METHODS OF USING ANTI-LGR5 ANTIBODIES
CROSS REFERENCE TO RELATED APPLICATIONS

[001] This application claims benefit under 35 U.S.C. §119 to provisional U.S. Application No.61/879,089, filed September 17, 2013, the contents of which are hereby incorporated by reference in their entirety.

SEQUENCE LISTING

[002] The instant application contains a Sequence Listing which has been submitted via EFS-Web and is hereby incorporated by reference in its entirety. Said ASCII copy, created on September 3, 2014, is named P5706R1-WO_SequenceListing.txt and is 51391 bytes in size.

FIELD OF THE INVENTION

[003] Provided herein are methods of using anti-LGR5 antibodies, for example, for treating a hedgehog-related disease.

BACKGROUND

[004] One of the emerging themes in cancer biology is the dependence of cancer subtypes on certain signaling pathways for continued tumor growth. For example, mutations that activate the Hedgehog (Hh) signaling pathway drive growth of a variety of cancers including basal cell carcinomas (BCCs) and medullary thyroidomas, along with pancreatic, prostate, and small cell lung cancer that account for up to 25% of all human cancer deaths (Epstein, Nat. Rev. Cancer 8:743-754 (2008)). BCCs are the most prevalent cancer in the world, and nearly half of all US citizens are likely to develop this cancer before retirement (NCI 2010). Twenty years of extensive research identifying Hh pathway components and their functional roles recently culminated in the FDA approved Hh pathway antagonist vismodegib for the treatment of locally advanced or metastatic BCCs. Although vismodegib effective, not all tumor cells are sensitive to the drug and further resistance can develop.

[005] Human LGR5 is a 907 amino acid protein, of which -540 amino acids are predicted to be in the extracellular space following cleavage of the amino-terminal signal sequence. LGR5 comprises 17 imperfect leucine-rich repeat motifs in the ectodomain, and a cysteine-rich region located between the leucine-rich repeats and the first transmembrane domain.

SUMMARY

[006] Provided herein are methods using anti-LGR5 antibodies. For example, provided herein are methods of treating a hedgehog-related disease in an individual comprising administering to the individual an effective amount of an anti-LGR5 antibody. For example, provided herein are methods of treating basal cell carcinoma in an individual comprising administering to the individual an effective amount of an anti-LGR5 antibody described herein.

[007] Also provided herein are methods of treating hedgehog-related disease in an individual comprising administering to the individual an effective amount of an anti-LGR5 antibody and an
effective amount of an inhibitor of the hedgehog pathway. For example, wherein the respective amounts the anti-LGR5 antibody and the inhibitor of the hedgehog pathway are effective to increase the period of response to therapy and/or delay the recurrence and/or development of resistance compared to treatment with the inhibitor of the hedgehog pathway alone.

[008] Provided herein are methods of increasing efficacy of a treatment of a hedgehog-related disease comprising an inhibitor of the hedgehog pathway in an individual, wherein the method comprises administering to the individual an effective amount of an anti-LGR5 antibody and an effective amount of the inhibitor of the hedgehog pathway.

[009] Further provided herein are methods of treating a hedgehog-related disease in an individual wherein the treatment comprises administering to the individual an effective amount of an anti-LGR5 antibody and an effective amount of an inhibitor of the hedgehog pathway, and wherein the treatment has increased efficacy compared to a standard treatment comprising administering an effective amount of the inhibitor of the hedgehog pathway without (in the absence of) the anti-LGR5 antibody.

[010] Also provided herein are methods of delaying and/or preventing development of the recurrence and/or resistance of a hedgehog-related disease to an inhibitor of the hedgehog pathway in an individual, comprising administering to the individual an effective amount of an anti-LGR5 antibody and an effective amount of the inhibitor of the hedgehog pathway. Also provided herein are methods of extending the period of sensitivity an inhibitor of the hedgehog pathway in an individual with a hedgehog-related disease comprising administering to the individual an effective amount of an anti-LGR5 antibody and an effective amount of the inhibitor of the hedgehog pathway. Provided herein are methods of extending the duration of response to an inhibitor of the hedgehog pathway in an individual with a hedgehog-related disease comprising administering to the individual an effective amount of an anti-LGR5 antibody and an effective amount of the inhibitor of the hedgehog pathway.

[011] Provided herein are methods of increasing sensitivity to an inhibitor of the hedgehog pathway in an individual with a hedgehog-related disease comprising administering to the individual an effective amount of an anti-LGR5 antibody and an effective amount of the inhibitor of the hedgehog pathway.

[012] In some embodiments of any of the methods, the anti-LGR5 antibody binds an epitope within amino acids 22-323 of SEQ ID NO: 67 or within amino acids 22-123 of SEQ ID NO: 67 and binds to LGR5 with an affinity of ≤ 5 nM. In some embodiments, the anti-LGR5 antibody is a monoclonal antibody. In some embodiments, the anti-LGR5 antibody is a human, humanized, or chimeric antibody. In some embodiments, the anti-LGR5 antibody is an antibody fragment that binds human LGR5 of SEQ ID NO: 67. In some embodiments, the anti-LGR5 antibody does not significantly inhibit WNT pathway signaling.

[013] In some embodiments of any of the methods, the anti-LGR5 antibody comprises: a) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 30, HVR-H2 comprising the amino acid sequence of SEQ ID NO: 31, and HVR-H3 comprising the amino acid sequence of SEQ ID NO: 32;
and b) HVR-L1 comprising the amino acid sequence of SEQ ID NO: 27, HVR-L2 comprising the amino acid sequence of SEQ ID NO: 28, and HVR-L3 comprising the amino acid sequence of SEQ ID NO: 29.

[014] In some embodiments of any of the methods, the anti-LGR5 antibody comprises: a) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 60, HVR-H2 comprising the amino acid sequence of SEQ ID NO: 61, and HVR-H3 comprising the amino acid sequence of SEQ ID NO: 62; and b) HVR-L1 comprising the amino acid sequence of SEQ ID NO: 57, HVR-L2 comprising the amino acid sequence of SEQ ID NO: 58, and HVR-L3 comprising the amino acid sequence of SEQ ID NO: 59.

[015] In some embodiments of any of the methods, wherein the anti-LGR5 antibody comprises: a) a VH sequence of SEQ ID NO: 6 and a VL sequence of SEQ ID NO: 5; b) a VH sequence of SEQ ID NO: 8 and a VL sequence of SEQ ID NO: 7; c) a VH sequence of SEQ ID NO: 10 and a VL sequence of SEQ ID NO: 9; d) a VH sequence of SEQ ID NO: 12 and a VL sequence of SEQ ID NO: 11; e) a VH sequence of SEQ ID NO: 14 and a VL sequence of SEQ ID NO: 13; f) a VH sequence of SEQ ID NO: 16 and a VL sequence of SEQ ID NO: 15; g) a VH sequence of SEQ ID NO: 18 and a VL sequence of SEQ ID NO: 17; h) a VH sequence of SEQ ID NO: 20 and a VL sequence of SEQ ID NO: 19; or i) a VH sequence of SEQ ID NO: 26 and a VL sequence of SEQ ID NO: 25.

[016] In some embodiments of any of the methods, the anti-LGR5 antibody is conjugated to a cytotoxic agent. In some embodiments, the anti-LGR5 antibody has the formula Ab-(L-D)p, wherein: (a) Ab is the anti-LGR5 antibody; (b) L is a linker; (c) D is a drug selected from a maytansinoid, an auristatin, a calicheamicin, a pyrrolobenzodiazepme, and a nemorubicin derivative; and (d) p ranges from 1-8.

[017] In some embodiments, D is an auristatin. In some embodiments, D has formula D_E

\[
\text{D}_E
\]

and wherein R^2 and R^6 are each methyl, R^3 and R^4 are each isopropyl, R^5 is H, R^7 is sec-butyl, each R^8 is independently selected from CH_3, O-CH_3, OH, and H; R^9 is H; and R^{18} is -C(R^8)_2-C(R^8)_2-aryl. In some embodiments, the drug is MMAE. In some embodiments, D is a pyrrolobenzodiazepme of Formula A:
wherein the dotted lines indicate the optional presence of a double bond between C1 and C2 or C2 and C3; R2 is independently selected from H, OH, =0, =CH2, CN, R, OR, =CH-RD, =C(RD)2, 0-S0 2-R, C0 2-R and COR, and optionally further selected from halo or dihalo, wherein RD is independently selected from R, C0 2-R, COR, CHO, C0 2-H, and halo; R6 and R9 are independently selected from H, R, OH, OR, SH, SR, NH2, NHR, NRR', NO 2, Me3Sn and halo; R7 is independently selected from H, R, OH, OR, SH, SR, NH2, NHR, NRR', NO 2, Me3Sn and halo; Q is independently selected from O, S and NH; R11 is either H, or R or, where Q is O, SO3M, where M is a metal cation; R and R' are each independently selected from optionally substituted C3_8 alkyl, C3_8 heterocyclil and C3_20 aryl groups, and optionally in relation to the group NRR', R and R' together with the nitrogen atom to which they are attached form an optionally substituted 4-, 5-, 6- or 7-membered heterocyclic ring; R12, R16, R19 and R17 are as defined for R2, R6, R9 and R7 respectively; R" is a C3_12 alkylene group, which chain may be interrupted by one or more heteroatoms and/or aromatic rings that are optionally substituted; and X and X' are independently selected from O, S and N(H). In some embodiments, D has the structure:

A(II);

wherein n is 0 or 1. In some embodiments, D has a structure selected from:

A(I);

A(III);
wherein $R$ and $R'$ are each independently selected from $H$ or $RD$, wherein $RD$ is independently selected from $R$, $C0_2R$, $COR$, $CHO$, $C0_2H$, and halo; wherein $Ar^1$ and $Ar^2$ are each independently optionally substituted $C_{1-2}aryl$; and wherein $n$ is 0 or 1. In some embodiments, $D$ is a pyrrolobenzodiazepine of Formula B:

wherein the horizontal wavy line indicates the covalent attachment site to the linker; $R^{V1}$ and $R^{V2}$ are independently selected from $H$, methyl, ethyl, phenyl, fluoro-substituted phenyl, and $C_{5-6}$ heterocyclyl; and $n$ is 0 or 1. In some embodiments, $D$ is a nemorubicin derivative. In some embodiments, $D$ has a structure selected from:

; and
In some embodiments of any of the methods, the linker is cleavable by a protease. In some embodiments, the linker comprises a val-cit dipeptide or a Phe-Lys dipeptide. In some embodiments of any of the methods, the linker is acid-labile. In some embodiments, the linker comprises hydrazone.

In some embodiments of any of the methods, the anti-LGR5 antibody has the formula:

wherein \( S \) is a sulfur atom.

In some embodiments of any of the methods, the anti-LGR5 antibody has the formula selected from the group consisting of:
In some embodiments of any of the methods, p ranges from 2-5.

In some embodiments of any of the methods, the inhibitor of the hedgehog pathway is an antagonist of smoothened. In some embodiments of any of the methods, the inhibitor of the hedgehog pathway is a cyclopamine-competitive antagonist of smoothened. In some embodiments, the antagonist of smoothened is 2-chloro-N-[4-chloro-3-(pyridin-2-yl)phenyl]-4-(methylsulfonyl)benzamide or a salt thereof. In some embodiments, the antagonist of smoothened is 2-chloro-N-[4-chloro-3-(pyridin-2-yl)phenyl]-4-(methylsulfonyl)benzamide. In some embodiments, the antagonist of smoothened is vismodegib.

In some embodiments of any of the methods, the hedgehog-related disease is cancer. In some embodiments, the cancer is basal cell carcinoma. In some embodiments, the basal cell carcinoma is
locally advanced or metastatic basal cell carcinoma. In some embodiments, the cancer is medulloblastoma. In some embodiments, the hedgehog-related disease is LGR5-positive.

In some embodiments of any of the methods, the inhibitor of the hedgehog pathway is administered concomitantly with the anti-LGR5 antibody. In some embodiments, the inhibitor of the hedgehog pathway is administered separately, sequentially, or simultaneously with the anti-LGR5 antibody.

**BRIEF DESCRIPTION OF THE FIGURES**

The patent or application file contains at least one drawing executed in color. Copies of this patent or patent application publication with color drawing(s) will be provided by the Office upon request and payment of the necessary fee.

**Figure 1** shows the extensive basal cell carcinoma observed in K14-CreER; Ptch1^{ββ}; p53^{ρρ} mice (C-D) compared to control mice (A-B).

**Figure 2** shows extensive tumor regression in K14-CreER; Ptch1^{ββ}; p53^{ρρ} mice upon treatment with GDC-0449 (vismodegib) (B) compared to untreated control K14-CreER; Ptch1^{ββ}; p53^{ρρ} mice (A). Residual disease is still observed in animal K14-CreER; Ptch1^{ββ}; p53^{ρρ} mice after treatment with 75 mg/kg GDC-0449 po BID for 56 days as shown in (C-D).

**Figure 3** shows (A) expression of Lgr5 in untreated control K14-CreER; Ptch1^{ββ}; p53^{ρρ} mice, and (B) expression of Lgr5 in K14-CreER; Ptch1^{ββ}; p53^{ρρ} mice after treatment 75 mg/kg GDC-0449 po BID for 28 days. (C-D) shows effect of DTR mediated ablation in K14-CreER; Ptch1^{ββ}; p53^{ρρ}; Lgr5^{DTR.EGFP} mice in control (5d saline) (C) and DT treated (5d) (D). DAPI is in blue, GFP is in green, and the apoptosis marker, CC3, is shown in red.

**Figure 4.** (A-B) show tumor regression in K14-CreER; Ptch1^{ββ}; p53^{ρρ}; Lgr5^{DTR.EGFP} mice after treatment 75 mg/kg GDC-0449 po BID for 38 days. (C-F) show enhanced tumor regression in K14-CreER; Ptch1^{ββ}; p53^{ρρ}; Lgr5^{DTR.EGFP} mice after treatment 75 mg/kg GDC-0449 po BID for 28 days followed by 75 mg/kg GDC-0449 po BID + DT for 8 days. (G-H) Shows that treatment with 75 mg/kg GDC-0449 po BID for 28 days followed by 75 mg/kg GDC-0449 po BID + DT for 8 days markedly reduces/eliminates residual superficial basal cell carcinoma in K14-CreER; Ptch1^{ββ}; p53^{ρρ}; Lgr5^{DTR.EGFP}. DAPI DNA staining is in blue. (G) Keratin 5 staining is in red. (H) The apoptosis marker, CC3, is in red.

**DETAILED DESCRIPTION**

1. **DEFINITIONS**

   The term "hedgehog," as used herein, refers to any member of the hedgehog family, including sonic, indian, desert and tiggy winkle. The term may be used to indicate protein or gene. The term is also used to describe homolog/ortholog sequences in different animal species.

   The terms "hedgehog (Hh) signaling pathway" and "hedgehog (Hh) signaling," as used herein, are used interchangeably and refer to the chain of events normally mediated by various
members of the signaling cascade such as hedgehog, patched (Ptch), smoothened (Smo), and Gli. The hedgehog pathway can be activated even in the absence of a hedgehog protein by activating a downstream component. By way of example only, overexpression of Smo will activate the pathway in the absence of hedgehog. Hh signaling components or members of Hh signaling pathway refer to gene products that participate in the Hh signaling pathway. An Hh signaling component frequently materially or substantially affects the transmission of the Hh signal in cells/tissues, typically resulting in changes in degree of downstream gene expression level and/or phenotypic changes. Hh signaling components, depending on their biological function and effects on the final outcome of the downstream gene activation/expression, may be divided into positive and negative regulators. A positive regulator is an Hh signaling component that positively affects the transmission of the Hh signal, i.e., stimulates downstream biological events when Hh is present. Examples include hedgehog, Smo, and Gli. A negative regulator is an Hh signaling component that negatively affects the transmission of the Hh signal, i.e., inhibits downstream biological events when Hh is present. Examples include (but are not limited to) Ptch and SuFu.

[033] The terms "hedgehog signaling antagonist(s)", "antagonists of Hh signaling" and "inhibitors of Hh signaling pathway," as used herein, are used interchangeably and refer to agents that inhibit the bioactivity of a positive Hh signaling component (such as hedgehog, Ptch, or Gli) or down-regulate the expression of the Hh signaling component. They also include agents which up-regulate a negative regulator of Hh signaling component. A hedgehog signaling antagonists may be directed to a protein encoded by any of the genes in the hedgehog pathway, including (but not limited to) sonic, indian or desert hedgehog, smoothened, ptch-1, ptch-2, gli-1, gli-2, gli-3, etc. For example, an inhibitor of Hh signaling pathway may refers to any molecule that partially or fully blocks, inhibits, or neutralizes a biological activity mediated by Hh. Examples of inhibitors include antibodies; ligand antibodies; small molecule antagonists; antisense and inhibitory RNA (e.g., shRNA) molecules. In a particular embodiment, an inhibitor has a binding affinity (dissociation constant) of about 1,000 nM or less. In another embodiment, inhibitor has a binding affinity of about 100 nM or less. In another embodiment, an inhibitor has a binding affinity of about 50 nM or less. In a particular embodiment, an inhibitor inhibits Hh signaling with an IC50 of 1,000 nM or less. In another embodiment, an inhibitor inhibits Hh signaling with an IC50 of 500 nM or less. In another embodiment, an inhibitor inhibits Hh signaling with an IC50 of 50 nM or less. In certain embodiments, the antagonist reduces or inhibits, by at least 10%, 20%, 30%, 40%, 50%, 60%, 70%, 80%, 90% or more, the expression level or biological activity of one or more Hh pathway components. In some embodiments, the inhibitor of Hh signaling is an antagonist of smoothened.

[034] The terms "Hedgehog-related disorder(s), or "Hedgehog-related disease(s)," as used herein, includes diseases and disorders associated with disruption or aberrance of the Hedgehog pathway, as well as disorders associated with normal but undesired growth states relating to activation of the Hedgehog pathway. "Hedgehog-related disorder(s)" include but are not limited to tumor formation,
cancer, neoplasia, malignant hyperproliferative disorders, and non-malignant hyperproliferative disorders. "Hedgehog-related disorder(s)" also include benign prostate hyperplasia, psoriasis, wet macular degeneration, osteopetrosis and unwanted hair growth.

[035] The term "substantially the same," as used herein, denotes a sufficiently high degree of similarity between two numeric values, such that one of skill in the art would consider the difference between the two values to be of little or no biological and/or statistical significance within the context of the biological characteristic measured by said values (e.g., Kd values or expression). The difference between said two values is, for example, less than about 50%, less than about 40%, less than about 30%, less than about 20%, and/or less than about 10% as a function of the reference/comparator value.

[036] The phrase "substantially different," as used herein, denotes a sufficiently high degree of difference between two numeric values such that one of skill in the art would consider the difference between the two values to be of statistical significance within the context of the biological characteristic measured by said values (e.g., Kd values). The difference between said two values is, for example, greater than about 10%, greater than about 20%, greater than about 30%, greater than about 40%, and/or greater than about 50% as a function of the value for the reference/comparator molecule.

[037] An "acceptor human framework" for the purposes herein is a framework comprising the amino acid sequence of a light chain variable domain (VL) framework or a heavy chain variable domain (VH) framework derived from a human immunoglobulin framework or a human consensus framework, as defined below. An acceptor human framework "derived from" a human immunoglobulin framework or a human consensus framework may comprise the same amino acid sequence thereof, or it may contain amino acid sequence changes. In some embodiments, the number of amino acid changes are 10 or less, 9 or less, 8 or less, 7 or less, 6 or less, 5 or less, 4 or less, 3 or less, or 2 or less. In some embodiments, the VL acceptor human framework is identical in sequence to the VL human immunoglobulin framework sequence or human consensus framework sequence.

[038] "Affinity" refers to the strength of the sum total of noncovalent interactions between a single binding site of a molecule (e.g., an antibody) and its binding partner (e.g., an antigen). Unless indicated otherwise, as used herein, "binding affinity" refers to intrinsic binding affinity which reflects a 1:1 interaction between members of a binding pair (e.g., antibody and antigen). The affinity of a molecule X for its partner Y can generally be represented by the dissociation constant (Kd). Affinity can be measured by common methods known in the art, including those described herein. Specific illustrative and exemplary embodiments for measuring binding affinity are described in the following.

[039] An "affinity matured" antibody refers to an antibody with one or more alterations in one or more hypervariable regions (HVRs), compared to a parent antibody which does not possess such alterations, such alterations resulting in an improvement in the affinity of the antibody for antigen.
The terms "anti-LGR5 antibody" and "an antibody that binds to LGR5" refer to an antibody that is capable of binding LGR5 with sufficient affinity such that the antibody is useful as a diagnostic and/or therapeutic agent in targeting LGR5. In one embodiment, the extent of binding of an anti-LGR5 antibody to an unrelated, non-LGR5 protein is less than about 10% of the binding of the antibody to LGR5 as measured, e.g., by a radioimmunoassay (RIA). In certain embodiments, an antibody that binds to LGR5 has a dissociation constant (Kd) of ≤ 1 μM, ≤ 10 nM, ≤ 1 nM, ≤ 0.1 nM, ≤ 0.01 nM, or ≤ 0.001 nM (e.g., 10^8 M or less, e.g. from 10^{-8} M to 10^{-15} M, e.g. from 10^{-9} M to 10^{-15} M). In certain embodiments, an anti-LGR5 antibody binds to an epitope of LGR5 that is conserved among LGR5 from different species.

The term "antibody" is used herein in the broadest sense and encompasses various antibody structures, including but not limited to monoclonal antibodies, polyclonal antibodies, multispecific antibodies (e.g., bispecific antibodies), and antibody fragments so long as they exhibit the desired antigen-binding activity.

An "antibody fragment" refers to a molecule other than an intact antibody that comprises a portion of an intact antibody and that binds the antigen to which the intact antibody binds. Examples of antibody fragments include but are not limited to Fv, Fab, Fab', Fab'-SH, F(ab')2; diabodies; linear antibodies; single-chain antibody molecules (e.g. scFv); and multispecific antibodies formed from antibody fragments.

An "antibody that binds to the same epitope" as a reference antibody refers to an antibody that blocks binding of the reference antibody to its antigen in a competition assay by 50% or more, and conversely, the reference antibody blocks binding of the antibody to its antigen in a competition assay by 50% or more. An exemplary competition assay is provided herein.

The terms "cancer" and "cancerous" refer to or describe the physiological condition in mammals that is typically characterized by unregulated cell growth/proliferation. Examples of cancer include, but are not limited to, carcinoma, lymphoma (e.g., Hodgkin's and non-Hodgkin's lymphoma), blastoma, sarcoma, and leukemia. More particular examples of such cancers include squamous cell cancer, small-cell lung cancer, non-small cell lung cancer, adenocarcinoma of the lung, squamous carcinoma of the lung, cancer of the peritoneum, hepatocellular cancer, gastrointestinal cancer, pancreatic cancer, glioma, cervical cancer, ovarian cancer, liver cancer, bladder cancer, hepatoma, breast cancer, colon cancer, colorectal cancer, small intestine cancer, endometrial or uterine carcinoma, salivary gland carcinoma, kidney cancer, liver cancer, prostate cancer, vulval cancer, thyroid cancer, hepatic carcinoma, leukemia and other lymphoproliferative disorders, and various types of head and neck cancer.

The term "chimeric" antibody refers to an antibody in which a portion of the heavy and/or light chain is derived from a particular source or species, while the remainder of the heavy and/or light chain is derived from a different source or species.
The "class" of an antibody refers to the type of constant domain or constant region possessed by its heavy chain. There are five major classes of antibodies: IgA, IgD, IgE, IgG, and IgM, and several of these may be further divided into subclasses (isotypes), e.g., IgG1, IgG2, IgG3, IgG4, IgA1, and IgA2. The heavy chain constant domains that correspond to the different classes of immunoglobulins are called α, δ, ε, γ, and μ, respectively.

The term "cytotoxic agent" as used herein refers to a substance that inhibits or prevents a cellular function and/or causes cell death or destruction. Cytotoxic agents include, but are not limited to, radioactive isotopes (e.g., At211, I131, 125I, Y90, Re186, Re188, Sm153, Bi212, P32, Pb212 and radioactive isotopes of Lu); chemotherapeutic agents or drugs (e.g., methotrexate, adriamicin, vinca alkaloids (vincristine, vinblastine, etoposide), doxorubicin, melphalan, mitomycin C, chlorambucil, daunorubicin or other intercalating agents); growth inhibitory agents; enzymes and fragments thereof such as nucleolytic enzymes; antibiotics; toxins such as small molecule toxins or enzymatically active toxins of bacterial, fungal, plant or animal origin, including fragments and/or variants thereof; and the various antitumor or anticancer agents disclosed below.

"Effector functions" refer to those biological activities attributable to the Fc region of an antibody, which vary with the antibody isotype. Examples of antibody effector functions include: Clq binding and complement dependent cytotoxicity (CDC); Fc receptor binding; antibody-dependent cell-mediated cytotoxicity (ADCC); phagocytosis; down regulation of cell surface receptors (e.g. B cell receptor); and B cell activation.

An "effective amount" of an agent, e.g., a pharmaceutical formulation, refers to an amount effective, at dosages and for periods of time necessary, to achieve the desired therapeutic or prophylactic result.

The term "epitope" refers to the particular site on an antigen molecule to which an antibody binds.

The term "Fc region" herein is used to define a C-terminal region of an immunoglobulin heavy chain that contains at least a portion of the constant region. The term includes native sequence Fc regions and variant Fc regions. In one embodiment, a human IgG heavy chain Fc region extends from Cys226, or from Pro230, to the carboxyl-terminus of the heavy chain. However, the C-terminal lysine (Lys447) of the Fc region may or may not be present. Unless otherwise specified herein, numbering of amino acid residues in the Fc region or constant region is according to the EU numbering system, also called the EU index, as described in Kabat et al., *Sequences of Proteins of Immunological Interest*, 5th Ed. Public Health Service, National Institutes of Health, Bethesda, MD, 1991.

"Framework" or "FR" refers to variable domain residues other than hypervariable region (HVR) residues. The FR of a variable domain generally consists of four FR domains: FR1, FR2, FR3, and FR4. Accordingly, the HVR and FR sequences generally appear in the following sequence in VH (or VL): FR1-H1(L1)-FR2-H2(L2)-FR3-H3(L3)-FR4.
The terms "full length antibody," "intact antibody," and "whole antibody" are used herein interchangeably to refer to an antibody having a structure substantially similar to a native antibody structure or having heavy chains that contain an Fc region as defined herein.

The term "glycosylated forms of LGR5" refers to naturally occurring forms of LGR5 that are post-translationally modified by the addition of carbohydrate residues.

The terms "host cell," "host cell line," and "host cell culture" are used interchangeably and refer to cells into which exogenous nucleic acid has been introduced, including the progeny of such cells. Host cells include "transformants" and "transformed cells," which include the primary transformed cell and progeny derived therefrom without regard to the number of passages. Progeny may not be completely identical in nucleic acid content to a parent cell, but may contain mutations. Mutant progeny that have the same function or biological activity as screened or selected for in the originally transformed cell are included herein.

A "human antibody" is one which possesses an amino acid sequence which corresponds to that of an antibody produced by a human or a human cell or derived from a non-human source that utilizes human antibody repertoires or other human antibody-encoding sequences. This definition of a human antibody specifically excludes a humanized antibody comprising non-human antigen-binding residues.

A "human consensus framework" is a framework which represents the most commonly occurring amino acid residues in a selection of human immunoglobulin VL or VH framework sequences. Generally, the selection of human immunoglobulin VL or VH sequences is from a subgroup of variable domain sequences. Generally, the subgroup of sequences is a subgroup as in Kabat et al., *Sequences of Proteins of Immunological Interest*, Fifth Edition, NIH Publication 91-3242, Bethesda MD (1991), vols. 1-3. In one embodiment, for the VL, the subgroup is subgroup kappa I as in Kabat et al., *supra*. In one embodiment, for the VH, the subgroup is subgroup III as in Kabat et al., *supra*.

A "humanized" antibody refers to a chimeric antibody comprising amino acid residues from non-human HVRs and amino acid residues from human FRs. In certain embodiments, a humanized antibody will comprise substantially all of at least one, and typically two, variable domains, in which all or substantially all of the HVRs (e.g., CDRs) correspond to those of a non-human antibody, and all or substantially all of the FRs correspond to those of a human antibody. A humanized antibody optionally may comprise at least a portion of an antibody constant region derived from a human antibody. A "humanized form" of an antibody, e.g., a non-human antibody, refers to an antibody that has undergone humanization.

The term "hypervariable region" or "HVR," as used herein, refers to each of the regions of an antibody variable domain which are hypervariable in sequence and/or form structurally defined loops ("hypervariable loops"). Generally, native four-chain antibodies comprise six HVRs; three in the VH (HI, H2, H3), and three in the VL (L1, L2, L3). HVRS generally comprise amino acid residues from...
the hypervariable loops and/or from the "complementarity determining regions" (CDRs), the latter being of highest sequence variability and/or involved in antigen recognition. Exemplary hypervariable loops occur at amino acid residues 26-32 (L1), 50-52 (L2), 91-96 (L3), 26-32 (H1), 53-55 (H2), and 96-101 (H3). (Chothia and Lesk, J. Mol. Biol. 196:901-917 (1987).) Exemplary CDRs (CDR-L1, CDR-L2, CDR-L3, CDR-H1, CDR-H2, and CDR-H3) occur at amino acid residues 24-34 of L1, 50-56 of L2, 89-97 of L3, 31-35B of H1, 50-65 of H2, and 95-102 of H3. (Kabat et al., Sequences of Proteins of Immunological Interest, 5th Ed. Public Health Service, National Institutes of Health, Bethesda, MD (1991).) With the exception of CDR1 in VH, CDRs generally comprise the amino acid residues that form the hypervariable loops. CDRs also comprise "specificity determining residues," or "SDRs," which are residues that contact antigen. SDRs are contained within regions of the CDRs called abbreviated-CDRs, or a-CDRs. Exemplary a-CDRs (a-CDR-L1, a-CDR-L2, a-CDR-L3, a-CDR-H1, a-CDR-H2, and a-CDR-H3) occur at amino acid residues 31-34 of L1, 50-55 of L2, 89-96 of L3, 31-35B of H1, 50-58 of H2, and 95-102 of H3. (See Almagro and Fransson, Front. Biosci. 13:1619-1633 (2008).) Unless otherwise indicated, HVR residues and other residues in the variable domain (e.g., FR residues) are numbered herein according to Kabat et al., supra.

[060] An "immunconjugate" is an antibody conjugated to one or more heterologous molecule(s), including but not limited to a cytotoxic agent.

[061] An "individual" or "subject" is a mammal. Mammals include, but are not limited to, domesticated animals (e.g., cows, sheep, cats, dogs, and horses), primates (e.g., humans and non-human primates such as monkeys), rabbits, and rodents (e.g., mice and rats). In certain embodiments, the individual or subject is a human.

[062] An "isolated antibody" is one which has been separated from a component of its natural environment. In some embodiments, an antibody is purified to greater than 95% or 99% purity as determined by, for example, electrophoretic (e.g., SDS-PAGE, isoelectric focusing (IEF), capillary electrophoresis) or chromatographic (e.g., ion exchange or reverse phase HPLC). For review of methods for assessment of antibody purity, see, e.g., Flatman et al., J. Chromatogr. B 848:79-87 (2007).

[063] An "isolated nucleic acid" refers to a nucleic acid molecule that has been separated from a component of its natural environment. An isolated nucleic acid includes a nucleic acid molecule contained in cells that ordinarily contain the nucleic acid molecule, but the nucleic acid molecule is present extrachromosomally or at a chromosomal location that is different from its natural chromosomal location.

[064] "Isolated nucleic acid encoding an anti-LGR5 antibody" refers to one or more nucleic acid molecules encoding antibody heavy and light chains (or fragments thereof), including such nucleic acid molecule(s) in a single vector or separate vectors, and such nucleic acid molecule(s) present at one or more locations in a host cell.
The term "LGR5," as used herein, refers to any native, mature LGR5 which results from processing of an LGR5 precursor protein in a cell. The term includes LGR5 from any vertebrate source, including mammals such as primates (e.g. humans and cynomolgus monkeys) and rodents (e.g., mice and rats), unless otherwise indicated. The term also includes naturally occurring variants of LGR5, e.g., splice variants or allelic variants. The amino acid sequence of an exemplary human LGR5 precursor protein, with signal sequence (amino acids 1-21) is shown in SEQ ID NO: 67. The amino acid sequence of an exemplary mature human LGR5.

The term "LGR5-positive cancer" refers to a cancer comprising cells that express LGR5 on their surface. For the purposes of determining whether a cell expresses LGR5 on the surface, LGR5 mRNA expression is considered to correlate to LGR5 expression on the cell surface. In some embodiments, expression of LGR5 mRNA is determined by a method selected from in situ hybridization and RT-PCR (including quantitative RT-PCR). Alternatively, expression of LGR5 on the cell surface can be determined, for example, using antibodies to LGR5 in a method such as immunohistochemistry, FACS, etc.

The term "LGR5-positive cell" refers to a cell that expresses LGR5 on its surface.

The term "monoclonal antibody" as used herein refers to an antibody obtained from a population of substantially homogeneous antibodies, i.e., the individual antibodies comprising the population are identical and/or bind the same epitope, except for possible variant antibodies, e.g., containing naturally occurring mutations or arising during production of a monoclonal antibody preparation, such variants generally being present in minor amounts. In contrast to polyclonal antibody preparations, which typically include different antibodies directed against different determinants (epitopes), each monoclonal antibody of a monoclonal antibody preparation is directed against a single determinant on an antigen. Thus, the modifier "monoclonal" indicates the character of the antibody as being obtained from a substantially homogeneous population of antibodies, and is not to be construed as requiring production of the antibody by any particular method. For example, the monoclonal antibodies to be used in accordance with the present invention may be made by a variety of techniques, including but not limited to the hybridoma method, recombinant DNA methods, phage-display methods, and methods utilizing transgenic animals containing all or part of the human immunoglobulin loci, such methods and other exemplary methods for making monoclonal antibodies being described herein.

A "naked antibody" refers to an antibody that is not conjugated to a heterologous moiety (e.g., a cytotoxic moiety) or radiolabel. The naked antibody may be present in a pharmaceutical formulation.

"Native antibodies" refer to naturally occurring immunoglobulin molecules with varying structures. For example, native IgG antibodies are heterotetrameric glycoproteins of about 150,000 daltons, composed of two identical light chains and two identical heavy chains that are disulfide-bonded. From N- to C-terminus, each heavy chain has a variable region (VH), also called a variable
heavy domain or a heavy chain variable domain, followed by three constant domains (CHI, CH2, and 
CH3). Similarly, from N- to C-terminus, each light chain has a variable region (VL), also called a 
variable light domain or a light chain variable domain, followed by a constant light (CL) domain. The 
light chain of an antibody may be assigned to one of two types, called kappa (κ) and lambda (λ), 
based on the amino acid sequence of its constant domain.

[071] The term "package insert" is used to refer to instructions customarily included in commercial 
packages of therapeutic products, that contain information about the indications, usage, dosage, 
administration, combination therapy, contraindications and/or warnings concerning the use of such 
therapeutic products.

[072] "Percent (%) amino acid sequence identity" with respect to a reference polypeptide sequence 
is defined as the percentage of amino acid residues in a candidate sequence that are identical with the 
amino acid residues in the reference polypeptide sequence, after aligning the sequences and 
introducing gaps, if necessary, to achieve the maximum percent sequence identity, and not 
considering any conservative substitutions as part of the sequence identity. Alignment for purposes of 
determining percent amino acid sequence identity can be achieved in various ways that are within the 
skill in the art, for instance, using publicly available computer software such as BLAST, BLAST-2, 
ALIGN or Megalign (DNASTAR) software. Those skilled in the art can determine appropriate 
parameters for aligning sequences, including any algorithms needed to achieve maximal alignment 
over the full length of the sequences being compared. For purposes herein, however, % amino acid 
sequence identity values are generated using the sequence comparison computer program ALIGN-2. 
The ALIGN-2 sequence comparison computer program was authored by Genentech, Inc., and the 
source code has been filed with user documentation in the U.S. Copyright Office, Washington D.C., 
20559, where it is registered under U.S. Copyright Registration No. TXU510087. The ALIGN-2 
program is publicly available from Genentech, Inc., South San Francisco, California, or may be 
compiled from the source code. The ALIGN-2 program should be compiled for use on a UNIX 
operating system, including digital UNIX V4.0D. All sequence comparison parameters are set by the 
ALIGN-2 program and do not vary.

[073] In situations where ALIGN-2 is employed for amino acid sequence comparisons, the % 
amino acid sequence identity of a given amino acid sequence A to, with, or against a given amino acid 
sequence B (which can alternatively be phrased as a given amino acid sequence A that has or 
comprises a certain % amino acid sequence identity to, with, or against a given amino acid sequence 
B) is calculated as follows:

$$100 \times \frac{X}{Y}$$

where X is the number of amino acid residues scored as identical matches by the sequence alignment 
program ALIGN-2 in that program's alignment of A and B, and where Y is the total number of amino
acid residues in B. It will be appreciated that where the length of amino acid sequence A is not equal to the length of amino acid sequence B, the % amino acid sequence identity of A to B will not equal the % amino acid sequence identity of B to A. Unless specifically stated otherwise, all % amino acid sequence identity values used herein are obtained as described in the immediately preceding paragraph using the ALIGN-2 computer program.

The term "pharmaceutical formulation" refers to a preparation which is in such form as to permit the biological activity of an active ingredient contained therein to be effective, and which contains no additional components which are unacceptably toxic to a subject to which the formulation would be administered.

A "pharmaceutically acceptable carrier" refers to an ingredient in a pharmaceutical formulation, other than an active ingredient, which is nontoxic to a subject. A pharmaceutically acceptable carrier includes, but is not limited to, a buffer, excipient, stabilizer, or preservative.

As used herein, "treatment" (and grammatical variations thereof such as "treat" or "treating") refers to clinical intervention in an attempt to alter the natural course of the individual being treated, and can be performed either for prophylaxis or during the course of clinical pathology. Desirable effects of treatment include, but are not limited to, preventing occurrence or recurrence of disease, alleviation of symptoms, diminishment of any direct or indirect pathological consequences of the disease, preventing metastasis, decreasing the rate of disease progression, amelioration or palliation of the disease state, and remission or improved prognosis. In some embodiments, antibodies of the invention are used to delay development of a disease or to slow the progression of a disease.

The term "concomitantly" is used herein to refer to administration of two or more therapeutic agents, give in close enough temporal proximity where their individual therapeutic effects overlap in time. Accordingly, concurrent administration includes a dosing regimen when the administration of one or more agent(s) continues after discontinuing the administration of one or more other agent(s). In some embodiments, the concomitantly administration is concurrently, sequentially, and/or simultaneously.

By "reduce or inhibit" is meant the ability to cause an overall decrease of 20%, 30%, 40%, 50%, 60%, 70%, 75%, 80%, 85%, 90%, 95%, or greater. Reduce or inhibit can refer to the symptoms of the disorder being treated, the presence or size of metastases, or the size of the primary tumor.

The term "variable region" or "variable domain" refers to the domain of an antibody heavy or light chain that is involved in binding the antibody to antigen. The variable domains of the heavy chain and light chain (VH and VL, respectively) of a native antibody generally have similar structures, with each domain comprising four conserved framework regions (FRs) and three hypervariable regions (HVRs). (See, e.g., Kindt et al. *Kuby Immunology*, 6th ed., W.H. Freeman and Co., page 91 (2007).) A single VH or VL domain may be sufficient to confer antigen-binding specificity. Furthermore, antibodies that bind a particular antigen may be isolated using a VH or VL domain from an antibody that binds the antigen to screen a library of complementary VL or VH

[080] The term "vector," as used herein, refers to a nucleic acid molecule capable of propagating another nucleic acid to which it is linked. The term includes the vector as a self-replicating nucleic acid structure as well as the vector incorporated into the genome of a host cell into which it has been introduced. Certain vectors are capable of directing the expression of nucleic acids to which they are operatively linked. Such vectors are referred to herein as "expression vectors."

[081] "Alkyl" is C1-C18 hydrocarbon containing normal, secondary, tertiary or cyclic carbon atoms. Examples are methyl (Me, -CH3), ethyl (Et, -CH2CH3), 1-propyl (n-Pr, n-propyl, -CH2CH2CH3), 2-propyl (i-Pr, i-propyl, -CH(CH3)2), 1-butyl (n-Bu, n-butyl, -CH2CH2CH2CH3), 2-methyl-1-propyl (i-Bu, i-butyl, -CH2CH(CH3)2), 2-butyl (s-Bu, s-butyl, -CH(CH3)CH2CH3), 2-methyl-2-propyl (t-Bu, t-butyl, -CH2CH2CH2CH3), 2-pentyl (-CH(CH3)2CH2CH2CH3), 3-pentyl (-CH2CH2CH2CH3), 2-methyl-2-butyl (-C(CH3)2CH2CH3), 3-methyl-2-butyl (-CH(CH3)CH2CH3), 3-methyl-1-butyl (-CH2CH2CH2CH3), 2-methyl-1-butyl (-CH2CH(CH3)CH2CH3), 1-hexyl (-CH2CH2CH2CH2CH3), 2-hexyl (-CH2CH(CH3)2CH2CH3), 3-hexyl (-CH2CH2CH3(CH2)2CH3), 2-methyl-2-pentyl (-C(CH3)2CH2CH2CH3), 3-methyl-2-pentyl (-CH(CH3)2CH(CH3)CH2CH3), 4-methyl-2-pentyl (-CH2CH(CH3)CH2CH2CH3), 3-methyl-3-pentyl (-C(CH3)(CH2)CH3), 2-methyl-3-pentyl (-CH2CH2CH3(CH2)3), 2,3-dimethyl-2-butyl (-C(CH3)2CH2CH3), 3,3-dimethyl-2-butyl (-CH2CH(CH3)2CH2CH3).

[082] The term "C1-C8 alkyl," as used herein refers to a straight chain or branched, saturated or unsaturated hydrocarbon having from 1 to 8 carbon atoms. Representative "C1-C8 alkyl" groups include, but are not limited to, -methyl, -ethyl, -n-propyl, -n-butyl, -n-pentyl, -n-hexyl, -n-heptyl, -n-octyl, -n-nonyl and -n-decyl; while branched C1-C8 alkyλs include, but are not limited to, -isopropyl, -sec-butyl, -isobutyl, -tert-butyl, -isopentyl, 2-methylbutyl, unsaturated C1-C8 alkyλs include, but are not limited to, -vinyl, -allyl, -1-butenyl, -2-butenyl, -isobutenyl, -1-pentenyl, -2-pentenyl, -3-methyl-1-butenyl, -2-methyl-2-butyl, -2,3-dimethyl-2-butenyl, 1-hexyl, 2-hexyl, 3-hexyl,-acetylenyl, -propynyl, -1-butynyl, -2-butylnyl, -1-pentylnyl, -2-pentylnyl, -3-methyl-1 butynyl. A C1-C8 alkyl group can be unsubstituted or substituted with one or more groups including, but not limited to, -C1-C8 alkyl, -O-(C1-C8 alkyl), -aryl, -C(0)R', -OC(0)R', -C(0)OR', -C(0)NH2, -C(0)NR', -C(0)N(R')2 -NHC(0)R', -SO2R', -S(0)R', -S(0)R', -OH, -halogen, -N3, -NH2, -NH(R'), -N(R')2 and -CN; where each R' is independently selected from H, -C1-C8 alkyl and aryl.

[083] The term "C9-C12 alkyl," as used herein refers to a straight chain or branched, saturated or unsaturated hydrocarbon having from 1 to 12 carbon atoms. A C9-C12 alkyl group can be unsubstituted or substituted with one or more groups including, but not limited to, -C1-C8 alkyl, -O-
(Ci-Cg alkyl), -aryl, -C(0)R', -OC(0)R', -C(0)OR', -C(0)NH₂, -C(0)NHR', -C(0)N(R')₂, -NHC(0)R', -SO₃R', -S(0)₂R', ... atoms from the same or two different carbon atoms of a parent alkane. Typical alkyl ene radicals include, but are not limited to, -methyl, -ethyl, -n-propyl, -n-butyl, and n-hexyl; while branched Ci-C₆ alkyls include, but are not limited to, -isopropyl, -sec-butyl, -isobutyl, -tert-butyl, -isopentyl, and 2-methylbutyl; unsaturated Ci-C₆ alkyls include, but are not limited to, -vinyl, -allyl, -1-butene, -2-butenyl, and -isobutenyl. A C₁-C₄ alkyl group can be unsubstituted or substituted with one or more groups, as described above for Ci-C₆ alkyl group.

[084] The term "Ci-C₆ alkyl," as used herein refers to a straight chain or branched, saturated or unsaturated hydrocarbon having from 1 to 6 carbon atoms. Representative "Ci-C₆ alkyl" groups include, but are not limited to, -methyl, -ethyl, -n-propyl, -n-butyl, and n-hexyl; while branched Ci-C₆ alkyls include, but are not limited to, -isopropyl, -sec-butyl, -isobutyl, -tert-butyl, -isopentyl, and 2-methylbutyl; unsaturated Ci-C₆ alkyls include, but are not limited to, -vinyl, -allyl, -1-butene, -2-butenyl, and -isobutenyl. A Ci-C₆ alkyl group can be unsubstituted or substituted with one or more groups, as described above for Ci-C₆ alkyl group.

[085] The term "C₁-C₄ alkyl," as used herein refers to a straight chain or branched, saturated or unsaturated hydrocarbon having from 1 to 4 carbon atoms. Representative "C₁-C₄ alkyl" groups include, but are not limited to, -methyl, -ethyl, -n-propyl, -n-butyl; while branched C₁-C₄ alkyls include, but are not limited to, -isopropyl, -sec-butyl, -isobutyl, -tert-butyl; unsaturated C₁-C₄ alkyls include, but are not limited to, -vinyl, -allyl, -1-butene, -2-butenyl, and -isobutenyl. A C₁-C₄ alkyl group can be unsubstituted or substituted with one or more groups, as described above for Ci-C₆ alkyl group.

[086] "Alkoxy" is an alkyl group singly bonded to an oxygen. Exemplary alkoxy groups include, but are not limited to, methoxy (-OCH₃) and ethoxy (-OCH₂CH₃). A "C₁-C₅ alkoxy" is an alkoxy group with 1 to 5 carbon atoms. Alkoxy groups may be unsubstituted or substituted with one or more groups, as described above for alkyl groups.

[087] "Alkenyl" is C₂-C₈ hydrocarbon containing normal, secondary, tertiary or cyclic carbon atoms with at least one site of unsaturation, i.e. a carbon-carbon, σ² double bond. Examples include, but are not limited to: ethylene or vinyl (-CH=CH₂), allyl (-CH₂=CH⁻CH₃), cyclopentenyl (-C₅H₅), and 5-hexenyl (-CH₂CH₃CH₂CH₂CH=CH₂). A "C₂-C₈ alkenyl" is a hydrocarbon containing 2 to 8 normal, secondary, tertiary or cyclic carbon atoms with at least one site of unsaturation, i.e. a carbon-carbon, σ² double bond.

[088] "Alkynyl" is C₂-C₁₈ hydrocarbon containing normal, secondary, tertiary or cyclic carbon atoms with at least one site of unsaturation, i.e. a carbon-carbon, σ triple bond. Examples include, but are not limited to: acetylenic (-C=CH) and propargyl (-CH₂C=CH). A "C₂-C₈ alkynyl" is a hydrocarbon containing 2 to 8 normal, secondary, tertiary or cyclic carbon atoms with at least one site of unsaturation, i.e. a carbon-carbon, σ triple bond.

[089] "Alkylene" refers to a saturated, branched or straight chain or cyclic hydrocarbon radical of 1-18 carbon atoms, and having two monovalent radical centers derived by the removal of two hydrogen atoms from the same or two different carbon atoms of a parent alkane. Typical alkylene radicals include, but are
not limited to: methylene (-CH₂-) 1,2-ethyl (-CH₂CH₂-), 1,3-propyl (-CH₂CH₂CH₂-), 1,4-butyl (-CH₂CH₂CH₂CH₂-), and the like.

[090] A "Cl-C₁₀ alkylene" is a straight chain, saturated hydrocarbon group of the formula -(CH₂)ₘ-, where ₘ 10. Examples of a Cl-C₁₀ alkylene include methylene, ethylene, propylene, butylene, pentylene, hexylene, heptylene, octylene, nonylene and decalene.

[091] "Alkenylene" refers to an unsaturated, branched or straight chain or cyclic hydrocarbon radical of 2-18 carbon atoms, and having two monovalent radical centers derived by the removal of two hydrogen atoms from the same or two different carbon atoms of a parent alkene. Typical alkenylene radicals include, but are not limited to: 1,2-ethylene (-CH=CH-).

[092] "Alkynylene" refers to an unsaturated, branched or straight chain or cyclic hydrocarbon radical of 2-18 carbon atoms, and having two monovalent radical centers derived by the removal of two hydrogen atoms from the same or two different carbon atoms of a parent alkyne. Typical alkynylene radicals include, but are not limited to: acetylene (-C≡C-), propargyl (-CH₂C≡C-), and 4-pentylnyl (-CH₂CH₂CH₂C≡C-).

[093] "Aryl" refers to a carbocyclic aromatic group. Examples of aryl groups include, but are not limited to, phenyl, naphthyl and anthracenyl. A carbocyclic aromatic group or a heterocyclic aromatic group can be unsubstituted or substituted with one or more groups including, but not limited to, -C₁-C₈ alkyl, -0-(C₁-C₈ alkyl), -aryl, -C(0)R', -OC(0)R', -C(0)OR', -C(0)NH₂, -C(0)NHR', -C(0)N(R')₂, -NHC(0)R', -S(0)₂R', -S(0)R', -OH, -halogen, -N₃, -NH₂, -NH(R'), -N(R')₂ and -CN; wherein each R' is independently selected from H, -Cl-C₈ alkyl and aryl.

[094] A "C₅-C₂₀ aryl" is an aryl group with 5 to 20 carbon atoms in the carbocyclic aromatic rings. Examples of C₅-C₂₀ aryl groups include, but are not limited to, phenyl, naphthyl and anthracenyl. A C₅-C₂₀ aryl group can be substituted or unsubstituted as described above for aryl groups. A "C₅-C₁₄ aryl" is an aryl group with 5 to 14 carbon atoms in the carbocyclic aromatic rings. Examples of C₅-C₁₄ aryl groups include, but are not limited to, phenyl, naphthyl and anthracenyl. A C₅-C₁₄ aryl group can be substituted or unsubstituted as described above for aryl groups.

[095] An "arylene" is an aryl group which has two covalent bonds and can be in the ortho, meta, or para configurations as shown in the following structures:

in which the phenyl group can be unsubstituted or substituted with up to four groups including, but not limited to, -C₁-C₈ alkyl, -0-(C₁-C₈ alkyl), -aryl, -C(0)R', -OC(0)R', -C(0)OR', -C(0)NH₂, -C(0)NHR', -C(0)N(R')₂, -NHC(0)R', -S(0)₂R', -S(0)R', -OH, -halogen, -N₃, -NH₂, -NH(R'), -N(R')₂ and -CN; wherein each R' is independently selected from H, -Cl-C₈ alkyl and aryl.
"Arylalkyl" refers to an acyclic alkyl radical in which one of the hydrogen atoms bonded to a carbon atom, typically a terminal or sp³ carbon atom, is replaced with an aryl radical. Typical arylalkyl groups include, but are not limited to, benzyl, 2-phenylethan-1-yl, 2-phenylethen-1-yl, naphthylmethyl, 2-naphthylethan-1-yl, 2-naphthylethen-1-yl, naphthobenzyl, 2-naphthophenylethan-1-yl and the like. The arylalkyl group comprises 6 to 20 carbon atoms, e.g. the alkyl moiety, including alkanoyl, alkenyl or alkynyl groups, of the arylalkyl group is 1 to 6 carbon atoms and the aryl moiety is 5 to 14 carbon atoms.

"Heteroarylalkyl" refers to an acyclic alkyl radical in which one of the hydrogen atoms bonded to a carbon atom, typically a terminal or sp³ carbon atom, is replaced with a heteroaryl radical. Typical heteroarylalkyl groups include, but are not limited to, 2-benzimidazolymethyl, 2-furylthethyl, and the like. The heteroarylalkyl group comprises 6 to 20 carbon atoms, e.g. the alkyl moiety, including alkanoyl, alkenyl or alkynyl groups, of the heteroarylalkyl group is 1 to 6 carbon atoms and the heteroaryl moiety is 5 to 14 carbon atoms and 1 to 3 heteroatoms selected from N, O, P, and S.

The heteroaryl moiety of the heteroarylalkyl group may be a monocycle having 3 to 7 ring members (2 to 6 carbon atoms or a bicycle having 7 to 10 ring members (4 to 9 carbon atoms and 1 to 3 heteroatoms selected from N, O, P, and S), for example: a bicyclo [4,5], [5,5], [5,6], or [6,6] system.

"Substituted alkyl," "substituted aryl," and "substituted arylalkyl" mean alkyl, aryl, and arylalkyl respectively, in which one or more hydrogen atoms are each independently replaced with a substituent. Typical substituents include, but are not limited to, -X, -R, -O-, -OR, -SR, -S-, -NR₂, -NR₃, =NR, -CX₃, -CN, -OCN, -SCN, -N=C=O, -NCS, -NO, -N₀₂, =N₂, -N₃, NC(=0)R, -C(=0)R, -S₀₂, -S₀₃, -SO₂H, -S(=0)₂OR, -S(=0)₂NR, -S(=0)₂R, -OP(=0)(OR)₂, -P(=0)(OR)₂, -P₀₂, -P₀₂H₂, -C(=0)R, -C(=0)X, -C(=S)R, -C₀₂₀R, -C₀₂₀R, -C(=S)OR, -C(=0)SR, -C(=0)S₁₀R, -C(=0)S₁₀R, -C(=S)NR₂, where each X is independently a halogen: F, Cl, Br, or I; and each R is independently -H, C₆H₅, alkyl, C₆H₅, aryl, C₆H₅, heterocycle, protecting group or prodrug moiety.

Alkylene, alkenylene, and alkynylene groups as described above may also be similarly substituted.

"Heteroaryl" and "heterocycle" refer to a ring system in which one or more ring atoms is a heteroatom, e.g. nitrogen, oxygen, and sulfur. The heterocycle radical comprises 3 to 20 carbon atoms and 1 to 3 heteroatoms selected from N, O, P, and S. A heterocycle may be a monocycle having 3 to 7 ring members (2 to 6 carbon atoms and 1 to 3 heteroatoms selected from N, O, P, and S) or a bicycle having 7 to 10 ring members (4 to 9 carbon atoms and 1 to 3 heteroatoms selected from N, O, P, and S), for example: a bicyclo [4,5], [5,5], [5,6], or [6,6] system.

Examples of heterocycles include by way of example and not limitation pyridyl, dihydropyridyl, tetrahydropropyridyl (piperidyl), thiazolyl, tetrahydrothiophenyl, sulfur oxidized tetrahydrothiophenyl, pyrimidinyl, furanyl, thienyl, pyrrolol, pyrazolyl, imidazolyl, tetrazolyl, benzfurananyl, thianaphthalenyl, indolyl, indolenyl, quinolinyl, isoquinolinyl, benzimidazolyl, piperidinyl, 4-piperidonyl, pyrrolidinyl, 2-pyrrolidonyl, pyrrolinyl, tetrahydrofuranyl, bis-tetrahydrofuranyl, bis-tetrahydropropyryl, tetrahydroquinolinyl, tetrahydroisoquinolinyl, decahydroquinolinyl, octahydroisoquinolinyl, azocinyl, triazinyl, 6H-1,2,5-thiadiazinyl, 2H,6H-1,5,2-dithiazinyl, thienyl, thianthrenyl, pyranyl, isobenzofurananyl, chromenyl, xanthenyl, phenoxathinyl, 2-H-pyrrolyl, isothiazolyl, isoxazolyl, pyrazinyl, pyridazinyl, indolizinyl, isoindolyl, 3H-indolyl, 1H-indazolyl, purinyl, 4H-quinolizinyll, phthalazinyl, naphthyridinyl, quinoxalinyll, quinazolinyll, cinnolinyll, pteridinyl, 4aH-carbazolyl, carbazolyl, β-carbolinyl, phenanthridinyl, acridinyl, pyrimidinyl, phenanthrolinyl, phenazinyl, phenothiazinyl, furazanyl, phenoazinyl, isochromanyl, chromanyll, imidazolidinyl, imidazolinyll, pyrazolidinyl, pyrazolinyll, piperazinyl, indolinyll, isoindolinyll, quinuclidinyll, morpholinyll, oxazolidinyl, benzotriazolyl, benzisoxazolinyll, oxindolyl, benzoxazolinyll, and isatinoyl.

By way of example and not limitation, carbon bonded heterocycles are bonded at position 2, 3, 4, 5, or 6 of a pyridine, position 3, 4, 5, or 6 of a pyridazine, position 2, 3, 4, or 5 of a furan, tetrahydrofuranyl, thiophene, pyrrole or tetrahydropropyrole, position 2, 3, or 5 of an oxazole, imidazole or thiazole, position 3, 4, or 5 of an azoxidinyl, pyrazole, or isothiazole, position 2, 3, or 4 of an azetidine, position 2, 3, 4, 5, 6, 7, or 8 of a quinoline or position 1, 3, 4, 5, 6, 7, or 8 of an isoquinoline. Still more typically, carbon bonded heterocycles include 2-pyridyl, 3-pyridyl, 4-pyridyl, 5-pyridyl, 6-pyridyl, 3-pyridazinyl, 4-pyridazinyl, 5-pyridazinyl, 6-pyridazinyl, 2-pyrimidinyl, 4-pyrimidinyl, 5-pyrimidinyl, 6-pyrimidinyl, 2-pyrinyl, 3-pyrinyl, 5-pyrinyl, 6-pyrinyl, 2-thiazolyl, 4-thiazolyl, or 5-thiazolyl.

By way of example and not limitation, nitrogen bonded heterocycles are bonded at position 1 of an aziridine, azetidine, pyrrole, pyrroldine, 2-pyrroline, 3-pyrroline, imidazole, imidazolidine, 2-imidazoline, 3-imidazoline, pyrazole, pyrazolone, 2-pyrazolene, 3-pyrazoline, piperidine, piperazine, indole, indoline, 1H-indazolene, position 2 of a isoindole, or isoindoline, position 4 of a morpholine, and position 9 of a carbazole, or β-carboline. Still more typically, nitrogen bonded heterocycles include 1-aziridyl, 1-azetidyl, 1-pyrrolyll, 1-imidazolyl, 1-pyrrolinyl, and 1-piperidinyl.

A "C₃-C₈ heterocycle" refers to an aromatic or non-aromatic C₃-C₈ carbocycle in which one to four of the ring carbon atoms are independently replaced with a heteroatom from the group consisting of O, S and N. Representative examples of a C₃-C₈ heterocycle include, but are not limited to, benzofurananyl, benzothiophene, indolyl, benzopyrazolonyll, coumarinyl, isoquinolinyl, pyrrolol, thiophenyl, furanyl, thiazolyl, imidazolyl, pyrazolyl, triazolyl, quinolinyl, pyrimidinyl, pyridinyl, pyridonyll, pyrazinyl, pyridazinyl, isothiazolyl, isoazolyl and tetrazolyl. A C₃-C₈ heterocycle can be
unsubstituted or substituted with up to seven groups including, but not limited to, -Cl-C₈ alkyl, -O-
(Cl-C₉ alkyl), -ary, -C(0)R', -OC(0)R', -C(0)OR', -C(0)NH₂, -C(0)NHR', -C(0)N(R')₂ -
NHC(0)R', -S(0)₂R', -S(0)OR', -OH, -halogen, -N₃, -NH₂, -NH(R'), -N(R')₂ and -CN; wherein each
R' is independently selected from H, -Cl-C₈ alkyl and aryl.

[01 05] "C₃-C₅ heterocyclo" refers to a C₃-C₅ heterocycle group defined above wherein one of the
heterocycle group's hydrogen atoms is replaced with a bond. A C₃-C₅ heterocycle can be
unsubstituted or substituted with up to six groups including, but not limited to, -C₁-C₈ alkyl, -O-(C₁-
C₈ alkyl), -ary, -C(0)R', -OC(0)R', -C(0)OR', -C(0)NH₂, -C(0)NHR', -C(0)N(R')₂ -NHC(0)R', -
S(0)₂R', -S(0)OR', -OH, -halogen, -N₃, -NH₂, -NH(R'), -N(R')₂ and -CN; wherein each R' is
independently selected from H, -Cl-C₈ alkyl and aryl.

[01 06] A "C₃-C₅₆ heterocycle" refers to an aromatic or non-aromatic C₃-C₅₆ carbocycle in which one
to four of the ring carbon atoms are independently replaced with a heteroatom from the group
consisting of O, S and N. A C₃-C₅₆ heterocycle can be unsubstituted or substituted with up to seven
groups including, but not limited to, -C₁-C₈ alkyl, -O-(C₁-C₈ alkyl), -ary, -C(0)R', -OC(0)R', -
C(0)OR', -C(0)NH₂, -C(0)NHR', -C(0)N(R')₂ -NHC(0)R', -S(0)₂R', -S(0)OR', -OH, -halogen, -N₃,
-NH₂, -NH(R'), -N(R')₂ and -CN; wherein each R' is independently selected from H, -C₁-C₈ alkyl
and aryl.

[01 07] "C₅-C₅₆ heterocyclo" refers to a C₅-C₅₆ heterocycle group defined above wherein one of the
heterocycle group's hydrogen atoms is replaced with a bond.

[01 08] "Carbocycle" means a saturated or unsaturated ring having 3 to 7 carbon atoms as a
monocycle or 7 to 12 carbon atoms as a bicyclic. Monocyclic carbocycles have 3 to 6 ring atoms, still
more typically 5 or 6 ring atoms. Bicyclic carbocycles have 7 to 12 ring atoms, e.g. arranged as a
bicyclo [4,5], [5,5], [5,6] or [6,6] system, or 9 or 10 ring atoms arranged as a bicyclo [5,6] or [6,6]
system. Examples of monocyclic carbocycles include cyclopropyl, cyclobutyl, cyclopentyl, 1-
cyclopent-1-enyl, 1-cyclopent-2-enyl, 1-cyclopent-3-enyl, cyclohexyl, 1-cyclohex-1-enyl, 1-cyclohex-
2-enyl, 1-cyclohex-3-enyl, cycloheptyl, and cyclooctyl.

[01 09] A "C₃-C₈ carbocycle" is a 3-, 4-, 5-, 6-, 7- or 8-membered saturated or unsaturated non-
aromatic carbocyclic ring. Representative C₃-C₈ carbocycles include, but are not limited to,
- cyclopropyl, -cyclobutyl, -cyclopentadienyl, -cyclohexyl, -cyclohexadienyl, -1,3-
cyclohexadienyl, -1,4-cyclohexadienyl, -cycloheptyl, -1,3-cycloheptadienyl, -1,3,5-cycloheptatrienyl,
-cyclooctyl, and -cyclooctadienyl. A C₃-C₈ carbocycle group can be unsubstituted or substituted with
one or more groups including, but not limited to, -Cl-C₈ alkyl, -O-(Cl-C₈ alkyl), -ary, -C(0)R', -
OC(0)R', -C(0)OR', -C(0)NH₂, -C(0)NHR', -C(0)N(R')₂ -NHC(0)R', -S(0)₂R', -S(0)OR', -OH,
-halogen, -N₃, -NH₂, -NH(R'), -N(R')₂ and -CN; wherein each R' is independently selected from H, -Cl-
C₈ alkyl and aryl.

[01 10] A "C₅-C₈ carbocyclo" refers to a C₅-C₈ carbocycle group defined above wherein one of the
carbocycle groups' hydrogen atoms is replaced with a bond.
"Linker" refers to a chemical moiety comprising a covalent bond or a chain of atoms that covalently attaches an antibody to a drug moiety. In various embodiments, linkers include a divalent radical such as an alkylidyl, an arylidyl, a heteroarylidyl, moieties such as: \(- (\text{CR}_2)_n \text{O(} \text{CR}_2)\text{)} \), repeating units of alkyleneoxy (e.g. polyethyleneoxy, PEG, polymethyleneoxy) and alkylamino (e.g. polyethyleneamino, Jeffamine™); and diacid ester and amides including succinate, succinamide, diglycolate, malonate, and caproamide. In various embodiments, linkers can comprise one or more amino acid residues, such as valine, phenylalanine, lysine, and homolysine.

The term "chiral" refers to molecules which have the property of non-superimposability of the mirror image partner, while the term "achiral" refers to molecules which are superimposable on their mirror image partner.

The term "stereoisomers" refers to compounds which have identical chemical constitution, but differ with regard to the arrangement of the atoms or groups in space.

"Diastereomer" refers to a stereoisomer with two or more centers of chirality and whose molecules are not mirror images of one another. Diastereomers have different physical properties, e.g. melting points, boiling points, spectral properties, and reactivities. Mixtures of diastereomers may separate under high resolution analytical procedures such as electrophoresis and chromatography.

"Enantiomers" refer to two stereoisomers of a compound which are non-superimposable mirror images of one another.

Stereochemical definitions and conventions used herein generally follow S. P. Parker, Ed., *McGraw-Hill Dictionary of Chemical Terms* (1984) McGraw-Hill Book Company, New York; and Elie, E. and Wilen, S., *Stereochemistry of Organic Compounds* (1994) John Wiley & Sons, Inc., New York. Many organic compounds exist in optically active forms, i.e., they have the ability to rotate the plane of plane-polarized light. In describing an optically active compound, the prefixes D and L, or \( R \) and \( S \), are used to denote the absolute configuration of the molecule about its chiral center(s). The prefixes \( d \) and \( l \) or (+) and (-) are employed to designate the sign of rotation of plane-polarized light by the compound, with (-) or 1 meaning that the compound is levorotatory. A compound prefixed with (+) or \( d \) is dextrorotatory. For a given chemical structure, these stereoisomers are identical except that they are mirror images of one another. A specific stereoisomer may also be referred to as an enantiomer, and a mixture of such isomers is often called an enantiomeric mixture. A 50:50 mixture of enantiomers is referred to as a racemic mixture or a racemate, which may occur where there has been no stereoselection or stereospecificity in a chemical reaction or process. The terms "racemic mixture" and "racemate" refer to an equimolar mixture of two enantiomeric species, devoid of optical activity.

"Leaving group" refers to a functional group that can be substituted by another functional group. Certain leaving groups are well known in the art, and examples include, but are not limited to,
a halide (e.g., chloride, bromide, iodide), methanesulfonyl (mesyl), p-toluenesulfonyl (tosyl),
trifluoromethylsulfonyl (triflate), and trifluoromethylsulfonate.

[0118] The term "protecting group" refers to a substituent that is commonly employed to block or
protect a particular functionality while reacting other functional groups on the compound. For
example, an "amino-protecting group" is a substituent attached to an amino group that blocks or
protects the amino functionality in the compound. Suitable amino-protecting groups include, but are
not limited to, acetyl, trifluoroacetyl, t-butoxycarbonyl (BOC), benzyloxy carbonyl (CBZ) and 9-
fluorenylmethylenoxycarbonyl (Fmoc). For a general description of protecting groups and their use,
see T. W. Greene, Protective Groups in Organic Synthesis, John Wiley & Sons, New York, 1991, or a
later edition.

II. THERAPEUTIC METHODS

A. Therapeutic Methods

[0119] Provided herein are methods using anti-LGR5 antibodies. For example, provided herein are
methods of treating a hedgehog-related disease in an individual comprising administering to the
individual an effective amount of an anti-LGR5 antibody. For example, provided herein are methods
of treating basal cell carcinoma in an individual comprising administering to the individual an
effective amount of an anti-LGR5 antibody described herein. In some embodiments, the anti-LGR5
antibody is an anti-LGR5 antibody conjugated to a cytotoxic agent (also referred to herein as
immunoconjugate). In some embodiments, the anti-LGR5 antibody does not significantly inhibit wnt
pathway signaling. In some embodiments, the hedgehog-related disease is basal cell carcinoma
("BCC"). In some embodiments, the basal cell carcinoma is locally advanced BCC or metastatic
BCC. In some embodiments, the hedgehog-related disease is medulloblastoma.

[0120] Also provided herein are methods of treating hedgehog-related disease in an individual
comprising administering to the individual an effective amount of an anti-LGR5 antibody and an
effective amount of an inhibitor of the hedgehog pathway. For example, wherein the respective
amounts the anti-LGR5 antibody and the inhibitor of the hedgehog pathway are effective to increase
the period of response to therapy and/or delay the recurrence and/or development of resistance
compared to treatment with the inhibitor of the hedgehog pathway alone. In some embodiments, the
inhibitor of the hedgehog pathway is an antagonist of smoothened. In some embodiments, the
inhibitor of the hedgehog pathway is a cyclopamine-competitive antagonist of smoothened. In some
embodiments, the antagonist of smoothened is 2-chloro-N-[4-chloro-3-(pyridin-2-yl)phenyl]-4-
(methylsulfonyl)benzamide or a salt thereof. In some embodiments, the antagonist of smoothened is 2-
chloro-N-[4-chloro-3-(pyridin-2-yl)phenyl]-4-(methylsulfonyl)benzamide. In some embodiments, the
antagonist of smoothened is vismodegib. In some embodiments, the anti-LGR5 antibody is an anti-
LGR5 antibody conjugated to a cytotoxic agent (also referred to herein as immunoconjugate). In some
embodiments, the anti-LGR5 antibody does not significantly inhibit wnt pathway signaling. In some
embodiments, the hedgehog-related disease is basal cell carcinoma ("BCC"). In some embodiments,
the basal cell carcinoma is locally advanced BCC or metastatic BCC. In some embodiments, the hedgehog-related disease is medulloblastoma.

[0121] Provided herein are methods of increasing efficacy of a treatment of a hedgehog-related disease comprising an inhibitor of the hedgehog pathway in an individual, wherein the method comprises administering to the individual an effective amount of an anti-LGR5 antibody and an effective amount of the inhibitor of the hedgehog pathway. In some embodiments, the inhibitor of the hedgehog pathway is an antagonist of smoothened. In some embodiments, the inhibitor of the hedgehog pathway is a cyclopamine-competitive antagonist of smoothened. In some embodiments, the antaonist of smoothened is 2-chloro-N-[4-chloro-3-(pyridin-2-yl)phenyl]-4-(methylsulfonyl)benzamide or a salt thereof. In some embodiments, the antaonist of smoothened is 2-chloro-N-[4-chloro-3-(pyridin-2-yl)phenyl]-4-(methylsulfonyl)benzamide. In some embodiments, the antaonist of smoothened is vismodegib. In some embodiments, the anti-LGR5 antibody is an anti-LGR5 antibody conjugated to a cytotoxic agent (also referred to herein as immunoconjugate). In some embodiments, the anti-LGR5 antibody does not significantly inhibit wnt pathway signaling. In some embodiments, the hedgehog-related disease is basal cell carcinoma ("BCC"). In some embodiments, the basal cell carcinoma is locally advanced BCC or metastatic BCC. In some embodiments, the hedgehog-related disease is medulloblastoma.

[0122] Further provided herein are methods of treating a hedgehog-related disease in an individual wherein the treatment comprises administering to the individual an effective amount of an anti-LGR5 antibody and an effective amount of an inhibitor of the hedgehog pathway, and wherein the treatment has increased efficacy compared to a standard treatment comprising administering an effective amount of the inhibitor of the hedgehog pathway without (in the absence of) the anti-LGR5 antibody. In some embodiments, the inhibitor of the hedgehog pathway is an antagonist of smoothened. In some embodiments, the inhibitor of the hedgehog pathway is a cyclopamine-competitive antagonist of smoothened. In some embodiments, the antaonist of smoothened is 2-chloro-N-[4-chloro-3-(pyridin-2-yl)phenyl]-4-(methylsulfonyl)benzamide or a salt thereof. In some embodiments, the antaonist of smoothened is 2-chloro-N-[4-chloro-3-(pyridin-2-yl)phenyl]-4-(methylsulfonyl)benzamide. In some embodiments, the antaonist of smoothened is vismodegib. In some embodiments, the anti-LGR5 antibody is an anti-LGR5 antibody conjugated to a cytotoxic agent (also referred to herein as immunoconjugate). In some embodiments, the anti-LGR5 antibody does not significantly inhibit wnt pathway signaling. In some embodiments, the hedgehog-related disease is basal cell carcinoma ("BCC"). In some embodiments, the basal cell carcinoma is locally advanced BCC or metastatic BCC. In some embodiments, the hedgehog-related disease is medulloblastoma.

[0123] Also provided herein are methods of delaying and/or preventing development of the recurrence and/or resistance of a hedgehog-related disease to an inhibitor of the hedgehog pathway in an individual, comprising administering to the individual an effective amount of an anti-LGR5 antibody and an effective amount of the inhibitor of the hedgehog pathway. Also provided herein are
methods of extending the period of sensitivity an inhibitor of the hedgehog pathway in an individual with a hedgehog-related disease comprising administering to the individual an effective amount of an anti-LGR5 antibody and an effective amount of the inhibitor of the hedgehog pathway. Provided herein are methods of extending the duration of response to an inhibitor of the hedgehog pathway in an individual with a hedgehog-related disease comprising administering to the individual an effective amount of an anti-LGR5 antibody and an effective amount of the inhibitor of the hedgehog pathway. In some embodiments, the inhibitor of the hedgehog pathway is an antagonist of smootherned. In some embodiments, the inhibitor of the hedgehog pathway is a cycloamine-competitive antagonist of smootherned. In some embodiments, the antaonist of smootherned is 2-chloro-N-[4-chloro-3-(pyridin-2-yl)phenyl]-4-(methylsulfonyl)benzamide or a salt thereof. In some embodiments, the antaonist of smootherned is 2-chloro-N-[4-chloro-3-(pyridin-2-yl)phenyl]-4-(methylsulfonyl)benzamide. In some embodiments, the antaonist of smootherned is vismodegib. In some embodiments, the anti-LGR5 antibody is an anti-LGR5 antibody conjugated to a cytotoxic agent (also referred to herein as immunoconjugate). In some embodiments, the anti-LGR5 antibody does not significantly inhibit wnt pathway signaling. In some embodiments, the hedgehog-related disease is basal cell carcinoma (“BCC”). In some embodiments, the basal cell carcinoma is locally advanced BCC or metastatic BCC. In some embodiments, the hedgehog-related disease is medulloblastoma.

[0124] Provided herein are methods of increasing sensitivity to an inhibitor of the hedgehog pathway in an individual with a hedgehog-related disease comprising administering to the individual an effective amount of an anti-LGR5 antibody and an effective amount of the inhibitor of the hedgehog pathway. In some embodiments, the inhibitor of the hedgehog pathway is an antagonist of smootherned. In some embodiments, the inhibitor of the hedgehog pathway is a cycloamine-competitive antagonist of smootherned. In some embodiments, the antaonist of smootherned is 2-chloro-N-[4-chloro-3-(pyridin-2-yl)phenyl]-4-(methylsulfonyl)benzamide or a salt thereof. In some embodiments, the antaonist of smootherned is 2-chloro-N-[4-chloro-3-(pyridin-2-yl)phenyl]-4-(methylsulfonyl)benzamide. In some embodiments, the antaonist of smootherned is vismodegib. In some embodiments, the anti-LGR5 antibody is an anti-LGR5 antibody conjugated to a cytotoxic agent (also referred to herein as immunoconjugate). In some embodiments, the anti-LGR5 antibody does not significantly inhibit wnt pathway signaling. In some embodiments, the hedgehog-related disease is basal cell carcinoma (“BCC”). In some embodiments, the basal cell carcinoma is locally advanced BCC or metastatic BCC. In some embodiments, the hedgehog-related disease is medulloblastoma.

[0125] Cancer having resistance to a therapy as used herein includes a cancer which is not responsive and/or reduced ability of producing a significant response (e.g., partial response and/or complete response) to the therapy. Resistance may be acquired resistance which arises in the course of a treatment method. In some embodiments, the acquired drug resistance is transient and/or reversible drug tolerance. Transient and/or reversible drug resistance to a therapy includes wherein the drug resistance is capable of regaining sensitivity to the therapy after a break in the treatment method. In
some embodiments, the acquired resistance is permanent resistance. Permanent resistance to a therapy includes a genetic change conferring drug resistance.

[0126] Cancer having sensitivity to a therapy as used herein includes cancer which is responsive and/or capable of producing a significant response (e.g., partial response and/or complete response).

[0127] Methods of determining of assessing acquisition of resistance and/or maintenance of sensitivity to a therapy are known in the art. In some embodiments, resistance may be indicated by a change in IC50, EC50 or decrease in tumor growth in drug tolerant persisters and/or drug tolerant expanded persisters. In some embodiments, the change is greater than about any of 50%, 100%, and/or 200%. In addition, changes in acquisition of resistance and/or maintenance of sensitivity may be assessed in vivo for examples by assessing response, duration of response, and/or time to progression to a therapy, e.g., partial response and complete response. Changes in acquisition of resistance and/or maintenance of sensitivity may be based on changes in response, duration of response, and/or time to progression to a therapy in a population of individuals, e.g., number of partial responses and complete responses.

[0128] In some embodiments, the cancer is LGR5-positive. Presence of various biomarkers in a sample can be analyzed by a number of methodologies, many of which are known in the art and understood by the skilled artisan, including, but not limited to, immunohistochemistry ("IHC"), Western blot analysis, immunoprecipitation, molecular binding assays, ELISA, ELIFA, fluorescence activated cell sorting ("FACS"), MassARRAY, proteomics, quantitative blood based assays (as for example Serum ELISA), biochemical enzymatic activity assays, in situ hybridization, Southern analysis, Northern analysis, whole genome sequencing, polymerase chain reaction ("PCR") including quantitative real time PCR ("qRT-PCR") and other amplification type detection methods, such as, for example, branched DNA, SISBA, TMA and the like, RNA-Seq, FISH, microarray analysis, gene expression profiling, and/or serial analysis of gene expression ("SAGE"), as well as any one of the wide variety of assays that can be performed by protein, gene, and/or tissue array analysis. Typical protocols for evaluating the status of genes and gene products are found, for example in Ausubel et al., eds., 1995, Current Protocols In Molecular Biology, Units 2 (Northern Blotting), 4 (Southern Blotting), 15 (Immunoblotting) and 18 (PCR Analysis). Multiplexed immunoassays such as those available from Rules Based Medicine or Meso Scale Discovery ("MSD") may also be used.

[0129] Inhibition of cell proliferation in vitro may be assayed using the CellTiter-Glo™ Luminescent Cell Viability Assay, which is commercially available from Promega (Madison, WI). That assay determines the number of viable cells in culture based on quantitation of ATP present, which is an indication of metabolically active cells. See Crouch et al. (1993) J. Immunol. Meth. 160:81-88, US Pat. No. 6602677. The assay may be conducted in 96- or 384-well format, making it amenable to automated high-throughput screening (HTS). See Cree et al. (1995) Anticancer Drugs 6:398-404. The assay procedure involves adding a single reagent (CellTiter-Glo Reagent) directly to cultured cells. This results in cell lysis and generation of a luminescent signal produced by a luciferase reaction. The
luminescent signal is proportional to the amount of ATP present, which is directly proportional to the number of viable cells present in culture. Data can be recorded by luminometer or CCD camera imaging device. The luminescence output is expressed as relative light units (RLU).

[0130] In a further aspect, the invention provides a method for treating LGR5-positive cancer. In one embodiment, the method comprises administering to an individual having such LGR5-positive cancer an effective amount of an anti-LGR5 antibody including immunoconjugate. In one such embodiment, the method further comprises administering to the individual an effective amount of at least one additional therapeutic agent, as described below.

[0131] In some embodiments, an LGR5-positive cancer is a cancer that receives an anti-LGR5 immunohistochemistry (IHC) or in situ hybridization (ISH) score greater than "0," which corresponds to very weak or no staining in >90% of tumor cells. In another embodiment, an LGR5-positive cancer expresses LGR5 at a 1+, 2+ or 3+ level. In some embodiments, an LGR5-positive cancer is a cancer that expresses LGR5 according to a reverse-transcriptase PCR (RT-PCR) assay that detects LGR5 mRNA. In some embodiments, the RT-PCR is quantitative RT-PCR.

[0132] An "individual" according to any of the above embodiments may be a human.

[0133] In a further aspect, the invention provides pharmaceutical formulations comprising any of the anti-LGR5 antibodies including immunoconjugate provided herein, e.g., for use in any of the above therapeutic methods. In one embodiment, a pharmaceutical formulation comprises any of the anti-LGR5 antibodies including immunoconjugates provided herein and a pharmaceutically acceptable carrier. In another embodiment, a pharmaceutical formulation comprises any of the anti-LGR5 antibodies including immunoconjugates provided herein and at least one additional therapeutic agent, e.g., as described below.

[0134] Antibodies including immunoconjugates can be used either alone or in combination with other agents in a therapy (e.g., inhibitors of hedgehog signaling). For instance, an antibody including immunoconjugate may be co-administered with at least one additional therapeutic agent (e.g., inhibitors of hedgehog signaling).

[0135] Such combination therapies noted above encompass combined administration (where two or more therapeutic agents are included in the same or separate formulations), and separate administration, in which case, administration of the antibody including immunoconjugate can occur prior to, simultaneously, and/or following, administration of the additional therapeutic agent and/or adjuvant. Antibodies including immunoconjugates can also be used in combination with radiation therapy.

[0136] An antibody including immunoconjugates (and any additional therapeutic agent) can be administered by any suitable means, including parenteral, intrapulmonary, and intranasal, and, if desired for local treatment, intralésional administration. Parenteral infusions include intramuscular, intravenous, intrarterial, intraperitoneal, or subcutaneous administration. Dosing can be by any suitable route, e.g., by injections, such as intravenous or subcutaneous injections, depending in part on
whether the administration is brief or chronic. Various dosing schedules including but not limited to single or multiple administrations over various time-points, bolus administration, and pulse infusion are contemplated herein.

[0137] Antibodies including immunocojugates would be formulated, dosed, and administered in a fashion consistent with good medical practice. Factors for consideration in this context include the particular disorder being treated, the particular mammal being treated, the clinical condition of the individual patient, the cause of the disorder, the site of delivery of the agent, the method of administration, the scheduling of administration, and other factors known to medical practitioners. The antibody including immunocojugates need not be, but is optionally formulated with one or more agents currently used to prevent or treat the disorder in question. The effective amount of such other agents depends on the amount of antibody including immunocojugates present in the formulation, the type of disorder or treatment, and other factors discussed above. These are generally used in the same dosages and with administration routes as described herein, or about from 1 to 99% of the dosages described herein, or in any dosage and by any route that is empirically/clinically determined to be appropriate.

[0138] For the prevention or treatment of disease, the appropriate dosage of an antibody including immunocojugates (when used alone or in combination with one or more other additional therapeutic agents (e.g., inhibitor of hedgehog pathway) will depend on the type of disease to be treated, the type of antibody including immunocojugate, the severity and course of the disease, whether the antibody including immunocojugate is administered for preventive or therapeutic purposes, previous therapy, the patient's clinical history and response to the antibody including immunocojugate, and the discretion of the attending physician. The antibody including immunocojugate is suitably administered to the patient at one time or over a series of treatments. Depending on the type and severity of the disease, about 1 µg/kg to 15 mg/kg (e.g., 0.1 mg/kg-10 mg/kg) of antibody including immunocojugate can be an initial candidate dosage for administration to the patient, whether, for example, by one or more separate administrations, or by continuous infusion. One typical daily dosage might range from about 1 µg/kg to 100 mg/kg or more, depending on the factors mentioned above. For repeated administrations over several days or longer, depending on the condition, the treatment would generally be sustained until a desired suppression of disease symptoms occurs. One exemplary dosage of the antibody including immunocojugate would be in the range from about 0.05 mg/kg to about 10 mg/kg. Thus, one or more doses of about 0.5 mg/kg, 2.0 mg/kg, 4.0 mg/kg or 10 mg/kg (or any combination thereof) may be administered to the patient. Such doses may be administered intermittently, e.g. every week or every three weeks (e.g. such that the patient receives from about two to about twenty, or e.g. about six doses of the antibody). An initial higher loading dose, followed by one or more lower doses may be administered. However, other dosage regimens may be useful. The progress of this therapy is easily monitored by conventional techniques and assays.
I t i s understood that any of the above formulations or therapeutic methods may be carried out using both an immunoconjugate and an anti-LGR5 antibody.

B. Anti-LGR5 Antibodies for Use in the Methods Described Herein

Provided herein are anti-LGR5 antibodies for use in the methods described herein. In some embodiments, the anti-LGR5 antibodies that bind to LGR5. LGR5 is a seven-transmembrane protein found, for example, on the surface of actively cycling intestinal stem cells.

An exemplary naturally occurring human LGR5 precursor protein sequence, with signal sequence (amino acids 1-21) is provided in SEQ ID NO: 67, and the corresponding mature LGR5 protein sequence (corresponding to amino acids 22-907 of SEQ ID NO: 67).

In certain embodiments, an anti-LGR5 antibody has at least one or more of the following characteristics, in any combination: (a) binds to an epitope within amino acids 22-555 of SEQ ID NO: 67; (b) binds LGR5 with an affinity of ≤ 5 nM, or ≤ 4 nM, or ≤ 3 nM, or ≤ 2 nM, or ≤ 1 nM, and optionally ≥ 0.0001 nM, or ≥ 0.001 nM, or ≥ 0.01 nM; (c) does not significantly disrupt the binding of R-spondin (RSPO) to LGR5; (d) does not significantly disrupt beta-catenin signaling; (e) does not significantly disrupt RSPO activation of LGR5 signaling; (f) activates caspase 3 cleavage; (g) recognizes both human and rodent LGR5; (h) recognizes human LGR5 but not rodent LGR5; (i) does not significantly inhibit tumor growth in its unconjugated form; and (j) does not induce stem cell differentiation. In some embodiments, the anti-LGR5 antibody is 8E11 and humanized variants thereof, such as hu8E1 1.v2; YW353; 2H6; and 3G12. In some embodiments, LGR5 is human LGR5. In some embodiments, LGR5 is selected from human, cynomolgus monkey, mouse, and rat LGR5.

(a) binds to an epitope within amino acids 22-555 of SEQ ID NO: 67

Methods of determining whether an anti-LGR5 antibody binds to an epitope of LGR5 are known in the art. In some embodiments, binding of an anti-LGR5 antibody to an epitope of LGR5 (e.g., within amino acids 22-555 of SEQ ID NO: 67) may be determined by expressing LGR5 polypeptides with N- and C-terminal deletions in 293 cells and testing by FACS binding of the antibody to the truncated polypeptides. In some embodiments, a substantial reduction (> 70% reduction) or elimination of binding of the antibody to a truncated polypeptide relative to binding to full-length LGR5 expressed in 293 cells indicates that the antibody does not bind to that truncated polypeptide. In some embodiments, LGR5 is human LGR5. In some embodiments, LGR5 is human LGR5 or cynomolgus monkey LGR5.

In some embodiments, the epitope of LGR5 comprises the lucine rich N-terminal domain of LGR5 (e.g., amino acid residues 25-66 of SEQ ID NO:67). In some embodiments, the epitope of LGR5 comprises one or more lucine rich repeats (LRR) of LGR5 (e.g., amino acid residues 67-446 of
SEQ ID NO:67; LRRs 1-16 of LGR5). In some embodiments, the epitope of LGR5 comprises LRR 1 of LGR5 (e.g., amino acid residues 67-90 of SEQ ID NO:67). In some embodiments, the epitope of LGR5 comprises LRR 2 of LGR5 (e.g., amino acid residues 91-12 of SEQ ID NO:67). In some embodiments, the epitope of LGR5 comprises LRR 3 of LGR5 (e.g., amino acid residues 115-136 of SEQ ID NO:67). In some embodiments, the epitope of LGR5 comprises LRR 4 of LGR5 (e.g., amino acid residues 139-160 of SEQ ID NO:67). In some embodiments, the epitope of LGR5 comprises LRR 5 of LGR5 (e.g., amino acid residues 163-184 of SEQ ID NO:67). In some embodiments, the epitope of LGR5 comprises LRR 6 of LGR5 (e.g., amino acid residues 187-208 of SEQ ID NO:67). In some embodiments, the epitope of LGR5 comprises LRR 7 of LGR5 (e.g., amino acid residues 211-232 of SEQ ID NO:67). In some embodiments, the epitope of LGR5 comprises LRR 8 of LGR5 (e.g., amino acid residues 235-256 of SEQ ID NO:67). In some embodiments, the epitope of LGR5 comprises LRR 9 of LGR5 (e.g., amino acid residues 258-279 of SEQ ID NO:67). In some embodiments, the epitope of LGR5 comprises LRR 10 of LGR5 (e.g., amino acid residues 282-303 of SEQ ID NO:67). In some embodiments, the epitope of LGR5 comprises LRR 11 of LGR5 (e.g., amino acid residues 306-328 of SEQ ID NO:67). In some embodiments, the epitope of LGR5 comprises LRR 12 of LGR5 (e.g., amino acid residues 329-350 of SEQ ID NO:67). In some embodiments, the epitope of LGR5 comprises LRR 13 of LGR5 (e.g., amino acid residues 353-374 of SEQ ID NO:67). In some embodiments, the epitope of LGR5 comprises LRR 14 of LGR5 (e.g., amino acid residues 375-396 of SEQ ID NO:67). In some embodiments, the epitope of LGR5 comprises LRR 15 of LGR5 (e.g., amino acid residues 399-420 of SEQ ID NO:67). In some embodiments, the epitope of LGR5 comprises LRR 16 of LGR5 (e.g., amino acid residues 423-446 of SEQ ID NO:67). In some embodiments, the epitope of LGR5 comprises any of LRR1 to LRR11, LRR2 to LRR1, LRR3 to LRR11, LRR1 to LRR3, LRR2 to LRR3, LRR2 to LRR8, LRR3 to LL7, or LRR4 to LL6.

[0146] In some embodiments, the epitope of LGR5 comprises an epitope within amino acids 22-555 of SEQ ID NO: 67. In some embodiments, the epitope of LGR5 comprises an epitope within amino acids 22-424 of SEQ ID NO: 67. In some embodiments, the epitope of LGR5 comprises an epitope within amino acids 22-123 of SEQ ID NO: 67. In some embodiments, the epitope of LGR5 comprises an epitope within amino acids 22-323 of SEQ ID NO: 67. In some embodiments, the epitope of LGR5 comprises an epitope within amino acids 324-555 of SEQ ID NO: 67. In some embodiments, the epitope of LGR5 comprises an epitope within amino acids 324-424 of SEQ ID NO: 67.

[0147] It is understood that aspect and embodiments described herein include "consisting" and/or "consisting effectively of" aspects and embodiments.

(b) binds LGR5 with an affinity of ≤ 5 nM, or ≤ 4 nM, or ≤ 3 nM, or ≤ 2 nM, or ≤ 1 nM, and optionally ≥ 0.0001 nM, or ≥ 0.001 nM, or ≥ 0.01 nM

[0148] Methods of determining binding affinity are known in the art. In some embodiments, the binding affinity may be determined according to a BIAcore® assay. Specifically, in some
embodiments, Kd may be measured using surface plasmon resonance assays using a BIACORE®-3000 (BIAcore, Inc., Piscataway, NJ). BIACore™ research grade CM5 chips may be activated with 1-ethyl-3-(3-dimethylaminopropyl) carbodiimide (EDC) and N-hydroxysuccinimide (NHS) reagents according to the supplier's instructions. Goat anti-human Fc IgGs may be coupled to the chips to achieve approximately 10,000 response units (RU) in each flow cell. Unreacted coupling groups may be blocked with 1M ethanolamine. For kinetics measurements, anti-LGR5 antibodies may be captured to achieve approximately 300 RU. Two-fold serial dilutions of human LGR5 ECD (for example, amino acids 22-557 (or a similar fragment, such as 22-555) fused to His-Fc expressed in a baculovirus system, or amino acids 22-558 (or a similar fragment, such as 22-555) fused to Fc expressed from CHO cells; 125 nM to 0.49 nM) may be injected in HBS-P buffer (0.01 M HEPES pH 7.4, 0.15 M NaCl, 0.005% surfactant P20) at 25°C with a flow rate of 30 µl/min. Association rates (k_on) and dissociation rates (k_off) may be calculated using a 1:1 Langmuir binding model (BIACore™ Evaluation Software version 3.2). The equilibrium dissociation constant (Kd) may be calculated as the ratio k_off/k_on. If the on-rate exceeds 10^6 M^-1 s^-1 by the surface plasmon resonance assay above, then the on-rate may be determined by using a fluorescent quenching technique that measures the increase or decrease in fluorescence emission intensity (excitation = 295 nm; emission = 340 nm, 16 nm band-pass) at 25°C of a 20 nM anti-antigen antibody (Fab form) in PBS, pH 7.2, in the presence of increasing concentrations of antigen as measured in a spectrometer, such as a stop-flow equipped spectrophotometer (Aviv Instruments) or a 8000-series SLM-Aminco® spectrophotometer (ThermoSpectronic) with a stirred cuvette.

[0149] In some embodiments, the anti-LGR5 antibody binds LGR5 with an affinity of about any of ≤ 5 nM, or ≤ 4 nM, or ≤ 3 nM, or ≤ 2 nM, or ≤ 1 nM. In some embodiments, the anti-LGR5 antibody binds LGR5 with an affinity of about ≤ 5. In some embodiments, the anti-LGR5 antibody binds LGR5 with an affinity of about ≤ 4 nM. In some embodiments, the anti-LGR5 antibody binds LGR5 with an affinity of about ≤ 3 nM. In some embodiments, the anti-LGR5 antibody binds LGR5 with an affinity of about ≤ 2 nM. In some embodiments, LGR5 is human LGR5. In some embodiments, LGR5 is human LGR5 or cynomolgus monkey LGR5.

[0150] As is understood by one skilled in the art, reference to "about" a value or parameter includes (and describes) embodiments that are direct to that value or parameter per se. For example, description referring to "about X" includes description of "X".

(c) does not significantly disrupt the binding of R-spondin (RSPO) to LGR5

[0151] Methods of determining the ability of an anti-LGR5 antibody to disrupt the binding of an RSPO to LGR5 are known in the art. In some embodiments, the ability of an anti-LGR5 antibody to significantly disrupt the binding of an R-spondon (RSPO) to LGR5 may be determined by flow cytometry. In some embodiments, for example, 293 cells expressing LGR5 may be contacted with fluorescently-labeled RSPO, such as RSP01, RSP02, RSP03, and/or RSP04, in the presence and absence of an anti-LGR5 antibody. Binding of RSPO to the 293 cells may be detected using
fluorescence-activated cell sorting (FACS). In some embodiments, a decrease in RSPO binding in the presence of an anti-LGR5 antibody of less than about 25% relative to RSPO binding in the presence of a control antibody, indicates that the anti-LGR5 antibody does not significantly disrupt binding of RSPO to LGR5.

[0152] In some embodiments, the ability of an anti-LGR5 antibody to significantly disrupt the binding of an R-spondon (RSPO) to LGR5 may be determined by BIAcore assay. In some embodiments, for example, LGR5 extracellular domain may be immobilized on CM5 chips, e.g., as described herein, and binding of RSPO, such as RSPO1, RSPO2, RSPO3, and/or RSPO4, to the immobilized LGR5 may be determined in the presence and absence of an anti-LGR5 antibody. In some embodiments, a decrease in RSPO binding in the presence of an anti-LGR5 antibody of less than about 25% relative to RSPO binding in the presence of a control antibody, indicates that the anti-LGR5 antibody does not significantly disrupt binding of RSPO to LGR5.

[0153] In some embodiments, the RSPO is selected from RSPO1, RSPO2, RSPO3, and RSPO4. In some embodiments, the antibody disrupts binding by less than about 25%, less than about 20%, less than about 15%, or less than about 10%. In some embodiments, the antibody does not detectably disrupt binding of an RSPO to LGR5. In some embodiments, LGR5 is human LGR5. In some embodiments, LGR5 is human LGR5 or cynomolgus monkey LGR5.

(d) does not significantly disrupt wnt/beta-catenin signaling

[0154] Methods of determining ability of an anti-LGR5 antibody to disrupt wnt/beta-catenin signaling are known in the art. In some embodiments, the ability of an anti-LGR5 antibody to significantly disrupt wnt/beta-catenin signaling may be determined using a reporter gene assay. In some embodiments, for example, a reporter construct comprising a reporter gene (such as, for example, a luciferase gene) under the control of a wnt/beta-catenin responsive promoter (such as, for example, a promoter comprising multimerized TCF/LEF DNA-binding sites) may be transfected into cells that express LGR5. The cells are then contacted with a Wnt ligand, such as Wnt3a, and an RSPO, such as RSPO1, RSPO2, RSPO3, and/or RSPO4, in the presence and absence of an anti-LGR5 antibody, and luciferase expression is measured. In some embodiments, a decrease in luciferase expression in the presence of antibody of less than about 25% relative to luciferase expression in the presence of a control antibody, indicates that the anti-LGR5 antibody does not significantly disrupt beta-catenin signaling.

[0155] In some embodiments, the antibody disrupts beta-catenin signaling by less than about 25%, less than about 20%, less than about 15%, or less than about 10%. In some embodiments, the antibody does not detectably disrupt beta-catenin signaling. In some embodiments, LGR5 is human LGR5. In some embodiments, LGR5 is human LGR5 or cynomolgus monkey LGR5.

(e) does not significantly disrupt RSPO activation of LGR5 signaling

[0156] Methods of determining ability of an anti-LGR5 antibody to disrupt RSPO activation of LGR5 are known in the art. In some embodiments, the ability of an anti-LGR5 antibody to
significantly disrupt RSPO activation of LGR5 signaling may be determined using a reporter gene assay. In some embodiments, for example, a reporter construct comprising a reporter gene (such as, for example, a luciferase gene) under the control of a beta-catenin responsive promoter (such as, for example, a promoter comprising multimerized TCF/LEF DNA-binding sites) may be transfected into cells that express LGR5. The cells may be then contacted with a Wnt ligand, such as Wnt3a, in the presence and absence of an RSPO, such as RSPO1, RSPO2, RSPO3, and/or RSPO4, and the activation of LGR5 signaling may be measured as the increase in luciferase expression in the presence of the RSPO. The activation of LGR5 signaling may also be measured in the presence and absence of an anti-LGR5 antibody. In some embodiments, a decrease in the activation of LGR5 signaling in the presence of RSPO1, RSPO2, RSPO3, and/or RSPO4 of less than about 25% when the cells are contacted with an anti-LGR5 antibody versus a control antibody, indicates that the anti-LGR5 antibody does not significantly disrupt RSPO activation of LGR5 signaling.

[0157] In some embodiments, the RSPO is selected from RSPO1, RSPO2, RSPO3, and RSPO4. In some embodiments, the antibody disrupts RSPO activation of LGR5 signaling by less than about 25%, less than about 20%, less than about 15%, or less than about 10%. In some embodiments, the antibody does not detectably disrupt RSPO activation of LGR5 signaling. In some embodiments, LGR5 is human LGR5. In some embodiments, LGR5 is human LGR5 or cynomolgus monkey LGR5.

(f) activates caspase 3 cleavage

[0158] Methods of determining ability of an anti-LGR5 antibody to activate caspase 3 cleavage are known in the art. In some embodiments, the ability of an anti-LGR5 antibody to activate caspase 3 cleavage may be determined in a rodent xenograft model. In some embodiments, the presence of cleaved caspase 3 may be measured as a function of tumor area, for example, in formalin fixed paraffin embedded (FFPE) tissue collected from tumorogenesis model mice that were administered an anti-LGR5 antibody. The presence of cleaved caspase 3 may be determined, in some embodiments, using immunohistochemistry. Further, in some embodiments, caspase 3 cleavage may be determined as a percent positive tumor area.

[0159] In some embodiments, an anti-LGR5 antibody increases the percentage of caspase 3 positive tumor area by about any of at least 20%, at least 25%, at least 30%, at least 35%, at least 40%, at least 45%, at least 50%, at least 55%, at least 60%, at least 65%, at least 70%, at least 75%, at least 80%, at least 85%, at least 90%, at least 95%, or at least 100% (i.e., the percentage of positive tumor area doubles).

(g) recognizes both human and rodent LGR5

[0160] Methods of determining the ability of an anti-LGR5 antibody to bind human and rodent LGR5 are known in the art. In some embodiments, human and rodent LGR5 polypeptides are expressed in 293 cells and binding of the antibody to the LGR5-expressing 293 cells is tested by FACS. In some embodiments, rodent LGR5 is mouse or rat LGR5. In some embodiments, rodent LGR5 is mouse LGR5.
(h) recognizes human LGR5 but not rodent LGR5

Methods of determining the ability of an anti-LGR5 antibody to bind human but not rodent LGR5 are known in the art. In some embodiments, human and rodent LGR5 polypeptides are expressed in 293 cells and binding of the antibody to the LGR5-expressing 293 cells is tested by FACS. In some embodiments, rodent LGR5 is mouse or rat LGR5. In some embodiments, rodent LGR5 is mouse LGR5.

(i) does not significantly inhibit tumor growth in its unconjugated form

Methods of determining the ability of an anti-LGR5 antibody to inhibit tumor growth in its unconjugated form are known in the art. Inhibition of tumor growth in a xenograft model or murine tumorigenesis model is determined relative to a vehicle control or control antibody. In some embodiments, an anti-LGR5 antibody inhibits tumor growth in its unconjugated form by less than about 25%, less than about 20%, less than about 15%, or less than about 10%. In some embodiments, an anti-LGR5 antibody does not detectably inhibit tumor growth in its unconjugated form.

(j) does not induce stem cell differentiation

Methods of determining the ability of an anti-LGR5 antibody to induce stem cell differentiation are known in the art. In some embodiments, stem cell differentiation may be assayed by determining ability to differentiation of crypt base columnar cells (CBCs), which are fast-cycling stem cells in the small intestine that express LGR5, into, for example, enterocytes, goblet cells, and/or enteroendocrine cells, in the presence and absence of an anti-LGR5 antibody. In some embodiments, an anti-LGR5 antibody is considered to not induce stem cell differentiation if about any of less than 25%, less than 20%, less than 15%, or less than 10% of a population of CBCs differentiates in the presence of the anti-LGR5 antibody under conditions in which a control antibody also induces stem cell differentiation in less than about 25% of a population of CBCs.

Exemplary anti-LGR5 Antibodies

In some embodiments, provided herein are exemplary, but nonlimiting, anti-LGR5 antibodies for use in the methods described herein. In some embodiments, any of the methods, the anti-LGR5 antibody comprises at least one, two, three, four, five, or six HVRs selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 30; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 31; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO: 32; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO: 27; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO: 28; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO: 29.
In some embodiments of any of the methods, the anti-LGR5 antibody comprises (a) a VH domain comprising (i) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 30, (ii) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 31, and (iii) HVR-H3 comprising an amino acid sequence selected from SEQ ID NO: 32; and/or (b) a VL domain comprising (i) HVR-L1 comprising the amino acid sequence of SEQ ID NO: 27, (ii) HVR-L2 comprising the amino acid sequence of SEQ ID NO: 28, and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO: 29.

In some embodiments, an anti-LGR5 antibody comprises HVRs as in any of the above embodiments, and further comprises a heavy chain framework FR3 sequence selected from SEQ ID NOs: 40 to 43. In some embodiments, an anti-LGR5 antibody comprises HVRs as in any of the above embodiments, and further comprises a heavy chain framework FR3 sequence of SEQ ID NO: 41. In some such embodiments, the heavy chain variable domain framework is a modified human VHI framework having an FR3 sequence selected from SEQ ID NOs: 40 to 43. In some such embodiments, the heavy chain variable domain framework is a modified human VHI framework having an FR3 sequence of SEQ ID NO: 41.

In some embodiments, an anti-LGR5 antibody comprises HVRs as in any of the above embodiments, and further comprises a light chain framework FR3 sequence of SEQ ID NO: 36. In some such embodiments, the heavy chain variable domain framework is a modified VL kappa IV consensus (VL\textsubscript{k,iv}) framework having an FR3 sequence of SEQ ID NO: 36.

In another aspect, in some embodiments of any of the methods, the anti-LGR5 antibody comprises a VH as in any of the embodiments provided above, and a VL as in any of the embodiments provided above. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO: 6 and SEQ ID NO: 5, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO: 8 and SEQ ID NO: 7, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO: 10 and SEQ ID NO: 9, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO: 12 and SEQ ID NO: 11, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO: 14 and SEQ ID NO: 13, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO: 16 and SEQ ID NO: 15, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO: 18 and SEQ ID NO: 17, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO: 20 and SEQ ID NO: 19, respectively, including post-translational modifications of those sequences.
In one aspect, in some embodiments of any of the methods, the anti-LGR5 antibody comprises at least one, two, three, four, five, or six HVRs selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 60; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 61; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO: 62; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO: 57; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO: 58; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO: 59.

In another aspect, in some embodiments of any of the methods, the anti-LGR5 antibody comprises (a) a VH domain comprising (i) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 60, (ii) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 61, and (iii) HVR-H3 comprising the amino acid sequence of SEQ ID NO: 62; and/or (b) a VL domain comprising (i) HVR-L1 comprising the amino acid sequence of SEQ ID NO: 57, (ii) HVR-L2 comprising the amino acid sequence of SEQ ID NO: 58, and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO: 59.

In another aspect, in some embodiments of any of the methods, the anti-LGR5 antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 60; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 61; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO: 62; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO: 57; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO: 58; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO: 59.

In another aspect, an anti-LGR5 antibody is provided, wherein the antibody comprises a VH as in any of the embodiments provided above, and a VL as in any of the embodiments provided above. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO: 26 and SEQ ID NO: 25, respectively, including post-translational modifications of those sequences.

In some embodiments, in some embodiments of any of the methods, the anti-LGR5 antibody comprises at least one, two, three, four, five, or six HVRs selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 48; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 49; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO: 50; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO: 45; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO: 46; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO: 47.

In another aspect, in some embodiments of any of the methods, the anti-LGR5 antibody comprises (a) a VH domain comprising (i) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 48, (ii) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 49, and (iii) HVR-H3 comprising an amino acid sequence selected from SEQ ID NO: 50; and/or (b) a VL domain comprising (i) HVR-L1 comprising the amino acid sequence of SEQ ID NO: 45, (ii) HVR-L2
comprising the amino acid sequence of SEQ ID NO: 46, and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO: 47.

[0177] In another aspect, in some embodiments of any of the methods, the anti-LGR5 antibody comprises a VH as in any of the embodiments provided above, and a VL as in any of the embodiments provided above. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO: 22 and SEQ ID NO: 21, respectively, including post-translational modifications of those sequences.

[0178] In some embodiments, in some embodiments of any of the methods, the anti-LGR5 antibody comprises at least one, two, three, four, five, or six HVRs selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 54; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 55; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO: 56; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO: 51; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO: 52; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO: 53.

[0179] In another aspect, in some embodiments of any of the methods, the anti-LGR5 antibody comprises (a) a VH domain comprising (i) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 54, (ii) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 55, and (iii) HVR-H3 comprising an amino acid sequence selected from SEQ ID NO: 56; and/or (b) a VL domain comprising (i) HVR-L1 comprising the amino acid sequence of SEQ ID NO: 51, (ii) HVR-L2 comprising the amino acid sequence of SEQ ID NO: 52, and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO: 53.

[0180] In another aspect, an anti-LGR5 antibody is provided, wherein the antibody comprises a VH as in any of the embodiments provided above, and a VL as in any of the embodiments provided above. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO: 24 and SEQ ID NO: 23, respectively, including post-translational modifications of those sequences.

[0181] In a further aspect, in some embodiments of any of the methods, the anti-LGR5 antibody binds to the same epitope as an anti-LGR5 antibody provided herein. For example, in certain embodiments, an antibody is provided that binds to the same epitope as an anti-LGR5 antibody comprising a VH sequence of SEQ ID NO: 24 and a VL sequence of SEQ ID NO: 23. In certain embodiments, an antibody is provided that binds to the same epitope as an anti-LGR5 antibody comprising a VH sequence of SEQ ID NO: 22 and a VL sequence of SEQ ID NO: 21. In certain embodiments, an antibody is provided that binds to an epitope of SEQ ID NO: 67 from, within, or overlapping amino acids 324-423. In some embodiments, an antibody is provided that binds to an epitope from, within, or overlapping amino acids 303-402. In certain embodiments, an antibody is provided that binds to an epitope of SEQ ID NO: 67 from, within, or overlapping amino acids 324-555. In some embodiments, an antibody is provided that binds to an epitope from, within, or overlapping amino acids 303-534. For example, in certain embodiments, an antibody is provided that
binds to the same epitope as an anti-LGR5 antibody comprising a VH sequence of SEQ ID NO: 26 and a VL sequence of SEQ ID NO: 25. In certain embodiments, an antibody is provided that binds to an epitope of SEQ ID NO: 67 from, within, or overlapping amino acids 22-123. In certain embodiments, an antibody is provided that binds to an epitope from, within, or overlapping amino acids 1-102. For example, in certain embodiments, an antibody is provided that binds to the same epitope as an anti-LGR5 antibody comprising a VH sequence of SEQ ID NO: 8 and a VL sequence of SEQ ID NO: 7. In certain embodiments, an antibody is provided that binds to an epitope of SEQ ID NO: 67, from, within, or overlapping amino acids 22-323. In some embodiments, an antibody is provided that binds to an epitope from, within, or overlapping amino acids 1-312.

[01 82] In any of the above embodiments, an anti-LGR5 antibody is humanized. In one embodiment, an anti-LGR5 antibody comprises HV Rs as in any of the above embodiments, and further comprises a human acceptor framework, e.g. a human immunoglobulin framework or a human consensus framework. In certain embodiments, the human acceptor framework is the human VL kappa IV consensus (V\textsubscript{L\_IV}) framework and/or the VH framework VHI. In certain embodiments, the human acceptor framework is the human VL kappa IV consensus (V\textsubscript{L\_IV}) framework and/or the VH framework VHI comprising an R71S mutation and an A78V mutation in heavy chain framework region FR3.

[01 83] In a further aspect, an anti-LGR5 antibody according to any of the above embodiments is a monoclonal antibody, including a chimeric, humanized or human antibody. In one embodiment, an anti-LGR5 antibody is an antibody fragment, e.g., a Fv, Fab, Fab', scFv, diabody, or Fab(ab')\textsubscript{2} fragment. In another embodiment, the antibody is a substantially full length antibody, e.g., an IgGl antibody or other antibody class or isotype as defined herein.

[01 84] In a further aspect, an anti-LGR5 antibody according to any of the above embodiments may incorporate any of the features, singly or in combination, as described in Sections 1-7 below.

1. Antibody Affinity

[01 85] In certain embodiments, an antibody provided herein has a dissociation constant (K\text{d}) of \( \leq 1\mu\text{M}, \leq 100\text{nM}, \leq 1\text{nM}, \leq 0.1\text{nM}, \leq 0.01\text{nM}, \text{or} \leq 0.001\text{nM}, \text{and optionally is} \geq 10^{-13}\text{M.} (e.g. 10\text{M} \text{or less}, e.g. from 10^{-8}\text{M} \text{to} 10^{-13}\text{M, e.g., from} 10^{-9}\text{M} \text{to} 10^{-13}\text{M}).

[01 86] In one embodiment, K\text{d} is measured by a radiolabeled antigen binding assay (RIA) performed with the Fab version of an antibody of interest and its antigen as described by the following assay. Solution binding affinity of Fabs for antigen is measured by equilibrating Fab with a minimal concentration of (\textsuperscript{125}I)-labeled antigen in the presence of a titration series of unlabeled antigen, then capturing bound antigen with an anti-Fab antibody-coated plate (see, e.g., Chen et al., J. Mol. Biol. 293:865-88 1(1999)). To establish conditions for the assay, MICROTITER\textsuperscript{®} multi-well plates (Thermo Scientific) are coated overnight with 5 \( \text{\mu g/ml} \) of a capturing anti-Fab antibody (Cappel Labs) in 50 \( \text{mM} \) sodium carbonate (pH 9.6), and subsequently blocked with 2% (w/v) bovine serum albumin in PBS for two to five hours at room temperature (approximately 23°C). In a non-adsorbent plate (Nunc
100 pM or 26 pM $[^{252}]$I-antigen are mixed with serial dilutions of a Fab of interest (e.g., consistent with assessment of the anti-VEGF antibody, Fab-12, in Presta et al., Cancer Res. 57:4593-4599 (1997)). The Fab of interest is then incubated overnight; however, the incubation may continue for a longer period (e.g., about 65 hours) to ensure that equilibrium is reached. Thereafter, the mixtures are transferred to the capture plate for incubation at room temperature (e.g., for one hour). The solution is then removed and the plate washed eight times with 0.1% polysorbate 20 (TWEEN-20®) in PBS. When the plates have dried, 150 μl/well of scintillant (MICROSCINT-20™; Packard) is added, and the plates are counted on a TOPCOUNT™ gamma counter (Packard) for ten minutes. Concentrations of each Fab that give less than or equal to 20% of maximal binding are chosen for use in competitive binding assays.

According to another embodiment, Kd is measured using surface plasmon resonance assays using a BIACORE®-2000 or a BIACORE®-3000 (BIAcore, Inc., Piscataway, NJ) at 25°C with immobilized antigen CM5 chips at ~10 response units (RU). Briefly, carboxymethylated dextran biosensor chips (CM5, BIACORE, Inc.) are activated with N-ethyl-$N'$- (3-dimethylaminopropyl)-carbodiimide hydrochloride (EDC) and N-hydroxysuccinimide (NHS) according to the supplier's instructions. Antigen is diluted with 10 mM sodium acetate, pH 4.8, to 5 μg/ml (~0.2 μM) before injection at a flow rate of 5 μl/minute to achieve approximately 10 response units (RU) of coupled protein. Following the injection of antigen, 1 M ethanolamine is injected to block unreacted groups. For kinetics measurements, two-fold serial dilutions of Fab (0.78 nM to 500 nM) are injected in PBS with 0.05% polysorbate 20 (TWEEN-20™) surfactant (PBST) at 25°C at a flow rate of approximately 25 μl/min. Association rates ($\Gamma_{on}$) and dissociation rates ($k_{off}$) are calculated using a simple one-to-one Langmuir binding model (BIACORE® Evaluation Software version 3.2) by simultaneously fitting the association and dissociation sensorgrams. The equilibrium dissociation constant (Kd) is calculated as the ratio $k_{off}/k_{on}$. See, e.g., Chen et al., J. Mol. Biol. 293:865-881 (1999). If the on-rate exceeds $10^4$ M$^{-1}$ s$^{-1}$ by the surface plasmon resonance assay above, then the on-rate can be determined by using a fluorescent quenching technique that measures the increase or decrease in fluorescence emission intensity (excitation = 295 nm; emission = 340 nm, 16 nm band-pass) at 25°C of a 20 nM anti-antigen antibody (Fab form) in PBS, pH 7.2, in the presence of increasing concentrations of antigen as measured in a spectrometer, such as a stop-flow equipped spectrophotometer (Aviv Instruments) or a 8000-series SLM-AMINCO™ spectrophotometer (ThermoSpectronic) with a stirred cuvette.

### 2. Antibody Fragments

In certain embodiments, an antibody provided herein is an antibody fragment. Antibody fragments include, but are not limited to, Fab, Fab', Fab$^\prime$-SH, F(ab')$_2$, Fv, and scFv fragments, and other fragments described below. For a review of certain antibody fragments, see Hudson et al. Nat. Med. 9:129-134 (2003). For a review of scFv fragments, see, e.g., Pluckthun, in The Pharmacology of

[0189] Diabodies are antibody fragments with two antigen-binding sites that may be bivalent or bispecific. See, for example, EP 404,097; WO 1993/01 161; Hudson et al., Nat. Med. 9:129-134 (2003); and Hollinger et al., Proc. Natl. Acad. Sci. USA 90: 6444-6448 (1993). Triabodies and tetrabodies are also described in Hudson et al., Nat. Med. 9:129-134 (2003).

[0190] Single-domain antibodies are antibody fragments comprising all or a portion of the heavy chain variable domain or all or a portion of the light chain variable domain of an antibody. In certain embodiments, a single-domain antibody is a human single-domain antibody (Domantis, Inc., Waltham, MA; see, e.g., U.S. Patent No. 6,248,516 B1).

[0191] Antibody fragments can be made by various techniques, including but not limited to proteolytic digestion of an intact antibody as well as production by recombinant host cells (e.g. E. coli or phage), as described herein.

3. Chimeric and Humanized Antibodies

[0192] In certain embodiments, an antibody provided herein is a chimeric antibody. Certain chimeric antibodies are described, e.g., in U.S. Patent No. 4,816,567; and Morrison et al., Proc. Natl. Acad. Sci. USA, 81:6851-6855 (1984)). In one example, a chimeric antibody comprises a non-human variable region (e.g., a variable region derived from a mouse, rat, hamster, rabbit, or non-human primate, such as a monkey) and a human constant region. In a further example, a chimeric antibody is a "class switched" antibody in which the class or subclass has been changed from that of the parent antibody. Chimeric antibodies include antigen-binding fragments thereof.

[0193] In certain embodiments, a chimeric antibody is a humanized antibody. Typically, a non-human antibody is humanized to reduce immunogenicity to humans, while retaining the specificity and affinity of the parental non-human antibody. Generally, a humanized antibody comprises one or more variable domains in which HVRs, e.g., CDRs, (or portions thereof) are derived from a non-human antibody, and FRs (or portions thereof) are derived from human antibody sequences. A humanized antibody optionally will also comprise at least a portion of a human constant region. In some embodiments, some FR residues in a humanized antibody are substituted with corresponding residues from a non-human antibody (e.g., the antibody from which the HVR residues are derived), e.g., to restore or improve antibody specificity or affinity.

43

4. Human Antibodies

0196 In certain embodiments, an antibody provided herein is a human antibody. Human antibodies can be produced using various techniques known in the art. Human antibodies are described generally in van Dijk and van de Winkel, Curr. Opin. Pharmacol. 5: 368-74 (2001) and Lonberg, Curr. Opin. Immunol. 20:450-459 (2008).

0197 Human antibodies may be prepared by administering an immunogen to a transgenic animal that has been modified to produce intact human antibodies or intact antibodies with human variable regions in response to antigenic challenge. Such animals typically contain all or a portion of the human immunoglobulin loci, which replace the endogenous immunoglobulin loci, or which are present extrachromosomally or integrated randomly into the animal’s chromosomes. In such transgenic mice, the endogenous immunoglobulin loci have generally been inactivated. For review of methods for obtaining human antibodies from transgenic animals, see Lonberg, Nat. Biotech. 23:1117-1125 (2005). See also, e.g., U.S. Patent Nos. 6,075, 181 and 6,150,584 describing XENOMOUSE technology; U.S. Patent No. 5,770,429 describing HuMAB® technology; U.S. Patent No. 7,041,870 describing K-M MOUSE® technology, and U.S. Patent Application Publication No. US 2007/0061900, describing VELOCIMOUSE® technology). Human variable regions from intact antibodies generated by such animals may be further modified, e.g., by combining with a different human constant region.

0198 Human antibodies can also be made by hybridoma-based methods. Human myeloma and mouse-human heteromyeloma cell lines for the production of human monoclonal antibodies have been described. (See, e.g., Kozbor J. Immunol. 133: 3001 (1984); Brodeur et al., Monoclonal Antibody Production Techniques and Applications, pp. 51-63 (Marcel Dekker, Inc., New York, 1987); and Boerner et al., J. Immunol., 147: 86 (1991).) Human antibodies generated via human B-cell hybridoma technology are also described in Li et al., Proc. Natl. Acad. Sci. USA, 103:3557-3562 (2006). Additional methods include those described, for example, in U.S. Patent No. 7,189,826

[0199] Human antibodies may also be generated by isolating Fv clone variable domain sequences selected from human-derived phage display libraries. Such variable domain sequences may then be combined with a desired human constant domain. Techniques for selecting human antibodies from antibody libraries are described below.

5. Library-Derived Antibodies

[0201] In certain phage display methods, repertoires of VH and VL genes are separately cloned by polymerase chain reaction (PCR) and recombined randomly in phage libraries, which can then be screened for antigen-binding phage as described in Winter et al., Ann. Rev. Immunol., 12: 433-455 (1994). Phage typically display antibody fragments, either as single-chain Fv (scFv) fragments or as Fab fragments. Libraries from immunized sources provide high-affinity antibodies to the immunogen without the requirement of constructing hybridomas. Alternatively, the naive repertoire can be cloned (e.g., from human) to provide a single source of antibodies to a wide range of non-self and also self antigens without any immunization as described by Griffiths et al., EMBO J, 12: 725-734 (1993). Finally, naive libraries can also be made synthetically by cloning unrearranged V-gene segments from stem cells, and using PCR primers containing random sequence to encode the highly variable CDR3 regions and to accomplish rearrangement in vitro, as described by Hoogenboom and Winter, J. Mol. Biol., 227: 381-388 (1992). Patent publications describing human antibody phage libraries include, for example: US Patent No. 5,750,373, and US Patent Publication Nos. 2005/0079574, 2005/01 19455, 2005/0266000, 2007/01 17126, 2007/0160598, 2007/0237764, 2007/0292936, and 2009/0002360.

[0202] Antibodies or antibody fragments isolated from human antibody libraries are considered human antibodies or human antibody fragments herein.
6. Multispecific Antibodies

In certain embodiments, an antibody provided herein is a multispecific antibody, e.g. a bispecific antibody. Multispecific antibodies are monoclonal antibodies that have binding specificities for at least two different sites. In certain embodiments, one of the binding specificities is for LGR5 and the other is for any other antigen. In certain embodiments, one of the binding specificities is for LGR5 and the other is for CD3. See, e.g., U.S. Patent No. 5,821,337. In certain embodiments, bispecific antibodies may bind to two different epitopes of LGR5. Bispecific antibodies may also be used to localize cytotoxic agents to cells which express LGR5. Bispecific antibodies can be prepared as full length antibodies or antibody fragments.

Engineered antibodies with three or more functional antigen binding sites, including "Octopus antibodies," are also included herein (see, e.g. US 2006/0025576A1).

The antibody or fragment herein also includes a "Dual Acting FAb" or "DAF" comprising an antigen binding site that binds to LGR5 as well as another, different antigen (see, US 2008/0069820, for example).

7. Antibody Variants

In certain embodiments, amino acid sequence variants of the antibodies provided herein are contemplated. For example, it may be desirable to improve the binding affinity and/or other biological properties of the antibody. Amino acid sequence variants of an antibody may be prepared by introducing appropriate modifications into the nucleotide sequence encoding the antibody, or by peptide synthesis. Such modifications include, for example, deletions from, and/or insertions into and/or substitutions of residues within the amino acid sequences of the antibody. Any combination of deletion, insertion, and substitution can be made to arrive at the final construct, provided that the final construct possesses the desired characteristics, e.g., antigen-binding.
a) **Substitution, Insertion, and Deletion Variants**

[0208] In certain embodiments, antibody variants having one or more amino acid substitutions are provided. Sites of interest for substitutional mutagenesis include the HVRs and FRs. Conservative substitutions are shown in Table 1 under the heading of "preferred substitutions." More substantial changes are provided in Table 1 under the heading of "exemplary substitutions," and as further described below in reference to amino acid side chain classes. Amino acid substitutions may be introduced into an antibody of interest and the products screened for a desired activity, e.g., retained/improved antigen binding, decreased immunogenicity, or improved ADCC or CDC.

Amino acids may be grouped according to common side-chain properties:

1. hydrophobic: Norleucine, Met, Ala, Val, Leu, He;
2. neutral hydrophilic: Cys, Ser, Thr, Asn, Gin;
(3) acidic: Asp, Glu;
(4) basic: His, Lys, Arg;
(5) residues that influence chain orientation: Gly, Pro;
(6) aromatic: Trp, Tyr, Phe.

[0209] Non-conservative substitutions will entail exchanging a member of one of these classes for another class.

[0210] One type of substitutional variant involves substituting one or more hypervariable region residues of a parent antibody (e.g. a humanized or human antibody). Generally, the resulting variant(s) selected for further study will have modifications (e.g., improvements) in certain biological properties (e.g., increased affinity, reduced immunogenicity) relative to the parent antibody and/or will have substantially retained certain biological properties of the parent antibody. An exemplary substitutional variant is an affinity matured antibody, which may be conveniently generated, e.g., using phage display-based affinity maturation techniques such as those described herein. Briefly, one or more HVR residues are mutated and the variant antibodies displayed on phage and screened for a particular biological activity (e.g. binding affinity).

[0211] Alterations (e.g., substitutions) may be made in HVRs, e.g., to improve antibody affinity. Such alterations may be made in HVR "hotspots," i.e., residues encoded by codons that undergo mutation at high frequency during the somatic maturation process (see, e.g., Chowdhury, *Methods Mol. Biol.* 207: 179-196 (2008)), and/or SDRs (a-CDRs), with the resulting variant VH or VL being tested for binding affinity. Affinity maturation by constructing and reselecting from secondary libraries has been described, e.g., in Hoogenboom et al. *mMethods in Molecular Biology* 178:1-37 (O'Brien et al., ed., Human Press, Totowa, NJ, (2001)). In some embodiments of affinity maturation, diversity is introduced into the variable genes chosen for maturation by any of a variety of methods (e.g., error-prone PCR, chain shuffling, or oligonucleotide-directed mutagenesis). A secondary library is then created. The library is then screened to identify any antibody variants with the desired affinity. Another method to introduce diversity involves HVR-directed approaches, in which several HVR residues (e.g., 4-6 residues at a time) are randomized. HVR residues involved in antigen binding may be specifically identified, e.g., using alanine scanning mutagenesis or modeling. CDR-H3 and CDR-L3 in particular are often targeted.

[0212] In certain embodiments, substitutions, insertions, or deletions may occur within one or more HVRs so long as such alterations do not substantially reduce the ability of the antibody to bind antigen. For example, conservative alterations (e.g., conservative substitutions as provided herein) that do not substantially reduce binding affinity may be made in HVRs. Such alterations may be outside of HVR "hotspots" or SDRs. In certain embodiments of the variant VH and VL sequences provided above, each HVR either is unaltered, or contains no more than one, two or three amino acid substitutions.
A useful method for identification of residues or regions of an antibody that may be targeted for mutagenesis is called "alanine scanning mutagenesis" as described by Cunningham and Wells (1989) Science, 244:1081-1085. In this method, a residue or group of target residues (e.g., charged residues such as arg, asp, his, lys, and glu) are identified and replaced by a neutral or negatively charged amino acid (e.g., alanine or polyalanine) to determine whether the interaction of the antibody with antigen is affected. Further substitutions may be introduced at the amino acid locations demonstrating functional sensitivity to the initial substitutions. Alternatively, or additionally, a crystal structure of an antigen-antibody complex is used to identify contact points between the antibody and antigen. Such contact residues and neighboring residues may be targeted or eliminated as candidates for substitution. Variants may be screened to determine whether they contain the desired properties.

Amino acid sequence insertions include amino- and/or carboxyl-terminal fusions ranging in length from one residue to polypeptides containing a hundred or more residues, as well as intrasequence insertions of single or multiple amino acid residues. Examples of terminal insertions include an antibody with an N-terminal methionyl residue. Other insertional variants of the antibody molecule include the fusion to the N- or C-terminus of the antibody to an enzyme (e.g. for ADEPT) or a polypeptide which increases the serum half-life of the antibody.

b) Glycosylation variants

In certain embodiments, an antibody provided herein is altered to increase or decrease the extent to which the antibody is glycosylated. Addition or deletion of glycosylation sites to an antibody may be conveniently accomplished by altering the amino acid sequence such that one or more glycosylation sites is created or removed.

Where the antibody comprises an Fc region, the carbohydrate attached thereto may be altered. Native antibodies produced by mammalian cells typically comprise a branched, biantennary oligosaccharide that is generally attached by an N-linkage to Asn297 of the CH2 domain of the Fc region. See, e.g., Wright et al. TIBTECH 15:26-32 (1997). The oligosaccharide may include various carbohydrates, e.g., mannose, N-acetyl glucosamine (GlcNAc), galactose, and sialic acid, as well as a fucose attached to a GlcNAc in the "stem" of the biantennary oligosaccharide structure. In some embodiments, modifications of the oligosaccharide in an antibody may be made in order to create antibody variants with certain improved properties.

In one embodiment, antibody variants are provided having a carbohydrate structure that lacks fucose attached (directly or indirectly) to an Fc region. For example, the amount of fucose in such antibody may be from 1% to 80%, from 1% to 65%, from 5% to 65% or from 20% to 40%. The amount of fucose is determined by calculating the average amount of fucose within the sugar chain at Asn297, relative to the sum of all glycostructures attached to Asn 297 (e.g. complex, hybrid and high mannose structures) as measured by MALDI-TOF mass spectrometry, as described in WO 2008/077546, for example. Asn297 refers to the asparagine residue located at about position 297 in the Fc region (Eu numbering of Fc region residues); however, Asn297 may also be located about ±

[0218] Antibodies variants are further provided with bisected oligosaccharides, e.g., in which a biantennary oligosaccharide attached to the Fc region of the antibody is bisected by GlcNAc. Such antibody variants may have reduced fucosylation and/or improved ADCC function. Examples of such antibody variants are described, e.g., in WO 2003/01 1878 (Jean-Mairet et al.); US Patent No. 6,602,684 (Umana et al.); and US 2005/0123546 (Umana et al.). Antibody variants with at least one galactose residue in the oligosaccharide attached to the Fc region are also provided. Such antibody variants may have improved CDC function. Such antibody variants are described, e.g., in WO 1997/30087 (Patel et al.); WO 1998/58964 (Raju, S.); and WO 1999/22764 (Raju, S.).

c) **Fc region variants**

[0219] In certain embodiments, one or more amino acid modifications may be introduced into the Fc region of an antibody provided herein, thereby generating an Fc region variant. The Fc region variant may comprise a human Fc region sequence (e.g., a human IgGl, IgG2, IgG3 or IgG4 Fc region) comprising an amino acid modification (e.g. a substitution) at one or more amino acid positions.

[0220] In certain embodiments, an antibody variant that possesses some but not all effector functions, which make it a desirable candidate for applications in which the half life of the antibody in vivo is important yet certain effector functions (such as complement and ADCC) are unnecessary or deleterious is contemplated as useful in the methods described herein. *In vitro* and/or *in vivo* cytotoxicity assays can be conducted to confirm the reduction/depletion of CDC and/or ADCC activities. For example, Fc receptor (FcR) binding assays can be conducted to ensure that the antibody lacks FcyR binding (hence likely lacking ADCC activity), but retains FcRn binding ability. The primary cells for mediating ADCC, NK cells, express FcRIII only, whereas monocytes express

[0221] Antibodies with reduced effector function include those with substitution of one or more of Fc region residues 238, 265, 269, 270, 297, 327 and 329 (U.S. Patent No. 6,737,056). Such Fc mutants include Fc mutants with substitutions at two or more of amino acid positions 265, 269, 270, 297 and 327, including the so-called "DANA" Fc mutant with substitution of residues 265 and 297 to alanine (US Patent No. 7,332,581).

[0222] Certain antibody variants with improved or diminished binding to FcRs are described. (See, e.g., U.S. Patent No. 6,737,056; WO 2004/056312, and Shields et al., *J. Biol. Chem.* 9(2): 6591-6604 (2001).)

[0223] In certain embodiments, an antibody variant comprises an Fc region with one or more amino acid substitutions which improve ADCC, e.g., substitutions at positions 298, 333, and/or 334 of the Fc region (EU numbering of residues).

[0224] In some embodiments, alterations are made in the Fc region that result in altered (i.e., either improved or diminished) Clq binding and/or Complement Dependent Cytotoxicity (CDC), e.g., as described in US Patent No. 6,194,551, WO 99/51642, and Idusogie et al. *J. Immunol.* 164: 4178-4184 (2000).

[0225] Antibodies with increased half lives and improved binding to the neonatal Fc receptor (FcRn), which is responsible for the transfer of maternal IgGs to the fetus (Guyer et al., *J. Immunol.* 117:587 (1976) and Kim et al., *J. Immunol.* 24:249 (1994)), are described in US2005/0014934A1 (Hinton et al.). Those antibodies comprise an Fc region with one or more substitutions therein which improve

d) Cysteine engineered antibody variants

[0227] In certain embodiments, it may be desirable to create cysteine engineered antibodies, e.g., "thioMAbs," in which one or more residues of an antibody are substituted with cysteine residues. In particular embodiments, the substituted residues occur at accessible sites of the antibody. By substituting those residues with cysteine, reactive thiol groups are thereby positioned at accessible sites of the antibody and may be used to conjugate the antibody to other moieties, such as drug moieties or linker-drug moieties, to create an immunoconjugate, as described further herein. In certain embodiments, any one or more of the following residues may be substituted with cysteine: V205 (Kabat numbering) of the light chain; A118 (EU numbering) of the heavy chain; and S400 (EU numbering) of the heavy chain Fc region. Cysteine engineered antibodies may be generated as described, e.g., in U.S. Patent No. 7,521,541.

[0228] Further exemplary V205C cysteine engineered thiomabs comprise a light chain comprising a variable region selected from SEQ ID NOs: 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, and 23 and a constant region of SEQ ID NO: 80; and a heavy chain comprising a variable region selected from SEQ ID NOs: 4, 6, 8, 10, 12, 14, 16, 18, 20, 22 and 24 and a human heavy chain constant region, such as an IgGl. Further exemplary A118C cysteine engineered thiomabs comprise a light chain comprising a variable region selected from SEQ ID NOs: 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, and 23 and a human light chain constant region, such as a kappa light chain constant region; and a heavy chain comprising a variable region selected from SEQ ID NOs: 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, and 24 and a constant region. Further exemplary S400C cysteine engineered thiomabs comprise a light chain comprising a variable region selected from SEQ ID NOs: 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, and 23 and a human light chain constant region, such as a kappa light chain constant region; and a heavy chain comprising a variable region selected from SEQ ID NOs: 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, and 24 and a constant region.

e) Antibody Derivatives

[0229] In certain embodiments, an antibody provided herein may be further modified to contain additional nonproteinaceous moieties that are known in the art and readily available. The moieties suitable for derivatization of the antibody include but are not limited to water soluble polymers. Non-limiting examples of water soluble polymers include, but are not limited to, polyethylene glycol (PEG), copolymers of ethylene glycol/propylene glycol, carboxymethylcellulose, dextran, polyvinyl alcohol, polyvinyl pyrrolidone, poly-1, 3-dioxolane, poly-l,3,6-trioxane, ethylene/maleic anhydride copolymer, polyaminoacids (either homopolymers or random copolymers), and dextran or poly(n-
vinyl pyrrolidone)polyethylene glycol, propylene glycol homopolymers, polypropylene oxide/ethylene oxide co-polymers, polyoxyethylated polyols (e.g., glycerol), polyvinyl alcohol, and mixtures thereof. Polyethylene glycol propionaldehyde may have advantages in manufacturing due to its stability in water. The polymer may be of any molecular weight, and may be branched or unbranched. The number of polymers attached to the antibody may vary, and if more than one polymer are attached, they can be the same or different molecules. In general, the number and/or type of polymers used for derivatization can be determined based on considerations including, but not limited to, the particular properties or functions of the antibody to be improved, whether the antibody derivative will be used in a therapy under defined conditions, etc.

[0230] In another embodiment, conjugates of an antibody and nonproteinaceous moiety that may be selectively heated by exposure to radiation are provided. In one embodiment, the nonproteinaceous moiety is a carbon nanotube (Kam et al., Proc. Natl. Acad. Sci. USA 102: 11600-11605 (2005)). The radiation may be of any wavelength, and includes, but is not limited to, wavelengths that do not harm ordinary cells, but which heat the nonproteinaceous moiety to a temperature at which cells proximal to the antibody-nonproteinaceous moiety are killed.

C. Recombinant Methods and Compositions

[0231] Antibodies may be produced using recombinant methods and compositions, e.g., as described in U.S. Patent No. 4,816,567. In one embodiment, isolated nucleic acid encoding an anti-LGR5 antibody described herein is provided. Such nucleic acid may encode an amino acid sequence comprising the VL and/or an amino acid sequence comprising the VH of the antibody (e.g., the light and/or heavy chains of the antibody). In a further embodiment, one or more vectors (e.g., expression vectors) comprising such nucleic acid are provided. In a further embodiment, a host cell comprising such nucleic acid is provided. In one such embodiment, a host cell comprises (e.g., has been transformed with): (1) a vector comprising a nucleic acid that encodes an amino acid sequence comprising the VL of the antibody and an amino acid sequence comprising the VH of the antibody, or (2) a first vector comprising a nucleic acid that encodes an amino acid sequence comprising the VL of the antibody and a second vector comprising a nucleic acid that encodes an amino acid sequence comprising the VH of the antibody. In one embodiment, the host cell is eukaryotic, e.g. a Chinese Hamster Ovary (CHO) cell or lymphoid cell (e.g., Y0, NSO, Sp20 cell). In one embodiment, a method of making an anti-LGR5 antibody is provided, wherein the method comprises culturing a host cell comprising a nucleic acid encoding the antibody, as provided above, under conditions suitable for expression of the antibody, and optionally recovering the antibody from the host cell (or host cell culture medium).

[0232] For recombinant production of an anti-LGR5 antibody, nucleic acid encoding an antibody, e.g., as described above, is isolated and inserted into one or more vectors for further cloning and/or expression in a host cell. Such nucleic acid may be readily isolated and sequenced using conventional
procedures (e.g., by using oligonucleotide probes that are capable of binding specifically to genes encoding the heavy and light chains of the antibody).

[0233] Suitable host cells for cloning or expression of antibody-encoding vectors include prokaryotic or eukaryotic cells described herein. For example, antibodies may be produced in bacteria, in particular when glycosylation and Fc effector function are not needed. For expression of antibody fragments and polypeptides in bacteria, see, e.g., U.S. Patent Nos. 5,648,237, 5,789,199, and 5,840,523. (See also Charlton, Methods in Molecular Biology, Vol. 248 (B.K.C. Lo, ed., Humana Press, Totowa, NJ, 2003), pp. 245-254, describing expression of antibody fragments in is. coli.) After expression, the antibody may be isolated from the bacterial cell paste in a soluble fraction and can be further purified.

[0234] In addition to prokaryotes, eukaryotic microbes such as filamentous fungi or yeast are suitable cloning or expression hosts for antibody-encoding vectors, including fungi and yeast strains whose glycosylation pathways have been "humanized," resulting in the production of an antibody with a partially or fully human glycosylation pattern. See Gerngross, Nat. Biotechnol. 22:1409-1414 (2004), and Li et al., Nat. Biotechnol. 24:210-215 (2006).

[0235] Suitable host cells for the expression of glycosylated antibody are also derived from multicellular organisms (invertebrates and vertebrates). Examples of invertebrate cells include plant and insect cells. Numerous baculoviral strains have been identified which may be used in conjunction with insect cells, particularly for transfection of Spodoptera frugiperda cells.

[0236] Plant cell cultures can also be utilized as hosts. See, e.g., US Patent Nos. 5,959,177, 6,040,498, 6,420,548, 7,125,978, and 6,417,429 (describing PLANTIBODIES™ technology for producing antibodies in transgenic plants).

[0237] Vertebrate cells may also be used as hosts. For example, mammalian cell lines that are adapted to grow in suspension may be useful. Other examples of useful mammalian host cell lines are monkey kidney CV1 line transformed by SV40 (COS-7); human embryonic kidney line (293 or 293 cells as described, e.g., in Graham et al., J. Gen Virol. 36:59 (1977)); baby hamster kidney cells (BHK); mouse Sertoli cells (TM4 cells as described, e.g., in Mather, Biol. Reprod. 23:243-251 (1980)); monkey kidney cells (CV1); African green monkey kidney cells (VERO-76); human cervical carcinoma cells (HELA); canine kidney cells (MDCK; buffalo rat liver cells (BRL 3A); human lung cells (W138); human liver cells (Hep G2); mouse mammary tumor (MMT 060562); TRI cells, as described, e.g., in Mather et al., Annals NY. Acad. Sci. 383:44-68 (1982); MRC 5 cells; and FS4 cells. Other useful mammalian host cell lines include Chinese hamster ovary (CHO) cells, including DHFR-CHO cells (Urlaub et al., Proc. Natl. Acad. Sci. USA 77:4216 (1980)); and myeloma cell lines such as Y0, NS0 and Sp2/0. For a review of certain mammalian host cell lines suitable for antibody production, see, e.g., Yazaki and Wu, Methods in Molecular Biology, Vol. 248 (B.K.C. Lo, ed., Humana Press, Totowa, NJ, pp. 255-268 (2003).
D. Assays

[0238] Anti-LGR5 antibodies provided herein may be identified, screened for, or characterized for their physical/chemical properties and/or biological activities by various assays known in the art.

[0239] In one aspect, an antibody is tested for its antigen binding activity, e.g., by known methods such as ELISA, BIACore®, FACS, or Western blot.

[0240] In another aspect, competition assays may be used to identify an antibody that competes with any of the antibodies described herein for binding to LGR5. In certain embodiments, such a competing antibody binds to the same epitope (e.g., a linear or a conformational epitope) that is bound by an antibody described herein. Detailed exemplary methods for mapping an epitope to which an antibody binds are provided in Morris (1996) "Epitope Mapping Protocols," in Methods in Molecular Biology vol. 66 (Humana Press, Totowa, NJ).

[0241] In an exemplary competition assay, immobilized LGR5 is incubated in a solution comprising a first labeled antibody that binds to LGR5 (e.g., any of the antibodies described herein) and a second unlabeled antibody that is being tested for its ability to compete with the first antibody for binding to LGR5. The second antibody may be present in a hybridoma supernatant. As a control, immobilized LGR5 is incubated in a solution comprising the first labeled antibody but not the second unlabeled antibody. After incubation under conditions permissive for binding of the first antibody to LGR5, excess unbound antibody is removed, and the amount of label associated with immobilized LGR5 is measured. If the amount of label associated with immobilized LGR5 is substantially reduced in the test sample relative to the control sample, then that indicates that the second antibody is competing with the first antibody for binding to LGR5. See Harlow and Lane (1988) Antibodies: A Laboratory Manual ch.14 (Cold Spring Harbor Laboratory, Cold Spring Harbor, NY).

E. Immunoconjugates

[0242] Provided herein are also anti-LGR5 antibodies for use herein comprising an anti-LGR5 antibody herein conjugated to one or more cytotoxic agents (also referred to as "immunoconjugates"), such as chemotherapeutic agents or drugs, growth inhibitory agents, toxins (e.g., protein toxins, enzymatically active toxins of bacterial, fungal, plant, or animal origin, or fragments thereof), or radioactive isotopes (i.e., a radioconjugate).

[0243] Immunoconjugates allow for the targeted delivery of a drug moiety to a tumor, and, in some embodiments intracellular accumulation therein, where systemic administration of unconjugated drugs may result in unacceptable levels of toxicity to normal cells (Polakis P. (2005) Current Opinion in Pharmacology 5:382-387).

[0244] Antibody-drug conjugates (ADC) are targeted chemotherapeutic molecules which combine properties of both antibodies and cytotoxic drugs by targeting potent cytotoxic drugs to antigen-expressing tumor cells (Teicher, B.A. (2009) Current Cancer Drug Targets 9:982-1004), thereby enhancing the therapeutic index by maximizing efficacy and minimizing off-target toxicity (Carter,
The ADC compounds for use herein include those with anticancer activity. In some embodiments, the ADC compounds include an antibody conjugated, i.e. covalently attached, to the drug moiety. In some embodiments, the antibody is covalently attached to the drug moiety through a linker. The antibody-drug conjugates (ADC) selectively deliver an effective dose of a drug to tumor tissue whereby greater selectivity, i.e. a lower efficacious dose, may be achieved while increasing the therapeutic index ("therapeutic window").

The drug moiety (D) of the antibody-drug conjugates (ADC) may include any compound, moiety or group that has a cytotoxic or cytostatic effect. Drug moieties may impart their cytotoxic and cytostatic effects by mechanisms including but not limited to tubulin binding, DNA binding or intercalation, and inhibition of RNA polymerase, protein synthesis, and/or topoisomerase. Exemplary drug moieties include, but are not limited to, a maytansinoid, dolastatin, auristatin, calicheamicin, pyrrolobenzodiazepine (PBD), nemorubicin and its derivatives, PNU-159682, anthracycline, duocarmycin, vinca alkaloid, taxane, trichothecene, CC1065, camptothecin, elinafide, and stereoisomers, isosteres, analogs, and derivatives thereof that have cytotoxic activity. Nonlimiting examples of such immunoconjugates are discussed in further detail below.

1. Exemplary Antibody-drug Conjugates

An exemplary embodiment of an antibody-drug conjugate (ADC) compound comprises an antibody (Ab) which targets a tumor cell, a drug moiety (D), and a linker moiety (L) that attaches Ab to D. In some embodiments, the antibody is attached to the linker moiety (L) through one or more amino acid residues, such as lysine and/or cysteine.

An exemplary ADC has Formula I:

\[
\text{Ab-(L-D)}_p \text{ I}
\]

where \( p \) is 1 to about 20. In some embodiments, the number of drug moieties that can be conjugated to an antibody is limited by the number of free cysteine residues. In some embodiments, free cysteine residues are introduced into the antibody amino acid sequence by the methods described herein. Exemplary ADC of Formula I include, but are not limited to, antibodies that have 1, 2, 3, or 4 engineered cysteine amino acids (Lyon, R. et al (2012) Methods in Enzym. 502: 123-138). In some embodiments, one or more free cysteine residues are already present in an antibody, without the use of engineering, in which case the existing free cysteine residues may be used to conjugate the antibody to a drug. In some embodiments, an antibody is exposed to reducing conditions prior to conjugation of the antibody in order to generate one or more free cysteine residues.

a) Exemplary Linkers

A "Linker" (L) is a bifunctional or multifunctional moiety that can be used to link one or more drug moieties (D) to an antibody (Ab) to form an antibody-drug conjugate (ADC) of Formula I. In some embodiments, antibody-drug conjugates (ADC) can be prepared using a Linker having
reactive functionalities for covalently attaching to the drug and to the antibody. For example, in some embodiments, a cysteine thiol of an antibody (Ab) can form a bond with a reactive functional group of a linker or a drug-linker intermediate to make an ADC.

[0250] In one aspect, a linker has a functionality that is capable of reacting with a free cysteine present on an antibody to form a covalent bond. Nonlimiting exemplary such reactive functionalities include maleimide, halocetamides, a-halocetyle, activated esters such as succinimide esters, 4-nitrophenyl esters, pentafluorophenyl esters, tetrafluorophenyl esters, anhydrides, acid chlorides, sulfonyl chlorides, isocyanates, and isothiocyanates. See, e.g., the conjugation method at page 766 of Klussman, et al (2004), Bioconjugate Chemistry 15(4):765-773, and the Examples herein.

[0251] In some embodiments, a linker has a functionality that is capable of reacting with an electrophilic group present on an antibody. Exemplary such electrophilic groups include, but are not limited to, aldehyde and ketone carbonyl groups. In some embodiments, a heteroatom of the reactive functionality of the linker can react with an electrophilic group on an antibody and form a covalent bond to an antibody unit. Nonlimiting exemplary such reactive functionalities include, but are not limited to, hydrazide, oxime, amino, hydrazine, thiosemicarbazone, hydrazine carboxylate, and arylhydrazide.

[0252] A linker may comprise one or more linker components. Exemplary linker components include 6-maleimodicaproly ("MC"), maleimidopropanoyl ("MP"), valine-citrulline ("val-cit" or "vc"), alanine-phenylalanine ("ala-phe"), p-aminobenzyloxycarbonyl ("PAB"), N-Succinimidyl 4-(2-pyridylthio) pentanoate ("SPP"), and 4-(N-maleimidomethyl) cyclohexane-1 carboxylate ("MCC"). Various linker components are known in the art, some of which are described below.

[0253] A linker may be a "cleavable linker," facilitating release of a drug. Nonlimiting exemplary cleavable linkers include acid-labile linkers (e.g., comprising hydrazone), protease-sensitive (e.g., peptidase-sensitive) linkers, photolabile linkers, or disulfide-containing linkers (Chari et al., Cancer Research 52:127-131 (1992); US 5208020).

[0254] In certain embodiments, a linker has the following Formula II:

\[ \text{A}_a \longrightarrow \text{W}_w \longrightarrow \text{Y}_y \]

wherein A is a "stretcher unit", and a is an integer from 0 to 1; W is an "amino acid unit", and w is an integer from 0 to 12; Y is a "spacer unit", and y is 0, 1, or 2. An ADC comprising the linker of Formula II has the Formula I(A): Ab-(A\text{a}W\text{w}Y\text{y}-D)p, wherein Ab, D, and p are defined as above for Formula I. Exemplary embodiments of such linkers are described in U.S. Patent No. 7,498,298, which is expressly incorporated herein by reference.

[0255] In some embodiments, a linker component comprises a "stretcher unit" (A) that links an antibody to another linker component or to a drug moiety. Nonlimiting exemplary stretcher units are shown below (wherein the wavy line indicates sites of covalent attachment to an antibody, drug, or additional linker components):
In some embodiments, a linker component comprises an "amino acid unit" (W). In some such embodiments, the amino acid unit allows for cleavage of the linker by a protease, thereby facilitating release of the drug from the immunoconjugate upon exposure to intracellular proteases, such as lysosomal enzymes (Doronina et al. (2003) Nat. Biotechnol. 21:778-784). Exemplary amino acid units include, but are not limited to, dipeptides, tripeptides, tetrapeptides, and pentapeptides. Exemplary dipeptides include, but are not limited to, valine-citrulline (vc or val-cit), alanine-phenylalanine (af or ala-phe); phenylalanine-lysine (fk or phe-lys); phenylalanine-homolysine (phe-homolys); and N-methyl-valine-citrulline (Me-val-cit). Exemplary tripeptides include, but are not limited to, glycine-valine-citrulline (gly-val-cit) and glycine-glycine-glycine (gly-gly-gly). An amino acid unit may comprise amino acid residues that occur naturally and/or minor amino acids and/or non-naturally occurring amino acid analogs, such as citrulline. Amino acid units can be designed and optimized for enzymatic cleavage by a particular enzyme, for example, a tumor-associated protease, cathepsin B, C and D, or a plasmin protease.

Typically, peptide-type linkers can be prepared by forming a peptide bond between two or more amino acids and/or peptide fragments. Such peptide bonds can be prepared, for example,
according to a liquid phase synthesis method (e.g., E. Schroder and K. Liibke (1965) "The Peptides", volume 1, pp 76-136, Academic Press).

[0258] In some embodiments, a linker component comprises a "spacer unit" (Y) that links the antibody to a drug moiety, either directly or through a stretcher unit and/or an amino acid unit. A spacer unit may be "self-immolative" or a "non-self-immolative." A "non-self-immolative" spacer unit is one in which part or all of the spacer unit remains bound to the drug moiety upon cleavage of the ADC. Examples of non-self-immolative spacer units include, but are not limited to, a glycine spacer unit and a glycine-glycine spacer unit. In some embodiments, enzymatic cleavage of an ADC containing a glycine-glycine spacer unit by a tumor-cell associated protease results in release of a glycine-glycine-drug moiety from the remainder of the ADC. In some such embodiments, the glycine-glycine-drug moiety is subjected to a hydrolysis step in the tumor cell, thus cleaving the glycine-glycine spacer unit from the drug moiety.

[0259] A "self-immolative" spacer unit allows for release of the drug moiety. In certain embodiments, a spacer unit of a linker comprises a p-aminobenzyl unit. In some such embodiments, a p-aminobenzyl alcohol is attached to an amino acid unit via an amide bond, and a carbamate, methylcarbamate, or carbonate is made between the benzyl alcohol and the drug (Hamann et al. (2005) Expert Opin. Ther. Patents (2005) 15:1087-1103). In some embodiments, the spacer unit comprises p-aminobenzoxycarbonyl (PAB). In some embodiments, an ADC comprising a self-immolative linker has the structure:

\[
\text{Ab}\left(A_a-W_w-\text{NH}-C(X-D)\right)_p
\]

wherein Q is -C_1-C_8 alkyl, -(C_1-C_8 alkyl), -halogen, -nitro, or -cyano; m is an integer ranging from 0 to 4; X may be one or more additional spacer units or may be absent; and p ranges from 1 to about 20. In some embodiments, p ranges from 1 to 10, 1 to 7, 1 to 5, or 1 to 4. Nonlimiting exemplary X spacer units include:

\[
\text{and }
\]

\[
; \text{ wherein } R_1 \text{ and } R_2 \text{ are independently selected from H and C}_1-C_8 \text{ alkyl. In some embodiments, } R_1 \text{ and } R_2 \text{ are each } -\text{CH}_3.
\]

[0260] Other examples of self-immolative spacers include, but are not limited to, aromatic compounds that are electronically similar to the PAB group, such as 2-aminomidazol-5-methanol derivatives (U.S. Patent No. 7,375,078; Hay et al. (1999) Bioorg. Med. Chem. Lett. 9:2237) and ortho- or para-aminobenzylacetals. In some embodiments, spacers can be used that undergo cyclization upon amide bond hydrolysis, such as substituted and unsubstituted 4-aminobutyric acid amides (Rodrigues

[0261] In some embodiments, linker L may be a dendritic type linker for covalent attachment of more than one drug moiety to an antibody through a branching, multifunctional linker moiety (Sun et al (2002) Bioorganic & Medicinal Chemistry Letters 12:2213-2215; Sun et al (2003) Bioorganic & Medicinal Chemistry 11:1761-1768). Dendritic linkers can increase the molar ratio of drug to antibody, i.e. loading, which is related to the potency of the ADC. Thus, where an antibody bears only one reactive cysteine thiol group, a multitude of drug moieties may be attached through a dendritic linker.

[0262] Nonlimiting exemplary linkers are shown below in the context of an ADC of Formula I:
R₁ and independently selected from H and C₆ alkyl. In some embodiments, R₁ and R₂ are each -CH₃.

wherein n is 0 to 12. In some embodiments, n is 2 to 10. In some embodiments, n is 4 to 8.

Further nonlimiting exemplary ADCs include the structures:

where X is:
In some embodiments, a linker is substituted with groups that modulate solubility and/or reactivity. As a nonlimiting example, a charged substituent such as sulfonate (-SO_3) or ammonium may increase water solubility of the linker reagent and facilitate the coupling reaction of the linker reagent with the antibody and/or the drug moiety, or facilitate the coupling reaction of Ab-L (antibody-linker intermediate) with D, or D-L (drug-linker intermediate) with Ab, depending on the synthetic route employed to prepare the ADC. In some embodiments, a portion of the linker is coupled to the antibody and a portion of the linker is coupled to the drug, and then the Ab-(linker portion)_a is coupled to drug-(linker portion)_b to form the ADC of Formula I.

The compounds expressly contemplate, but are not limited to, ADC prepared with the following linker reagents: bis-maleimido-trioxy ethylene glycol (BMPEO), N-(β-maleimidopropyloxy)-N-hydroxy succinimide ester (BMPS), N,4,8-maleimidocaproyloxy) succinimide ester (EMCS), N-[y-maleimidobutryloxy)succinimide ester (GMBS), 1,6-hexane-bis-vinylsulfone (HBVS), succinimidyl 4-(N-maleimidomethyl)cyclohexane-1-carboxy-(6-amidocaproate) (LC-SMCC), m-maleimidobenzoyl-N-hydroxysuccinimide ester (MBS), 4-(4-N-Maleimidophenyl)butyric acid hydrazide (MPBH), succinimidyl 3-(bromoacetamido)propionate (SBAP), succinimidyl iodoacetate (SIA), succinimidyl (4-iodoacetyl)aminobenzoate (SIAB), Nsuccinimidyl-3-(2-pyridyldithio)propionate (SPDP), N-succinimidyl-4-(2-pyridylthio)pentanoate (SPP), succinimidyl 4-(N-maleimidomethyl)cyclohexane-1-carboxylate (SMCC), succinimidyl 4-(p-maleimidophenyl)butyrate (SMPB), succinimidyl 6-[(beta-maleimidopropionamido)hexanoate] (SMPH), iminothiolane (IT), sulfo-EMCS, sulfo-GMBS, sulfo-KMUS, sulfo-MBS, sulfo-SIAB, sulfo-SMCC, and sulfo-SMPB, and succinimidyl-(4-vinylsulfone)benzoate (SVSB), and including bis-maleimide reagents: dithiobismaleimidooethane (DTME), 1,4-Bismaleimidobutane (BMB), 1,4 Bismaleimidyl-2,3-dihydroxybutane (BMDB), bismaleimidohexane (BMH), bismaleimidoethane
(BMOE), BM(PEG)\textsubscript{2} (shown below), and BM(PEG)\textsubscript{3} (shown below); bifunctional derivatives of imidoesters (such as dimethyl adipiminate \textsc{HCl}), active esters (such as disuccinimidyl suberate), aldehydes (such as glutaraldehyde), bis-azido compounds (such as bis (p-azidobenzoyl) hexanediamine), bis-diazonium derivatives (such as bis-(p-diazoniumbenzoyl)-ethylenediamine), disiocyanates (such as toluene 2,6-diisocyanate), and bis-active fluorine compounds (such as 1,5-difluoro-2,4-dinitrobenzene). In some embodiments, bis-maleimide reagents allow the attachment of the thiol group of a cysteine in the antibody to a thiol-containing drug moiety, linker, or linker-drug intermediate. Other functional groups that are reactive with thiol groups include, but are not limited to, iodoacetamide, bromoacetamide, vinyl pyridine, disulfide, pyridyl disulfide, isocyanate, and thiocyanate.

\begin{center}
\begin{tikzpicture}
\node at (0,0) {BM(PEG)\textsubscript{2}}; \node at (2,0) {BM(PEG)\textsubscript{3}};
\end{tikzpicture}
\end{center}

[0266] Certain useful linker reagents can be obtained from various commercial sources, such as Pierce Biotechnology, Inc. (Rockford, IL), Molecular Biosciences Inc.(Boulder, CO), or synthesized in accordance with procedures described in the art; for example, in Toki et al (2002) J. Org. Chem. 67:1866-1872; Dubowchik, et al. (1997) 

[0267] Carbon-14-labeled 1-isothiocyanatobenzyl-3-methylidene triaminepentacetic acid (MX-DTPA) is an exemplary chelating agent for conjugation of radionucleotide to the antibody. See, e.g., WO94/11026.

b) Exemplary Drug Moieties

(1) Maytansine and maytansinoids

[0268] In some embodiments, an immunoconjugate comprises an antibody conjugated to one or more maytansinoid molecules. Maytansinoids are derivatives of maytansine, and are mitotic inhibitors which act by inhibiting tubulin polymerization. Maytansine was first isolated from the east African shrub Maytenus serrata (U.S. Patent No. 38961 11). Subsequently, it was discovered that certain microbes also produce maytansinoids, such as maytansinol and C-3 maytansinol esters (U.S. Patent No. 4,151,042). Synthetic maytansinoids are disclosed, for example, in U.S. Patent Nos. 4,137,230; 4,248,870; 4,256,746; 4,260,608; 4,265,814; 4,294,757; 4,307,016; 4,308,268; 4,308,269; 4,309,428; 4,313,946; 4,315,929; 4,317,821; 4,322,348; 4,331,598; 4,361,650; 4,364,866; 4,424,219; 4,450,254; 4,362,663; and 4,371,533.

[0269] Maytansinoid drug moieties are attractive drug moieties in antibody-drug conjugates because they are: (i) relatively accessible to prepare by fermentation or chemical modification or derivatization
of fermentation products, (ii) amenable to derivatization with functional groups suitable for conjugation through non-disulfide linkers to antibodies, (iii) stable in plasma, and (iv) effective against a variety of tumor cell lines.

[0270] Certain maytansinoids suitable for use as maytansinoid drug moieties are known in the art and can be isolated from natural sources according to known methods or produced using genetic engineering techniques (see, e.g., Yu et al (2002) PNAS 99:7968-7973). Maytansinoids may also be prepared synthetically according to known methods.

[0271] Exemplary maytansinoid drug moieties include, but are not limited to, those having a modified aromatic ring, such as: C-19-dechloro (US Pat. No. 4256746) (prepared, for example, by lithium aluminum hydride reduction of ansamytocin P2); C-20-hydroxy (or C-20-demethyl) +/-C-19-dechloro (US Pat. Nos. 4361650 and 4307016) (prepared, for example, by demethylation using Streptomyces or Actinomycetes or dechlorination using LAH); and C-20-demethoxy, C-20-acyloxy (-OCOR), +/-dechloro (U.S. Pat. No. 4,294,757) (prepared, for example, by acylation using acyl chlorides), and those having modifications at other positions of the aromatic ring.

[0272] Exemplary maytansinoid drug moieties also include those having modifications such as: C-9-SH (US Pat. No. 4424219) (prepared, for example, by the reaction of maytansinol with H₂S or P₂S₃); C-14-alkoxymethyl(demethoxy/CH₂OR)(US 4331598); C-14-hydroxymethyl or acyloxymethyl (CH₂OH or CH₂OAc) (US Pat. No. 4450254) (prepared, for example, from Nocardia); C-15-hydroxy/acyloxy (US 4364866) (prepared, for example, by the conversion of maytansinol by Streptomyces); C-15-methoxy (US Pat. Nos. 4313946 and 4315929) (for example, isolated from Trewia nudiflora); C-18-N-demethyl (US Pat. Nos. 4362663 and 4322348) (prepared, for example, by the demethylation of maytansinol by Streptomyces); and 4,5-deoxy (US 4371533) (prepared, for example, by the titanium trichloride/LAH reduction of maytansinol).

[0273] Many positions on maytansinoid compounds are useful as the linkage position. For example, an ester linkage may be formed by reaction with a hydroxyl group using conventional coupling techniques. In some embodiments, the reaction may occur at the C-3 position having a hydroxyl group, the C-14 position modified with hydroxymethyl, the C-15 position modified with a hydroxyl group, and the C-20 position having a hydroxyl group. In some embodiments, the linkage is formed at the C-3 position of maytansinol or a maytansinol analogue.

[0274] Maytansinoid drug moieties include those having the structure:
where the wavy line indicates the covalent attachment of the sulfur atom of the maytansinoid drug moiety to a linker of an ADC. Each R may independently be H or a C\textsubscript{i}-C\textsubscript{j} alkyl. The alkylene chain attaching the amide group to the sulfur atom may be methanyl, ethanyl, or propyl, i.e., m is 1, 2, or 3 (US 633410; US 5208020; Chari et al (1992) Cancer Res. 52:127-131; Liu et al (1996) Proc. Natl. Acad. Sci USA 93:8618-8623).

[0275] All stereoisomers of the maytansinoid drug moiety are contemplated for the ADC, i.e. any combination of R and S configurations at the chiral carbons (US 7276497; US 6913748; US 6441 163; US 633410 (RE39151); US 5208020; Widdison et al (2006) J. Med. Chem. 49:4392-4408, which are incorporated by reference in their entirety). In some embodiments, the maytansinoid drug moiety has the following stereochemistry:

[0276] Exemplary embodiments of maytansinoid drug moieties include, but are not limited to, DM1; DM3; and DM4, having the structures:
[0277] Other exemplary maytansinoid antibody-drug conjugates have the following structures and abbreviations (wherein Ab is antibody and p is 1 to about 20. In some embodiments, p is 1 to 10, p is 1 to 7, p is 1 to 5, or p is 1 to 4):
Exemplary antibody-drug conjugates where DM1 is linked through a BMPEO linker to a thiol group of the antibody have the structure and abbreviation:

where Ab is antibody; n is 0, 1, or 2; and p is 1 to about 20. In some embodiments, p is 1 to 10, p is 1 to 7, p is 1 to 5, or p is 1 to 4.

[0280] In some embodiments, antibody-maytansinoid conjugates may be prepared by chemically linking an antibody to a maytansinoid molecule without significantly diminishing the biological activity of either the antibody or the maytansinoid molecule. See, e.g., U.S. Patent No. 5,208,020 (the disclosure of which is hereby expressly incorporated by reference). In some embodiments, ADC with an average of 3-4 maytansinoid molecules conjugated per antibody molecule has shown efficacy in enhancing cytotoxicity of target cells without negatively affecting the function or solubility of the antibody. In some instances, even one molecule of toxin/antibody is expected to enhance cytotoxicity over the use of naked antibody.

[0281] Exemplary linking groups for making antibody-maytansinoid conjugates include, for example, those described herein and those disclosed in U.S. Patent No. 5208020; EP Patent 0 425 235 Bl; Chari et al. Cancer Research 52:127-131 (1992); US 2005/0276812 Al; and US 2005/016993 Al, the disclosures of which are hereby expressly incorporated by reference.

(2) Auristatins and dolastatins

[0283] Exemplary auristatin embodiments include the N-terminus linked monomethylauristatin drug moieties D_E and D_F, disclosed in US 7498298 and US 7659241, the disclosures of which are expressly incorporated by reference in their entirety:
wherein the wavy line of D_e and D_f indicates the covalent attachment site to an antibody or antibody-linker component, and independently at each location:

- R^2 is selected from H and Ci-C_8 alkyl;
- R^3 is selected from H, Ci-C_8 alkyl, C_3-C_8 carbocycle, aryl, Ci-C_8 alkyl-aryl, Ci-C_8 alkyl-(C_3-C_8 carbocycle), C_3-C_8 heterocycle and Ci-C_8 alkyl-(C_3-C_8 heterocycle);
- R^4 is selected from H, Ci-C_8 alkyl, C_3-C_8 carbocycle, aryl, Ci-C_8 alkyl-aryl, Ci-C_8 alkyl-(C_3-C_8 carbocycle), C_3-C_8 heterocycle and Ci-C_8 alkyl-(C_3-C_8 heterocycle);
- R^5 is selected from H and methyl;
- R^6 is selected from H and Ci-C_8 alkyl;
- R^7 is selected from H, Ci-C_8 alkyl, C_3-C_8 carbocycle, aryl, Ci-C_8 alkyl-aryl, Ci-C_8 alkyl-(C_3-C_8 carbocycle), C_3-C_8 heterocycle and Ci-C_8 alkyl-(C_3-C_8 heterocycle);
- R^8 is independently selected from H, OH, Ci-C_8 alkyl, C_3-C_8 carbocycle and 0-(Ci-C_8 alkyl);
- R^9 is selected from H and Ci-C_8 alkyl;
- R^10 is selected from aryl or C_3-C_8 heterocycle;
- Z is O, S, NH, or NR^{12}, wherein R^{12} is C_1-C_8 alkyl;
- R^11 is selected from H, Ci-C_20 alkyl, aryl, C_3-C_8 heterocycle, -(R^{13}0)_m-R^{10}, or -(R^{13}0)_m-CH(R^10)_2;
- m is an integer ranging from 1-1000;
- R^{13} is C_2-C_8 alkyl;
- R^{14} is H or C_1-C_8 alkyl;
- each occurrence of R^{15} is independently H, COOH, -(CH_2)_n-N(R^{16})_o-(CH_2)_n-S0_2-H, or -(CH_2)_n-S0_2-C_1-C_8 alkyl;
- each occurrence of R^{16} is independently H, C_1-C_8 alkyl, or -(CH_2)_n-COOH;
- R^{17} is selected from -C(R^{8})_2-C(R^{8})_2-aryl, -C(R^{8})_2-C(R^{8})_2-(C_3-C_8 heterocycle), and -C(R^{8})_2-C(R^{8})_2-(C_3-C_8 carbocycle); and
- n is an integer ranging from 0 to 6.
[0284] In one embodiment, \( R^1, R^4 \) and \( R^7 \) are independently isopropyl or sec-butyl and \( R^5 \) is -H or methyl. In an exemplary embodiment, \( R^3 \) and \( R^4 \) are each isopropyl, \( R^5 \) is -H, and \( R^7 \) is sec-butyl.

[0285] In yet another embodiment, \( R^2 \) and \( R^6 \) are each methyl, and \( R^9 \) is -H.

[0286] In still another embodiment, each occurrence of \( R^8 \) is -OCH₃.

[0287] In an exemplary embodiment, \( R^3 \) and \( R^4 \) are each isopropyl, \( R^2 \) and \( R^6 \) are each methyl, \( R^5 \) is -H, \( R^7 \) is sec-butyl, each occurrence of \( R^8 \) is -OCH₃, and \( R^9 \) is -H.

[0288] In one embodiment, \( Z \) is -O- or -NH-.

[0289] In one embodiment, \( R^\pi \) is aryl.

[0290] In an exemplary embodiment, \( R^\pi \) is -phenyl.

[0291] In an exemplary embodiment, when \( Z \) is -O-, \( R^{11} \) is -H, methyl or t-butyl.

[0292] In one embodiment, when \( Z \) is -NH, \( R^{11} \) is -CH(R^{15})₂, wherein \( R^{15} \) is -(CH₂)ₖ-N(R^{6})₂, and \( R^{16} \) is -Ci-C₈ alkyl or -(CH₂)ₙ-COOH.

[0293] In another embodiment, when \( Z \) is -NH, \( R^{11} \) is -CH(R^{15})₂, wherein \( R^{15} \) is -(CH₂)ₖ-SO₃H.

[0294] An exemplary auristatin embodiment of formula Dₖ is MMAE, wherein the wavy line indicates the covalent attachment to a linker (L) of an antibody-drug conjugate:

[0295] An exemplary auristatin embodiment of formula Dₖ is MMAF, wherein the wavy line indicates the covalent attachment to a linker (L) of an antibody-drug conjugate:

[0296] Other exemplary embodiments include monomethylvalme compounds having phenylalanine carboxy modifications at the C-terminus of the pentapeptide auristatin drug moiety (WO 2007/008848) and monomethylvalme compounds having phenylalanine sidechain modifications at the C-terminus of the pentapeptide auristatin drug moiety (WO 2007/008603).

[0297] Nonlimiting exemplary embodiments of ADC of Formula I comprising MMAE or MMAF and various linker components have the following structures and abbreviations (wherein “Ab” is an antibody; \( p \) is 1 to about 8, “Val-Cit” is a valine-citrulline dipeptide; and “S” is a sulfur atom:

\[
\text{Ab-MC-vc-PAB-MMAF}
\]
Nonlimiting exemplary embodiments of ADCs of Formula I comprising MMAF and various linker components further include Ab-MC-PAB-MMAF and Ab-PAB-MMAF. Immunoconjugates comprising MMAF attached to an antibody by a linker that is not proteolytically cleavable have been shown to possess activity comparable to immunoconjugates comprising MMAF attached to an antibody by a proteolytically cleavable linker (Doronina et al. (2006) Bioconjugate Chem. 17:1 14-124). In some such embodiments, drug release is believed to be effected by antibody degradation in the cell.

In some embodiments, auristatin/dolastatin drug moieties of formulas D_E such as MMAE, and D_F, such as MMAF, and drug-linker intermediates and derivatives thereof, such as MC-MMAF, MC-MMAE, MC-vc-PAB-MMAF, and MC-vc-PAB-MMAE, may be prepared using methods described...

(3) **Calicheamicin**

[0301] In some embodiments, the immunonconjugate comprises an antibody conjugated to one or more calicheamicin molecules. The calicheamicin family of antibiotics, and analogues thereof, are capable of producing double-stranded DNA breaks at sub-picomolar concentrations (Hinman et al., (1993) *Cancer Research* 53:3336-3342; Lode et al., (1998) *Cancer Research* 58:2925-2928). Calicheamicin has intracellular sites of action but, in certain instances, does not readily cross the plasma membrane. Therefore, cellular uptake of these agents through antibody-mediated internalization may, in some embodiments, greatly enhances their cytotoxic effects. Nonlimiting exemplary methods of preparing antibody-drug conjugates with a calicheamicin drug moiety are described, for example, in US 5712374; US 5714586; US 5739116; and US 5767285.

(4) **Pyrrolobenzodiazepines**

[0303] PBD dimers have been conjugated to antibodies and the resulting ADC shown to have anti-cancer properties. Nonlimiting exemplary linkage sites on the PBD dimer include the five-membered pyrrolo ring, the tether between the PBD units, and the N10-C1 l imine group (WO 2009/016516; US 2009/304710; US 2010/047257; US 2009/036431; US 2011/0256157; WO 2011/130598).

[0304] Nonlimiting exemplary PBD dimer components of ADCs are of Formula A:
and salts and solvates thereof, wherein:

the wavy line indicates the covalent attachment site to the linker;

the dotted lines indicate the optional presence of a double bond between C1 and C2 or C2 and C3;

R^2 is independently selected from H, OH, =0, =CH_2, CN, R, OR, =CH-R^D, =C(R^D)_2,
0-S0_2-R, C0_2-R and COR, and optionally further selected from halo or dihalo, wherein R^D is independently selected from R, C0_2-R, COR, CHO, C0_2-H, and halo;

R^6 and R^9 are independently selected from H, R, OH, OR, SH, SR, NH_2, NHR, NRR', NO_2, Me_3Sn and halo;

R^7 is independently selected from H, R, OH, OR, SH, SR, NH_2, NHR, NRR', NO_2, Me_3Sn and halo;

Q is independently selected from O, S and NH;

R'^1 is either H, or R or, where Q is O, SO_3M, where M is a metal cation;

R and R' are each independently selected from optionally substituted C_3-8 alkyl, C_1-4 alkyl, C_3-8 heterocyclyl, C_3-20 heterocycle, and C_3-20 aryl groups, and optionally in relation to the group NRR', R and R' together with the nitrogen atom to which they are attached form an optionally substituted 4-, 5-, 6- or 7-membered heterocyclic ring;

R'^2, R'^9, R'^10 and R'^11 are as defined for R^2, R^6, R^9 and R^7 respectively;

R'' is a C_3-12 alkyne group, which chain may be interrupted by one or more heteroatoms, e.g. O, S, N(H), NMe and/or aromatic rings, e.g. benzene or pyridine, which rings are optionally substituted; and

X and X' are independently selected from O, S and N(H).

[0305] In some embodiments, R and R' are each independently selected from optionally substituted C_3-12 alkyl, C_3-20 heterocycle, and C_3-20 aryl groups, and optionally in relation to the group NRR', R and R' together with the nitrogen atom to which they are attached form an optionally substituted 4-, 5-, 6- or 7-membered heterocyclic ring.

[0306] In some embodiments, R^9 and R'^9 are H.

[0307] In some embodiments, R^6 and R'^6 are H.
[0308] In some embodiments, $R^7$ are $R^{17}$ are both $OR^7A$, where $R^7A$ is optionally substituted $C_4$ alkyl. In some embodiments, $R^7A$ is $Me$. In some embodiments, $R^7A$ is $CH_2Ph$, where $Ph$ is a phenyl group.

[0309] In some embodiments, $X$ is $O$.

[0310] In some embodiments, $R^{11}$ is $H$.

[0311] In some embodiments, there is a double bond between $C_2$ and $C_3$ in each monomer unit.

[0312] In some embodiments, $R^2$ and $R^{12}$ are independently selected from $H$ and $R$. In some embodiments, $R^2$ and $R^{12}$ are independently $R$. In some embodiments, $R^2$ and $R^{12}$ are independently optionally substituted $C_{5,6}$aryl or $C_{5,7}$aryl or $C_{6,10}$aryl. In some embodiments, $R^2$ and $R^{12}$ are independently optionally substituted phenyl, thienyl, naphthyl, pyridyl, quinolinyl, or isoquinolinyl. In some embodiments, $R^2$ and $R^{12}$ are independently selected from $=0$, $=CH_2$, $=CH-R^D$, and $=C(R^D)\_2$. In some embodiments, $R^2$ and $R^{12}$ each $=CH_2$. In some embodiments, $R^2$ and $R^{12}$ are each $H$. In some embodiments, $R^2$ and $R^{12}$ are each $=0$. In some embodiments, $R^2$ and $R^{12}$ are each $=CF_2$. In some embodiments, $R^2$ and/or $R^{12}$ are independently $=C(R^D)\_2$. In some embodiments, $R^2$ and/or $R^{12}$ are independently $=CH-R^D$.

[0313] In some embodiments, when $R^2$ and/or $R^{12}$ is $=CH-R^D$, each group may independently have either configuration shown below:

```
\begin{align*}
\text{(I)} & \\
\text{(II)} & 
\end{align*}
```

In some embodiments, a $=CH-R^D$ is in configuration (I).

[0314] In some embodiments, $R^*$ is a $C_3$ alkylene group or a $C_4$ alkylene group.

[0315] In some embodiments, an exemplary PBD dimer component of an ADC has the structure of Formula A(I):

![A(I)](image)

wherein $n$ is 0 or 1.

[0316] In some embodiments, an exemplary PBD dimer component of an ADC has the structure of Formula A(II):
wherein \( n \) is 0 or 1.

[03 17] In some embodiments, an exemplary PBD dimer component of an ADC has the structure of Formula A(II):

wherein \( R^E \) and \( R^{E'} \) are each independently selected from H or \( R^D \), wherein \( R^D \) is defined as above; and

wherein \( n \) is 0 or 1.

[03 18] In some embodiments, \( n \) is 0. In some embodiments, \( n \) is 1. In some embodiments, \( R^E \) and/or \( R^{E'} \) is H. In some embodiments, \( R^E \) and \( R^{E'} \) are H. In some embodiments, \( R^E \) and/or \( R^{E'} \) is \( R^D \), wherein \( R^D \) is optionally substituted \( \text{C}_{1-13} \) alkyl. In some embodiments, \( R^E \) and/or \( R^{E'} \) is \( R^D \), wherein \( R^D \) is methyl.

[03 19] In some embodiments, an exemplary PBD dimer component of an ADC has the structure of Formula A(IV):

wherein \( \text{Ar}^1 \) and \( \text{Ar}^2 \) are each independently optionally substituted \( \text{C}_{5-30} \)aryl; wherein \( \text{Ar}^1 \) and \( \text{Ar}^2 \) may be the same or different; and

wherein \( n \) is 0 or 1.

[03 20] In some embodiments, an exemplary PBD dimer component of an ADC has the structure of Formula A(V):
wherein Ar\(^1\) and Ar\(^2\) are each independently optionally substituted C\(_2\)o aryl; wherein Ar\(^1\) and Ar\(^2\) may be the same or different; and

wherein \(n\) is 0 or 1.

[0321] In some embodiments, Ar\(^1\) and Ar\(^2\) are each independently selected from optionally substituted phenyl, furanyl, thiophenyl and pyridyl. In some embodiments, Ar\(^1\) and Ar\(^2\) are each independently optionally substituted phenyl. In some embodiments, Ar\(^1\) and Ar\(^2\) are each independently optionally substituted thien-2-yl or thien-3-yl. In some embodiments, Ar\(^1\) and Ar\(^2\) are each independently optionally substituted quinolinyl or isoquinolinyl. The quinolinyl or isoquinolinyl group may be bound to the PBD core through any available ring position. For example, the quinolinyl may be quinolin-2-yl, quinolin-3-yl, quinolin-4-yl, quinolin-5-yl, quinolin-6-yl, quinolin-7-yl and quinolin-8-yl. In some embodiments, the quinolinyl is selected from quinolin-3-yl and quinolin-6-yl. The isoquinolinyl may be isoquinolin-1-yl, isoquinolin-3-yl, isoquinolin-4-yl, isoquinolin-5-yl, isoquinolin-6-yl, isoquinolin-7-yl and isoquinolin-8-yl. In some embodiments, the isoquinolinyl is selected from isoquinolin-3-yl and isoquinolin-6-yl.

[0322] Further nonlimiting exemplary PBD dimer components of ADCs are of Formula B:

![Diagram of PBD dimer component]

and salts and solvates thereof, wherein:

the wavy line indicates the covalent attachment site to the linker;
the wavy line connected to the OH indicates the S or R configuration;
\(R^1\) and \(R^2\) are independently selected from H, methyl, ethyl and phenyl (which phenyl may be optionally substituted with fluoro, particularly in the 4 position) and C\(_5\)\(_\alpha\) heterocyclyl; wherein \(R^1\) and \(R^2\) may be the same or different; and
\(n\) is 0 or 1.

[0323] In some embodiments, \(R^1\) and \(R^2\) are independently selected from H, phenyl, and 4-fluorophenyl.

[0324] In some embodiments, a linker may be attached at one of various sites of the PBD dimer drug moiety, including the N10 imine of the B ring, the C-2 endo/exo position of the C ring, or the tether unit linking the A rings (see structures C(I) and C(II) below).

[0325] Nonlimiting exemplary PBD dimer components of ADCs include Formulas C(I) and C(II):
Formulas C(I) and C(II) are shown in their N10-C1 imine form. Exemplary PBD drug moieties also include the carbinolamine and protected carbinolamine forms as well, as shown in the table below:

<table>
<thead>
<tr>
<th>Imine</th>
<th>Carbinolamine</th>
<th>Protected Carbinolamine</th>
</tr>
</thead>
<tbody>
<tr>
<td>N-H</td>
<td>N-H-CH(=O)</td>
<td>N-H-CH(=O)-OR</td>
</tr>
</tbody>
</table>

wherein:

X is CH₂ (n = 1 to 5), N, or O;
Z and Z' are independently selected from OR and NR₂, where R is a primary, secondary or tertiary alkyl chain containing 1 to 5 carbon atoms;
R₁, R'₁, R₂ and R'₂ are each independently selected from H, C₁-₄ alkyl, C₂-C₈ alkenyl, C₂-C₈ alkynyl, C₅-₂₀ aryl (including substituted aryls), C₅-₂₀ heteroaryl groups, -NH₂, -NHMe, -OH, and -SH, where, in some embodiments, alkyl, alkenyl and alkynyl chains comprise up to 5 carbon atoms;
R₃ and R'_₃ are independently selected from H, OR, NHR, and NR₂, where R is a primary, secondary or tertiary alkyl chain containing 1 to 5 carbon atoms;
R₄ and R'₄ are independently selected from H, Me, and OMe;
R₅ is selected from C₁-₄ alkyl, C₂-C₈ alkenyl, C₂-C₈ alkynyl, C₅-₂₀ aryl (including aryls substituted by halo, nitro, cyano, alkoxy, alkyl, heterocyclyl) and C₅-₂₀ heteroaryls, where, in some embodiments, alkyl, alkenyl and alkynyl chains comprise up to 5 carbon atoms;
R₁₁ is H, C₁-₄ alkyl, or a protecting group (such as acetyl, trifluoroacetetyl, t-butoxycarbonyl (BOC), benzyloxycarbonyl (CBZ), 9-fluorenylmethyleneoxycarbonyl (Fmoc), or a moiety comprising a self-immolating unit such as valine-citrulline-PAB);
R₁₂ is H, C₁-₄ alkyl, or a protecting group;
wherein a hydrogen of one of R₁, R'₁, R₂, R'₂, R₃, or R₁₂ or a hydrogen of the -OCH₂CH₂(X)ₙCH₂CH₂O - spacer between the A rings is replaced with a bond connected to the linker of the ADC.
[0327] Exemplary PDB dimer portions of ADC include, but are not limited to (the wavy line indicates the site of covalent attachment to the linker):

![PBD dimer](image1)

[0328] Nonlimiting exemplary embodiments of ADCs comprising PBD dimers have the following structures:

![PBD dimer-Val-cit-PAB-Ab](image2)

![PBD dimer-Phe-Lys-PAB-Ab](image3)

n is 0 to 12. In some embodiments, n is 2 to 10. In some embodiments, n is 4 to 8. In some embodiments, n is selected from 4, 5, 6, 7, and 8.
The linkers of PBD dimer-val-cit-PAB-Ab and the PBD dimer-Phe-Lys-PAB-Ab are protease cleavable, while the linker of PBD dimer-maleimide-acetal is acid-labile. PBD dimers and ADC comprising PBD dimers may be prepared according to methods known in the art. See, e.g., WO 2009/016516; US 2009/304710; US 2010/047257; US 2009/036431; US 2011/0256157; WO 2011/130598.

(5) Anthracyclines

In some embodiments, an ADC comprising anthracycline. Anthracyclines are antibiotic compounds that exhibit cytotoxic activity. While not intending to be bound by any particular theory, studies have indicated that anthracyclines may operate to kill cells by a number of different mechanisms, including: 1) intercalation of the drug molecules into the DNA of the cell thereby inhibiting DNA-dependent nucleic acid synthesis; 2) production by the drug of free radicals which then react with cellular macromolecules to cause damage to the cells, and/or 3) interactions of the drug molecules with the cell membrane (see, e.g., C. Peterson et al., "Transport And Storage Of Anthracycline In Experimental Systems And Human Leukemia" in Anthracycline Antibiotics In Cancer Therapy; N.R. Bachur, "Free Radical Damage" id. at pp.97-102). Because of their cytotoxic potential anthracyclines have been used in the treatment of numerous cancers such as leukemia, breast carcinoma, lung carcinoma, ovarian adenocarcinoma and sarcomas (see e.g., P.H. Wiernik, in Anthracycline: Current Status And New Developments p 11).

A nonlimiting exemplary ADC comprising nemorubicin or nemorubicin derivatives is shown in Formula la:

wherein $R_1$ is hydrogen atom, hydroxy or methoxy group and $R_2$ is a C$_1$-C$_5$ alkoxy group, or a pharmaceutically acceptable salt thereof;

$L_1$ and $Z$ together are a linker (L) as described herein;

$T$ is an antibody (Ab) as described herein; and

$m$ is 1 to about 20. In some embodiments, $m$ is 1 to 10, 1 to 7, 1 to 5, or 1 to 4.

In some embodiments, $R_1$ and $R_2$ are both methoxy (-OMe).

A further nonlimiting exemplary ADC comprising nemorubicin or nemorubicin derivatives is shown in Formula lb:

wherein $R_1$ is hydrogen atom, hydroxy or methoxy group and $R_2$ is a C$_1$-C$_5$ alkoxy group, or a pharmaceutically acceptable salt thereof;

$L_2$ and $Z$ together are a linker (L) as described herein;

$T$ is an antibody (Ab) as described herein; and

$m$ is 1 to about 20. In some embodiments, $m$ is 1 to 10, 1 to 7, 1 to 5, or 1 to 4.

In some embodiments, $R_1$ and $R_2$ are both methoxy (-OMe).
In some embodiments, the nemorubicin component of a nemorubicin-containing ADC is PNU-1 59682. In some such embodiments, the drug portion of the ADC may have one of the following structures:

![Chemical structures]

wherein the wavy line indicates the attachment to the linker (L).

Anthracyclines, including PNU-1 59682, may be conjugated to antibodies through several linkage sites and a variety of linkers (US 2011/0076287; WO2009/099741; US 2010/0034837; WO 2010/009124), including the linkers described herein.

Exemplary ADCs comprising a nemorubicin and linker include, but are not limited to:
PNU-159682 maleimide acetal-Ab;

PNU-159682-val-cit-PAB-Ab;

PNU-159682-val-cit-PAB-spacer-Ab;
PNU-1 59682-val-cit-PAB-spacer(R¹R²)-Ab, wherein:

R₁ and R₂ are independently selected from H and Ci-C₆ alkyl; and

PNU-1 59682-maleimide-Ab.

[0341] The linker of PNU-159682 maleimide acetal-Ab is acid-labile, while the linkers of PNU-159682-val-cit-PAB-Ab, PNU-1 59682-val-cit-PAB-spacer-Ab, and PNU-159682-val-cit-PAB-spacer(R¹R²)-Ab are protease cleavable.

(6) Other Drug Moieties

exotoxin A chain (from Pseudomonas aeruginosa), ricin A chain, abrin A chain, modeccin A chain, alpha-sarcin, Aleurites fordii proteins, dianthin proteins, Phytolaca americana proteins (PAPI, PAPII, and PAP-S), momordica charantia inhibitor, curcin, crotin, sapoanaria officinalis inhibitor, gelonin, mitogellin, restrictocin, phenomycin, enomycin and the tricothecenes. See, e.g.,WO 93/21232.

[0343] Drug moieties also include compounds with nucleolytic activity (e.g., a ribonuclease or a DNA endonuclease).

[0344] In certain embodiments, an immunoconjugate may comprise a highly radioactive atom. A variety of radioactive isotopes are available for the production of radioconjugated antibodies. Examples include At$^{211}$, I$^{131}$, I$^{125}$, Y$^{90}$, Re$^{186}$, Re$^{188}$, Sm$^{153}$, Bi$^{212}$, P$^{32}$, Pb$^{212}$ and radioactive isotopes of Lu. In some embodiments, when an immunoconjugate is used for detection, it may comprise a radioactive atom for scintigraphic studies, for example Te$^{99}$ or I$^{125}$, or a spin label for nuclear magnetic resonance (NMR) imaging (also known as magnetic resonance imaging, MRI), such as zirconium-89, iodine-123, iodine-131, indium-III, fluorine-19, carbon-13, nitrogen-15, oxygen-17, gadolinium, manganese or iron. Zirconium-89 may be complexed to various metal chelating agents and conjugated to antibodies, e.g., for PET imaging (WO 201 1/056983).

[0345] The radio- or other labels may be incorporated in the immunoconjugate in known ways. For example, a peptide may be biosynthesized or chemically synthesized using suitable amino acid precursors comprising, for example, one or more fluorine-19 atoms in place of one or more hydrogens. In some embodiments, labels such as Te$^+$, I$^{123}$, Re$^{186}$, Re$^{188}$ and In$^{111}$ can be attached via a cysteine residue in the antibody. In some embodiments, yttrium-90 can be attached via a lysine residue of the antibody. In some embodiments, the IODOGEN method (Fraker et al (1978) Biochem. Biophys. Res. Commun. 80: 49-57) can be used to incorporate iodine-123. "Monoclonal Antibodies in Immunoscentigraphy" (Chatal, CRC Press 1989) describes certain other methods.

[0346] In certain embodiments, an immunoconjugate may comprise an antibody conjugated to a prodrug-activating enzyme. In some such embodiments, a prodrug-activating enzyme converts a prodrug (e.g., a peptidyl chemotherapeutic agent, see WO 81/01 145) to an active drug, such as an anti-cancer drug. Such immunoconjugates are useful, in some embodiments, in antibody-dependent enzyme-mediated prodrug therapy ("ADEPT"). Enzymes that may be conjugated to an antibody include, but are not limited to, alkaline phosphatases, which are useful for converting phosphate-containing prodrugs into free drugs; arylsulfatases, which are useful for converting sulfate-containing prodrugs into free drugs; cytosine deaminase, which is useful for converting non-toxic 5-fluorocytosine into the anti-cancer drug, 5-fluorouracil; proteases, such as serratia protease, thermolysin, subtilisin, carboxypeptidases and cathepsins (such as cathepsins B and L), which are useful for converting peptide-containing prodrugs into free drugs; D-alanlycarboxypeptidases, which are useful for converting prodrugs that contain D-amino acid substituents; carbohydrate-cleaving enzymes such as β-galactosidase and neuraminidase, which are useful for converting glycosylated prodrugs into free drugs; β-lactamase, which is useful for converting drugs derivatized with β-lactams.
into free drugs; and penicillin amidases, such as penicillin V amidase and penicillin G amidase, which are useful for converting drugs derivatized at their amine nitrogens with phenoxacyethyl or phenylacetyl groups, respectively, into free drugs. In some embodiments, enzymes may be covalently bound to antibodies by recombinant DNA techniques well known in the art. See, e.g., Neuberger et al., Nature 312:604-608 (1984).

c) **Drug Loading**

[0347] Drug loading is represented by \( p \), the average number of drug moieties per antibody in a molecule of Formula I. Drug loading may range from 1 to 20 drug moieties (D) per antibody. ADCs of Formula I include collections of antibodies conjugated with a range of drug moieties, from 1 to 20. The average number of drug moieties per antibody in preparations of ADC from conjugation reactions may be characterized by conventional means such as mass spectroscopy, ELISA assay, and HPLC. The quantitative distribution of ADC in terms of \( p \) may also be determined. In some instances, separation, purification, and characterization of homogeneous ADC where \( p \) is a certain value from ADC with other drug loadings may be achieved by means such as reverse phase HPLC or electrophoresis.

[0348] For some antibody-drug conjugates, \( p \) may be limited by the number of attachment sites on the antibody. For example, where the attachment is a cysteine thiol, as in certain exemplary embodiments above, an antibody may have only one or several cysteine thiol groups, or may have only one or several sufficiently reactive thiol groups through which a linker may be attached. In certain embodiments, higher drug loading, *e.g.* \( p > 5 \), may cause aggregation, insolubility, toxicity, or loss of cellular permeability of certain antibody-drug conjugates. In certain embodiments, the average drug loading for an ADC ranges from 1 to about 8; from about 2 to about 6; or from about 3 to about 5. Indeed, it has been shown that for certain ADCs, the optimal ratio of drug moieties per antibody may be less than 8, and may be about 2 to about 5 (US 7498298).

[0349] In certain embodiments, fewer than the theoretical maximum of drug moieties are conjugated to an antibody during a conjugation reaction. An antibody may contain, for example, lysine residues that do not react with the drug-linker intermediate or linker reagent, as discussed below. Generally, antibodies do not contain many free and reactive cysteine thiol groups which may be linked to a drug moiety; indeed most cysteine thiol residues in antibodies exist as disulfide bridges. In certain embodiments, an antibody may be reduced with a reducing agent such as dithiothreitol (DTT) or tricarbonylthiophosphine (TCEP), under partial or total reducing conditions, to generate reactive cysteine thiol groups. In certain embodiments, an antibody is subjected to denaturing conditions to reveal reactive nucleophilic groups such as lysine or cysteine.

[0350] The loading (drug/antibody ratio) of an ADC may be controlled in different ways, and for example, by: (i) limiting the molar excess of drug-linker intermediate or linker reagent relative to antibody, (ii) limiting the conjugation reaction time or temperature, and (iii) partial or limiting reductive conditions for cysteine thiol modification.

**d) Certain Methods of Preparing Immunoconjugates**

An ADC of Formula I may be prepared by several routes employing organic chemistry reactions, conditions, and reagents known to those skilled in the art, including: (1) reaction of a nucleophilic group of an antibody with a bivalent linker reagent to form Ab-L via a covalent bond, followed by reaction with a drug moiety D; and (2) reaction of a nucleophilic group of a drug moiety with a bivalent linker reagent, to form D-L, via a covalent bond, followed by reaction with a nucleophilic group of an antibody. Exemplary methods for preparing an ADC of Formula I via the latter route are described in US 7498298, which is expressly incorporated herein by reference.

Nucleophilic groups on antibodies include, but are not limited to: (i) N-terminal amine groups, (ii) side chain amine groups, e.g. lysine, (iii) side chain thiol groups, e.g. cysteine, and (iv) sugar hydroxyl or amino groups where the antibody is glycosylated. Amine, thiol, and hydroxyl groups are nucleophilic and capable of reacting to form covalent bonds with electrophilic groups on linker moieties and linker reagents including: (i) active esters such as NHS esters, HOBT esters, haloforlates, and acid halides; (ii) alkyl and benzyl halides such as haloacetamides; and (iii) aldehydes, ketones, carboxyl, and maleimide groups. Certain antibodies have reducible interchain disulfides, i.e. cysteine bridges. Antibodies may be made reactive for conjugation with linker reagents by treatment with a reducing agent such as DTT (dithiothreitol) or tricarbonylethylphosphine (TCEP), such that the antibody is fully or partially reduced. Each cysteine bridge will thus form, theoretically, two reactive thiol nucleophiles. Additional nucleophilic groups can be introduced into antibodies through modification of lysine residues, e.g., by reacting lysine residues with 2-iminothiolane (Traut's reagent), resulting in conversion of an amine into a thiol. Reactive thiol groups may also be
introduced into an antibody by introducing one, two, three, four, or more cysteine residues (e.g., by preparing variant antibodies comprising one or more non-native cysteine amino acid residues).

Antibody-drug conjugates may also be produced by reaction between an electrophilic group on an antibody, such as an aldehyde or ketone carbonyl group, with a nucleophilic group on a linker reagent or drug. Useful nucleophilic groups on a linker reagent include, but are not limited to, hydrazide, oxime, amino, hydrazine, thiosemicarbazone, hydrazine carboxylate, and arylhydrazide. In one embodiment, an antibody is modified to introduce electrophilic moieties that are capable of reacting with nucleophilic substituents on the linker reagent or drug. In another embodiment, the sugars of glycosylated antibodies may be oxidized, e.g. with periodate oxidizing reagents, to form aldehyde or ketone groups which may react with the amine group of linker reagents or drug moieties. The resulting imine Schiff base groups may form a stable linkage, or may be reduced, e.g. by borohydride reagents to form stable amine linkages. In one embodiment, reaction of the carbohydrate portion of a glycosylated antibody with either galactose oxidase or sodium meta-periodate may yield carbonyl (aldehyde and ketone) groups in the antibody that can react with appropriate groups on the drug (Hermanson, Bioconjugate Techniques). In another embodiment, antibodies containing N-terminal serine or threonine residues can react with sodium meta-periodate, resulting in production of an aldehyde in place of the first amino acid (Geoghegan & Stroh, (1992) Bioconjugate Chem. 3:138-146; US 5362852). Such an aldehyde can be reacted with a drug moiety or linker nucleophile.

Exemplary nucleophilic groups on a drug moiety include, but are not limited to: amine, thiol, hydroxyl, hydrazide, oxime, hydrazine, thiosemicarbazone, hydrazine carboxylate, and arylhydrazide groups capable of reacting to form covalent bonds with electrophilic groups on linker moieties and linker reagents including: (i) active esters such as NHS esters, HOBt esters, haloformates, and acid halides; (ii) alkyl and benzyl halides such as haloacetamides; (iii) aldehydes, ketones, carboxyl, and maleimide groups.

Nonlimiting exemplary cross-linker reagents that may be used to prepare ADC are described herein in the section titled "Exemplary Linkers." Methods of using such cross-linker reagents to link two moieties, including a proteinaceous moiety and a chemical moiety, are known in the art. In some embodiments, a fusion protein comprising an antibody and a cytotoxic agent may be made, e.g., by recombinant techniques or peptide synthesis. A recombinant DNA molecule may comprise regions encoding the antibody and cytotoxic portions of the conjugate either adjacent to one another or separated by a region encoding a linker peptide which does not destroy the desired properties of the conjugate.

In yet another embodiment, an antibody may be conjugated to a "receptor" (such as streptavidin) for utilization in tumor pre-targeting wherein the antibody-receptor conjugate is administered to the patient, followed by removal of unbound conjugate from the circulation using a clearing agent and then administration of a "ligand" (e.g., avidin) which is conjugated to a cytotoxic agent (e.g., a drug or radionucleotide).
F. Methods and Compositions for Diagnostics and Detection

[0358] In certain embodiments, any of the anti-LGR5 antibodies provided herein is useful in any of the methods described herein for detecting the presence of LGR5 in a biological sample. The term "detecting" as used herein encompasses quantitative or qualitative detection. A "biological sample" comprises, e.g., a cell or tissue (e.g., biopsy material, including cancerous or potentially cancerous basal cell carcinoma).

[0359] In one embodiment, an anti-LGR5 antibody for use in a method of diagnosis or detection is provided. In a further aspect, a method of detecting the presence of LGR5 in a biological sample is provided. In certain embodiments, the method comprises contacting the biological sample with an anti-LGR5 antibody as described herein under conditions permissive for binding of the anti-LGR5 antibody to LGR5, and detecting whether a complex is formed between the anti-LGR5 antibody and LGR5 in the biological sample. Such method may be an in vitro or in vivo method. In one embodiment, an anti-LGR5 antibody is used to select subjects eligible for therapy with an anti-LGR5 antibody, e.g. where LGR5 is a biomarker for selection of patients. In a further embodiment, the biological sample is a cell or tissue (e.g., biopsy material, including cancerous or potentially cancerous basal cell carcinoma tissue).

[0360] In a further embodiment, an anti-LGR5 antibody is used in vivo to detect, e.g., by in vivo imaging, an LGR5-positive cancer in a subject, e.g., for the purposes of diagnosing, prognosing, or staging cancer, determining the appropriate course of therapy, or monitoring response of a cancer to therapy. One method known in the art for in vivo detection is immuno-positron emission tomography (immuno-PET), as described, e.g., in van Dongen et al., The Oncologist 12:1379-1389 (2007) and Verel et al., J. Nucl. Med. 44:1271-1281 (2003). In such embodiments, a method is provided for detecting an LGR5-positive cancer in a subject, the method comprising administering a labeled anti-LGR5 antibody to a subject having or suspected of having an LGR5-positive cancer, and detecting the labeled anti-LGR5 antibody in the subject, wherein detection of the labeled anti-LGR5 antibody indicates an LGR5-positive cancer in the subject. In certain of such embodiments, the labeled anti-LGR5 antibody comprises an anti-LGR5 antibody conjugated to a positron emitter, such as $^{68}$Ga, $^{18}$F, $^{64}$Cu, $^{86}$Y, $^{76}$Br, $^{89}$Zr, and $^{124}$I. In a particular embodiment, the positron emitter is $^{89}$Zr.

[0361] In further embodiments, a method of diagnosis or detection comprises contacting a first anti-LGR5 antibody immobilized to a substrate with a biological sample to be tested for the presence of LGR5, exposing the substrate to a second anti-LGR5 antibody, and detecting whether the second anti-LGR5 is bound to a complex between the first anti-LGR5 antibody and LGR5 in the biological sample. A substrate may be any supportive medium, e.g., glass, metal, ceramic, polymeric beads, slides, chips, and other substrates. In certain embodiments, a biological sample comprises a cell or tissue (e.g., biopsy material, including cancerous or potentially cancerous basal cell carcinoma tissue). In certain embodiments, the first or second anti-LGR5 antibody is any of the antibodies described herein. In some such embodiments, the second anti-LGR5 antibody may be 8E11 or antibodies
derived from 8E11, e.g., as described herein. In some such embodiments, the second anti-LGR5 antibody may be YW353 or antibodies derived from YW353, e.g., as described herein. In some embodiments, the first or second anti-LGR5 antibody is selected from 3G12 and 2H6 and antibodies derived from 3G12 and/or 2H6, e.g., as described herein.

[0362] Exemplary disorders that may be diagnosed or detected according to any of the above embodiments include LGR5-positive cancers. In some embodiments, an LGR5-positive cancer is a cancer that receives an anti-LGR5 immunohistochemistry (IHC) or in situ hybridization (ISH) score greater than “0,” which corresponds to very weak or no staining in >90% of tumor cells, under the conditions described herein in Example B. In another embodiment, an LGR5-positive cancer expresses LGR5 at a 1+, 2+ or 3+ level, as defined under the conditions described herein in Example B. In some embodiments, an LGR5-positive cancer is a cancer that expresses LGR5 according to a reverse-transcriptase PCR (RT-PCR) assay that detects LGR5 mRNA. In some embodiments, the RT-PCR is quantitative RT-PCR.

[0363] In certain embodiments, labeled anti-LGR5 antibodies are provided. Labels include, but are not limited to, labels or moieties that are detected directly (such as fluorescent, chromophoric, electron-dense, chemiluminescent, and radioactive labels), as well as moieties, such as enzymes or ligands, that are detected indirectly, e.g., through an enzymatic reaction or molecular interaction. Exemplary labels include, but are not limited to, the radioisotopes ³²P, ¹³C, ¹²⁵I, ¹¹H, and ¹³¹I, fluorophores such as rare earth chelates or fluorescein and its derivatives, rhodamine and its derivatives, dansyl, umbelliferone, luciferases, e.g., firefly luciferase and bacterial luciferase (U.S. Patent No. 4,737,456), luciferin, 2,3-dihydrophthalazinediones, horseradish peroxidase (HRP), alkaline phosphatase, β-galactosidase, glucoamylase, lysozyme, saccharide oxidases, e.g., glucose oxidase, galactose oxidase, and glucose-6-phosphate dehydrogenase, heterocyclic oxidases such as uricase and xanthine oxidase, coupled with an enzyme that employs hydrogen peroxide to oxidize a dye precursor such as HRP, lactoperoxidase, or microperoxidase, biotin/avidin, spin labels, bacteriophage labels, stable free radicals, and the like. In another embodiment, a label is a positron emitter. Positron emitters include but are not limited to ⁶⁸Ga, ¹⁵F, ⁶⁴Cu, ⁸⁶Y, ⁷⁵Br, ⁶⁸Zr, and ¹²⁴I. In a particular embodiment, a positron emitter is ⁸⁹Zr.

G. Pharmaceutical Formulations

[0364] Pharmaceutical formulations of an anti-LGR5 antibody including immunoconjugates as described herein are prepared by mixing such antibody including immunoconjugate having the desired degree of purity with one or more optional pharmaceutically acceptable carriers (Remington's Pharmaceutical Sciences 16th edition, Osol, A. Ed. (1980)), in the form of lyophilized formulations or aqueous solutions. Pharmaceutically acceptable carriers are generally nontoxic to recipients at the dosages and concentrations employed, and include, but are not limited to: buffers such as phosphate, citrate, and other organic acids; antioxidants including ascorbic acid and methionine; preservatives (such as octadecyldimethylbenzyl ammonium chloride; hexamethonium chloride; benzalkonium
chloride; benzethonium chloride; phenol, butyl or benzyl alcohol; alkyl parabens such as methyl or propyl paraben; catechol; resorcinol; cyclohexanol; 3-pentanol; and m-cresol); low molecular weight (less than about 10 residues) polypeptides; proteins, such as serum albumin, gelatin, or immunoglobulins; hydrophilic polymers such as polyvinylpyrrolidone; amino acids such as glycine, glutamine, asparagine, histidine, arginine, or lysine; monosaccharides, disaccharides, and other carbohydrates including glucose, mannose, or dextrins; chelating agents such as EDTA; sugars such as sucrose, mannitol, trehalose or sorbitol; salt-forming counter-ions such as sodium; metal complexes (e.g. Zn-protein complexes); and/or non-ionic surfactants such as polyethylene glycol (PEG).

Exemplary pharmaceutically acceptable carriers herein further include interstitial drug dispersion agents such as soluble neutral-active hyaluronidase glycoproteins (sHASEGP), for example, human soluble PH-20 hyaluronidase glycoproteins, such as rHuPH20 (HYLENEX®, Baxter International, Inc.). Certain exemplary sHASEGPs and methods of use, including rHuPH20, are described in US Patent Publication Nos. 2005/0260186 and 2006/0104968. In one aspect, a sHASEGP is combined with one or more additional glycosaminoglycans such as chondroitinases.

[0365] Exemplary lyophilized antibody including immuno-conjugate formulations are described in US Patent No. 6,267,958. Aqueous antibody including immuno-conjugate formulations include those described in US Patent No. 6,171,586 and WO2006/044908, the latter formulations including a histidine-acetate buffer.

[0366] The formulation herein may also contain more than one active ingredient as necessary for the particular indication being treated, preferably those with complementary activities that do not adversely affect each other.

[0367] Active ingredients may be entrapped in microcapsules prepared, for example, by coacervation techniques or by interfacial polymerization, for example, hydroxyethylcellulose or gelatin-microcapsules and poly-(methylmethacrylate) microcapsules, respectively, in colloidal drug delivery systems (for example, liposomes, albumin microspheres, microemulsions, nano-particles and nanocapsules) or in macroemulsions. Such techniques are disclosed in Remington's Pharmaceutical Sciences 16th edition, Osol, A. Ed. (1980).

[0368] Sustained-release preparations may be prepared. Suitable examples of sustained-release preparations include semipermeable matrices of solid hydrophobic polymers containing the antibody including immunoconjugate, which matrices are in the form of shaped articles, e.g. films, or microcapsules.

[0369] The formulations to be used for in vivo administration are generally sterile. Sterility may be readily accomplished, e.g., by filtration through sterile filtration membranes.

H. Articles of Manufacture

[0370] In another aspect, an article of manufacture containing materials useful for the treatment, prevention and/or diagnosis of the disorders described above is provided. The article of manufacture comprises a container and a label or package insert on or associated with the container. Suitable
containers include, for example, bottles, vials, syringes, IV solution bags, etc. The containers may be formed from a variety of materials such as glass or plastic. The container holds a composition which is by itself or combined with another composition effective for treating, preventing and/or diagnosing the disorder and may have a sterile access port (for example the container may be an intravenous solution bag or a vial having a stopper pierceable by a hypodermic injection needle). At least one active agent in the composition is an antibody including immunoconjugate. The label or package insert indicates that the composition is used for treating the condition of choice. Moreover, the article of manufacture may comprise (a) a first container with a composition contained therein, wherein the composition comprises an antibody including immunoconjugate; and (b) a second container with a composition contained therein, wherein the composition comprises a further cytotoxic or otherwise therapeutic agent. In some embodiments, the second container with a composition contained therein, wherein the composition comprises an inhibitor of the hedgehog pathway. In some embodiments, the inhibitor of the hedgehog pathway is an antagonist of smoothened. In some embodiments, the inhibitor of the hedgehog pathway is a cyclopamine-competitive antagonist of smoothened. In some embodiments, the antagonist of smoothened is 2-chloro-N-[4-chloro-3-(pyridin-2-yl)phenyl]-4-(methylsulfonyl)benzamide or a salt thereof. In some embodiments, the antagonist of smoothened is 2-chloro-N-[4-chloro-3-(pyridin-2-yl)phenyl]-4-(methylsulfonyl)benzamide. In some embodiments, the antagonist of smoothened is vismodegib.

[0371] The article of manufacture in this embodiment may further comprise a package insert indicating that the compositions can be used to treat a particular condition. Alternatively, or additionally, the article of manufacture may further comprise a second (or third) container comprising a pharmaceutically-acceptable buffer, such as bacteriostatic water for injection (BWFI), phosphate-buffered saline, Ringer’s solution or dextrose solution. It may further include other materials desirable from a commercial and user standpoint, including other buffers, diluents, filters, needles, and syringes.

III. EXAMPLES

[0372] The following are examples of methods and compositions of the invention. It is understood that various other embodiments may be practiced, given the general description provided above.

Example 1

LGR5\textsuperscript{DTR-EGFP} Construction

[0373] For LGR5, a 7,213bp fragment (assembly NCB137/mm9, chr1:0:1 15,020,315-1 15,027,527) from a C57BL/6 BAC (RP23 library) was cloned into plasmid pBlight-TK25. To generate the DTR-EGFP KI vector for LGR5, a DTR-EGFP-pA-loxP-Neo-loxP cassette was synthesized (Blue Heron/Origene, DTR-EGFP sequence was based on that described previously\textsuperscript{17}, and inserted right after the ATG of LGR5 (chr1:0:1 15,024,547, reverse strand), deleting the remainder of exon 1 and splice donor of intron 1 (a 212 bp deletion). To generate the CreERT2 KI vector, a dsRed2-IRES-
CreERT2-pA-Frt-neo-Frt cassette was synthesized (Blue Heron/Origene) and inserted at the same position as the DTR-EGFP cassette. The final vectors were confirmed by DNA sequencing.

The LGR5 KI vectors were linearized with NotI and C57BL/6 C2 embryonic stem cells were targeted using standard methods (G418-positive and gancyclovir-negative selection). Positive clones were identified using PCR and taqman analysis, and confirmed by sequencing of the modified locus. Correctly targeted embryonic stem cells were transfected with a Cre or Flpe plasmid, respectively, to remove the Neo cassette. The modified embryonic stem cells were then injected into blastocysts using standard techniques, and germline transmission was obtained after crossing the resulting chimaeras with C57BL/6N females.

DT cell ablation in Superficial Basal Cell Carcinoma (BCC)

To evaluate the effects of DT treatments on residual superficial BCC, mice were treated with the indicated dose of Vismodegib (GDC-0449) for 38 days with concomitant with Diphtheria Toxin (DT) at 50 μg/kg every other day for the final 8 days starting at day 29. Control mice were treated with Vismodegib (GDC-0449) for 38 days with concomitant with 200 μL IP saline for the final 8 days of treatment. In addition, animals showing signs of disease (listed above) were treated with saline or DT alone at 50 μg/kg every other day for 5 days to test the effect of single DT treatments.

Histology and Immunofluorescent Staining

Harvested skin from treated animals was processed for Hematoxylin and Eosin (H&E) staining using established protocols. Alternatively, backskin from treated animals was fixed over night in 4% paraformaldehyde/PBS solution, washed, incubated in 30% sucrose/PBS solution overnight, and embedded in frozen OCT. Sections were then cut at 8 μm from the frozen blocks and stained for the apoptosis marker cleaved caspase 3 (1:1000), GFP (1:1000), or Keratin 5 (1:1000). Sections were counterstained with DAPI.

Results

Strong GFP expression was observed in superficial BCC tumors in animals treated with saline alone. This result is consistent with observations from in situ hybridization experiments revealing that LGR5 is expressed in superficial BCC. In these control mice, apoptotic cells marked by CC3 staining were scarce and isolated to hair follicles. In mice treated with DT for a total of 5 days, a significant CC3 staining in tumors was observed as well as in hair follicles. No significant apoptosis was observed in basal cells of the epidermis suggesting that DT treatments specifically targeted tumors and hair follicles.
To determine whether DT treatments could target residual BCC, mice were treated for 28 days with Vismodegib and then co-treated with Vismodegib and DT for an additional 8 days. In at least one animal, residual disease was scarce as revealed by Keratin 5 staining. Minimal CC3 staining suggested that residual disease had been largely eliminated in this animal. In other mice, we observed targeted apoptosis occurring in residual tumors not originally cleared from the skin by the Smoothened antagonist Vismodegib.

H&E staining was performed on a variety of tissues from treated and control mice. A marked decrease was observed in the thickening of ear tissue treated with Vismodegib plus DT compared to treatment with Vismodegib alone suggesting that additional ablation of LGR5 positive cells with DT treatments was beneficial in removing residual disease.

Although the foregoing invention has been described in some detail by way of illustration and example for purposes of clarity of understanding, the descriptions and examples should not be construed as limiting the scope of the invention. The disclosures of all patent and scientific literature cited herein are expressly incorporated in their entirety by reference.

</table>
WHAT IS CLAIMED IS:

1) A method of treating a hedgehog-related disease in an individual comprising administering to
the individual an effective amount of an anti-LGR5 antibody.

2) A method of treating hedgehog-related disease in an individual comprising administering to
the individual an effective amount of an anti-LGR5 antibody and an effective amount of an inhibitor
of the hedgehog pathway.

3) The method of claim 2, wherein the respective amounts the anti-LGR5 antibody and the
inhibitor of the hedgehog pathway are effective to increase the period of response to therapy and/or
delay the recurrence and/or development of resistance compared to treatment with the inhibitor of the
hedgehog pathway alone.

4) A method of increasing efficacy of a treatment of a hedgehog-related disease comprising an
inhibitor of the hedgehog pathway in an individual, wherein the method comprises administering to
the individual an effective amount of an anti-LGR5 antibody and an effective amount of the inhibitor
of the hedgehog pathway.

5) A method of treating a hedgehog-related disease in an individual wherein the treatment
comprises administering to the individual an effective amount of an anti-LGR5 antibody and an
effective amount of an inhibitor of the hedgehog pathway, and wherein the treatment has increased
efficacy compared to a standard treatment comprising administering an effective amount of the
inhibitor of the hedgehog pathway without (in the absence of) the anti-LGR5 antibody.

6) A method of delaying and/or preventing development of the recurrence and/or resistance of a
hedgehog-related disease to an inhibitor of the hedgehog pathway in an individual, comprising
administering to the individual an effective amount of an anti-LGR5 antibody and an effective amount
of the inhibitor of the hedgehog pathway.

7) A method of increasing sensitivity to an inhibitor of the hedgehog pathway in an individual
with a hedgehog-related disease comprising administering to the individual an effective amount of an
anti-LGR5 antibody and an effective amount of the inhibitor of the hedgehog pathway.

8) A method of extending the period of sensitivity an inhibitor of the hedgehog pathway in an
individual with a hedgehog-related disease comprising administering to the individual an effective
amount of an anti-LGR5 antibody and an effective amount of the inhibitor of the hedgehog pathway.

9) A method of extending the duration of response to an inhibitor of the hedgehog pathway in an
individual with a hedgehog-related disease comprising administering to the individual an effective
amount of an anti-LGR5 antibody and an effective amount of the inhibitor of the hedgehog pathway.

10) The method of any one of claims 1-9, wherein the anti-LGR5 antibody is a monoclonal
antibody.

11) The method of any one of claims 1-10, wherein the anti-LGR5 antibody binds an epitope
within amino acids 22-323 of SEQ ID NO: 67 or within amino acids 22-123 of SEQ ID NO: 67 and
binds to LGR5 with an affinity of ≤ 5 nM.
12) The method of any one of claims 1-11, wherein the anti-LGR5 antibody is a human, humanized, or chimeric antibody.

13) The method of any one of claims 1-12, wherein the anti-LGR5 antibody is an antibody fragment that binds human LGR5 of SEQ ID NO: 67.

14) The method of any one of claims 1-13, wherein the anti-LGR5 antibody comprises:
   a) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 30, HVR-H2 comprising the amino acid sequence of SEQ ID NO: 31, and HVR-H3 comprising the amino acid sequence of SEQ ID NO: 32; and
   b) HVR-L1 comprising the amino acid sequence of SEQ ID NO: 27, HVR-L2 comprising the amino acid sequence of SEQ ID NO: 28, and HVR-L3 comprising the amino acid sequence of SEQ ID NO: 29.

15) The method of any one of claims 1-13, wherein the anti-LGR5 antibody comprises:
   a) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 60, HVR-H2 comprising the amino acid sequence of SEQ ID NO: 61, and HVR-H3 comprising the amino acid sequence of SEQ ID NO: 62; and
   b) HVR-L1 comprising the amino acid sequence of SEQ ID NO: 57, HVR-L2 comprising the amino acid sequence of SEQ ID NO: 58, and HVR-L3 comprising the amino acid sequence of SEQ ID NO: 59.

16) The method of any one of claims 1-13, wherein the anti-LGR5 antibody comprises:
   a) a VH sequence of SEQ ID NO: 6 and a VL sequence of SEQ ID NO: 5;
   b) a VH sequence of SEQ ID NO: 8 and a VL sequence of SEQ ID NO: 7;
   c) a VH sequence of SEQ ID NO: 10 and a VL sequence of SEQ ID NO: 9;
   d) a VH sequence of SEQ ID NO: 12 and a VL sequence of SEQ ID NO: 11;
   e) a VH sequence of SEQ ID NO: 14 and a VL sequence of SEQ ID NO: 13;
   f) a VH sequence of SEQ ID NO: 16 and a VL sequence of SEQ ID NO: 15;
   g) a VH sequence of SEQ ID NO: 18 and a VL sequence of SEQ ID NO: 17;
   h) a VH sequence of SEQ ID NO: 20 and a VL sequence of SEQ ID NO: 19; or
   i) a VH sequence of SEQ ID NO: 26 and a VL sequence of SEQ ID NO: 25.

17) The method of any one of claims 1-16, wherein the anti-LGR5 antibody is conjugated to a cytotoxic agent.

18) The method of any one of claims 1-17, wherein the anti-LGR5 antibody has the formula Ab-(L-D)p, wherein:
   (a) Ab is the anti-LGR5 antibody;
   (b) L is a linker;
   (c) D is a drug selected from a maytansinoid, an auristatin, a calicheamicin, a pyrrolobenzodiazepine, and a nemorubicin derivative; and
   (d) p ranges from 1-8.
19) The method of claim 18, wherein D is an auristatin.

20) The method of claim 18, wherein wherein D has formula D_E

and wherein R^2 and R^6 are each methyl, R^3 and R^4 are each isopropyl, R^5 is H, R^7 is sec-butyl, each R^8 is independently selected from CH_3, 0-CH_3, OH, and H; R^9 is H; and R^n is -C(R^9)_2-C(R^9)_2-aryl.

21) The method of claim 18, wherein the drug is MMAE.

22) The method of claim 18, wherein D is a pyrrolobenzodiazepine of Formula A:

wherein the dotted lines indicate the optional presence of a double bond between C1 and C2 or C2 and C3;

R^2 is independently selected from H, OH, =0, =CH=CN, R, OR, =CH-R^D, =C(R^D)_2, 0-SO_2-R, C(O)=R and COR, and optionally further selected from halo or dihalo, wherein R^D is independently selected from R, C(O)=R, COR, CHO, C(O)=H, and halo;

R^6 and R^7 are independently selected from H, R, OH, OR, SH, SR, NH_2, NHR, NRR', N0, Me, Sn and halo;

R^7 is independently selected from H, R, OH, OR, SH, SR, NH_2, NHR, NRR', N0, Me, Sn and halo;

Q is independently selected from O, S and NH;

R'^{11} is either H, or R or, where Q is O, S0 3M, where M is a metal cation;

R and R' are each independently selected from optionally substituted C_{1-8} alkyl, C_{3-8} heterocyclyl and C_{1-20} aryl groups, and optionally in relation to the group NRR', R and R' together with the nitrogen atom to which they are attached form an optionally substituted 4-, 5-, 6- or 7-membered heterocyclic ring;

R'^{12}, R'^{10}, R'^{19} and R'^{17} are as defined for R^2, R^6, R^9 and R^7 respectively;

R'' is a C_{3-5} alkylene group, which chain may be interrupted by one or more heteroatoms and/or aromatic rings that are optionally substituted; and

X and X' are independently selected from O, S and N(H).
23) The method of claim 18, wherein D has the structure:

![Structure A(II)]

wherein \( n \) is 0 or 1.

24) The method of claim 18, wherein D has a structure selected from:

![Structure A(I)]

![Structure A(III)]

![Structure A(IV)]

![Structure A(V)]

wherein \( R \) and \( R \) are each independently selected from halogen, \( \text{CHO} \), \( \text{COR} \), \( \text{CO}_{2}R \), and \( \text{R}^D \);
wherein \( \text{R}^D \) is independently selected from \( \text{R} \), \( \text{C}_0 \text{R} \), \( \text{COR} \), \( \text{CHO} \), \( \text{C}_0 \text{H} \), and halo;
wherein \( \text{Ar}^1 \) and \( \text{Ar}^2 \) are each independently optionally substituted \( \text{C}_{1-3} \text{aryl} \); and
wherein \( n \) is 0 or 1.

25) The method of claim 18, wherein D is a pyrrolobenzodiazepine of Formula B:

![Structure A(VI)]
wherein the horizontal wavy line indicates the covalent attachment site to the linker; R^{vl} and R^{v2} are independently selected from H, methyl, ethyl, phenyl, fluoro-substituted phenyl, and C_{x-x} heterocyclyl; and n is 0 or 1.

26) The method of claim 18, wherein D is a nemorubicin derivative.

27) The method of claim 18, wherein D has a structure selected from:

![Chemical structure](image)

; and

![Chemical structure](image)

28) The method of any one of claims 18-27, wherein the linker is cleavable by a protease.

29) The method of claim 28, wherein the linker comprises a val-cit dipeptide or a Phe-Lys dipeptide.

30) The method of any one of claims 18-27, wherein the linker is acid-labile.

31) The method of claim 30, wherein the linker comprises hydrazone.

32) The method of claim 18 having the formula:
wherein S is a sulfur atom.

33) The method of claim 18 having the formula:

34) The method of claim 18 having a formula selected from:
35) The method of any one of claims 18-34, wherein p ranges from 2-5.

36) The method of any one of claims 1-35, wherein the inhibitor of the hedgehog pathway is an antagonist of the smoothened receptor.

37) The method of claim 36, wherein the antagonist of the smoothened receptor is 2-chloro-N-[4-chloro-3-(pyridin-2-yl)phenyl]-4-(methylsulfonyl)benzamide or a salt thereof.

38) The method of claim 37, wherein the antagonist of the smoothened receptor is 2-chloro-N-[4-chloro-3-(pyridin-2-yl)phenyl]-4-(methylsulfonyl)benzamide.

39) The method of claim 36, wherein the antagonist of the smoothened receptor is vismodegib.

40) The method of any one of claims 1-39, wherein the hedgehog-related disease is cancer.

41) The method of claim 40, wherein the cancer is basal cell carcinoma.
42) The method of claim 41, wherein the basal cell carcinoma is locally advanced or metastatic basal cell carcinoma.

43) The method of claim 40, wherein the cancer is medulloblastoma.

44) The method of any one of claims 40-43, wherein the hedgehog-related disease is LGR5-positive.

45) The method of any one of claims 1-44, wherein the inhibitor of the hedgehog pathway is administered concomitantly with the anti-LGR5 antibody.

46) The method of any one of claims 1-44, wherein the inhibitor of the hedgehog pathway is administered separately, sequentially, or simultaneously with the anti-LGR5 antibody.

[ ] Further documents are listed in the continuation of Box C. [ ] See patent family annex.

* Special categories of cited documents:

**A** document defining the general state of the art which is not considered to be of particular relevance

**E** earlier application or patent but published on or after the international filing date

**L** document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)

**O** document referring to an oral disclosure, use, exhibition or other means

**P** document published prior to the international filing date but later than the priority date claimed

**T** later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

**X** document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

**Y** document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art

**A** document member of the same patent family

Date of the actual completion of the international search 19 December 2014

Date of mailing of the international search report 19/01/2015

Name and mailing address of the ISA/
European Patent Office, P.B. 5818 Patentlaan 2 NL-2280 HV Rijswijk
Tel. (+31-70) 340-2040, Fax: (+31-70) 340-3016

Authorized officer
Covone-van Hees, M

Form PCT/ISA/210 (second sheet) (April 2005)
