UNITED STATES PATENT OFFICE.

JOHN CHARLES McLEOD, OF CINCINNATI, OHIO.

MEDICAMENT-HOLDER.

1,051,149.

Specification of Letters Patent.

Patented Jan. 21, 1913.

Application filed May 3, 1912. Serial No. 694,933.

To all whom it may concern:

Be it known that I, JOHN C. McLEOD, a citizen of the United States, residing at Cincinnati, in the county of Hamilton and State of Ohio, have invented certain new and useful Improvements in Medicament-Holders, of which the following is a specification.

This invention relates to improvements in means for medicating the head, and the object of the invention is to provide a receptacle for retaining and dispensing a medicinal preparation which may be worn within the hat of a wearer.

Another object of the invention is to provide a receptacle for containing and dispensing a medicinal preparation which may be secured to a hat in such manner that the preparation will be dispensed by means of air passing through the hat, preparation, and container so that it will be held confined to the space around the head by means of the hat.

With the above and other objects in view I have invented the device illustrated in the accompanying drawings in which—

Figure 1 is a top plan view of my improved receptacle, Fig. 2 is a bottom plan view of the cover therefor, Fig. 3 is a longitudinal sectional view through my device as attached to a hat crown, and Fig. 4 is a perspective view of a hat to which my device is secured.

Like reference characters indicate like parts throughout the specification and in the several views in the drawings in which—

1 indicates a container having a bottom 2 provided with a series of perforations 3.

4 is a cover for the container 1, said cover being provided with an annular flange 5 set in from the edge 6 thereof against which the upper edge 7 of the container is adapted to tightly bind, whereby it will be held to the said cover by friction. The cover 4 is secured to the crown 8 of the hat 9 by means of rivet eyelets 10 having passages 11 through the center thereof, these eyelets being adapted to pass through openings in the cover 4 and openings in the crown of the hat 9 and rivet the cover to the hat.

Any proper medicinal preparation may

be contained in the receptacle 4 and air passing through the eyelets 10 into the receptacle and through the preparation and in through the perforations 3 to the space surrounding the wearer's head. In this manner the head of a person may be constantly treated with preparations for stimulating and invigorating the growth of hair and also for treating dandruff and other diseases of the scalp.

My device is constructed preferably of rubber, the top being of harder rubber and the receptacle proper of a softer and more pliable rubber, whereby it will not only bind securely to the flange 5 but will also prevent injury to the head of a wearer if it should be so located in the hat that it will possibly contact the head.

Having now described my invention, what I claim and desire to secure by Letters Patent is:

1. A device for holding medicinal preparations consisting of a receptacle having a perforated bottom and a cover having passages for air into said receptacle, said passages consisting of eyelets adapted to hold said cover to the crown of a hat.

2. A device for holding medicinal preparations consisting of a receptacle having a perforated bottom, a cover having passages for air into said receptacle, said passages consisting of eyelets adapted to hold said cover to the crown of a hat, said cover being of a non-flexible material and having a flange thereon adapted to engage said receptacle.

3. A device for holding medicinal preparations consisting of a receptacle having a perforated bottom, a cover having passages for air into said receptacle, said passages consisting of eyelets adapted to hold said cover to the crown of a hat, said cover being of a non-flexible material and having a flange thereon adapted to engage said receptacle, said receptacle consisting of a flexible material.

4. A device for holding medicinal preparations consisting of a receptacle having a perforated bottom, a cover having passages for air into said receptacle, said passages consisting of eyelets adapted to hold said

cover to the crown of a hat, said cover being
of a non-flexible material and having a
flange thereon adapted to engage said re-
ceptacle, said receptacle consisting of a flexi-
5 ble material, having an elastic edge adapted
to bind upon said flange.

In testimony whereof I affix my signature
in presence of two witnesses.

JOHN CHARLES McLEOD.
