1 mM DTT and 10% glycerol to approximately 5 mg protein/ml. Membranes (2-10 µg protein/well) are incubated in 96-well plates with 1 nM [3H]PGD2 and test compound in Assay Buffer (50 mM Hepes, 10 mM MnCl2, 1 mM EDTA, plus or minus 0.2% human serum albumin, pH 7.4) for 60 minutes at room temperature. The reactions are terminated by rapid filtration through Whatman GF/C glass fibre filter plates. The filter plates were pre-soaked in 0.33% polythlenitnine for 30 minutes at room temperature then washed in Wash Buffer (50 mM Hepes, 0.5 M NaCl pH 7.4) prior to harvesting. After harvesting, the filter plates are washed 3 times with 1 ml cold Wash Buffer then dried. Scintillant is then added to the plates and the radioactivity retained on the filters is determined on a Packard TopCount (Perkin Elmer). Specific binding is determined as total radioactive binding minus non-specific binding in the presence of 10 µM PGD2. IC50S were determined using GraphPad prism analysis of drug titration curves. Compounds in Table 1 and Table 2 that were tested had an IC50 of less than 30 micromolar in this assay, unless otherwise noted.

The membranes are resuspended in 10 mM Hepes, 7.4 containing 1 mM DTT and 10% glycerol. Membranes (~12.5 µg per well) are incubated in 96-well plates with 0.05 nM [35S]-GTPyS, 80 nM PGD2, 5 µM GDP, and test compound in Assay Buffer (50 mM Hepes, pH 7.4, 100 mM NaCl, 5 mM MgCl2 and 0.2% human serum albumin) for 60 minutes at 30°C. The reactions are terminated by rapid filtration through Whatman GF/B glass fibre filter plates. The filter plates are washed 3 times with 1 ml cold Assay Buffer and dried. Scintillant is then added to the plates and the radioactivity retained on the filters is determined on a Packard TopCount (Perkin Elmer). Specific binding is determined as total radioactive binding minus non-
specific binding in the absence of the ligand (80 nM PGD₂). IC₅₀S were determined using Graphpad prism analysis of drug titration curves.

**Example 230c: Whole Blood Eosinophil Shape Change Assay**

[01114] Blood is drawn from consenting human volunteers in EDTA vacutainer tubes and used within 1 hr of draw. A 98 µl aliquot of blood is mixed with 2 µl of test compound (in 50% DMSO) in 1.2 ml polypropylene tubes. The blood is vortexed and incubated at 37°C for 15 minutes. 5 µl of 1 µM PGD₂ in PBS is added for a final concentration of 50 nM and the tubes briefly vortexed. The reactions are incubated for exactly 5 minutes at 37°C and then terminated by placing the tubes on ice and immediately adding 250 µl of ice-cold 1:4 diluted Cytofix (BD Biosciences). The reactions are transferred to 12 x 75 mM polystyrene round bottom tubes and the red blood cells lysed by the addition of 3 ml ammonium chloride lysing solution (150 mM NH₄Cl, 10 mM KHCO₃, 0.1 mM EDTA disodium salt) and incubation at room temperature for 15 minutes. The cells are pelleted by spinning at 1300 rpm for 5 minutes at 4°C and washed once with 3 ml ice-cold PBS. The cells are resuspended in 0.2 ml of ice-cold 1:4 diluted Cytofix (BD Biosciences) and analyzed on a FACSCalibur (BD Biosciences) within 2 hours. Eosinophils were gated on the basis of autofluorescence in the FL2 channel and shape change on 500 eosinophils was assayed by forward scatter and side scatter analysis. The specific change in shape induced by PGD₂ was calculated as the difference between the percentage of high forward scatter eosinophils in the presence and absence of PGD₂. Specific binding is determined as total radioactive binding minus non-specific binding in the presence of 10 µM BW A868C. IC₅₀S were determined using GraphPad prism analysis of drug titration curves.
Example 231: *In vivo* assays

**Mouse Allergic Rhinitis Model**

[01116] The compounds ability to inhibit allergen-induced sneezing and nasal rubbing is assessed using a mouse model of allergic rhinitis. Methods were adapted from those detailed in Nakaya, M., *et al.*, 2006. Noninvasive system for evaluating allergen-induced nasal hypersensitivity in murine allergic rhinitis. *Laboratory Investigation*, 86:917-926. Female BALB/c mice (20-25g) are immunized by an intraperitoneal injection (i.p.) of 2 µg ovalumin (OVA) complexed with alum in a volume 0.2 ml on days 0 and 14. Seven days later (day 21) mice are challenged intranasally with 20 µl of a 10mg/ml solution of OVA. The challenge period occurs daily from days 21 to day 25. Mice (5-7/group) are randomly assigned to receive either compound or vehicle and are treated by oral gavage 1-2 hour prior to each OVA challenge. The number of sneezes and nasal rubs are counted by an independent blind observer during a period of 8 minutes immediately following OVA challenge on days 21, 23 and 25. A significant increase in allergen-induced sneezing and nasal rubbing occurs over the 5-day challenge period. Inhibition of this effect by select compounds is determined statistically using Graphpad prism.

[01117] The compounds ability to inhibit leukocyte migration in vivo was assessed using intravenous injection of 13,14-dihydro-15-keto-prostaglandin D2 (DK-PGD2). Methods were adapted from those detailed Shichijo *et al.*, 2003, Chemoattractant receptor-homologous molecule expressed on Th2 cells activation *in vivo* increases blood leukocyte counts and its blockade abrogates 13, 14-dihydro-15-keto-prostaglandin D2-induced eosinophilia in rats. *Journal of Pharmacology and Experimental Therapeutics*, 307:518-525. Male Hartley guinea pigs were immunized with ovalumin (OVA) on day 0 by intraperitoneal (TP) injection of 1 ml of a 100 µg/ml solution in Imject Alum. They were then used in the DK-PGD2 procedure between days 14 and 21. Subjects were randomly assigned to receive either vehicle (0.5% methyl cellulose, 4 ml/kg, oral (PO)) or one of three to four doses of test compound. Two hours or eighteen hours after dosing, animals were anesthetized with ketamine and challenged with DK-PGD2 (1 mg/kg, IV). Thirty minutes after IV administration, blood was collected via the marginal ear vein into EDTA tubes for cell analysis. 10 µl blood was lysed in 190 µl water followed by a further 20-fold dilution in PBS. A 10 µl fraction was mixed with equal parts trypan blue and loaded on a hemocytometer. Cells were visualized at a magnification of 4OX using a LabPro light microscope and totals counted and recorded. Cells are expressed as total cells x 10⁸ per ml of blood. Inhibition of this effect by select compounds is determined statistically using Graphpad prism.

[01118] The compounds that were tested in Table 1 and Table 2 had IC₅₀ below 30 µM in the CRTH2 binding assay, unless otherwise noted.

Example 233: Clinical Trials in Humans

Study 1: Clinical Trial Evaluating Effect of Compound of Formula (I) on ex vivo PGD2-induced blood eosinophil shape change

[01119] In this double-blind, randomized, placebo-controlled, single ascending dose study of Compound of Formula (I) in healthy volunteers the inhibition of ex vivo PGD2-induced blood eosinophil shape change is determined to show proof of biochemical mechanism of DP2 receptor antagonism. Eight subjects (6 active, 2 placebo) per dose level are used. Pre-dose blood is drawn and challenged with PGD2 to determine baseline shape change as described above in Example 230. At varying times after dosing blood is drawn for both pharmacokinetic analyses of drug concentration in blood, and also for PGD2 challenge and eosinophil shape change determination. The extent of receptor blockage is determined from the relationship between drug blood concentration and percentage inhibition of eosinophil shape change.

Study 2: Clinical Trial Evaluating Effect of Compound of Formula (T) on Allergen-induced Nasal symptoms and inflammatory and allergic biomarkers

[01120] In this double-blind, randomized, placebo-controlled study of Compound of Formula (I) in individuals with allergic rhinitis the inhibition of nasal symptoms and allergic biomarkers is determined following nasal challenge with appropriate allergen. Fifteen subjects (10 active, 5 placebo) are used. Subjects are dosed for 7 days with either placebo or an amount of compound of formula (T) that results in complete DP2 receptor block in an ex vivo PGD2-induced blood eosinophil shape change pharmacodynamic study as described above. On day 7 subjects undergo nasal allergen challenge (2 hours post-dose) and early allergic response (0.25-1.0hr) and late
allergic response (4-24hr) are evaluated as an increase from baseline for treated vs placebo. In addition changes in inflammatory cell differentials, TH2 cytokines and other inflammatory markers are determined as increase from baseline for treated vs placebo.

**Compound of Formula (I) assay**

[01121] The plasma concentrations of compound of Formula (I) are determined by gas chromatography, giving a detection limit of 1 ng·ml⁻¹ (Ritter W. Determination of BAY u 3405, a novel thromboxane antagonist, in plasma and urine by HPLC and GC. 1Q: Reid E, Wilson Ed. eds. Bioanalytical Approaches for Drugs, Including Anti-asthmatics and Metabolites. Methodological Surveys in Biochemistry and Analysis, 1992; 22: 211-216).

**Example 234a: Parenteral Composition**

[01122] To prepare a parenteral pharmaceutical composition suitable for administration by injection, 100 mg of a water-soluble salt of a compound of Formula (I) is dissolved in DMSO and then mixed with 10 mL of 0.9% sterile saline. The mixture is incorporated into a dosage unit form suitable for administration by injection.

**Example 234b: Oral Composition**

[01123] To prepare a pharmaceutical composition for oral delivery, 100 mg of a compound of Formula (I) is mixed with 750 mg of starch. The mixture is incorporated into an oral dosage unit form, such as a hard gelatin capsule, which is suitable for oral administration.

**Example 234c: Sublingual (Hard Lozenge) Composition**

[01124] To prepare a pharmaceutical composition for buccal delivery, such as a hard lozenge, mix 100 mg of a compound of Formula (I) with 420 mg of powdered sugar mixed, with 1.6 mL of light corn syrup, 2.4 mL distilled water, and 0.42 mL mint extract. The mixture is gently blended and poured into a mold to form a lozenge suitable for buccal administration.

**Example 234d: Fast-Disintegrating Sublingual Tablet**

[01125] A fast-disintegrating sublingual tablet is prepared by mixing 48.5% by weigh of a compound of Formula (I), 44.5% by weight of microcrystalline cellulose (KG-802), 5% by weight of low-substituted hydroxypropyl cellulose (50 μm), and 2% by weight of magnesium stearate. Tablets are prepared by direct compression (AAPS PharmSciTech, 2006;7(2):E41). The total weight of the compressed tablets is maintained at 150 mg. The formulation is prepared by mixing the amount of compound of Formula (I) with the total quantity of microcrystalline cellulose (MCC) and two-thirds of the quantity of low-substituted hydroxypropyl cellulose (L-HPC) by using a three dimensional manual mixer (Inversina Φ, Bioengineering AG, Switzerland) for 4.5 minutes. All of the magnesium stearate (MS) and the remaining one-third of the quantity of L-HPC are added 30 seconds before the end of mixing.

**Example 234e: Inhalation Composition**
[01126] To prepare a pharmaceutical composition for inhalation delivery, 20 mg of a compound of Formula (I) is mixed with 50 mg of anhydrous citric acid and 100 mL of 0.9% sodium chloride solution. The mixture is incorporated into an inhalation delivery unit, such as a nebulizer, which is suitable for inhalation administration.

**Example 234f: Rectal Gel Composition**

[01127] To prepare a pharmaceutical composition for rectal delivery, 100 mg of a compound of Formula (I) is mixed with 2.5 g of methylcellulose (1500 mPa), 100 mg of methylparaben, 5 g of glycerin and 100 mL of purified water. The resulting gel mixture is then incorporated into rectal delivery units, such as syringes, which are suitable for rectal administration.

**Example 234g: Topical Gel Composition**

[01128] To prepare a pharmaceutical topical gel composition, 100 mg of a compound of Formula (I) is mixed with 1.75 g of hydroxypropyl cellulose, 10 mL of propylene glycol, 10 mL of isopropyl myristate and 100 mL of purified alcohol USP. The resulting gel mixture is then incorporated into containers, such as tubes, which are suitable for topical administration.

**Example 234h: Ophthalmic Solution Composition**

[01129] To prepare a pharmaceutical ophthalmic solution composition, 100 mg of a compound of Formula (I) is mixed with 0.9 g of NaCl in 100 mL of purified water and filtered using a 0.2 micron filter. The resulting isotonic solution is then incorporated into ophthalmic delivery units, such as eye drop containers, which are suitable for ophthalmic administration.
