UNITED STATES PATENT OFFICE.

PETER BOYLE, OF CHICAGO, ILLINOIS.

HOLDER FOR TABLETS AND PENCILS.

SPECIFICATION forming part of Letters Patent No. 327,759, dated October 6, 1885.

Application filed April 28, 1885. Serial No. 163,766. (No model.)

To all whom it may concern:

Be it known that I, PETER BOYLE, of Chicago, in the county of Cook and State of Illinois, have invented a new and Improved Holder for Tablets and Pencils, of which the following is a full, clear, and exact description.

The object of my invention is to provide a new and improved tablet or pad and pencil holder, which can be fastened on the left arm, so that the pad or tablet and pencil are at all times very handy, and cannot be misplaced or lost.

The invention consists of the construction of parts, substantially as hereinafter set forth, and pointed out in the claims.

Reference is to be had to the accompanying drawings, forming a part of this specification, in which similar letters of reference indicate corresponding parts in both the figures.

Figure 1 is a face view of my improved tablet and pencil holder, showing it applied. Fig. 2 is a cross-sectional view of the same on the line *x x*, Fig. 1.

The metal plates *A A'* are made integral with a strip, *B*, uniting them, and the said strip is bent to form a loop, *C*, in which a rubber tube, *D*, is held, forming a holder for a pencil, *E*. The plate *A* is held above the plate *A'*, which latter has upwardly-projecting flanges *A²* at three of its edges. A recess or notch, *F*, is cut in the plate *A'*, as shown.

A strap, *G*, provided with a buckle, *H*, is held in the plate *A'*, and serves to hold the holder on the arm *J*. A pad, *K*, is held on the holder by passing the pasteboard bottom plate, *L*, of the pad between the plates *A A'*, as shown.

The pad or tablet can easily be replaced by another. It is always at hand, and can be reached easily.

The holder is held on the left arm, and the person can conveniently write on the top leaf of the pad, and then tear off the said top leaf.

Having thus fully described my invention, I claim as new and desire to secure by Letters Patent—

1. A tablet and pencil holder formed of two plates united by a strip, which is bent to form a pencil-holding loop, substantially as herein shown and described.

2. In a tablet and pencil holder, the plates united by a strip bent to form a pencil-holding loop, the same also having means, substantially as described, for the connection thereof to the arm, as set forth.

3. In a tablet and pencil holder, the plate *A* and the plate *A'*, having the flange *A²* and notch *F*, which plates are united by the strip *B*, substantially as herein shown and described.

PETER BOYLE.
