Title: GRAM-POSITIVE CARBAPENEM ANTIBACTERIALS AND PROCESSES FOR THEIR PREPARATION

Abstract: The present invention provides β-methyl carabpenem compounds and pharmaceutical compositions useful in the treatment of bacterial infections and methods for treating such infections using such compounds and/or compositions. The invention includes administering an effective amount of a carabpenem compound or salt and/or prodrug thereof to a host in need of such a treatment. The present invention is also in the field of synthetic organic chemistry and is specifically provides an improved method of synthesis of β-methyl carabpenems which are useful as antibacterial agents.
GRAM-POSITIVE CARBAPENEM ANTIBACTERIALS AND PROCESSES FOR THEIR PREPARATION

CROSS REFERENCE TO RELATED APPLICATIONS

[0001] This application claims priority to U.S. Provisional Application No. 60/578,632, filed June 10, 2004.

FIELD OF THE INVENTION

[0002] This invention provides novel carbapenem compounds and their salts and prodrugs, methods of treatment of gram-positive bacterial infections with an effective amount of the compounds and pharmaceutical compositions including the compounds.

DESCRIPTION OF RELATED ART

[0003] The worldwide exploitation of antibiotics to treat infectious diseases has grown dramatically over the last forty years. In 1954, two million pounds of antibiotics were produced in the United States. Today, the figure exceeds 50 million pounds. According to the Centers Disease Control (CDC), humans consume 235 million doses of antibiotics annually.

[0004] Widespread misuse or overuse of antibiotics has fostered the spread of antibiotic resistance and has contributed to the development of a serious public health problem. Antibiotic resistance occurs when bacteria that cause infection are not killed by the antibiotics taken to stop the infection. The bacteria survive and continue to multiply, causing more harm. For example, the bacterium Staphylococcus aureus is a major cause of hospital acquired infections that, historically, responded satisfactorily to the antibiotic vancomycin. Recently, however, many strains of S. aureus have been found to be resistant to vancomycin. Moreover, the death rate for some communicable diseases such as tuberculosis has started to rise again, in part because of increases in bacterial resistance to antibiotics.

[0005] Antibiotics are used therapeutically to treat bacterial infections. Several types of antibiotics, classified according to their mechanism of action, are currently employed. The known types of antibiotics include, e.g. cell wall synthesis inhibitors,

![Chemical structure of thienamycin](image)

However, this molecule is chemically unstable due to its lactam nucleus and amino acid configuration. Chemical stability issues associated with the intermolecular aminolysis of the azetidinone (β-lactam) ring of one molecule of thienamycin by the primary amine in the cysteamine side chain of another thienamycin molecule, resulted in abandonment of thienamycin as a drug candidate.
[0007] As a result of the problems associated with thienamycin, N-formimidoyl thienamycin, known as imipenem, was synthesized (Leanza, W.J., et al., J. Med. Chem., 22, pp. 1435-1436 (1979)). This compound bears a more basic amidine functionality on the 2' side chain, which is protonated at physiological pH, preventing the compound from initiating a nucleophilic attack on another imipenem molecule. However, poor urinary tract recovery from test subjects revealed instability of this compound to the mammalian β-lactamase renal dehydropeptidase-I (DHP-I) (Shimada, J., et al., Drugs Exp Clin Res., 20, pp. 241-245 (1994)). Consequently, the compound cilastatin was developed for use in co-administration in order to prevent hydrolysis and degradation by DHP-I; this combination therapy is currently prescribed under the name Primaxin® (Merck Frosst Std).

![Meropenem Structure]

This compound was shown to be active against a large number of Gram-negative bacteria. Meropenem is currently prescribed for intravenous use (Merrem® IV; AstraZeneca) in the treatment of intra-abdominal infections and bacterial meningitis.

Ertapenem has received regulatory approval in both the United States (November, 2001) and the European Union (April, 2002).

[0010] A carbapenem having a fused pyrazole ring system (see below; also known as L-627; Biapenem) was developed by Lederle Ltd. (Japan), and introduced a methyl radical at the 1-β position of the carbapenem skeleton (see, U.S. Patent No. 4,866,171). This structural modification reportedly gave biapenem stability against hydrolysis by kidney dehydropeptidase, and exhibits potency across a wide bacterial spectrum.

This compound has been shown to have a prophylactic efficacy against both Gram-positive and Gram-negative bacterial systemic infections similar to that of imipenem

[0012] U.S. Patent No. 6,255,300 to Merck & Co. describes certain carbapenem antibacterial agents in which the carbapenem nucleus is substituted with an iodo-phenyl linked through a methyl-oxygen linkage. The patent states that these compounds are useful against gram positive bacterial infections. Similarly, U.S. Patent No. 6,310,055 provides carbapenem compounds with aromatic side chains that are halogen substituted, linked through an alkoxy unsaturated group.

[0013] European Publication No. 0 292 191 to Merck & Co. describes certain 2-(substituted methyl)-1-alkylcarbapenem compounds useful as antibiotic agents.

[0014] U.S. Patent No. 6,399,597, also to Merck & Co. describes certain napthosultam compounds that are allegedly useful in the treatment of certain drug resistant bacterial infections.

[0015] Since the discovery of thienamycin having a potential antimicrobial activity against Gram-negative and Gram-positive bacteria, studies on the syntheses of carbapenem derivatives which are analogous to thienamycin have been widely developed. As a result, it was found that carbapenem derivatives having, as their 2-side chain, a substituent derived from 4-hydroxy-proline, i.e. an optionally substituted pyrrolidinyl group substituted on its 2-position, for example a carbonyl group substituted with various substituents, exhibit a potential antimicrobial activity and are useful as medicines or as intermediates for compounds possessing antimicrobial activity.

[0016] 1-β-methyl carbapenem antibiotics, are particularly well known for treating a broad spectrum of gram-negative and gram-positive bacterial infections. See for example U.S. Pat. No. 4,962,103; U.S. Pat. No. 4,933,333; U.S. Pat. No. 4,943,569; U.S. Pat. No. 5,122,604; U.S. Pat. No. 5,034,384 and U.S. Pat. No. 5,011,832.

[0017] Because of the difficulty in developing effective carbapenem compounds due to hydrolysis of the β-lactam ring and low recovery, compounds with superior antibacterial activity have not been developed.

[0018] The development of new drugs is an essential component to strategies designed to reverse the problem of bacterial resistance, particularly in treating
infectious diseases (e.g. bacterial infections). Accordingly, there is a need to identify additional compounds to treat infectious diseases (e.g. bacterial infections).

[0019] There is an increasing need for agents effective against drug-resistant pathogens, including methicillin resistant Staphylococcus aureus (MRSA), methicillin resistant Staphylococcus epidermidis (MRSE), methicillin resistant coagulase negative Staphylococci (MRCNS), vancomycin resistant Enterococcus faecalis, and/or vancomycin resistant Enterococcus faecium, which are optionally relatively free from undesirable side effects.

[0020] Therefore, it is one object of the present invention to provide novel compounds that are effective antimicrobial agents.

[0021] It is another object of the present invention to provide methods for the treatment of gram-positive bacteria that can be drug-resistant and/or multi-drug resistant.

**SUMMARY OF THE INVENTION**

[0022] In one embodiment, a carbapenem is provided, of the formula (I), (II), (III) or (IV):

![Chemical Structures](image)

or a pharmaceutically acceptable salt and/or prodrug thereof, wherein
R\textsuperscript{1} is H or alkyl, such as a lower alkyl such as CH\textsubscript{3};

CO\textsubscript{2}M represents a carboxylic acid, a carboxylate anion, a pharmaceutically acceptable ester group or a carboxylic acid protected by a protecting group;

P represents hydrogen, hydroxyl, F or hydroxyl protected by a hydroxyl-protecting group;

X is O, S, S(O)\textsubscript{x}, with x equal to 0, 1 or 2, phosphate, carbonyl, thiocarbonyl, iminyl, P(O)\textsubscript{2}, P(O)\textsubscript{3}, C(O), C(O)O, OC(O), C(O)NH, C(O)NR, NHC(O), NRC(O), amine, NH, or NR;

each R is independently H or alkyl, for example a lower alkyl such as CH\textsubscript{3};

each \[\textcircled{Z} \text{ and } \textcircled{O}\] is independently a 5- or 6-membered monocyclic aromatic or heteroaromatic ring;

Z is present or absent, and when present, represents members selected from the group consisting of: C=CR\textsubscript{2}, C=CV\textsubscript{1}, O, S, carbonyl, thiocarbonyl, iminyl, C(O), C(O)O, OC(O), C(O)NH, C(O)NR, NHC(O), NRC(O), N(A-(CH\textsubscript{2})\textsubscript{n}-Q)C(O), CON(A-(CH\textsubscript{2})\textsubscript{n}-Q), C(=NH), C(=NR), C(=N-A-(CH\textsubscript{2})\textsubscript{n}-Q), amine, NH, NR, or N(A-(CH\textsubscript{2})\textsubscript{n}-Q);

each Y\textsuperscript{1} and Y\textsuperscript{2} is independently selected from: hydrogen; halo; -CN; -NO\textsubscript{2}; -NR\textsuperscript{a}R\textsuperscript{b}; -OR\textsuperscript{c}; -SR\textsuperscript{c}; -C(O)NR\textsuperscript{a}R\textsuperscript{b}; -C(O)OR\textsuperscript{c}; S(O)R\textsuperscript{c}; -SO\textsubscript{2}R\textsuperscript{c}; -SO\textsubscript{2}NR\textsuperscript{a}R\textsuperscript{b}; -NR\textsuperscript{a}SO\textsubscript{2}R\textsuperscript{b}; -C(O)R\textsuperscript{c}; -OC(O)R\textsuperscript{c}; OC(O)NR\textsuperscript{a}R\textsuperscript{b}; -NR\textsuperscript{c}C(O)NR\textsuperscript{b}R\textsuperscript{c}; -NR\textsuperscript{a}CO\textsubscript{2}R\textsuperscript{b}; -OCO\textsubscript{2}R\textsuperscript{h}; NR\textsuperscript{a}C(O)R\textsuperscript{b}; -C\textsubscript{1-6} straight- or branched-chain alkyl, -C\textsubscript{2-6} straight- or branched-chain alkenyl, or -C\textsubscript{2-6} straight- or branched-chain alkynyl, unsubstituted or substituted with one to four R\textsuperscript{d} groups; -A-(CH\textsubscript{2})\textsubscript{n}-Q; -A-(CH\textsubscript{2})\textsubscript{n}-A-Q; -[(CH\textsubscript{2})\textsubscript{n}A]\textsubscript{m}(CH\textsubscript{2})\textsubscript{p}-Q; -CH\textsubscript{2}N-Q; and -C\textsubscript{3-7} cycloalkyl, unsubstituted or substituted with one to four R\textsuperscript{d} groups;

A represents O, S, NH, NCH\textsubscript{2}, NR, or -CH\textsubscript{2}-;

each m, n, and p independently represents an integer 0, 1, 2 or 3;

each R\textsuperscript{a}, R\textsuperscript{b} and R\textsuperscript{c} independently represents hydrogen, -C\textsubscript{1-6} straight- or branched-chain alkyl, unsubstituted or substituted with one to four R\textsuperscript{d} groups, or -C\textsubscript{2-7} cycloalkyl, unsubstituted or substituted with one to four R\textsuperscript{d} groups;

or R\textsuperscript{a} and R\textsuperscript{b} taken together with any intervening atoms represent a 4-6 membered saturated ring optionally interrupted by one or more of O, S, NR\textsuperscript{c}, with R\textsuperscript{c} as
defined above, or \(-\text{C(O)}\)-, said ring being unsubstituted or substituted with one to four \(R^i\) groups;  
or \(R^b\) and \(R^e\) taken together with any intervening atoms represent a 4-6 membered saturated ring optionally interrupted by one to three of \(O, S, NR^g\), with \(R^g\) as defined above, or \(-\text{C(O)}\)-, said ring being unsubstituted or substituted with one to four \(R^i\) groups; 
each \(R^d\) independently represents halo; \(-\text{CN}\); \(-\text{NO}_2\); \(-\text{NR}^gR^f\); \(-\text{OR}^g\); \(-\text{SR}^g\); \(-\text{CONR}^gR^f\); 
\(-\text{COOR}^g\); \(-\text{SOR}^g\); \(-\text{SO}_2R^g\); \(-\text{SO}_2\text{NR}^gR^f\); \(-\text{NR}^g\text{SO}_2R^f\); \(-\text{COR}^g\); \(-\text{NR}^g\text{COR}^f\); \(-\text{OCOR}^g\); 
\(-\text{OCONR}^gR^f\); \(-\text{NR}^g\text{CONR}^gR^g\); \(-\text{NR}^g\text{CO}_2R^h\); \(-\text{OCO}_2R^h\); \(-\text{C(NR}^g)\text{NR}^gR^g\); 
\(-\text{NR}^g\text{C(NH)NR}^gR^g\) or \(-\text{NR}^g\text{C(NR}^g)\text{R}^g\); 
each \(R^e\), \(R^f\) and \(R^g\) independently represents hydrogen; \(-\text{R}\); \(-\text{C}_{1-6}\) straight- or branched-chain alkyl unsubstituted or substituted with one to four \(R^i\) groups;  
or \(R^e\) and \(R^f\) taken together with any intervening atoms represent a 4-6 membered saturated ring optionally interrupted by one to three of \(O, S, \text{-C(O)}\)- or \(NR^g\) with \(R^g\) as defined above, said ring being unsubstituted or substituted with one to four \(R^i\) groups;  
each \(R^d\) independently represents halo; \(-\text{CN}\); \(-\text{NO}_2\); phenyl; \(-\text{NH}_2\text{SO}_2R^h\); \(-\text{OR}^h\); \(-\text{SR}^h\); 
\(-\text{N}(R^h)_2\); \(-\text{N}^+(R^h)_3\); \(-\text{C(O)}N(R^h)_2\); \(-\text{SO}_2\text{N}(R^h)_2\); heteroaryl; heteroarylilum; \(-\text{CO}_2R^h\); 
\(-\text{C(O)}R^h\); \(-\text{OCOR}^h\); \(-\text{NHCOR}^h\); guanidinyl; carbamimidoyl or ureido; 
each \(R^b\) independently represents hydrogen, a \(-\text{C}_{1-6}\) straight or branched-chain alkyl group, a \(-\text{C}_3-\text{C}_5\) cycloalkyl group or phenyl, or when two \(R^h\) groups are present, said \(R^h\) groups may be taken in combination and represent a 4-6 membered saturated ring, optionally interrupted by one or two of \(O, S, \text{SO}_2, \text{-C(O)}-, \text{NH}\) and \(\text{NCH}_3\);  
each \(Q\) is selected from the group consisting of:

\[
\begin{align*}
\text{wherein:} \\
\text{a and b are independently 1, 2 or 3;} \\
\text{L}^- \text{ is a pharmaceutically acceptable counterion;} \\
\text{a represents O, S or NR}^g; 
\end{align*}
\]
\[ \beta, \delta, \lambda, \mu, \text{ and } \sigma \text{ represent CR}^1, N \text{ or } N^+R^2; \]

provided that no more than one of \( \beta, \delta, \lambda, \mu, \text{ and } \sigma \) is \( N^+R^2; \)

each \( R^2 \) independently represents hydrogen; phenyl or \( C_{1-6} \) straight- or branched-chain alkyl, unsubstituted or substituted with one to four \( R^1 \) groups;

each \( R^1 \) independently represents hydrogen; halo; phenyl; -CN; -NO_2; -NR^+R^2; -OR^2; -SR^2; -CONR^+R^2; -COOR^2; -SOR^2; -SO_2R^2; -SO_2NR^+R^2; -NR^+SO_2R^2; -COR^2; -NR^+COR^2; -OCOR^2; -OCONR^+R^2; -NR^+CO_2R^2; -NR^+CONR^+R^2; -OCO_2R^2; -C_{1-6} \) straight- or branched-chain alkyl, unsubstituted or substituted with one to four \( R^1 \) groups;

each \( R^x \) and \( R^y \) represent hydrogen or \(-C_{1-6} \) straight- or branched-chain alkyl, unsubstituted or substituted with one to four \( R^1 \) groups;

or \( R^x \) and \( R^y \) together with any intervening atoms represent a 4-6 membered saturated ring optionally interrupted by one or more of O, S, NRW or -C(O)-, said ring being unsubstituted or substituted with one to four \( R^1 \) groups;

each \( R^w \) independently represents hydrogen; \(-C_{1-6} \) straight- or branched-chain alkyl, unsubstituted or substituted with one to four \( R^1 \) groups; \( C_{3-6} \) cycloalkyl optionally substituted with one to four \( R^1 \) groups; phenyl optionally substituted with one to four \( R^1 \) groups, or heteroaryl optionally substituted with 1-4 \( R^1 \) groups; or \( R^h \) and \( R^w \) taken together with any intervening atoms represent a 5-6 membered saturated ring, optionally interrupted by one or two of O, S, SO_2, NH or NCH_3;

\( R^x \) represents hydrogen or a \( C_{1-8} \) straight- or branched chain alkyl, optionally interrupted by one or two of O, S, SO_2, NR^w, N^+R^hR^w, or -C(O)-, said chain being unsubstituted or substituted with one to four of halo, CN, NO_2, OR^w, SR^w, SOR^w, SO_2R^w, NR^hR^w, N^+(R^h)_2R^w, -C(O)-R^w, C(O)NR^hR^w, SO_2NR^hR^w, CO_2R^w, OC(O)R^w, OC(O)NR^hR^w, NR^hC(O)R^w, NR^hC(O)NR^hR^w, or a phenyl or heteroaryl group which is in turn optionally substituted with from one to four \( R^1 \) groups or with one to two \( C_{1-3} \) straight- or branched-chain alkyl groups, said alkyl groups being unsubstituted or substituted with one to four \( R^1 \) groups;

Each \( R^y \) and \( R^z \) independently represent hydrogen; phenyl; \(-C_{1-6} \) straight or branched chain alkyl, unsubstituted or substituted with one to four \( R^1 \) groups, and optionally interrupted by O, S, NR^w, N^+R^hR^w or -C(O)-;
or R^x and R^y together with any intervening atoms represent a 4-6 membered
saturated ring optionally interrupted by O, S, SO_2, NR^w, N^R^bR^w or -C(O)-,
unsubstituted or substituted with 1 - 4 R^1 groups,
and when R^x and R^y together represent a 4-6 membered ring as defined above, R^z
is as defined above or R^z represents an additional saturated 4-6 membered ring
fused to the ring represented by R^x and R^y taken together, optionally
interrupted by O, S, NR^w or -C(O)-, said rings being unsubstituted or
substituted with one to four R^i groups;
wherein if the compound is of formula (III), X is O and R is CH_3, then the substituent

![Diagram](image)

[0023] In one embodiment, at least one of Y^1 and Y^2 is not hydrogen.
[0024] In one subembodiment of the present invention, the carbapenem is of the
formula (V):

![Diagram](image)

(V)

or a pharmaceutically acceptable salt and/or prodrug thereof, wherein R, P, R^1,
CO_2M, X, Z, Y^1 and Y^2 are as defined above.

[0025] In another particular subembodiment of the present invention, the carbapenem
of the formula (Va):

![Diagram](image)

(Va)
or a pharmaceutically acceptable salt and/or prodrug thereof wherein R, P, R¹, CO₂M, X, Y¹ and Y² are as defined above.

[0026] In one embodiment of the present invention, the carbapenem is of the formula (Va) and at least one of Y¹ and Y² is not hydrogen.

[0027] In a further embodiment of the present invention, the carbapenem is of the formula (Va) and Y¹ is hydrogen and Y² is not hydrogen.

[0028] In another particular embodiment of the present invention, the carbapenem is of the formula (Vb):

or a pharmaceutically acceptable salt and/or prodrug thereof, wherein:
P' is hydrogen or hydroxyl;
R¹' is hydrogen or methyl; and
CO₂M and Y² are as defined above.

[0029] In another particular embodiment of the present invention, the carbapenem is of the formula (Vc):

or a pharmaceutically acceptable salt and/or prodrug thereof; wherein
P’ is hydrogen or hydroxyl;
R¹’ is hydrogen or methyl; and
CO₂M and Y² are as defined above.
[0030] In another embodiment of the present invention, the carbapenem is of the formula (VI):

![Chemical Structure Image]

or a pharmaceutically acceptable salt and/or prodrug thereof, wherein:

$X$ is $O$ or $NH$;

$Y^1$ is $-(CH_2)_n-Q$ wherein $n=1-3$ and $Q$ is selected from the group consisting of $-NH-C(=NR^3)-N(R^3)_2$, $-S-C(=NR^3)-N(R^3)_2$ and $-S-O_2-N(R^3)_2$, wherein $R^3$ is independently $C_1-C_4$ alkyl or $H$; and

$R$, $P$, $R^1$, $CO_2M$ and $Z$ are as defined above.

[0031] The present invention also provides a pharmaceutical composition comprising a compound of the invention, or a pharmaceutically acceptable salt and/or prodrug therein, alone or, optionally, in combination with one or more other antimicrobial agents, optionally with a pharmaceutically acceptable carrier or diluent.

[0032] The present invention also provides a method of preventing or treating a bacterial infection, in a host, such as an animal, and typically a human, including administering to the host a therapeutic amount of a compound of the present invention, or a pharmaceutically acceptable salt and/or prodrug therein, optionally in a pharmaceutically acceptable carrier or diluent where the bacterial infection is due to a gram-positive bacteria.

[0033] In one embodiment, the bacterial infection is from a drug resistant and/or multiple-drug resistant bacterium. In specific embodiments, the bacteria is at least one of methicillin resistant Staphylococcus aureus (MRSA), methicillin resistant Staphylococcus epidermidis (MRSE), methicillin resistant coagulase negative Staphylococci (MRCNS), vancomycin resistant Enterococcus faecalis, and/or vancomycin resistant Enterococcus faecium.

[0034] The present invention also provides a method of preventing or treating a bacterial infection, in a host, such as an animal, and typically a human, including administering to the host a therapeutic amount of a compound of the present invention, or a pharmaceutically acceptable salt and/or prodrug therein, in combination or alternation with one or more other antimicrobial agents, optionally in
a pharmaceutically acceptable carrier or diluent where the bacterial infection is due to a gram-positive bacteria. In one embodiment, the bacterial infection is from a drug resistant and/or multiple-drug resistant bacterium.

[0035] The invention also provides the use of a therapeutically effective amount of a compound of the present invention, alone or, optionally, in combination with another agent, optionally in a pharmaceutically acceptable carrier in the prevention or treatment or preparation of a medicament for the prevention or treatment of a gram-positive bacterial infection in a host. The bacteria can be drug resistant and/or multiple-drug resistant. In some embodiments, the other agent is another antimicrobial agent that can be effective against gram positive bacterial infections.

[0036] The carbapenems of the present invention can be synthesized using any method known in the art. In one embodiment, a process for synthesizing a compound represented by formula I, II, III, or IV, or a pharmaceutically acceptable salt and/or prodrug thereof, is provided.

[0037] The present invention also is directed to methods of efficient synthesis of β-methyl carbapenems from available precursors with the option of introducing functionality as needed. Therefore, in one embodiment, the carbapenems are synthesized using the process described herein.

[0038] The invention also provides intermediates disclosed herein that are useful in the preparation of compounds of the present invention as well as synthetic methods for preparing the compounds of the invention.

DETAILED DESCRIPTION OF THE INVENTION

[0039] The invention provides carbapenem compounds or their pharmaceutically acceptable salts or prodrugs, pharmaceutical compositions containing these compounds and methods of their use in the treatment or prevention of gram-positive bacterial infections.

DEFINITIONS

[0040] The numbering system for the carbapenem compounds used in this specification is set out below, wherein the numbering of the carbapenem nucleus is in accordance with standards in the art (see, Tiraby, G., et al., Biochem J, 276 (pt. 1), pp. 269-270 (1991)).

[0041] Whenever a range is presented herein it should be understood to include each element of the range. For example, the range “C1 to C4” alkyl independently includes C1, C2, C3 and C4 alkyl groups. When such a range is stated, each element has been contemplated and the range is used merely for convenience.

[0042] Generally, while the compounds, compositions and methods are described in terms of "comprising" various components or steps, the compounds, compositions and methods can also "consist essentially of" or "consist of" the various components and steps.

[0043] The term “alkyl”, as used herein, unless otherwise specified, includes a saturated straight, branched, or cyclic, primary, secondary, or tertiary hydrocarbon of C1 to C10. The term includes both substituted and unsubstituted alkyl groups. Moieties with which the alkyl group can be substituted are selected from the group consisting of hydroxyl, halo (F, Cl, Br, I), amino, alkylamino, arylamino, alkoxy, aryloxy, nitro, cyano, sulfonic acid, sulfate, phosphonic acid, phosphate, or
phosphonate, either unprotected, or protected as necessary, as known to those skilled in the art, for example, as taught in Greene, et al., Protective Groups in Organic Synthesis, John Wiley and Sons, Second Edition, 1991, hereby incorporated by reference. When the alkyl group is said to be substituted with an alkyl group, this is used interchangeably with "branched alkyl group". Specific examples of alkyls and/or substituted alkyls includes, but are not limited to, methyl, trifluoromethyl, ethyl, propyl, isopropyl, cyclopropyl, butyl, isobutyl, t-butyl, pentyl, cyclopentyl, isopentyl, neopentyl, hexyl, iso hexyl, cyclohexyl, cyclohexymethyl, 3-methylpentyl, 2,2-dimethylbutyl, and 2,3-dimethylbutyl.

[0044] The term “lower alkyl”, as used herein, and unless otherwise specified, refers to a C₁ to C₄ saturated straight, branched, or if appropriate, a cyclic (for example, cyclopropyl) alkyl group, including both substituted and unsubstituted forms. Unless otherwise specifically stated in this application, when alkyl is a suitable moiety, lower alkyl is typical. Similarly, when alkyl or lower alkyl is a suitable moiety, unsubstituted alkyl or lower alkyl is typical.

[0045] Cycloalkyl is a species of alkyl containing from 3 to 15 carbon atoms, without alternating or resonating double bonds between carbon atoms. It may contain from 1 to 4 rings which are fused.

[0046] The term "alkenyl" includes a hydrocarbon radical straight, branched or cyclic containing from 2 to 10 carbon atoms and at least one carbon to carbon double bond. Examples of alkenyl groups include ethenyl, propenyl, butenyl and cyclohexenyl.

[0047] The term "alkynyl" refers to a hydrocarbon radical straight or branched, containing from 2 to 10 carbon atoms and at least one carbon to carbon triple bond. Examples of alkynyl groups include ethynyl, propynyl and butynyl.

[0048] “Alkoxy” includes C₁-C₄ alkyl-O-, with the alkyl group optionally substituted as described herein.

[0049] The term “alkylamino” or “arylamino” refers to an amino group that has one or two alkyl or aryl substituents, respectively.

[0050] “Aryl” refers to aromatic rings e.g., phenyl, substituted phenyl, biphenyl, and the like, as well as rings which are fused, e.g., naphthyl, phenanthrenyl and the like. An aryl group thus contains at least one ring having at least 6 atoms, with up to five such rings being present, containing up to 22 atoms therein, with alternating
(resonating) double bonds between adjacent carbon atoms or suitable heteroatoms. The typical aryl groups are phenyl, naphthyl and phenanthrenyl. The term includes both substituted and unsubstituted moieties. The aryl group can be substituted with one or more moieties selected from the group consisting of bromo, chloro, fluoro, iodo, hydroxyl, amino, alkylamino, arylamino, alkoxy, aryloxy, nitro, cyano, sulfonic acid, sulfate, phosphonic acid, phosphate, or phosphonate, either unprotected, or protected as necessary, as known to those skilled in the art, for example, as taught in Greene, et al., Protective Groups in Organic Synthesis, John Wiley and Sons, Second Edition, 1991. Typical substituted aryls include phenyl and naphthyl.

[0051] The term “alkaryl” or “alkylaryl” refers to an aralkyl group with an aryl substituent. The term “aralkyl” or “arylmethyl” refers to an aryl group with an alkyl substituent.

[0052] The term “heteroaryl” or “heteroaromatic”, as used herein, refers to an aromatic group that includes at least one sulfur, oxygen, nitrogen or phosphorus in the aromatic ring. Heteroaryl or heteroaromatic compounds include monocyclic aromatic hydrocarbon group having 5 or 6 ring atoms, or a bicyclic aromatic group having 8 to 10 atoms, containing at least one heteroatom, O, S or N, in which a carbon or nitrogen atom is the point of attachment, and in which one, two or three additional carbon atoms are optionally replaced by a heteroatom selected from oxygen, sulfur or nitrogen heteroatom. Examples of this type are pyrrole, pyridine, oxazole, thiazole and oxazine. Additional nitrogen atoms may be present together with the first nitrogen and oxygen or sulfur, giving, e.g., thiazidezole. Examples include the following.
[0053] The heteroaryl or heteroaromatic group can be optionally substituted with one or more substituent selected from halogen, haloalkyl, alkyl, alkoxy, hydroxy, carboxyl derivatives, amido, amino, alkylamino, dialkylamino. Functional oxygen and nitrogen groups on the heterocyclic or heteroaryl group can be protected as necessary or desired. Suitable protecting groups are well known to those skilled in the art, and include trimethylsilyl, dimethylhexylsilyl, t-butyldimethylsilyl, and t-butyldiphenylsilyl, trityl or substituted trityl, alkyl groups, acyl groups such as acetyl and propionyl, methanesulfonyl, and p-toluensulfonyl.

[0054] “Heteroarylium” refers to heteroaryl groups bearing a quaternary nitrogen atom and thus a positive charge. Examples include the following.
[0055] When a charge is shown on a particular nitrogen atom in a ring which contains one or more additional nitrogen atoms, it is understood that the charge may reside on a different nitrogen atom in the ring by virtue of charge resonance that occurs.

[0056] The term "heterocycloalkyl" refers to a cycloalkyl group (nonaromatic) in which one of the carbon atoms in the ring is replaced by a heteroatom selected from O, S or N, and in which up to three additional carbon atoms may be replaced by heteroatoms.

[0057] The terms "quaternary nitrogen" and "positive charge" refer to tetravalent, positively charged nitrogen atoms including, e.g., the positively charged nitrogen in a tetraalkylammonium group (e.g. tetramethylammonium), heteroarylium, (e.g., N-methyl-pyridinium), basic nitrogens which are protonated at physiological pH, and the
like. Cationic groups thus encompass positively charged nitrogen-containing groups, as well as basic nitrogens which are protonated at physiologic pH.

[0058] The term “heteroatom” refers to oxygen, sulfur, nitrogen, phosphorus, and selenium, selected on an independent basis.

[0059] Halogen and "halo", as used herein, includes bromine, chlorine, fluorine and iodine.

[0060] The term acyl refers to a carboxylic acid ester in which the non-carbonyl moiety of the ester group is selected from straight, branched, or cyclic alkyl or lower alkyl, alkoxyalkyl including methoxymethyl, aralkyl including benzyl, aryloxyalkyl such as phenoxyethyl, aryl including phenyl optionally substituted with halogen, C₁ to C₄ alkyl or C₁ to C₄ alkoxy, sulfonate esters such as alkyl or aralkyl sulphonyl including methanesulfonyl, the mono, di or triphosphate ester, trityl or monomethoxytrityl, substituted benzyl, trialkylsilyl (e.g. dimethyl-β-butyldimethylsilyl) or diphenylmethyldimethylsilyl. Aryl groups in the esters typically include a phenyl group. The term “lower acyl” refers to an acyl group in which the non-carbonyl moiety is lower alkyl.

[0061] “Carboxylate anion” refers to a negatively charged group –COO.

[0062] “Guanidinyl” refers to the group: H₂NC(NH)NH⁻.

[0063] “Carbamimidoyl” refers to the group: H₂NC(NH)⁻.

[0064] “Ureido” refers to the group: H₂NC(O)NH⁻.

[0065] When a group is "optionally interrupted", this includes one or more of the interrupting moieties in combination, as well as said moieties located at either or both ends of the chain. Thus, it includes terminating the group as well.

[0066] When a group is termed "substituted", unless otherwise indicated, this means that the group contains from 1 to 4 substituents thereon. With respect to R, R⁰, R⁰⁰ and R⁰⁰⁰, the substituents available on alkyl groups are selected from the values of R⁰. Many of the variable groups are optionally substituted with up to four R¹ groups. With respect to R⁰, R⁰¹ and R⁰², when these variables represent substituted alkyl, the substituents available thereon are selected from the values of R¹.

[0067] When a functional group is termed "protected", this means that the group is in modified form to preclude undesired side reactions at the protected site, and unless
otherwise defined refers to a group that is added to an oxygen, nitrogen, or phosphorus atom to prevent its further reaction or for other purposes. In some of the carbapenem compounds of the present invention, M is a readily removable carboxyl protecting group, and/or P represents a hydroxyl which is protected by a hydroxyl protecting group. Such protecting groups are used to protectively block the hydroxyl or carboxyl group during the synthesis procedures and are readily removable by procedures that will not cause cleavage or other disruption of the remaining portions of the molecule. Such procedures include chemical and enzymatic hydrolysis, treatment with chemical reducing or oxidizing agents under mild conditions, treatment with a transition metal catalyst and a nucleophile and catalytic hydrogenation.

[0068] A wide variety of oxygen and nitrogen protecting groups are known to those skilled in the art of organic synthesis. Suitable protecting groups for the compounds of the present invention will be recognized from the present application taking into account the level of skill in the art, and with reference to standard textbooks, such as Greene, T. W. and Wuts, P. M., Protective Groups in Organic Synthesis, 3rd Ed., Wiley, New York (1991). Examples of carboxyl protecting groups include allyl, benzhydryl, 2-naphthylmethyl, benzyl (Bn), silyl such as t-butyldimethylsilyl (TBDMS), phenacyl, p-methoxybenzyl, o-nitrobenzyl, p-methoxyphenyl, p-nitrobenzyl, 4-pyridylmethyl and t-butyl. Examples of suitable C-6 hydroxyethyl protecting groups include triethylsilyl (TES), t-butyldimethylsilyl (TBDMS), o-nitrobenzyloxy carbonyl (ONB), p-nitrobenzyloxy carbonyl (PNB), benzoxycarbonyl (CBz), allyloxy carbonyl (Alloc), t-butyloxy carbonyl (Boc), 2,2,2-trichloroethoxy carbonyl (Troc), and the like.

[0069] The phrase "pharmaceutically acceptable ester, salt or hydrate," refers to those salts, esters and hydrated forms of the compounds of the present invention which would be apparent to the pharmaceutical chemist. i.e., those which are substantially non-toxic and which may favorably affect the pharmacokinetic properties of said compounds, such as palatability, absorption, distribution, metabolism and excretion. Other factors that are also important in the selection are cost of the raw materials, ease of crystallization, yield, stability, solubility, hygroscopicity and flowability of the resulting bulk drug.
[0070] "Pharmaceutically acceptable salts" include salts that retain the desired biological activity of the parent compound and do not impart undesired toxicological effects. These salts can take the form -COOM, where M is a negative charge, which is balanced by a counterion. These include salts formed with cations such as sodium, potassium, NH$_4^+$, magnesium, zinc, ammonium, or alkylammonium cations such as tetramethylammonium, tetrabutylammonium, choline, triethylhydroammonium, meglumine, triethanolhydroammonium, calcium, and calcium polyamines such as spermine and spermidine. These can also include salts formed from elemental anions such as chloride, bromide, and iodide. They can also include acid addition salts, for example, salts derived from inorganic or organic acids. Included among such salts are the following: acetate, adipate, alginate, ascorbic acid, aspartate, benzoate, benzenesulfonate, bisulfate, butyrate, citrate, camphorate, camphorsulfonate, cyclopentanepropionate, digluconate, dodecylsulfate, ethanesulfonate, fumarate, glucoheptanoate, gluconic acid, glycerophosphate, hemisulfate, heptanoate, hexanoate, hydrochloride, hydrobromide, hydroiodide, 2-hydroxyethanesulfonate, lactate, maleate, methanesulfonate, 2-naphthalenesulfonate, nicotinate, nitric acid, oxalate, palmitic acid, pamoate, pectinate, persulfate, 3-phenylpropionate, phosphoric acid, picrate, pivalate, polygalacturonic acid; polyglutamic acid, propionate, p-toluenesulfonic acid, succinate, sulfuric acid, tannic acid, tartrate, thiocyanate, tosylate and undecanoate.

[0071] The term "prodrug" includes a compound that, when administered to an animal, is converted under physiological conditions to a compound of the invention, for example a pharmaceutically acceptable ester.

[0072] The pharmaceutically acceptable esters are such as would be readily apparent to a medicinal chemist, and include, for example, those described in detail in U.S. Pat. No. 4,309,438. Included within such pharmaceutically acceptable esters are those which are hydrolyzed under physiological conditions, such as pivaloyloxyethyl, acetoxyethyl, phthalidyl, indanyl and methoxymethyl. These are also referred to as "biolabile esters", which are biologically hydrolysable. Examples of biolabile esters include compounds in which M represents an alkoxyalkyl, alkylcarbonyloxyalkyl, alkoxycarbonyloxyalkyl, cycloalkoxyalkyl, alkenyloxyalkyl, aryloxyalkyl, alkoxyaryl, alkylthioalkyl, cycloalkylthioalkyl, alkenylthioalkyl, arythioalkyl or alkylthioaryl group. These groups can be substituted in the alkyl or aryl portions
thereof with acyl or halo groups. The following M species are examples of biolabile ester forming moieties: acetoxymethyl, 1-acetoxyethyl, 1-acetoxypropyl, pivaloyloxymethyl, 1-isopropylloxyacylonyxethyl, 1-cyclohexyloxycarbonyloxyethyl, phthalidyl and (2-oxo methyl-1,3-dioxolenyl)methyl.

[0073] The term “host”, as used herein, refers to a unicellular or multicellular organism in which the bacteria can replicate, including cell lines and animals. Alternatively, the host can be carrying a part of the bacterial particles, whose replication and/or function can be altered by the compounds of the present invention. The term host refers to infected cells, cells transfected with all or part of the bacteria and animals, such as, primates (including chimpanzees) and, in one embodiment, the host is a human. Veterinary applications are also encompassed by the present invention.

[0074] The term “treatment” as used herein, includes an approach for obtaining beneficial or desired results including clinical results, including alleviation of symptoms, diminishment of extent of disease, stabilization (i.e., not worsening) state of disease, preventing spread of disease, preventing or reducing occurrence or recurrence of disease, delay or slowing of disease progression, and reduction of incidence of disease or symptoms. As used herein, the phrase “anti-bacterially effective amount” means an amount effective for treating the bacterial infection.

**COMPOUNDS OF THE INVENTION**

[0075] In one embodiment, a carbapenem is provided, of the formula (I), (II), (III) or (IV):

(I) 

(II)
or a pharmaceutically acceptable salt and/or prodrug thereof, wherein

R^1 is H or alkyl, typically a lower alkyl such as CH₃;

CO₂M represents a carboxylic acid, a carboxylate anion, a pharmaceutically acceptable ester group or a carboxylic acid protected by a protecting group;

P represents hydrogen, hydroxyl, F or hydroxyl protected by a hydroxyl-protecting group;

X is selected from the group consisting of O, S, S(O)ₓ, with x equal to 0, 1 or 2,

phosphate, carbonyl, thiocarbonyl, iminyl, P(O)ₓ, P(O)ᵧ, C(O), C(O)O, OC(O),

C(O)NH, C(O)NR, NHC(O), NRC(O), amine, NH and NR;

each R is independently H or alkyl, typically a lower alkyl such as CH₃;

each Z and O is independently a 5- or 6-membered monocyclic aromatic

or heteroaromatic ring;

Z is present or absent, and when present, represents members selected from the group

consisting of C=CR₂, C=CY¹, O, S, carbonyl, thiocarbonyl, iminyl, C(O), C(O)O,

OC(O), C(O)NH, C(O)NR, NHC(O), NRC(O), N(A-(CH₂)ₙ-Q)C(O), CON(A-

(CH₂)ₙ-Q), C(=NH), C(=NR), C(=N-A-(CH₂)ₙ-Q), amine, NH, NR and N(A-

(CH₂)ₙ-Q);

each Y¹ and Y² is independently selected from the group consisting of hydrogen;

halo; -CN; -NO₂; -NRₐRₜ; -ORₗ; -SRₗ; -C(O)NRₐRₜ; -C(O)ORₗ; S(O)Rₗ; -SO₂Rₗ;

-SO₂NRₐRₜ; -NRₐSO₂Rₜ; -C(O)Rₗ; -OC(O)Rₗ; OC(O)NRₐRₜ; -NRₐC(O)NRₐRₚ;

-NRₚCO₂Rₚ; -OCO₂Rₚ; NRₚC(O)Rₚ; -Cₘ straight- or branched-chain alkyl, -C₂₋₆

straight- or branched-chain alkenyl, or -C₂₋₆ straight- or branched-chain alkynyl,

unsubstituted or substituted with one to four Rₜ groups; -A-(CH₂)ₙ-Q; (CH₂)ₙ-A-

Q; -[(CH₂)ₙ,A]m(CH₂)ₙ-Q; -CH₂N-Q; and -C₃₋₇ cycloalkyl, unsubstituted or

substituted with one to four Rₜ groups;
A is selected from the group consisting of O, S, NH, NCH₃, NR, and -CH₂-;

n is an integer 0, 1, 2, or 3;

each Rᵣ, Rᵇ and Rᶜ is independently selected from the group consisting of hydrogen, -C₄₋₆ straight- or branched-chain alkyl, unsubstituted or substituted with one to four Rᵈ groups, and -C₃₋₇ cycloalkyl, unsubstituted or substituted with one to four Rᵈ groups;

or Rᵃ and Rᵇ taken together with any intervening atoms is a 4-6 membered saturated ring optionally interrupted by one or more of O, S, NRᶜ, with Rᶜ as defined above, or -C(O)-, wherein the ring is unsubstituted or substituted with one to four Rⁱ groups;

or Rᵇ and Rᶜ taken together with any intervening atoms is a 4-6 membered saturated ring optionally interrupted by one to three of O, S, NRᵃ, with Rᵃ as defined above, or -C(O)-, wherein the ring is unsubstituted or substituted with one to four Rⁱ groups;

each Rᵈ is independently selected from the group consisting of halo; -CN; -NO₂; -NRᵃRᵇ; -ORᵇ; -SRᵇ; -CONRᵃRᵇ; -COORᵇ; -SORᵇ; -SO₂Rᵇ; -SO₂NRᵃRᵇ; -NRᵃSO₂Rᵇ; -CORᵇ; -NRᵃCORᵇ; -OCORᵇ; -OCONRᵃRᵇ; NRⁿCONRᵃRᵇ; -NRⁿCO₂Rᵇ; -OCO₂Rᵇ; -C(NRⁿ)NRⁿRᵇ; NRⁿC(NH)NRⁿRᵇ and -NRⁿC(NRⁿ)Rᵇ;

each Rᶜ, Rᵇ and Rᵍ are independently selected from the group consisting of H, -R and -C₄₋₆ straight- or branched-chain alkyl, unsubstituted or substituted with 1-4 Rⁱ groups;

or Rᶜ and Rᵇ taken together with any intervening atoms is a 4-6 membered saturated ring optionally interrupted by one to three of O, S, -C(O)- or NRᵍ with Rᵍ as defined above, wherein the ring is unsubstituted or substituted with one to four Rⁱ groups;

each Rⁱ independently represents halo; -CN; -NO₂; phenyl; -NH₂SO₂Rᵇ; -ORᵇ; -SRᵇ; -N(Rʰ)₂; -N⁺(Rʰ)₃; -C(O)N(Rʰ)₂; SO₂N(Rʰ)₂; heteroaryl; heteroarylium; -CO₂Rʰ; -C(O)Rʰ; -OCORʰ; NHCORʰ; guanidinyl; carbamimidoyl or ureido;

each Rʰ is independently selected from the group consisting of H, a -C₁₋₆ straight or branched-chain alkyl group, a -C₃₋₆ cycloalkyl group or phenyl, or, when two Rʰ groups are present, the Rʰ groups may be taken in combination and be a 4-6 membered saturated ring, optionally interrupted by one or two of O, S, SO₂, -C(O)-, NH and NCH₃;
each Q is selected from the group consisting of:

\[
\begin{align*}
&\text{N}^\circ \text{R}_b, \quad \text{N} \circ \text{R}_b \\
&\text{N} \circ \text{R}_b \circ \text{R}_b, \quad \text{N} \circ \text{R}_b \circ \text{R}_b \\
&\text{N} \circ \text{R}_b \circ \text{R}_b \circ \text{R}_b, \quad \text{N} \circ \text{R}_b \circ \text{R}_b \circ \text{R}_b \\
&\text{N} \circ \text{R}_b \circ \text{R}_b \circ \text{R}_b \circ \text{R}_b
\end{align*}
\]

wherein:

a and b are 1, 2 or 3;

L' is a pharmaceutically acceptable counterion;

\(\alpha\) is selected from O, S or NR;\(\text{R}^2\);

\(\beta, \delta, \lambda, \mu, \text{ and } \sigma\) are selected from CR, N or N^R, provided that no more than one of \(\beta, \delta, \lambda, \mu, \text{ and } \sigma\) is N^R;

each R^s independently represents hydrogen; phenyl or C_{1-6} straight- or branched-chain alkyl, unsubstituted or substituted with one to four R^i groups;

each R^i independently represents hydrogen; halo; phenyl; -CN; -NO_2; -NR^R; -OR^u; -SR^u; -CONR^R^v; -COOR^h; -SOR^h; -SO_2R^u; -SO_2NR^R^v; -NR^uSO_2R^v; -COR^u; -NR^uCOR^v; -OCOR^u; -OCNR^R^v; -NR^uCO_2R^v; -NR^uCONR^R^w; -OCO_2R^v; -C_{1-6} straight- or branched-chain alkyl, unsubstituted or substituted with one to four R^i groups;

each R^u and R^v represent hydrogen or -C_{1-6} straight- or branched-chain alkyl, unsubstituted or substituted with one to four R^i groups;

or R^u and R^v together with any intervening atoms represent a 4-6 membered saturated ring optionally interrupted by one or more of O, S, NRW or -C(O), said ring being unsubstituted or substituted with one to four R^i groups;

each R^w independently represents hydrogen; -C_{1-6} straight- or branched-chain alkyl, unsubstituted or substituted with one to four R^i groups; C_{3-6} cycloalkyl optionally substituted with one to four R^i groups; phenyl optionally substituted with one to four R^i groups, or heteroaryl optionally substituted with 1-4 R^i groups; or R^h and R^w taken together with any intervening atoms represent a 5-6 membered saturated ring, optionally interrupted by one or two of O, S, SO_2, NH or NCH_3;

R^x represents hydrogen or a C_{1-6} straight- or branched chain alkyl, optionally interrupted by one or two of O, S, SO_2, NR^w, N^R^hR^w, or -C(O), said chain being unsubstituted or substituted with one to four of halo, CN, NO_2, OR^w, SR^w, SOR^w, SO_2R^w, NR^hR^w, N^h(R^h)_2R^w, -C(O)-R^w, C(O)NR^hR^w,
SO₂NR⁺R⁻, CO₂R⁻, OC(O)R⁻, OC(O)NR⁻R⁻, NR⁻C(O)R⁻, NR⁻C(O)NR⁻R⁻, or a phenyl or heteroaryl group which is in turn optionally substituted with from one to four R¹ groups or with one to two C₁₋₃ straight- or branched- chain alkyl groups, said alkyl groups being unsubstituted or substituted with one to four R¹ groups;

each R² and R³ independently represents hydrogen; phenyl; -C₁₋₆ straight or branched chain alkyl, unsubstituted or substituted with one to four R¹ groups, and optionally interrupted by O, S, NR⁻, N⁺R⁺R⁻ or -C(O)-;
or R⁴ and R⁵ together with any intervening atoms represent a 4-6 membered saturated ring optionally interrupted by O, S, SO₂, NR⁻, N⁺R⁺R⁻ or -C(O)-, unsubstituted or substituted with 1 - 4 R¹ groups,

and when R⁴ and R⁵ together represent a 4-6 membered ring as defined above, R⁶ is as defined above or R⁶ represents an additional saturated 4-6 membered ring fused to the ring represented by R⁴ and R⁵ taken together, optionally interrupted by O, S, NR⁻ or -C(O)-, said rings being unsubstituted or substituted with one to four R¹ groups;

wherein if the compound is of formula (III), X is O and R is CH₃, then the substituent

[0076] In one embodiment, R¹ is methyl.

[0077] In another embodiment, P is hydroxyl or hydroxyl protected by hydroxyl-protecting group.

[0078] In one embodiment, n is 0 or 1.

[0079] In another embodiment, at least one of Y¹ and Y² is not hydrogen.

[0080] In another embodiment, at least one of Y¹ and Y² attached to the aromatic ring system contains a positively charged moiety. In a more particular embodiment, one of Y¹ and Y² represents -A-(CH₂)ₙ-Q, and the remaining Y¹ or Y² is hydrogen or a group other than -A-(CH₂)ₙ-Q. In a particular embodiment, one of Y¹ and Y² is -A-(CH₂)ₙ-Q, and A represents -CH₂-.
[0081] In one embodiment of Formula I or II, R^i is lower alkyl;
P is hydroxyl or hydroxyl protected by a hydroxyl-protecting group;
X is O, S or NH;
each R is independently H or alkyl;
each Y^1 and Y^2 is independently selected from the group consisting of -NR^aR^b, -OR^a;
-C_{1-6} straight- or branched-chain alkyl, -C_{2,6} straight- or branched-chain alkenyl, or
-C_{2,6} straight- or branched-chain alkynyl, unsubstituted or substituted with one to
four R^d groups; -A-(CH_2)_n-Q; or -(CH_2)_n-A-Q; unsubstituted or substituted with
one to four R^d groups;
A is selected from the group consisting of O, S, NH, NCH_3, NR, and -CH_2-;
n is an integer 0, 1, 2, or 3;
each R^a, R^b and R^c is independently selected from the group consisting of hydrogen, -
C_{1-6} straight- or branched-chain alkyl, unsubstituted or substituted with one to four
R^d groups, and -C_{3-7} cycloalkyl, unsubstituted or substituted with one to four R^d
groups;
or R^a and R^b or R^b and R^c taken together with any intervening atoms is a 4-6
membered saturated ring optionally interrupted by one or more of O, S, NR^c, with
R^c as defined above, wherein the ring is unsubstituted or substituted with one to
four R^i groups;
each R^d is independently selected from the group consisting of halo; -CN; -NO_2; -
NR^cR^e; -C(NR^c)NR^cR^e; NR^cC(NH)NR^cR^e and -NR^c(NR^c)R^e;
each R^i, R^j and R^k are independently selected from the group consisting of H, -R and -
C_{1-6} straight- or branched-chain alkyl, unsubstituted or substituted with 1- 4 R^i
groups;
each R^i independently represents halo; -CN; -NO_2; phenyl; -N(R^b)_2; -N^+R^b_3; heteryloaryl;
each R^b is independently selected from the group consisting of H, a -C_{1-6} straight or
branched-chain alkyl group, or a -C_{3-6} cycloalkyl group or phenyl;
each Q is selected from the group consisting of:

\[ \text{Structures} \]

wherein:
α is selected from O, S or NR²;
β, δ, λ, μ, and σ are selected from CR¹, N or N⁺R⁴, provided that no more than one
of β, δ, λ, μ, and σ is N⁺R⁴;
each R⁸ independently represents hydrogen; phenyl or C₁₋₆ straight- or branched-
chain alkyl, unsubstituted or substituted with one to four R¹ groups;
each R¹ independently represents hydrogen; halo; phenyl; -CN; -NO₂; -NR³R⁴; -
OR⁵; -CONR³R⁴; -COOR⁶; -COR⁷; -NR³COR⁸; -NR³CO₂R⁸; -C₁₋₆ straight- or
branched-chain alkyl, unsubstituted or substituted with one to four R¹ groups;
each R⁵ and R⁷ represent hydrogen or -C₁₋₆ straight- or branched-chain alkyl,
unsubstituted or substituted with one to four R¹ groups;
or R⁵ and R⁷ together with any intervening atoms represent a 4-6 membered
saturated ring optionally substituted with one to four R¹ groups.

[0082] In another embodiment, one of Y¹ and Y² is -A-(CH₂)ₙ-Q, and Q is

\[ \begin{align*}
&\begin{array}{c}
\text{or} \\
\text{or}
\end{array} \\
\begin{array}{c}
\text{or} \\
\text{or}
\end{array}
\end{align*}
\]

wherein:
α is O, S or NR²; and
β, δ, λ, μ, and σ are independently CR¹, N or N⁺R⁴, provided that no more than one
of β, δ, λ, μ, and σ is N⁺R⁴, balanced by L', which is a pharmaceutically acceptable
counterion, and R⁶ is as originally defined.

[0083] In another embodiment, one of Y¹ and Y² is -A-(CH₂)ₙ-Q, and Q is either

\[ \begin{align*}
&\begin{array}{c}
\text{or} \\
\text{or}
\end{array} \\
\text{or}
\end{align*}\]

a and b are 2;
L' is a pharmaceutically acceptable counterion; and
R⁵, R⁷ and R⁹ are as originally defined.

[0084] In a particular embodiment, one of Y¹ and Y² is -A-(CH₂)ₙ-Q, and Q is

\[ \begin{align*}
\end{align*}\]
[0085] In another embodiment, one of $Y^1$ and $Y^2$ is -A-(CH$_2$)$_n$-Q, and Q is

![Chemical structure](image)

wherein

$\alpha$ is O, S or NR$_k$; and

$\beta$, $\delta$, $\lambda$, $\mu$, and $\sigma$ are independently CR$_i$, N or N$^+$$R^i$, provided that no more than one of $\beta$, $\delta$, $\lambda$, $\mu$, and $\sigma$ is N$^+$$R^i$, balanced by $L^-$, which is a pharmaceutically acceptable counterion, and $R^i$ is as originally defined or as defined in one of the previous embodiments.

[0086] In another embodiment, -CO$_2$M is a carboxylic acid or a carboxylate anion. In this embodiment, M is a negative charge which will be balanced by a positively charged group, such as in the positively charged R group. If the positively charged R group contains more than one positive charge, a negatively charged counterion can be present which in combination with the carboxylate anion, provides overall charge neutrality.

[0087] In one subembodiment of the present invention, the carbapenem is of the formula (V):

![Chemical structure](image)

or a pharmaceutically acceptable salt and/or prodrug thereof, wherein $R$, $P$, $R^1$, CO$_2$M, $X$, $Z$, $Y^1$ and $Y^2$ are as defined above.

[0088] In another particular subembodiment of the present invention, the carbapenem of the formula (Va):

![Chemical structure](image)
or a pharmaceutically acceptable salt and/or prodrug thereof, wherein R, P, R¹, 
CO₂M, X, Y¹ and Y² are as defined above.

[0089] In one subembodiment of formula (Va), X is either O or NH and Y¹ and Y² are 
independently -NR²R³ or -OR⁴, wherein R², R³ and R⁴ are as defined above.

[0090] In one sub-embodiment of formula (Va), at least one of Y¹ and Y² is not 
hydrogen. In a particular subembodiment, Y¹ is hydrogen and Y² is not hydrogen.

[0091] In another embodiment of (Va), one of Y¹ and Y² is -A-(CH₂)ₙ-Q, and Q is

\[
\begin{align*}
\text{(a) or } \text{(b)} \\
\end{align*}
\]

wherein:

α is O, S or NR³; and

β, δ, λ, μ, and σ are independently CR¹, N or NR², provided that no more than one 
of β, δ, λ, μ, and σ is N⁺R², balanced by L⁴, which is a pharmaceutically acceptable 
counterion, and R² is as originally defined.

[0092] In another embodiment of (Va), one of Y¹ and Y² is -A-(CH₂)ₙ-Q, and Q is either

\[
\begin{align*}
\text{(a) or } \text{(b)} \\
\end{align*}
\]

a and b are 2;

L⁴ is a pharmaceutically acceptable counterion; and 

R³, R⁴ and R⁵ are as originally defined.

[0093] In a particular embodiment of (Va), one of Y¹ and Y² is -A-(CH₂)ₙ-Q, and Q is

\[
\begin{align*}
\end{align*}
\]

[0094] In another embodiment of (Va), one of Y¹ and Y² is -A-(CH₂)ₙ-Q, and Q is

\[
\begin{align*}
\end{align*}
\]

wherein
α is O, S or NR³; and

β, δ, λ, μ, and σ are independently CR¹, N or NR², provided that no more than one of β, δ, λ, μ, and σ is NR², balanced by L⁻, which is a pharmaceutically acceptable counterion, and R³ is as originally defined.

[0095] In another particular embodiment of the present invention, the carbapenem is of the formula (Vb):

![Chemical structure](Vb)

or a pharmaceutically acceptable salt and/or prodrug thereof; wherein

P' is hydrogen or hydroxy;

R¹ is hydrogen or methyl; and

Y² is -(CH₂)ₙ₁-A-(CH₂)ₙ₂-Q, wherein n₁ and n₂ are independently 0-4, A is selected from the group consisting of O, S, NH, NHR² and N(R²)₂, wherein R² is independently C₁-C₄ alkyl and Q is either -NH-C(=NR³)-N(R³)₂, -S-C(=NR³)-N(R³)₂, or -NR³-SO₂-N(R³)₂, wherein R³ is independently C₁-C₄ alkyl or H.

[0096] In a particular subembodiment of the present invention, the carbapenem is of the formula (Vc):

![Chemical structure](Vc)

or a pharmaceutically acceptable salt and/or prodrug thereof; wherein CO₂M is as defined above;

n₁ is either 1 or 2;

n₂ is either 1, 2, or 3; and
$X'$ is selected from S or NH.

[0097] In another particular embodiment of the present invention, the carbapenem is of the formula (Vd):

![Chemical Structure](image)

(Vd)

or a pharmaceutically acceptable salt and/or prodrug thereof, wherein:

$P'$ is hydrogen or hydroxyl;

$R'^1$ is hydrogen or methyl; and

$Y^2$ is $-(\text{CH}_2)_n\text{-Q}$, wherein $n$ is 0, 1, 2, 3 or 4, and $Q$ is either $-\text{NH-C(=NR}^3\text{-N(R}^3\text{)}_2$, $-\text{S-C(=NR}^3\text{-N(R}^3\text{)}_2$, or $\text{NR}^2\text{-SO}_2\text{-N(R}^3\text{)}_2$, wherein $R^3$ is independently $\text{C}_1-\text{C}_4$ alkyl or H.

[0098] In a particular embodiment of Formula (Vd), $P'$ is hydroxyl, $R^1$ is methyl, and $Y^2$ is $-(\text{CH}_2)_n\text{-X''-C(=NH)-NH}_2$, wherein $n=1$ or 2 and $X''=\text{S or NH}$.

[0099] In another particular embodiment of the present invention, the carbapenem is of the formula (Ve):

![Chemical Structure](image)

(Ve)

or a pharmaceutically acceptable salt and/or prodrug thereof, wherein

$P'$ is hydrogen or hydroxyl;

$R'^1$ is hydrogen or methyl; and

$Y^2$ is $-(\text{CH}_2)_{n_1}\text{-A-(CH}_2)_{n_2}\text{-Q}$, wherein $n_1$ and $n_2$ are independently 0-4, A is selected from the group consisting of O, S, NH, $\text{NHR}^2$ and $\text{N(R}^3\text{)}_2$, wherein $R^2$ is independently $\text{C}_1-\text{C}_4$ alkyl, and $Q$ is either $-\text{NH-C(=NR}^3\text{-N(R}^3\text{)}_2$ or $-\text{S}$-
C(=NR^3)-N(R^3)_2, wherein R^3 is independently C_1-C_4 alkyl or H.

[0100] In another particular embodiment of the present invention, the carbapenem is of the formula (Vf):

or a pharmaceutically acceptable salt and/or prodrug thereof; wherein
P' is hydrogen or hydroxyl;
R'' is hydrogen or methyl; and
Y^2 is -(CH_2)_n-Q wherein n is 0, 1, 2, 3 or 4 and Q is either -NH-C(=NR^3)-
N(R^3)_2 or -S-C(=NR^3)-N(R^3)_2, wherein R^3 is independently C_1-C_4 alkyl or H.

[0101] In another embodiment of the present invention, the carbapenem is of the formula (VI):

or a pharmaceutically acceptable salt and/or prodrug thereof, wherein R, P, R',
CO_2M, X, Z and Y^1 are as defined above.

[0102] In a subembodiment of the carbapenem of formula (VI), X is O or NH, Y^1 is -(CH_2)_n-Q, wherein n is 1-3, Q is selected from the group consisting of -NH-C(=NR^3)-
N(R^3)_2, -S-C(=NR^3)-N(R^3)_2 and -S-O_2-N(R^3)_2, wherein R^3 is independently C_1-C_4 alkyl or H; and R, P, R', CO_2M and Z are as defined above.

[0103] The group -CO_2M, which is typically attached to the carbapenem nucleus at position 3 represents a carboxylic acid group (M represents H), a carboxylate anion (M represents a negative charge), a pharmaceutically acceptable ester (M represents an ester forming group) or a carboxylic acid protected by a protecting group (M represents a carboxyl protecting group).
[0104] L⁻ can be present or absent as necessary to maintain the appropriate charge balance. When present, L⁻ represents a pharmaceutically acceptable counterion. Most anions derived from inorganic or organic acids are suitable. Representative examples of such counterions are the following: acetate, adipate, aminosalicylate, anhydromethylene citrate, ascorbate, aspartate, benzoate, benzenesulfonate, bromide, citrate, camphorate, camphorsulphonate, chloride, estolate, ethanesulfonate, fumarate, glucoheptanoate, gluconate, glutamate, lactobionate, malate, maleate, mandelate, methanesulfonate, pantothenate, pectinate, phosphate/diphosphate, polygalacturonate, propionate, salicylate, stearate, succinate, sulfate, tartrate and tosylate. Other suitable anionic species will be apparent to the ordinarily skilled chemist. When L⁻ represents a species with more than one negative charge, such as malonate, tartrate or ethylenediaminetetraacetate (EDTA), an appropriate number of carbapenem molecules can be found in association therewith to maintain the overall charge balance and neutrality.

[0105] When the side chain is neutral and the 3-carboxylate is in the form of an anion, the molecule is charge balanced by the presence of an appropriately charged group, such as L⁻. Suitable positively charged groups include cations, such as sodium, potassium, calcium, magnesium and the like. Protonated moieties are also acceptable, such as tetraalkylammonium and the like.

[0106] The compounds of the present invention having the formula I, II, III, IV, V or VI specifically include those compounds shown in Figure 2.

**PROCESS OF MAKING COMPOUNDS**

[0107] The compounds of the present invention can be prepared using the general process outlined in scheme 1, above, such as from CPI 5 illustrated in Figure 3. Reagents and substrates used herein can be either purchased, or synthesized according to known procedures.

[0108] In one embodiment of the invention, the carbapenem intermediate is synthesized using Scheme 1, which is shown in greater detail in Figure 3.

**SCHEME 1**

34
[0109] This carbapenem intermediate, containing an activated -O(CO)$_2$R', wherein R' is an alkyl, such as -O(CO)$_2$(t-Bu), to achieve coupling of the carbapenem to the heteroaromatic side chain, including a oxygen or nitrogen moiety, to produce a β-methyl carbapenem.

[0110] Briefly, the method for preparing β-methyl carbapenems includes:

a) preparing or obtaining a carbapenem intermediate of the structure (A), for example using the process of Scheme 1

wherein

P, R and R$^1$ are as defined above;
P' is a suitable carboxyl protecting group; and
R' is an alkyl or substituted alkyl; and then

b) coupling the compound of structure (A) with a moiety with a free hydroxyl, such as an aromatic alcohol or a heteroaromatic alcohol, or a mono- or di-substituted amine, such as a aromatic amine or heteroaromatic amine, to obtain an β-methyl carbapenem; and then
c) optionally deprotecting the β-methyl carbapenem, if necessary.

[0111] In one illustrative embodiment, the carbapenem intermediate (A), is the following compound (A*).

\[ \text{Chemical Structure Image} \]

[0112] The selection of reaction conditions should take into account the ease of substitution of the \(-\text{O(CO}_2\text{)}\text{R}\) in the carbapenem intermediate to form the desired carbapenem. Some combinations of protecting groups, leaving groups, and solvent systems may result in the formation of the undesired elimination product.

[0113] The process of synthesis is applicable to a wide range of oxygen and nitrogen linkers, as well as other heteroatom linkers, such as sulfur and phosphorus. The carbapenems made according to the present invention can also be used as synthetic intermediates in the preparation of a variety of other β-methyl carbapenem analogs, as well as additional derivatives obtained by subsequent functional group manipulations.

[0114] The process of preparing the compounds of the invention includes coupling a naphthol in the presence of Pd(db){db} as a catalyst in a nonpolar solvent. In one embodiment, the reaction is carried out at room temperature. In a particular embodiment, triethyl phosphite is also included as a ligand in the reaction. In one embodiment, the palladium is at 1-5 mole percent. In another embodiment, the concentration of starting material is between 10 and 50mmol/liter, for example about 10, about 15, about 20, about 25, about 30, about 35, about 40, about 45 or about 50mmol/liter. In another particular embodiment, the reaction does not contain an acid or a base.

[0115] Suitable solvents for carrying out the processes of the present disclosure are inert organic solvents, including but are not limited to, alcohols, aldehydes, amides, ethers, esters, halogenated solvents, hydrocarbons, glycols and glycol ethers, ketones, nitriles, and numerous other solvents common in chemical processes, as well as mixtures of such solvents. These inert solvents can be used alone or in combination,
and can be miscible or immiscible with each other, with the proviso only that the compounds of interest are at least partially soluble in the solvent or solvents used. In the instance of using an immiscible, or 2-phase, solvent system, the process can also include the addition of a phase-transfer agent. Suitable phase-transfer agents are known in the art, such as those described in Sasson, et al., Handbook of Phase Transfer Catalysis, Kluwer Academic Publishers, 1997.

[0116] For the purpose of the present invention, the inert organic solvents suitable for use in preparing the compounds described and claimed herein include but are not limited to aromatic solvents, such as benzene, toluene, chloro benzene, styrene, tetraline, biphenyl, and xylene; ether solvents, such as diethyl ether, n-butyl ether, methyl tert-butyl ether, tetrahydrofuran (THF), and 1,4-dioxane; halogenated solvents, such as chloroform, bromoform, carbon tetrachloride, dichloromethane (DCM), dichloroethane, trichloroethane, dichlorobenzene, and chlorobenzene; alcohols, including C$_1$-C$_{10}$ alkanols, which can be linear, branched, or cyclic, and may be saturated or unsaturated, including methanol, ethanol, 2-propanol, butanol and hexanol; C$_1$-C$_{10}$ hydrocarbon solvents, which can be linear, branched, or cyclic, and may be saturated or unsaturated, including hexane, heptane, cyclohexane, cyclohexene, and pentane; ester and ketone solvents, such as acetone, ethyl acetate, isopropyl acetate, methylbutyl ketone (2-hexanone), methyl ethyl ketone (MEK), methylisobutyl ketone (MIBK), methyl n-butyl ketone (MBK), methyl isopropyl ketone, and cyclohexanone; and nitrogen-containing solvents, including acetonitrile, nitromethane, N,N-dimethylformamide (DMF), dimethylacetamide (DMA), hexamethylphosphoramide (HMPA), N-methylpyrrolidinone (NMP), N,N'-dimethylpropylene urea (DMPU), 1,3-dimethyl-2-oxohexahydropyrimidine, and N-ethylpyrrolidinone.

[0117] In one embodiment, a non-polar, aprotic solvent is used. In this embodiment, the process produces less than 10% of a β-lactam-compromised (ring-opened) by-product. In subembodiments, the solvent is toluene. In one subembodiment, at least 70%, 80%, 90%, 95%, 98%, 99% or 100% toluene is used. In another embodiment, up to 5%, 10%, 15% or 20% or more THF or up to 5%, or 10% or more DMF in toluene is used, particularly in the preparation of compounds with polar sidechains. In one embodiment, the sidechain is dissolved in a minimal amount of THF or DMF (for
example 2-3 mL per 100mg sidechain) and then added to the reaction flask containing a solution of all other reagents in toluene (for example 40-80mL).

[0118] Bases suitable for use in conducting certain of the synthetic transformations described and claimed herein include but are not limited to carbonates, including alkali metal carbonates and bicarbonates, such as sodium carbonate, sodium bicarbonate, potassium carbonate, rubidium carbonate, and cesium carbonate; alkaline earth metal carbonates, such as magnesium carbonate, calcium carbonate, and strontium carbonate; hydroxides, such as sodium hydroxide and potassium hydroxide; and transition metal bases, such as zinc hydroxide. Also suitable for use as bases in the transformations described herein are organic bases, including but not limited to triethylamine (TEA); diethylamine; diisopropylamine; N,N-diisopropylethylamine (DIPEA or DIEA, also known as Hunig’s base); dimethylamine; benzylamine; 4-dimethylaminopyridine (DMAP); ureas, such as tetramethylurea (TMU); pyridine; 2,6-lutidine; imidazole; pyrrole; diphenylamine; tri-n-propylamine; cyclohexylamine; triphenylamine; pyrrolidine; ureas, such as tetramethylurea (TMU); and piperidine.

[0119] As defined above, when a functional group is termed to be “protected” with a “protecting group” (herein represented by the letter designation, P), this means that the group is chemically modified to preclude undesired side reactions at the protected site. Suitable compounds for use with the compounds of the present invention will be recognized from the present application, and include those included in such standard reference texts known to those of skill in the art as Greene, T.W. and Wuts, P.G.M., “Protective Groups in Organic Synthesis, Third Edition”, Wiley Interscience, New York (1999). Examples of suitable protecting groups include but are not limited to silyl protecting groups, including tri-C$_{1-6}$ alkyl silyl groups (e.g., trimethylsilyl and triethylsilyl), diphenyl siloxy groups (e.g., t-butyldiphenylsilyl (TBDPS)), C$_{1-6}$ alkyl silyloxy groups (e.g., tert-butyldimethylsilyl (TBDMs)), substituted and unsubstituted benzyl groups (e.g., benzyl, benzylxycarbonyl, o-nitrobenzylxycarbonyl, p-nitrobenzylxycarbonyl), carbonyls, such as 2,2,2-trichloroethylxycarbonyl (Troc), allyloxycarbonyl (Alloc), and fluorenylmethoxycarbonyl (Fmoc).

[0120] The processes of preparing the compounds of the present invention are suitably conducted at a temperature in a range of from about -78 °C to the boiling point of the reaction medium or solvent (e.g., from about -78 °C to about 200 °C), and are typically conducted at a temperature in a range of from about -50 °C to the boiling
point of the reaction medium or solvent. In one embodiment, the temperature is in a range of from about -20 °C to the boiling point of the reaction medium or solvent. In another embodiment, the temperature is in the range of from about -10 °C to the boiling point of the reaction medium or solvent.

[0121] The reactants used in the presently disclosed process can be added to the reaction vessel (also referred to herein as the reaction "pot", or "round bottom") concurrently, either together or separately, or they can be added sequentially in either order.

**METHOD OF TREATMENT**

[0122] The present invention also provides a method of preventing or treating a bacterial infection, in a host, for example an animal, and typically a human, including administering a therapeutic amount of a compound of the present invention, or a pharmaceutically acceptable salt and/or prodrug therein, optionally in a pharmaceutically acceptable carrier or diluent where the bacterial infection is due to a gram-positive bacteria.

[0123] In one embodiment, the bacterial infection is a drug resistant and/or multiple-drug resistant bacterial infection. In specific embodiments, the infection is from at least one of methicillin resistant Staphylococcus aureus (MRSA), methicillin resistant Staphylococcus epidermidis (MRSE), methicillin resistant coagulase negative Staphylococci (MRCNS), vancomycin resistant Enterococcus faecalis, and/or vancomycin resistant Enterococcus faecium.

[0124] The invention also provides a compound of the present invention for use in medical therapy.

[0125] The present invention also provides a use of a therapeutic amount of a compound of the present invention, or a pharmaceutically acceptable salt and/or prodrug therein, optionally in a pharmaceutically acceptable carrier or diluent, for preventing or treating a gram-positive bacterial infection, in a host, such as an animal, and typically a human.

[0126] Gram positive bacteria are generally characterised by having as part of their cell wall structure peptidoglycan as well as polysaccharides and/or teichoic acids. The
peptidoglycans which are sometimes also called murein are heteropolymers of glycan strands, which are cross-linked through short peptides. Generally, gram-positive bacteria are the endospore formers and typically (though certainly not always) are the exotoxin releasers.

[0127] Gram Positive cocci include, for example, Streptococcus (e.g. Streptococcus pneumoniae), Staphylococcus (e.g. Staphylococcus aureus), and Enterococcus. Gram Positive Rods include, for example, Corynebacteria (i.e. Corynebacterium diphtheriae), Listeria monocytogenes, Bacillus anthracis (i.e. anthrax) and Erysipelothrix rhusiopathiae. Gram Positive Branching Organisms include, for example, Actinomycetes. Gram positive bacteria include: Bacillus anthracis; Bacillus subtilis; Clostridium botulinum; Clostridium perfringens; Clostridium tetani; Corynebacterium diphtheriae; Lactobacillus spp.; Listeria monocytogenes; Mycobacterium leprae; Mycobacterium tuberculosis; Mycoplasma pneumoniae; Staphylococcus aureus; Streptococcus spp.. Mycobacterium stain acid-fast but phyllogenetically are more closely related to the gram-positives than they are to the gram-negatives. Mycoplasma stain gram-negative but phyllogenetically are more closely related to the gram-positives than they are to the gram-negatives (it is their lack of a cell wall which leads to this confusing state). Additional gram positive bacteria are listed, for example, in volume 2 of Bergey's Manual, which contains six sections covering all gram-positive bacteria except the actinomycetes. Bacteria are distributed among these sections on the basis of their shape, the ability to form endospores, acid fastness, oxygen relationships, the ability to temporarily form mycelia, and other properties.

[0128] The present invention also provides a use of a therapeutic amount of a compound of the present invention, or a pharmaceutically acceptable salt and/or prodrug therein, optionally in a pharmaceutically acceptable carrier or diluent, for preventing or treating a methicillin resistant Staphylococcus aureus (MRSA), methicillin resistant Staphylococcus epidermidis (MRSE), methicillin resistant coagulase negative Staphylococci (MRCNS), vancomycin resistant Enterococcus faecalis, and/or vancomycin resistant Enterococcus faecium infection in a host, such as an animal, and typically a human.

[0129] The present invention also provides a use of a therapeutic amount of a compound of the present invention, or a pharmaceutically acceptable salt and/or
prodrug therein, optionally in a pharmaceutically acceptable carrier or diluent, in the manufacture of a medicament for preventing or treating a gram-positive bacterial infection, in a host, such as an animal, and typically a human.

[0130] The invention also includes methods of inhibiting bacterial infection in a host. Inhibition of bacterial replication or treatment of an infection in a cell can be measured by showing a reduction in bacterial replication in a cell to a level lower than the level in an otherwise identical cell, which was not administered the compound of the invention. The reduction can be by about 80%, 85%, 90%, 95%, about 99.9% or more. The level of bacterial replication in a cell can be assessed by any known methods. For example, the level of bacterial replication in a cell can be assessed by evaluating the number of bacterial particles or amount of a bacterial component, such as a bacterial protein, a bacterial enzyme, or bacterial nucleic acid, in the cell or in fluid or debris associated with the cell. The number of infectious bacteria in a cell can be evaluated, for example, in a plaque assay. The level of a bacterial component such as a bacterial protein or enzyme in a cell can be evaluated using standard analytical techniques of protein biochemistry, such as, for example, using an activity assay for a bacterial enzyme, or using Western blotting or quantitative gel electrophoresis for a bacterial protein. Bacterial nucleic acid levels in a cell can be evaluated using standard analytical techniques such as Northern blotting and Southern Blotting or quantitation by polymerase chain reaction (PCR).

**COMBINATION AND ALTERNATION THERAPIES**

[0131] In one embodiment of the invention, one or more therapeutic agents, including particularly antimicrobial agents such as antibiotic agents that are effective against gram positive bacteria, can be used in combination and/or alternation with the compound/composition of the present invention to achieve a additive and/or synergistic therapeutic effect.
[0132] The active compounds can be administered in combination, alternation or sequential steps with another anti-bacterial agent. In combination therapy, effective dosages of two or more agents are administered together, whereas in alternation or sequential-step therapy, an effective dosage of each agent is administered serially or sequentially. The dosages given will depend on absorption, inactivation and excretion rates of the drug as well as other factors known to those of skill in the art. It is to be noted that dosage values will also vary with the severity of the condition to be alleviated. It is to be further understood that for any particular subject, specific dosage regimens and schedules should be adjusted over time according to the individual need and the professional judgment of the person administering or supervising the administration of the compositions. In some embodiments, an anti-bacterial agent that exhibits an EC$_{50}$ of 10-15 $\mu$M or less, or typically less than 1-5 $\mu$M, is desirable.

[0133] It is possible that drug-resistant variants of bacteria can emerge after prolonged treatment with an anti-bacterial agent. The efficacy of a drug against the bacterial infection can be prolonged, augmented, or restored by administering the compound in combination or alternation with a second, and perhaps third, anti-bacterial agent, for example with a different site of activity than the principle drug. Alternatively, the pharmacokinetics, biodistribution or other parameter of the drug can be altered by such combination or alternation therapy. In general, combination therapy is typical because it induces multiple simultaneous stresses on the bacteria.

[0192] Nonlimiting examples of agents that can be used in combination or alternation with the compounds of the invention include: aminoglycosides, $\beta$-lactam antibiotics, cephalosporins, macrolides, miscellaneous antibiotics, penicillins, tetracyclines,
antifungals, antimalarial agents, antituberculosis agents, antibacterials, leprosticats, miscellaneous anti-infectives, quinolones, sulfonamides, urinary anti-infectives, nasal antibiotics, ophthalmic antibiotics, ophthalmic antibacterials, ophthalmic quinolones, ophthalmic sulfonamides, skin and mucous membrane antibiotics, skin and mucous membrane antifungals, skin and mucous membrane antibacterials, skin and mucous membrane miscellaneous anti-infectives, skin and mucous membranescabicides and pedulicides, skin and mucous membrane antineoplasts, nitrofurans and oxazolidinones.

[0193] Specific compounds include, for example, Amikacin (amikacin sulfate); Craramycin (gentamicin sulfate); Nebcin (tobramycin sulfate); Netromycin (netilmicin sulfate); Streptomycin Sulfate; and TOBI (tobramycin), Azactam (aztreonam); Cefotan (cefotetan); Lorabid (loracarbef); Mefoxin (cefoxitin); Merrem (meropenem); and Primaxin (imipenem and cilastatin for injectable suspension); Ancef (cefaclor); Cectol (cefaclor); Cedax (ceffibuten); Cefizox (cefazoxime sodium); Cefobid (cefofetidone sodium); Ceftin (cefoxime axetil); Cefzil (cefoxizil); Ceptaz (cefotrizide); Claforan (cefofetidone); Duricef (cefaclor monohydrate); Fortaz (cephalothin); Keftab (cephalexin HCl); Kefurox (cefuroxime); Keftol (ceffazolin); Mandol (cefarandole nafate); Maxipime (cefeprime HCl); Monocid (cefonicid sodium); Omnicef (cefdinir); Rocephin (ceftaxone); Suprax (cefixime); Tazicef (ceftazidime); Tazidime (ceftazidime); Vantin (cefprozox monohydrate); and Zinacef5 (cefoxime); Baxin (clarithromycin); Dynabac (dirithromycin); E.E.S. 200 (Erythromycin Ethylsuccinate); E.E.S. 400 (Erythromycin Ethylsuccinate); Ery-Ped 200 (Erythromycin Ethylsuccinate); EryPed 400 (Erythromycin Ethylsuccinate); Ery-Tab (Erythromycin delayed-release tablets); Erythrocin Stearate (Erythromycin stearate); Ilosone (erythromycin estolate); PCE Dispertab (erythromycin particles in tablets); Pediazole(erythromycin ethylsuccinate and sulfisoxazole acetyl for oral suspension); Tao (troleandomycin); Zithromax (azithromycin); and Erythromycin; Cleocin HCl (clindamycin hydrochloride); Cleotin Phosphate (clindamycin phosphate); Coly-Mycin M (colistimethate sodium); and Vancocin HCl (vancomycin hydrochloride); Amoxicil (amoxicillin); Augmentin (amoxicillin/ clavulanate potassium); Bicillin C-R 900/300 (Penicillin G benzathine and Penicillin G procaine suspension); Bicillin C-R (Penicillin G benzathine and Penicillin G procaine suspension); Bicillin L-A (Penicillin G benzathine suspension);
Geoillin (carbencillin indanyl sodium); Mezlin (sterile mezlocillin sodium); Omnipen (ampicillin); Pen-Vee K (penicillin V potassium); Pfizerpen (penicillin G potassium); Pipracil (piperacillin sodium); Speetrobid (bacampicillin-HCl); Ticar (tiearcillin disodium); Timentin (ticarcillin disodium and clavulanate potassium); Unasyn (ampicillin sodium/subactam sodium); Zosyn (piperacillin sodium and tazobactam sodium); and Dicloxacillin Sodium; Achromycin V (tetracycline HCl); Declomycin (demeclocycline HCl); Dynacin (minocycline HCl); Minocin (minocycline hydrochloride); Monodox (Doxycline monohydrate capsules); Terramycin (oxytetracycline); Vectrin (minocycline hydrochloride); Vibramycin Calcium (doxycycline sodium); Vibramycin Hyclate (doxycycline hyclate); Vibramycin Monohydrate (doxycycline monohydrate); Vibra-Tabs (doxycycline-hydrate); Declomycin (demeclocycline HCl); Vibramycin (doxycycline); Dynacin(Minocycline HCl); Terramycin (oxytetracycline HCl); Achromycin V capsules5 (tetracycline HCl); Linco-mycins; and Cleotin HCl (clindamycin HCl); Abelcet (amphotericin B lipid complex); AmBisome (amphotericin B); Amphotec (amphotericin B cholesterol sulfatecomplex); Ancobon (fluocytosine); Diflucan (fluconazole); Fulvicin P/Gamma (ultramicrosize griseofulvin); Fulvicin P/G 165 and 330 (ultramicrosize griseofulvin); Grifulvin V (griseofulvin); Gals-PEG (gxiseofulvin ultramicrosize); Lamisil (terbinafine hydrochloride); Nizoral (ketoconazole); Amphotericin B; Lotrimin (clotrimazole); Dapsone tablets (dapsone); Diflucan (fluconazole); Monistat-Derm cream (miconazole); Mycostatin Crc .am (nystatin); and Sporanox (itraconazole); Aralen hydrochloride (chloroquine HCl); Aralen phosphate (chloroquine phosphate); Dataprim (pyrimethamine); Ladam (mefloquine HCl); and Plaquenil (hydroxychloroquine sulfate); Capastat sulfate (capreomycinsulfate); Myambutol (ethambutol hydrochloride); Mycobutin (rifabutin capsules); Nydrazid (isoniazid injection); Paser (aminosalicylic acid); Priffin (rifapentine); Pyrazinamide tablets (pyrazinamide); Rifadin (rifampin capsules); Rifadin IV(rifampin for injection); Rifamate (rifampin and isoniazid); Rifater (rifampin,isoniazid and pyrazinamide); Seromycin (cyclolserine capsules); Streptomycin-Sulfate; Tice BCG (BCG vaccine); Cycloserine (seromycin capsules); Urised (Methenamine); and Trecator-SC (ethionamide tablets); Alferon N (interferon alfa-n3); Crixivan (indinavir sulfate); Cytovene (ganciclovir); Cytovene-IV (ganciclovir sodium); Epivir (lamivudine); Famvir (famciclovir); Flumadine (rimantadine HCl); Foscavir (foscarnet sodium); Hivid (zalcitabine); Intron A (interferon alfa-2b); Invirase (saquinavir mesylate);
Norvir (ritonavir); Rebetron combination therapy, which contains Rebetrol (ribavirin) and Intron A (interferon alfa-2b); Rescriptor (delavirdine mesylate); Retrovir (ziduvudine); Retrovir IV (ziduvudine); Symmetrel (amantadine HCl); Synagis (palivizumab); Valtrex (valacyclovir HCl); Videx (didanosine); Viracept (nefelanavir mesylate); Viramune (nevirapine); Virazole (ribavirin); Vistide (cidofovir); Zerit ( stavudine d4T); Symmetrel Syrup amantadine HCl; Combivir Tablets (lamivudine); and Zovirax (acyclovir); Dapsone Tablets (dapsone); Daraprim (pyrimethamine); Flagyl 375 (metronidazole); Flagyl ER Tablets (metronidazole); Flagyl I.v. (metronidazole); Furoxone (furfazolidone); Mepron (atovaquone); and Neutrexin (tflometrexate glucuronate); Cipro (ciprofloxacin HCl); Floxin (ofloxacin); Levaquin (levofoxacin); Mazaquin (lomefloxacin HCl); Noroxin (norfloxacin); Penetrex (enoxacin); Raxar (grepafloxacin HCl); Trovan ( trovafloxacin mesylate); and Zagam (sparfloxacin); Bactrim (trimethoprim and sulfamethoxazole); Bactrim DS (trimethoprim and sulfamethoxazole double strength); Pediazole (erythromycin ethylsuccinate and sulfisoxazole acetyl); Septra (trimethoprim and sulfamethoxazole); Septra DS (trimethoprim and sulfamethoxazole); Co-Trimoxazole, Sulfadiazine, Battrim I.V. Infusion (sulfamethoxazole); Sulfapyridine and Pediazole (erythromycin ethylsuccinate and sulfisoxazole acetyl); Furadantin (nitrofurantoin); Macrobid (nitrofurantoin monohydrate macrocrystals); Macrodantin (nitrofurantoin macrocrystals); Monurol Sachet (fosfomycin tromethamine); NegGram Caplets (nalidixic acid); Septra (trimethoprim and sulfamethoxazole); Septra DS (trimethoprim and sulfamethoxazole); Urised (a combination of the antiseptics methenamine, methylene blue, phenyl salicylate, benzoic acid and parasympatholytics (atropine sulfate) hyoscyamine); (oxytetracycline HCl, sulfamethizole and phenazopyridine HCl); (methenamine mandelate); Bactroban (mupirocin); Chloromycetin ophthalmic (chloramphenical); Cortisporin (neomycin and polymyxin [3 sulfates and hydrocortisone acetate cream]; Iloctin (erythromycin ophthalmic ointment); NeoDecadron (neomycin sulfate - dexamethasone sodium phosphate); Polytrim (trimethoprim and polyoxymycin [3 sulfate ophthalmic solution]; Terra-Cortril (oxytetracycline HCl and hydrocortisone acetate); Terramycin (oxytetracycline); and TobraDex (tobramycin and dexamethasone ophthalmic suspension and ointment); Vita-A ophthalmic ointment, (vidatabase); (norfloxacin ophthalmic solution; Ciloxan ophthalmic solution and ointment (Ciprofloxacin HCl); and Ocuflox ophthalmic solution
(ofioxacin), Blephamide opthalmic ointment (sulfacetamide sodium and prednisolone acetate); and Blephamide opthalmic suspension (sulfacetamide sodium and prednisolone acetate); A/T/S (erythromycin); Bactroban (mupirocin); Benzamycin (erythromycin-benzoyle peroxide topical gel); Betadine (povidone-odine); Cleotin T (clindamycin phosphate topical solution); Clindets (clindamycin phosphate pledgets); Cortisopin (neomycin, polymyxin B sulfates and hydrocortisone acetate cream); Emgel (erythromycin); Erycette (erythromycin topical solution); Garamycin (gentamicin sulfate); Klaron (sodium sulfacetamide lotion); Mycostatin (nystatin cream); Theramycin Z (erythromycin topical solution); T-Stat (erythromycin); Chloromycetin (chloramphenicol ophthalmic ointment); Cortisporin (neomycin and polymyxin B sulfates, bacitracin zinc and hydrocortisone ophthalmic ointment); Ilotycin (erythromycin); NeoDecadron (neomycin sulfate-dexamethasone sodium phosphate); Polytrim (trimethoprim and polymyxin B sulfate); Terra-Cortril (oxytetracycline HCl and hydrocortisone acetate); Terramycin (oxytetracycline); Exelderm (salicylazone nitrate); Fungizone (amphotericin B oral suspension); Lamisil (terbinafine hydrochloride cream); Loprox (ciclopiroxolamine); Lotrimin (clotrimazol); Lotrisone (clotrimazole and betamethasone dipropionate); Mentax (butenafine HCl); Monistat-Denn (miconazole nitrate); Mycelex (clotrimazole); Mycostatin (nystatin); Naffin (nattifine HCl); Nizoral (cetoconazole); Nystop (nystatin); Oxistat (oxiconazole nitrate); Selsun Rx (2.5% selenium sulfide lotion); and Spectazole (econazole nitrate); Denavir (penciclovir cream); and Zovirax (acyclovir); Benzashave Coenzoyl peroxide); Betadine (povidone-iodine); Betasept (chlorhexidine gluconate); Cetaphil (soap substitute); Cloractin WCS-90 (sodium oxychlorosene); Dapsone Tablets (dapsone); Desquam-E Coenzoyl peroxide); Desquam-X (benzyol peroxide); Hibiclens (chlorhexidine gluconate); Hibistat (chlorhexidine gluconate); Impregon (tetrachlorosalicylanilide 2%); MetroCream (metronidazole); MetroGel (metronidazole); Noritate (metronidazole); pHisoHex (hexachlorophene detergent cleanser); Sulfacet-R (sodium sulfacetamide 10% and sulfur 5%); Sulfoxylon (materfide acetate); Tflaz Coenzoyl peroxide); and Vanoxide-HC Coenzoyl peroxide hydrocortisone); Acticin (permethrin); Elimite (permethrin); Eurax (crotamiton); Efudex (fluoro-uracil); Fluoroplex.
PHARMACEUTICAL COMPOSITIONS

[0134] Hosts, including humans can be treated by administering to the patient an effective amount of the active compound or a pharmaceutically acceptable prodrug or salt thereof in the presence of a pharmaceutically acceptable carrier or diluent. The active materials can be administered by any appropriate route, for example, orally, parenterally, intravenously, intradermally, subcutaneously, or topically, in liquid or solid form.

[0135] An optional dose of the compound for treatment of a bacterial (such as a gram positive bacteria) infection is about 1 to 50 mg/kg, or 1 to 20 mg/kg, of body weight per day, more generally 0.1 to about 100 mg per kilogram body weight of the recipient per day. The effective dosage range of the pharmaceutically acceptable salts and prodrugs can be calculated based on the weight of the parent nucleoside to be delivered. If the salt or prodrug exhibits activity in itself, the effective dosage can be estimated as above using the weight of the salt or prodrug, or by other means known to those skilled in the art.

[0136] Optionally, the active ingredient should be administered to achieve peak plasma concentrations of the active compound of from about 0.2 to 70 M, e.g., about 1.0 to 10 uM. This may be achieved, for example, by the intravenous injection of a 0.1 to 5% solution of the active ingredient, optionally in saline, or administered as a bolus of the active ingredient. The concentration of active compound in the drug composition will depend on absorption, inactivation and excretion rates of the drug as well as other factors known to those of skill in the art. It is to be further understood that for any particular subject, specific dosage regimens should be adjusted according to the individual need and the professional judgment of the person administering or supervising the administration of the compositions, and that the concentration ranges set forth herein are exemplary only and are not intended to limit the scope or practice of the claimed composition. The active ingredient may be administered at once, or may be divided into a number of smaller doses to be administered at varying intervals of time.

[0137] The compound is conveniently administered in unit any suitable dosage form, including but not limited to one containing 7 to 3000 mg, or 70 to 1400 mg of active ingredient per unit dosage form. A dosage of 50-1000 mg is optional.
[0138] The active compound can be administered in a pharmaceutically acceptable carrier available in the art, and can be administered by a chosen route of administration. Pharmaceutical compositions can be prepared, packaged, or sold in a variety of formulations which can be suitable for one or more routes of administration such as, for example, oral, intravenous, intramuscular, topical, subcutaneous, rectal, vaginal, parenteral, pulmonary, intranasal, buccal, ophthalmic, or another route of administration. The active materials can be administered in liquid or solid form. Other contemplated formulations include projected nanoparticles, liposomal preparations, ressealed erythrocytes containing the active ingredient, and immunologically-based formulations.

[0139] The active compound may be administered intravenously or intraperitoneally by infusion or injection. Solutions of the active compound or its salts may be prepared in water or saline, optionally mixed with a non-toxic surfactant. Dispersions may be prepared in glycerol, liquid polyethylene glycols, triacetin, mixtures thereof, and in oils. Under ordinary conditions of storage and use, these preparations contain a preservative to prevent growth of microorganisms.

[0140] Pharmaceutical dosage forms suitable for injection or infusion may include sterile aqueous solutions or dispersions or sterile powders comprising the active ingredient which are adapted for the extemporaneous preparation of sterile injectable or infusible solutions or dispersions, optionally encapsulated in liposomes. The ultimate dosage form is optionally sterile, fluid, and stable under conditions of manufacture and storage. The liquid carrier or vehicle may be a solvent or liquid dispersion medium comprising, for example, water, ethanol, a polyol (for example, glycerol, propylene glycol, liquid polyethylene glycols, and the like), vegetable oils, nontoxic glyceryl esters, and suitable mixtures thereof.

[0141] For oral therapeutic administration, the active compound can be combined with one or more excipients and used in the form of ingestible tablets, buccal tablets, troches, capsules, elixirs, suspensions, syrups, wafers, and the like. Such compositions and preparations can contain at least 0.1 % (w/w) of active compound. The percentage of the compositions and preparations can, of course, be varied, for example from about 0.1 % to nearly 100 % of the weight of a given unit dosage form. The amount of active compound in such therapeutically useful compositions is such that an effective dosage level will be obtained upon administration.
[0142] The tablets, troches, pills, capsules, and the like may also contain one or more of the following: binders, such as microcrystalline cellulose, gum tragacanth, acacia, corn starch, or gelatin; excipients, such as dicalcium phosphate, starch or lactose; a disintegrating agent, such as corn starch, potato starch, alginic acid, primogel, and the like; a lubricant, such as magnesium stearate or Sterotes; a glidant, such as colloidal silicon dioxide; a sweetening agent, such as sucrose, fructose, lactose, saccharin, or aspartame; a flavoring agent such as peppermint, methylsalicylate, oil of wintergreen, or cherry flavoring; and a peptide antibacterial agent, such as envuvirtide (Fuzeon™). When the unit dosage form is a capsule, it can contain, in addition to materials of the above type, a liquid carrier, such as a vegetable oil or a polyethylene glycol. Various other materials may be present as coatings or to otherwise modify the physical form of the solid unit dosage form.

[0143] In one embodiment, the active compounds are prepared with carriers that will protect the compound against rapid elimination from the body, such as a controlled release formulation, including implants and microencapsulated delivery systems. Biodegradable, biocompatible polymers may be used, such as ethylene vinyl acetate, polyanhydrides, polyglycolic acid, collagen, polyorthoesters, and polylactic acid. Methods for preparation of such formulations will be apparent to those skilled in the art. The materials may also be obtained commercially from Alza Corporation.

[0144] Other formulations can also be developed. For example, the compounds can be administered in liposomal suspensions (including liposomes targeted to infected cells with monoclonal antibodies to bacterial antigens). These may be prepared according to methods known to those skilled in the art, for example, as described in U.S. Patent No. 4,522,811. For example, liposome formulations may be prepared in a variety of lipid(s) (such as stearoyl phosphatidyl ethanolamine, stearoyl phosphatidyl choline, arachadoyl phosphatidyl choline, and cholesterol).

[0145] A pharmaceutical composition of the invention may be prepared, packaged, or sold in a formulation suitable for rectal administration. Such a composition may be in the form of, for example, a suppository, a retention enema preparation, and a solution for rectal or colonic irrigation. A pharmaceutical composition of the invention may also be prepared, packaged, or sold in a formulation suitable for vaginal administration. Such a composition may be in the form of, for example, a
suppository, an impregnated or coated vaginally-insertable material such as a tampon, a douche preparation, or a solution for vaginal irrigation.

[0146] A pharmaceutical composition of the invention may be prepared, packaged, or sold in a formulation suitable for pulmonary administration via the buccal cavity. Such a formulation may comprise dry particles which comprise the active ingredient and which have a diameter in the range from about 0.5 to about 7 nanometers, or from about 1 to about 6 nanometers. Such compositions are conveniently in the form of dry powders for administration, which can include particles wherein at least 98% of the particles by weight have a diameter greater than 0.5 nanometers and at least 95% of the particles by number have a diameter less than 7 nanometers. Typically least 95% of the particles by weight have a diameter greater than 1 nanometer and at least 90% of the particles by number have a diameter less than 6 nanometers. The active ingredient can also be in the form of droplets of a solution or suspension, for example those that have an average diameter in the range from about 0.1 to about 200 nanometers.

[0147] The formulations described herein as being useful for pulmonary delivery are also useful for intranasal delivery of a pharmaceutical composition of the invention. Another formulation suitable for intranasal administration is a coarse powder comprising the active ingredient and having an average particle from about 0.2 to 500 micrometers.

[0148] A pharmaceutical composition of the invention may be prepared, packaged, or sold in a formulation suitable for ophthalmic administration. For topical administration, the present compounds can be applied in pure form, i.e., as a liquid. However, typically, the compounds are administered to the skin as compositions or formulations, in combination with a dermatologically acceptable carrier. Useful solid carriers include finely divided solids such as talc, clay, microcrystalline cellulose, silica, alumina, and the like. Useful liquid carriers include water, alcohols, glycols, and blends of two or more of these, in which the present compounds can be dissolved or dispersed at effective levels, optionally with the aid of non-toxic surfactants. Adjuvants such as fragrances and additional antimicrobial agents can be added to optimize properties for a given use. The resulting liquid compositions can be applied using absorbent pads, used to impregnate bandages or other dressings, or sprayed onto the affected area using pump-type or aerosol sprayers.
[0149] The compounds/compositions of the present invention are optionally administered in a controlled release formulation, which can be a degradable or nondegradable polymer, hydrogel or ganogel or other physical construct that modifies the bioabsorption, half life or biodegradation of the active agent(s). The controlled release formulation can be a material that is painted or otherwise applied onto the afflicted site, either internally or externally. In one embodiment, the invention provides a biodegradable bolus or implant. The controlled release formulation with appropriated selected imaging agent can be used to coat a transplanted organ or tissue to prevent rejection. It can alternatively be implanted or otherwise applied near the site of potential infection.

[0150] Thickeners such as synthetic polymers, fatty acids, fatty acid salts and esters, fatty alcohols, modified celluloses, or modified mineral materials can also be employed with liquid carriers to form spreadable pastes, gels, ointments, soaps, and the like, for application directly to the skin of the user.

[0151] The compound or a pharmaceutically acceptable prodrug or salts thereof can also be mixed with other active materials that do not impair the desired action, or with materials that supplement the desired action, such as antibiotics, antifungals, anti-inflammatories, or other antibacterials, including other nucleoside compounds. Solutions or suspensions used for parenteral, intradermal, subcutaneous, or topical application can include the following components: a sterile diluent such as water for injection, saline solution, fixed oils, polyethylene glycols, glycerine, propylene glycol or other synthetic solvents; antiatheral agents such as benzyl alcohol or methyl parabens; antioxidants such as ascorbic acid or sodium bisulfite; chelating agents such as ethylenediaminetetraacetic acid; buffers such as acetates, citrates or phosphates and agents for the adjustment of tonicity such as sodium chloride or dextrose. The parental preparation can be enclosed in ampoules, disposale syringes or multiple dose vials made of glass or plastic. If administered intravenously, useful carriers are physiological saline or phosphate buffered saline (PS).

[0152] In one embodiment, the active compounds are prepared with carriers that will protect the compound against rapid elimination from the body, such as a controlled release formulation, including implants and microencapsulated delivery systems. Biodegradable, biocompatible polymers can be used, such as ethylene vinyl acetate, polyanhydrides, polyglycolic acid, collagen, polyorthoesters and polylactic acid.
Methods for preparation of such formulations will be apparent to those skilled in the art. The materials can also be obtained commercially from Alza Corporation.

[0153] The concentration of the compound(s) in a liquid composition, such as a lotion, will, for example, range from about 0.1 % to about 95 % by weight, or from about 0.5 % to about 25 % by weight. The concentration in a semi-solid or solid composition such as a gel or a powder will, for example, range from about 0.1 % to 100% by weight, or about 0.5 % to about 5 % by weight. Single doses for intravenous injection, subcutaneous, intramuscular or topical administration, infusion, ingestion or suppository will generally be from about 0.001 to about 5000 mg, and be administered from about 1 to about 3 times daily, to yield levels of about 0.01 to about 500 mg/kg, for adults.

[0154] The invention also includes one or more compounds disclosed herein, or any combination thereof, or salt thereof, in an amount effective to inhibit bacterial (such as a gram positive bacteria) replication in a host. The compound can be useful for inhibiting bacterial replication in a cell or neutralization (i.e. inactivation) of extracellular bacteria.

[0155] As used herein, to inhibit bacterial replication in a host means to reduce the bacterial load in a host to a level which is lower than the level of the bacterial load in an otherwise identical host which was not administered the compound. Bacterial load in a mammal can be reduced by about 1 to 12 log10 or more relative to an otherwise identical mammal which was not administered the compound. Bacterial load in a mammal can be assessed by a number of methods known in the art such as, for example, obtaining a tissue or fluid sample from the mammal and assessing the amount of bacterial components in the mammal contained therein using technology which is either immunological, biochemical or molecular biological in nature and which is well known to the skilled artisan and which are described elsewhere herein. Inhibition of bacterial replication in a cell is assessed using similar or identical assays as those used to assess bacterial load in a mammal.

[0156] The invention also includes a kit for administering a compound of the invention, a pharmaceutically acceptable salt thereof, or a pharmaceutical composition, to a host for treatment of a bacterial (such as a gram positive bacteria) infection. Typically, the host is a human. The kit comprises one or more compounds
of the invention, or a combination thereof, and optionally an instructional material, which describes adventitiously administering the composition to the mammal by any of the routes of administration described herein. In another embodiment, this kit comprises a (typically sterile) solvent suitable for dissolving or suspending the composition of the invention prior to administering the compound to the mammal.

**EXAMPLES**

[0157] Melting points were determined on a Mel-temp II laboratory device and are uncorrected. Nuclear magnetic resonance spectra were obtained on a GE 300 Plus (300 MHz), a Varian INOVA 400 (400 MHz), and a Varian INOVA 600 (600 MHz) spectrometer; chemical shifts (δ) are reported in parts per million (ppm), and the signals are described as s (singlet), d (doublet), t (triplet), q (quartet), bs or brs (broad singlet), dd (doublet of doublet), and m (multiplet). UV spectra were obtained on a Beckman DU 650 spectrophotometer. Mass spectra were measured on a Micromass Inc. Autospec High Resolution double focussing sector (EBE) MS spectrometers. Infrared spectra were obtained on a Nicolet 510 FT-IR spectrometer. All reactions were monitored using thin layer chromatography on Analtech, 200 mm silica gel GF plates. Dry 1,2-dichloroethane, dichloromethane, acetonitrile, N,N-dimethylformamide, and THF were obtained by drying over 4A molecular sieves.

**ABBREVIATIONS:**

- **ACN:** acetonitrile
- **DCE:** 1,2-dichloroethane
- **DCM:** dichloromethane
- **DDQ:** dichlorodicyano quinone
- **DIEA:** diisopropylethyl amine
- **DI H₂O:** deionized water
- **DMAP:** 4-N,N-dimethylamino pyridine
- **DMF:** N,N-dimethyl formamide
- **LAH:** lithiumaluminum hydride
- **LHMDS:** lithium hexamethyldisilazide
Pd/C: palladium on carbon
PNB: para-nitrobenzyl
TBAF: tetrabutylammonium fluoride
TBDMS: t-butyldimethylsilyl
TEA: triethylamine
TES: triethylsilyl
TFA: trifluoroacetic acid
THF: tetrahydrofuran
TLC: thin layer chromatography
TBDPS: t-butyldiphenylsilyl

Preparation of the Carbapenem Intermediate (CPI) 5

[0158] Carbapenem Intermediate (CPI) 5 was prepared according to the synthetic scheme shown in FIGURE 3. In the first step of the process, benzyl propionate is reacted with isobutoxycarbonyloxy acetic acid methyl ester in a solvent at low temperature in the presence of LDA to form ketoester A. The ketoester A is then contacted with the acetoxazetidinone B (prepared by any number of known, synthetic routes) in a solvent, and sodium carbonate is added. The reaction ages for a period of time at a temperature such that the reaction goes substantially to completion, generating the target lactam C.

![Chemical reaction diagram](image)

FIGURE 3
[0159] The lactam \( C \) is dissolved in a solvent, such as DMF, to which a suitable base (such as DIEA) and TBSOTf are added, and the mixture allowed to age for a period of time at a temperature. Following workup, the bis-TBS-ketoester \( D \) is isolated.

[0160] The crude ketoester \( D \) is dissolved in ethyl acetate in an appropriate reaction vessel. Formic acid and a catalyst, such as Pd/C, are added to the reaction vessel, and the entire mixture is hydrogenated at an appropriate hydrogen pressure (40-50 psi) for a period of time such that the decarboxylation reaction proceeds to completion. The reaction mixture is filtered over a pad of Celite®, and the solvent is removed under vacuum. Product \( E \) is isolated following purification by column chromatography.

[0161] The bis-TBDMS ketolactam \( E \) is then de-silylated using 2 N HCl in ACN and the product is isolated after a standard aqueous workup. The crude product is dissolved in a solvent, such as DCM, and allowed to react with triethylsilyl chloride and imidazole for several hours (monitored by TLC) at rt. Following aqueous workup, O-TES ketolactam \( F \) was isolated and purified on silica gel.

[0162] N-PNB, O-TES ketolactam \( G \) is produced by reacting ketolactam \( F \) with p-nitrobenzyl oxalylechloride in a suitable solvent (DCM, for example) in the presence of a base (DIEA, for example). The mixture is allowed to age for a period of time (and at an appropriate temperature) to effect a substantially complete reaction as monitored by an appropriate means (e.g., TLC or HPLC). Following workup in a usual manner, intermediate \( G \) was isolated.

[0163] To a solution of compound \( G \) is a suitable solvent was added triethylphosphite, and the mixture heated to reflux until complete by TLC. Following workup and purification in the appropriate manner, CPI 5 was isolated.

**Examples of 5-Alkyl-substituted-1-Naphthol CP Analogs:**

*Preparation of “1-Carbon” 5-Hydroxymethyl-1-Naphthol CPI 6*
Discussion:

[0164] 2-Amino-6-(methoxycarbonyl) benzoic acid (1) was made from 3-nitrophthalic acid using the procedure first reported by Rogers and Averill (Rogers, M.E. and Averill, B.A., *J. Org. Chem.*, 1986, 51, 3308) and then used immediately to make Diels Alder cycloadduct 2 via the 3-(methoxycarbonyl)dehydrobenzene intermediate that is generated under aprotic diazotization reaction conditions (based on modified conditions first reported by Giles, R.G.F., Sargent, M.V., and Sianipar, H., *J. Chem. Soc. Perkin Trans I*, 1991, 1571). Treatment of cycloadduct 2 with TFA in refluxing methanol yielded a 1:2 mixture of regioisomeric naphthols 3a and 3b which were separated by column chromatography on silica gel. The 1,5-naphthol regioisomer (3a) was then reduced with LAH to produce 5-hydroxymethyl naphthol 4, which was then coupled to carbapenem intermediate 5 (CPI 5) with catalytic palladium to produce the 1-carbon naphthol coupled CPI 6.

Experimental:

*Preparation of Diels Alder adduct 2*

[0165] In a three neck round bottom flask equipped with two addition funnels, dry chloroform (300mL) was added and heated to reflux. In one addition funnel was added a mixture of furan (35mL, 480 mmol) and isoamyl nitrite (45mL, 420 mmol). In the second addition funnel was added a solution of aniline 1 (50g, 222mmol) in dioxane/furan (200mL/20mL). The two reactants were then added dropwise simultaneously while at reflux. Upon completion of the addition, the mixture was heated for additional 2h and then allowed to cool to rt. The mixture was concentrated
under a reduced pressure and partitioned between ethyl acetate (300mL), sodium bicarbonate solution (100mL), and water (100mL). The organic layer was washed with water (100mL) and the solution was concentrated to dryness. Column chromatography using 10% ethyl acetate in hexanes afforded the cycloadduct \( \mathbf{2} \) (31g, 153mmol, 69% yield).

\[ \text{[0166]} \] \( ^1\text{H NMR (CDCl}_3, 300\text{MHz)} \delta: 3.94 (s, 3\text{H}), 5.75 (s, 1\text{H}), 6.38 (s, 1\text{H}), 7.07 (m, 3\text{H}), 7.39 (d, 1\text{H}), 7.57 (d, 1\text{H}). \]

**Rearrangement to 1,5-Naphthylesters \( \mathbf{3a} \) and \( \mathbf{3b} \)**

\[ \text{[0167]} \] The Diels Alder adduct \( \mathbf{2} \) (31g, 153 mmol) was dissolved in a mixture of acetic acid/TFA (50mL/10mL) and the resulting solution was heated to reflux for 2h. The mixture was concentrated to dryness. Column chromatography using 10% ethyl acetate in hexanes yielded the 1,5-naphtholester \( \mathbf{3a} \) (19g, 94 mmol, 61% yield) and the isomeric 1,8-naphtholactone \( \mathbf{3b} \) (5.0g, 29.4 mmol, 19% yield).

\[ \text{[0168]} \] \( ^1\text{H NMR (CDCl}_3, 300\text{MHz)}: \delta 4.00 (s, 3\text{H}), 5.38 (\text{brs, 1H}), 6.87 (d, 1\text{H}), 7.47 (m, 2\text{H}), 8.20 (d, 1\text{H}), 8.47 (d, 2\text{H}). \]

**Reduction of Ester \( \mathbf{3a} \) to Diol \( \mathbf{4} \)**

\[ \text{[0169]} \] In a round bottom flask, ester \( \mathbf{3a} \) (10g, 49.4mmol) was dissolved in dry THF (300mL) and the solution cooled to 0\( ^\circ \)C. In a separate flask, a solution of LAH (2.81g, 74.2mmol) was prepared in 50mL of dry THF. The solution of hydride was added dropwise to the solution of ester \( \mathbf{3a} \) and the resulting mixture was warmed to rt and then aged for 3 hours. Rochelle salt solution (30mL) was added to quench the reaction. The reaction mixture was filtered over celite and the solvent was concentrated to dryness. The organic residue was purified by flash column chromatography on silica gel using 30% ethyl acetate in hexanes to afford the alcohol \( \mathbf{4} \) (6.29g, 73% yield).

\[ \text{[0170]} \] \( ^1\text{H NMR (CDCl}_3, 300\text{MHz)}: \delta 4.80 (s, 2\text{H}), 6.85 (d, 1\text{H}), 7.30 (m, 2\text{H}), 7.55 (m 2\text{H}), 8.20 (d, 1\text{H}). \]

**Preparation of \( \mathbf{6} \) via Palladium-Catalyzed Coupling Reaction**
[0171] A mixture of toluene (450mL) and THF (50mL) was degassed at 0°C (ice/water bath) with 3 nitrogen/vacuum cycles. After warming to ambient temperature, Pd$_2$dba$_3$-CHCl$_3$ (tris(dibenzoylacetone)-dipalladium(0)-chloroform adduct) (876mg, 0.847mmol), and triethyl phosphite (0.874mL, 2.54mmol) were added and the solution was stirred for 1-2h or until the solution became bright yellow. Naphthol 4 (3.09g, 17.9mmol) and CPI 5 (10g, 16.9mmol) were then simultaneously added to the solution as solids, the mixture degassed for several minutes, and the resulting mixture was aged for 4h. The solvents were removed under reduced pressure and crude residue was purified by flash column chromatography with 7:3 Hex/EtOAc to afford the desired couple product 6 as a white solid (9.39g, 86% yield).

[0172] $^1$H NMR (CDCl$_3$, 300MHz): $\delta$ 0.60 (q, $J$= 7.8 Hz, 6H), 0.90 (t, $J$= 7.8 Hz, 9H), 1.15 (d, $J$= 6.1 Hz, 3H), 1.18 (d, $J$= 7.4 Hz, 3H), 3.30 (d, 1H), 3.55 (m, 1H), 4.30 (m, 2H), 4.90 (d, 1H), 5.15 (brs, 2H), 5.30 (d, $J$= 17.1 Hz, 1H), 5.50 (d, $J$= 17.1 Hz, 1H), 5.65 (d, $J$= 13.5 Hz, 1H), 6.90 (d, $J$= 7.5 Hz, 1H), 7.40 (m, 2H), 7.60 (m, 1H), 7.75 (m, 3H), 8.20 (m, 3H).

**Preparation of "2-Carbon" 5-Hydroxyethyl-1-Naphthol CPI 14**

![Chemical structure diagram]

**Discussion:**
[0173] 5-Methoxy-1-tetralone (7) was converted into alcohol 8 by allowing it to react with the enolate generated from ethyl acetate. Treatment of alcohol 8 with TFA in refluxing toluene yielded a 1:2 mixture of olefins 9a and 9b. The mixture was then subjected to phase transfer catalysis reaction conditions with 10% Pd/C and cyclohexene/dioxane to produce a 1:1 mixture of the fully aromatic bicyclic adduct 10 and the monoaromatic bicyclic adduct 11. After further oxidation of the crude reaction mixture with DDQ, the fully aromatic product was isolated by column chromatography. Boron tribromide deprotection of methyl ether 10 followed by LAH reduction of ester 12 yielded the desired 2-carbon naphthol linker 13, which was coupled to CPI 5 using similar conditions as described earlier (see preparation of CPI 6).

**Experimental:**

**Preparation of Alcohol 8**

[0174] Lithium hexamethyldisilazide (LHMDS) solution (1M in hexane, 280mL, 280 mmol) and a dry THF (300mL) were added to a dry 1-L round bottom flask and the solution was cooled to -78°C. Dry ethyl acetate (24.5mL, 250 mmol) in THF (25mL) was added to the base solution by syringe pump over 2h while maintaining the internal temperature below -70°C. A solution of tetralone 7 (38g, 216mmol) in dry THF (50mL) was added via syringe pump over 2h while maintaining an internal temperature below -70°C. The resulting mixture was aged at -70°C for 1h, quenched with aq. HCl solution (50mL conc HCl in 50 mL water), and allowed to warm up to rt. The mixture was extracted twice with ethyl acetate (200mL, 100mL) and the combined organic layers were washed with water (300mL) and concentrated to dryness. Column chromatography using 10% ethyl acetate in hexanes afforded hydroxyester 8 (50g, 189 mmol) in 88% yield.

[0175] 1H NMR (CDCl3, 300MHz): δ 1.25 (t, 3H), 1.75 (m, 1H), 1.85 (m, 2H), 2.10 (m, 1H), 2.70 (m, 4H), 3.80 (s, 3H), 4.2 (q, 2H), 6.75 (m, 1H), 7.2 (m, 2H).

**Aromatization of Alcohol 8 to Ester 10**
[0176] Hydroxyester 8 (33.5g, 127 mmol) was dissolved in toluene/TFA (250mL/5mL) and the mixture was heated to reflux for 3h. The mixture was then cooled to rt, diluted with ethyl acetate (100mL), and washed with 1N NaOH aq solution (100mL) and DI water (200mL). The organic layer was concentrated to dryness to yield a 1:2 mixture of olefins 9a and 9b (32.5g, 127 mmol, 100% yield) which was used directly in the next step.

[0177] ¹H NMR (CDCl₃, 300MHz): δ 1.20 (t, 2H), 1.25 (t, 1H), 1.85 (m, 0.5H), 2.30 (m, 1.5H), 2.80 (m, 2H), 3.20 (m, 0.5H), 3.40 (s, 1.5H), 3.80 (s, 3H), 4.20 (m, 2H), 6.00 (t, 0.7H), 6.35 (s, 0.3H), 6.80 (m, 1.5H), 7.15 (m, 1H), 7.25 (m, 0.5H).

[0178] A mixture of olefins 9a, 9b (36.5g, 148 mmol) was dissolved in cyclohexene/dioxane (150mL/50mL). 10% Pd-C (2g) was then added and the mixture heated to reflux for 16h. The mixture was cooled to RT, filtered through a pad of celite, and the pad was washed with ethyl acetate (100mL). The combined filtrates were concentrated to dryness to give a 1:3 mixture of 10 and 11 (41.4g, 100% yield).

[0179] The above mixture was dissolved in toluene (500mL). To this was added DDQ (33.6g, 150 mmol), and the mixture heated at reflux for 2h. Additional DDQ (20.5g, 90 mmol) was added and the mixture was heated for an additional 2h. The mixture was then cooled to rt, and the resulting solids were removed by filtration. The filtrate was concentrated to dryness and the product was purified by column chromatography using 15% ethyl acetate in hexanes to yield the desired naphthylester 10 (28.6g, 117 mmol, 79% yield) and the reduced byproduct 11 (1.0g, 4.1 mmol, 2.8% yield).

[0180] ¹H NMR for 10 (CDCl₃, 300MHz): δ 1.20 (t, 3H), 4.00 (s, 3H), 4.09 (s, 2H), 4.15 (q, 2H), 6.85 (d, 1H), 7.40 (m, 3H), 7.55 (m, 1H), 8.27 (t, 1H).

[0181] ¹H NMR for 11 (CDCl₃, 300MHz): δ 1.25 (t, 3H), 1.80 (m, 4H), 2.55 (m, 2H), 2.70 (m, 2H), 3.35 (m, 1H), 3.80 (s, 3H), 4.20 (q, 2H), 6.70 (d, 1H), 6.80 (d, 1H), 7.10 (t, 1H).
Demethylation of 10 to Naphthol 12

[0182] Naphthylether 10 (19.8g, 81 mmol) was dissolved in a dry DCM (400mL) and the solution cooled to -70°C. A solution of BBr₃ (1M in DCM, 160 mL, 160 mmol) was added dropwise while maintaining an internal temperature below -60°C. The mixture was aged at this temperature for an additional 30 min, then allowed to warm up to RT and aged for additional 2h at rt. The mixture was then again cooled to -70°C, treated with absolute ethanol (20mL), and the resulting mixture was aged at rt overnight. The solution was poured into a cold NaHCO₃ solution (500mL, saturated aq) and vigorously stirred. The organic layer was washed with dilute HCl solution (0.1N, 200mL) and with water (200mL), and the solvent removed. Column chromatography of the resulting residue using 20% ethyl acetate in hexanes yielded the naphthylester 12 (17.6g, 76.4 mmol) in 94% yield.

[0183] ¹H NMR (CDCl₃, 300MHz) δ: 1.25 (t, 3H), 4.10 (s, 2H), 4.20 (q, 2H), 6.00 (s, 1H), 6.65 (d, 1H), 7.25 (t, 1H), 7.40 (m, 2H), 7.50 (d, 1H), 8.15 (m, 1H).

Reduction of Ester 12 to Diol 13

[0184] In a round bottom flask, ester 12 (14.69g, 63.7mmol) was dissolved in dry THF (300mL) and the solution was cooled to 0°C. In a separate flask, a solution of LAH (3.63g, 95.6mmol) was prepared in 50mL of dry THF. The solution of hydride was added dropwise to the reaction. The reaction was then warmed to rt and aged for 3h. Rochelle salt solution (30mL) was added to quench the reaction and the resulting mixture was filtered over celite and concentrated to dryness. The organic residue was purified by flash column using 40% ethyl acetate in hexanes to afford alcohol 13 (11.47g) in 95% yield.

[0185] ¹H NMR for (CDCl3, 300MHz) δ: 3.14 (t, 2H), 4.00 (t, 2H), 6.80 (d, 1H), 7.20 (m, 3H), 7.65 (d, 1H), 8.15 (d, 1H).

Preparation of 14 via Palladium-Catalyzed Coupling Reaction

[0186] 5-Ethylhydroxy1-1-naphthol (13, 1.5g, 8mmol) to was coupled to CPI 5 (4.72g, 8mmol) using a similar procedure described for the synthesis of CPI 6 and the
desired coupled product 14 (4.84g, 85% yield) was isolated after flash column chromatography using 7:3 Hex/EtOAc as pale yellow solid.

[0187] $^1$H NMR (CDCl$_3$, 300MHz): δ 0.60 (q, J= 7.8 Hz, 6H), 0.90 (t, J= 7.8 Hz, 9H), 1.15 (d, J= 6.1 Hz, 3H), 1.18 (d, J= 7.4 Hz, 3H), 3.30 (m, 3H), 3.55 (m, 1H), 4.30 (m, 2H), 4.90 (d, 1H), 5.30 (d, J= 17.1 Hz, 1H), 5.50 (d, J= 17.1 Hz, 1H), 5.65 (d, J= 13.5 Hz, 1H), 6.85 (d, J= 7.5 Hz, 1H), 7.40 (m, 2H), 7.60 (m, 1H), 7.75 (m, 3H), 8.10 (m, 3H).

**General Procedure for the Synthesis of “1-Carbon” Naphthol Analogs 17**

**Discussion:**

[0188] The reaction scheme shown above represents the general synthetic route that was used to synthesize all of the 1-carbon naphthol ammonium salt analogs as well as some of the neutral sulfonamide, thiourea, thiol, amine, or ether containing analogs with the general structure of 17. First, CPI 6 was converted to its mesylate intermediate 15 with methanesulfonyl chloride and DIPEA in DCM at 0° C. After aqueous work up, the crude mesylate was dried under high vacuum, re-dissolved in dry ACN or DMF, and allowed to react with a slight excess the nucleophile. Following careful purification of 16, a tandem 2-step, 1-pot deprotection procedure
was then used to produce the final 1-carbon naphthol analogs (17). Purification of the final compounds was done on either SP-207 or HP-20 resin using gradient elusions of DI water/IPA or DI water/acetone.

**Experimental:**

*General Procedure for the Synthesis of Mesylate Intermediate 15*

[0189] CPI 6 (0.46 mmol, 300 mg) was dissolved in dry DCM (60 mL) and the solution cooled to 0°C under N₂ atmosphere. Methanesulfonyl chloride (0.71 mmol, 81 mg) was then added in one portion and the mixture aged 5 min at 0°C. DIEA (1.37 mmol, 180 mg) was then added in one portion and mixture aged for an additional 2-3h at 0°C. The reaction was then quenched with chilled sat. aq NaHCO₃ solution (30 mL) and the resulting mixture was stirred for 5 minutes. The layers were then separated and the aqueous layer was re-extracted with DCM (50 mL). The combined organic layers were dried over anhydrous Na₂SO₄, filtered, and concentrated. The crude mesylate was then dried to a light brown foam under high vacuum (approximately 30 minutes) and used immediately in the next step.

[0190] ¹H NMR (CDCl₃, 300 MHz); δ 8.33 (d, J = 7.8 Hz, 1H), 8.21 (d, J = 9.0 Hz, 2H), 7.67 (q, J = 9.1 Hz, 4H), 7.50 (m, 2H), 6.91 (d, J = 7.5 Hz, 1H), 5.70 (s, 2H), 5.67 (d, J = 14.7 Hz, 1H), 5.50 (d, J = 13.2 Hz, 1H), 5.29 (d, J = 14.1 Hz, 1H), 4.95 (d, J = 14.4 Hz, 1H), 4.31 (m, 2H), 3.56 (m, 1H), 3.34 (dd, J = 5.2, 5.3 Hz, 1H), 2.85 (s, 3H), 1.32 (d, J = 7.5 Hz, 3H), 1.26 (d, J = 6.9 Hz, 3H), 0.95 (t, J = 8 Hz, 9H), 0.61 (q, J = 7.5 Hz, 6H).

*General Procedure for the Nucleophilic Displacement of Mesylate 15*

[0191] The crude mesylate 15 (0.46 mmol, 345 mg) was dissolved in dry ACN (100 mL) and stirred under N₂ atmosphere at rt. (Note: DMF and or THF could also be used as solvents or co-solvents). The nucleophile (1.0 – 1.2 eq) was then added and the resulting mixture aged for 24-72h (until complete by TLC). The crude reaction
mixture was concentrated to approximately 10 mL total volume, loaded onto a silica column, and purified with 1-5% water in ACN. Percent yields of 16: 40-86% (from CPI 6).

*General Procedure for the Tandem 2-Step, 1-Pot Deprotection; Synthesis of 1-Carbon Naphthol Analogs (17)*

[0192] TES-Protected intermediate 16 (300mg) was placed in a 100mL RBF equipped with a side arm, dissolved in THF/IPA (6mL/6mL), and cooled to 0°C with stirring. 0.06N HCl solution (approximately 2-3 mL) was then added in 0.5 mL increments until the reaction pH = 2.5-3.0 and then aged overnight at 0°C. The reaction mixture was then neutralized with 0.25 M sodium phosphate buffer (pH = 7.0, approximately 2-3 mL). After adding 5% platinum on carbon catalyst to the mixture (0.5mg catalyst / 1.0 mg substrate), the flask was fitted with a hydrogen balloon, purged well with H₂, and allowed to age for 4-6h at 0°C. The hydrogen source was then removed, the mixture diluted with EtOAc (20 mL) and DI water (20 mL), and the resulting mixture was stirred for 10 minutes at 0°C. The reaction mixture was then poured over a pad of celite, the celite pad washed well with DI water (25mL) and EtOAc (25mL), and the aqueous fraction lyophilized to a solid. Purification of the final products (17) was performed on either SP-207 or HP-20 resin.

*General Procedure for the Synthesis of “2-Carbon” Naphthol Analogs 20*

\[ \text{Nu} = \text{amines (1°, 2° and 3°), thioureas, sulfonamides, thiols, etc.} \]
[0193] All of the 2-carbon naphthol ammonium salt analogs as well as some of the neutral sulfonamide, thiourea, thiol, amine, or ether containing analogs with the general structure of 20 were synthesized from CPI 14. The three step procedure involves the generation and nucleophilic displacement of triflate intermediate 18 followed by the tandem 2-step, 1-pot deprotection sequence previously discussed in the general synthesis of 17. Purification of the final compounds was done on SP-207 or HP-20 resin using gradient elutions of DI water/IPA or DI water/acetone.

General Procedure for Formation and Nucleophilic Displacement of Triflate Intermediate 18

[0194] Alcohol 14 was dissolved in DCM and cooled down to −78°C under nitrogen atmosphere. To the solution were added lutidine (2 eq.) and triflic anhydride (1.5 eq), respectively. After 30 min, a solution of the nucleophile in dry ACN was added, and the resulting mixture was gradually warmed to 0°C and aged overnight at 0°C. The mixture was then concentrated under vacuum and purified by a flash column chromatography on silica gel to afford a desired coupled intermediate 19.

General Procedure for the Tandem 2-Step, 1-Pot Deprotection; Synthesis of 2-Carbon Naphthol Analogs (20)

[0195] TES-Protected intermediate 19 (300mg) was placed in a 100mL RBF equipped with a side arm, dissolved in THF/IPA (6mL/6mL), and cooled to 0°C with stirring. 0.06N HCl solution (approximately 2-3 mL) was then added in 0.5 mL increments until the reaction pH = 2.5-3.0 and then aged overnight at 0°C. The reaction mixture was then neutralized with 0.25 M sodium phosphate buffer (pH = 7.0, approximately 2-3 mL). After adding 5% platinum on carbon catalyst to the mixture (0.5mg catalyst / 1.0 mg substrate), the flask was fitted with a hydrogen balloon, purged well with H₂, and allowed to age for 4-6h at 0°C. The hydrogen source was then removed, the mixture diluted with EtOAc (20 mL) and DI water (20 mL), and the resulting mixture was stirred for 10 minutes at 0°C. The reaction mixture was then poured over a pad of celite, the celite pad washed well with DI water (25mL) and EtOAc (25mL), and the
aqueous fraction lyophilized to a solid. Purification of the final products (20) was performed on either SP-207 or HP-20 resin.

Examples of Charged (Cationic) 1-Carbon Naphthol CP Analogs

Example 1:

TES-protected N,N-Dimethylethylamine Intermediate 21

\[ \text{Chemical Structure} \]

[0196] Percent yield; 98%: \(^1\)H NMR (CDCl\(_3\), 300MHz); \(\delta \) 8.41 (d, \(J = 7.8\) Hz, 1H), 8.19 (\(J = 8.1\) Hz, 2H), 8.02 (d, \(J = 8.4\) Hz, 2H), 7.78 (m, 3H), 7.67 (d, \(J = 8.7\) Hz, 2H), 7.53 (m, 2H), 7.47 (m, 2H), 6.90 (d, \(J = 7.8\) Hz, 1H), 5.65 (d, \(J = 13.5\) Hz, 1H), 5.50 (d, \(J = 13.5\) Hz, 1H), 5.30 (d, \(J = 14.4\) Hz, 1H), 5.15 (m, 4H), 4.95 (d, \(J = 13.2\) Hz, 1H), 4.33 (m, 2H), 4.07 (m, 2H), 3.90 (m, 2H), 3.57 (m, 1H), 3.35 (dd, \(J = 5.3, 3.8\) Hz, 1H), 3.13 (bs, 6H), 2.86 (s, 3H), 1.33 (d, \(J = 7.2\) Hz, 3H), 1.26 (d, \(J = 6.3\) Hz, 3H), 0.95 (t, \(J = 8.4\) Hz, 9H), 0.61 (q, \(J = 7.8\) Hz, 6H).

N,N-Dimethylethylamine Analog 22

\[ \text{Chemical Structure} \]

[0197] Percent yield; 31%: \(^1\)H NMR (D\(_2\)O + DMSO-d6, 300 MHz); \(\delta \) 8.53 (d, \(J = 7.8\) Hz, 1H), 7.85 (m, 2H), 7.67 (m, 2H), 7.11 (d, \(J = 8.1\) Hz, 1H), 5.59 (d, \(J = 6.3\) Hz, 3H), 5.59 (d, \(J = 15.0\) Hz, 1H), 5.13 (s, 2H), 4.94 (d, \(J = 15.0\) Hz, 1H), 4.16 (m, 2H), 3.30 (m, 2H), 3.59 (m, 2H), 3.44 (m, 2H), 3.14 (s, 6H), 1.25 (d, \(J = 7.5\) Hz, 3H), 1.20 (d, \(J = 6.0\) Hz, 3H).

Example 2:
**TES-protected N,N-Dimethylaminoethylene Guanidine Salt Intermediate 23**

![Chemical Structure 23]

[0198] Percent yield; 84% (white solid): $^1$H NMR (CDCl$_3$, 300MHz); $\delta$ 11.60 (bs, 1H), 9.01 (t, $J = 6$ Hz, 1H), 8.36 (d, $J = 8$ Hz, 1H), 8.15 (m, 6H), 7.93 (t, $J = 8.2$ Hz, 2H), 7.66 (d, $J = 9$ Hz, 2H), 7.46 (m, 6H), 6.86 (d, $J = 7.8$ Hz, 1H), 5.60 (d, $J = 14.2$ Hz, 1H), 5.49 (d, $J = 14.1$ Hz, 1H), 5.28 (m, 4H), 5.23 (s, 2H), 4.93 (d, $J = 14$ Hz, 1H), 4.32 (m, 2H), 4.24 (m, 2H), 4.15 (m, 2H), 4.15 (m, 2H), 3.55 (m, 1H), 3.35 (dd, $J = 6, 3$ Hz, 1H), 3.22 (bs, 6H), 2.84 (s, 3H), 2.35 (bs, 1H), 1.30 (d, $J = 7.2$ Hz, 3H), 1.26 (d, $J = 7.5$ Hz, 3H), 0.94 (t, $J = 8.1$ Hz, 9 $J = 6$ Hz, H), 0.60 (q, $J = 7.8$ Hz).

**Synthesis of the Nucleophile Intermediates and Supporting Reagents:**

**Part I:** The following procedures were used to make the nucleophilic intermediates necessary for the synthesis of the cationic N,N-Dimethylamino-substituted analogs 22, 24, 26, 28, 34, 36, 43, 45, 49, 67, 69, 73, and 83.

**Synthesis of bis-PNB-protected Pyrazole Guanidation Reagent 101**

[0283] The bis-PNB-protected guanidation reagent (101) was synthesized from 1H-pyrazole-1-carboxamidine dihydrochloride using a modified procedure first reported by Bernatowicz, et al. (Bernatowicz, M.S., Wu, Y., and Matsueda, G.R., *Tetrahedron Letters*, 1993, 34, 3389. The only modification was the substitution of PNB for CBZ) in 69% overall yield and isolated as a white solid.
[0284] $^1$H NMR (CDCl$_3$ + MeOD-d6, 300MHz); δ 8.33 (d, J = 2.1 Hz, 1H), 8.06 (d, J = 8.4 Hz, 4H), 7.56 (s, 1H), 7.47 (d, J = 8.4 Hz, 4H), 6.31 (t, J = 2.1 Hz, 1H), 5.07 (s, 4H).

**Synthesis of bis-PNB-protected N,N-Dimethylethylene Guanidine Nucleophile 102**

![Diagram of 102]

[0285] N,N-Dimethylethylene diamine (1.65 mmol, 145 mg) and bis-PNB pyrazole 101 were added to dry ACN (10 mL) and the resulting mixture was stirred at rt for 48 hrs (until complete by TLC) under inert atmosphere. After concentrating the mixture under reduced pressure, the reaction mixture was purified on a silica column using a DCM:MeOH:NH$_4$OH (79:20:1) solvent system and the product (102) isolated as a white solid in 82% yield.

[0286] $^1$H NMR (CDCl$_3$, 300MHz); δ 11.76 (bs, 1H), 8.26 (m, 4H), 7.54 (m, 4H), 5.29 (s, 2H), 5.22 (s, 2H), 3.53 (q, J = 5.4 Hz, 2H), 2.49 (t, J = 5.4 Hz, 2H), 2.27 (s, 6H).

**Synthesis of the N,N-Dimethylaminopropyl Guanidine Intermediate 103**

![Diagram of 103]

[0287] The same procedure was used as was described for the preparation of 102 except that N,N-dimethylpropylene diamine was substituted for N,N-dimethylethylene diamine.

Percent yield: 95%; $^1$H NMR (CDCl$_3$, 300MHz): δ 1.70(q, 2H), 2.20 (s, 6H), 2.38 (t, 2H), 3.5 (q, 2H), 5.20 (s, 2H), 5.30 (s, 2H), 7.55 (m, 4H), 8.20 (m, 4H), 9.15 (s, 1H).

**Synthesis of mono-PNB-Protected Thioguanidine Nucleophile 104**
[0288] S-(2-Dimethylaminoethyl)isothiourea dihydrochloride (9.1 mmol, 2.0 g) was suspended in dry DCM (100 mL) and the mixture cooled to 0°C under N₂ atm. DIEA (31.8 mmol, 4.2 g) was then added via syringe over 10 minutes and the mixture stirred until it became homogenous. A solution of 4-nitrobenzyl chloroformate (10.9 mmol, 2.35 g) in DCM (50 mL) was then added over 1 hr. via an addition funnel and the resulting mixture aged overnight at 0°C. The reaction mixture was then transferred to a separatory funnel, washed with water, dried over anhydrous Na₂SO₄, filtered, and concentrated. Thioguanidine 104 was then purified by column chromatography on silica gel (DCM:MeOH:NH₄OH; 79:20:1) and isolated (2.0 g) as a white solid in 68% yield.

[0289] ¹H NMR (CDCl₃, 300MHz); δ 8.19 (d, J = 9.3 Hz, 2H), 7.55 (d, J = 7.8 Hz, 2H), 5.20 (s, 2H), 3.03 (t, J = 5.1 Hz, 2H), 2.77 (J = 5.1 Hz, 2H), 2.32 (s, 6H).

*Synthesis of the mono-PNB-Protected N,N-Dimethylethylamine Sidechain 105*

[0290] N₂N-Dimethylethylamine (11.3 mmol, 1 g) was dissolved in dry DCM (100 mL) and cooled to 0°C under N₂ atm. DIEA (17.0 mmol, 2.2 g) was then added in one portion and the mixture stirred for 5 min. A solution of 4-nitrobenzyl chloroformate (12.5 mmol, 2.7 g) in dry DCM (20 mL) was then added dropwise over 10 minutes and the resulting mixture was allowed to age while warming to rt overnight. The crude reaction mixture was then washed with DI water, 50% brine, dried over anhydrous Na₂SO₄, filtered, and concentrated. The crude residue was then purified by column chromatography on silica gel eluted with 9:1 ACN:DI water to produce 2.2g of the desired product (105, 72% yield) as a white solid.

100
[0291] $^1$H NMR (CDCl$_3$, 300MHz); $\delta$ 8.20 (d, $J = 8.1$ Hz, 2H), 7.51 (d, $J = 7.5$ Hz, 2H), 5.53 (bs, 1H), 5.18 (s, 2H), 3.29 (q, $J = 5.5$ Hz, 2H), 2.44 (t, $J = 5.5$ Hz, 2H), 2.21 (s, 6H).

**Synthesis of bis-PNB-Protected N,N-Dimethylpropylthioguanidine Nucleophile 106**

![Chemical structure](image)

[0292] N,N-Dimethylaminopropyl thioguanidine dihydrochloride (1.71 mmol, 400 mg) was suspended in dry DCM and cooled to 0°C under N$_2$ atm. DIEA (6.0 mmol, 775 mg) was then added over 5 min. and the mixture stirred until it became homogeneous (5-10 min). A solution of 4-nitrobenzylchloroformate (2.05 mmol, 445 mg) in dry DCM (10 mL) was then added via syringe over 15 minutes and the resulting mixture was allowed to warm to rt overnight. The crude reaction mixture was then washed with DI water and 50% brine, dried over anhydrous Na$_2$SO$_4$, filtered, and concentrated. Purification of the resulting residue by column chromatography on silica gel with 9:1 ACN:DI water afforded the desired product (106, 350 mg, 40% yield) as a white foamy solid.

[0293] $^1$H NMR (CDCl$_3$, 300MHz); $\delta$ 8.22 (d, $J = 8.7$ Hz, 4H), 7.55 (d, $J = 7.5$ Hz, 4H), 5.27 (s, 4H), 3.10 (t, $J = 7.5$ Hz, 2H), 2.40 (t, $J = 7.5$ Hz, 2H), 2.22 (s, 6H), 1.86 (q, $J = 7.5$ Hz, 2H).

**Synthesis of the PNB-Protected Amidine 107**

![Chemical structure](image)

[0294] Methyipiperazine (134µL, 1.21mmol) and triethylamine (337µL, 2.42mmol) were dissolved in dry EtOH (20mL) and stirred at rt. Isopropylformiminate (180mg, 1.45mmol) was then added and the reaction was aged for 3h. 4-Nitrobenzylchloroformate (313mg, 1.45mmol) was added and the mixture aged for 12h. The solvent was removed under reduced pressure and the crude residue was
purified by flash column chromatography 5% methanol in dichloromethane to afford
the desired product 107 as a white solid (200mg, 52% yield).

[0295] $^1$H NMR (CDCl$_3$, 300MHz): $\delta$ 2.30 (s, 3H), 2.50 (m, 4H), 3.55 (m, 2H), 3.80
(m, 2H), 5.25 (s, 2H), 7.60 (d, 2H), 8.20 (d, 2H), 8.45 (s, 1H).

_N-PNB-Protected Pyrrolidine 108_

[0296] 1-(2-Aminoethyl)pyrrolidine (100µg, 0.80mmol) was dissolved in dry DCM
(15mL) cooled to 0°C. 4-Nitrobenzylochloroformate (172mg, 0.8mmol) was then
added and the resulting mixture was aged for 1 hour at 0°C, quenched with saturated
NaHCO$_3$ solution (aq., 15mL), extracted with dichloromethane (10mL) and dried over
anhydrous MgSO$_4$. The crude product 108 (220mg, 94% yield) was used directly in
the next step without purification.

[0297] $^1$H NMR (CDCl$_3$, 300MHz) $\delta$: 1.75 (m, 4H), 2.50 (m, 4H), 2.60 (q, 2H), 3.30
(q, 2H), 5.20 (s, 2H), 7.55 (brs, 1H), 7.55 (d, 2H), 8.25 (d, 2H).

**Synthesis of the Nucleophile Intermediates and Supporting Reagents:**

**Part II:** The following procedure was used to make the neutral amine, amidine,
guanidine, and sulfonamide analogs 59, 61, 63, 65, 89, 97, and 100.
Discussion:

[0298] The reaction sequence begins by first protecting the naphthol hydroxyl group of the 1- and 2-carbon naphthol intermediates 3a and 12 with either a TBDMS or a TBDPS group. The ester groups of each series were then reduced with LAH to produce the monoprotected alcohol intermediates 110. Activation of the hydroxyl group with mesyl chloride followed by nucleophilic displacement with sodium azide produced the corresponding azides 112, which were reduced to their corresponding amines 114 with zinc dust/ammonium chloride in refluxing ethanol/DI water (Lin, W., Zhang, Ze, H., Jin, Y., Gong, L., and Mi, A., Synthetic Communications, 2002, 32, 3279). Amines 113 were then either PNB protected or further functionalized to their protected amidine or guanidine intermediates 114, desilylated with TBAF/AcOH to naphthols 115, and then coupled to CPI 5 using similar conditions as previously described for 6 and 14. Deprotection of the TES-protected intermediates using the tandem 2-step, 1-pot procedure described above yielded the final analogs 59, 61, 63, 65, 89, 97, and 100.

Experimental:
General Procedure for the Synthesis of the Naphthol Silyl Ether Intermediates 109

[0299] Naphthols 3a, 12 (18.7 mmol) was dissolved in dry DCM (100 mL) and cooled to 0°C under N₂ atm. Either TBDMS chloride or TBDPS chloride (20.5 mmol) was then added and the mixture stirred 5 minutes at 0°C (Note: ACN, THF, and DMF can also be used as solvents or co-solvents). DIEA (28.0 mmol) was then added by syringe over 15 minutes and the resulting mixture was allowed to warm to rt overnight. (Note: Heat was required to drive the reaction when TBDPS chloride was used; reactions were monitored by TLC). Upon completion, the crude reaction mixture was washed with DI water and the organics dried over anhydrous Na₂SO₄, filtered, and the solvent removed under vacuum. Purification of the resulting residue by column chromatography on silica gel with 9:1 hexanes:EtOAc afforded silyl ether 109 in 76-96% yield.

General Procedure for the LAH Reduction

[0300] A solution of ester 109 (16.5 mmol) in dry THF (200 mL) was stirred and cooled to 0°C under N₂ atm. Solid LAH was then added portionwise and the resulting mixture was aged for 2 hrs at 0°C (monitored by TLC). Upon completion, the reaction mixture was quenched with cold EtOAc (10 mL) and, after stirring for 5 min., DI water (5 mL) was added. The resulting mixture was stirred until homogeneous, dried with anhydrous Na₂SO₄, filtered over celite, and concentrated. Purification was done by column chromatography with 5-20% EtOAc in hexanes to yield alcohols 110 in 68-80% yield.

General Procedure for the Synthesis of Azides 112

[0301] Both 1- and 2-carbon naphthols were converted to their corresponding mesylate intermediates 111 using the reaction conditions previously described (see 15) and used immediately after formation. The crude mesylate (6.6 mmol) and sodium azide (19.8 mmol) were then added to dry DMF (100 mL) and the resulting mixture was stirred at 60°C for 18h (until complete by TLC). The reaction mixture was then allowed to cool to rt, concentrated under vacuum, and purified by column chromatography with 10-20% EtOAc in hexanes (percent yields, 60-70%).
General Procedure for the Synthesis of Amines 113

[0302] To a solution of azide 112 (4.6 mmol) in THF/EtOH (10 mL/25 mL) was added DI water (7 mL), zinc dust (5.7 mmol), and solid ammonium chloride (9.6 mmol) and the resulting mixture was refluxed for 1 – 2 hrs (monitored by TLC). After cooling to rt, the reaction mixture was basified with 5% NH₄OH solution to pH 9-11, diluted with EtOAc (50 mL), filtered over a pad of celite, and the filter cake washed with EtOAc (2 x 25 mL). The filtrate was then washed with brine, dried over anhydrous Na₂SO₄, filtered, and concentrated. Purification on silica gel with DCM:MeOH:NH₄OH (79:20:1) afforded amine 113 as a colorless waxy solid in 65-75% yield.

General Procedure for the Deprotection of TBDMS or TBDPS Ethers

[0303] To a solution of silyl ether 114 (0.68 mmol) in dry THF (20 mL) at 0°C under N₂ atm were added glacial acetic acid (neat, 2.0 mmol), and TBAF solution (1.0M solution in THF, 1.35 mmol) and the resulting mixture was maintained at 0°C for 2-4 hrs (monitored by TLC). Upon completion, the reaction mixture was quenched with 0.25M sodium phosphate buffer (pH=7.0, 25 mL), stirred for several minutes, diluted with EtOAc (50 mL), and washed with 50% brine. The organics were then dried over anhydrous Na₂SO₄, filtered, and concentrated. The crude products were purified by column chromatography on silica gel using 10-50% EtOAc in hexanes to produce naphthols 115 in 60-88% yield.
[0304] Percent yield: 76%; $^1$H NMR (CDCl$_3$, 300MHz); $\delta$ 8.77 (d, $J = 8.1$ Hz, 1H), 8.37 (d, $J = 8.1$ Hz, 1H), 8.20 (dd, $J = 8.1$, 1.5 Hz, 1H), 7.76 (d, $J = 7.5$ Hz, 4H), 7.58 (t, $J = 7.5$ Hz, 1H), 7.41 (m, 6H), 7.15 (t, $J = 8.5$ Hz, 1H), 6.51 (d, $J = 8.1$ Hz, 1H), 4.00 (s, 3H), 1.20 (s, 9H).

Synthesis of the Nucleophile Intermediates and Supporting Reagents:

**Part III:** The following procedures were used to synthesize the nucleophilic intermediates for the S- and N-alkylated guanidine and thioguanidine analogs 30 and 32.

![PNBO](image-url)
**N,N'-bis(p-nitrobenzylxoycarbonyl)-S-methylisothiourea 132**

[0321] To a clean 3-necked round bottom flask equipped with two addition funnels were added DCM (60mL), S-methylisothiourea (1g, 7.18mmol), and 6.25N NaOH solution (aq, 570 uL). After cooling the resulting mixture to 0°C, a solution of 4-nitrobenzyl chloroformate (3.17 g, 14.73 mmol) in DCM (20 mL) and a solution of sodium hydroxide (aq, 1N, 15mL) were simultaneously added dropwise using the two addition funnels while maintaining pH 11. The mixture was aged for 16 h with gradual warming to rt. The layers were separated and the organic phase was washed with brine (20 mL) and dried over sodium sulfate. Solvent was removed under vacuum and the resulting white solid recrystallized from ethyl acetate and hexanes to give 132 (2.7 g, 84%) as a white powder.

\[ 132 \]

[0322] \(^1^H\) NMR (CDCl\(_3\), 300 MHz): \( \delta \) 11.92 (s, 1H), 8.23 (d, \( J= \) 9.2 Hz, 4H), 7.55 (d, \( J= \) 8.4 Hz, 4H), 5.29 (s, 4H), 2.46 (s, 3H).

\[

\text{PNBO} \\
\text{HN} \\
\text{N} \\
\text{O} \\
\text{OPNB}
\end{array}
\]

**N,N'-bis(p-Nitrobenzylxoycarbonyl)-N-Methylguanidine Intermediate 133**

[0323] To a solution of 132 (0.5 g, 1.11 mmol) in dry THF (35 mL) was added methylamine (1.12 mL of 2.0 M in THF, 2.23 mmol). The mixture was aged for 8 h at rt and then concentrated under vacuum. The crude light yellow solid was purified by recrystallization from ethyl acetate and hexanes to give 133 (370 mg, 76%) as a white solid.

\[ 133 \]

[0324] \(^1^H\) NMR (CDCl\(_3\), 300 MHz): \( \delta \) 11.77 (s, 1H), 8.24 (d, \( J= \) 9.0 Hz, 2H), 8.23 (d, \( J= \) 8 Hz, 2H), 7.55 (m, 4H), 5.31 (s, 2H), 5.28 (s, 2H), 3.00 (d, \( J= \) 4.6 Hz, 3H).

**N,N'-bis(p-Nitrobenzylxoycarbonyl)-N,N-Dimethylamino Intermediate 134**

110
[0325] A clean round-bottomed flask was charged with 133 (266 mg, 0.62 mmol), N,N-dimethylethanolamine (55 mg, 0.62 mmol), triphenylphosphine (356 mg, 1.36 mmol) and dry THF (10 mL). After cooling to 0°C, the mixture was treated dropwise over a 20 min. period with a solution of diisopropylazodicarboxylate (247 mg, 1.36 mmol) in THF (1 mL). The mixture was aged for 16 h with gradual warming to rt and then concentrated under vacuum. The resulting orange gum was purified by column chromatography on silica gel with 5% water in acetonitrile to give 134 (145 mg, 50%) as a white solid.

[0326] 1H NMR (acetone-d6+CDCl3, 300 MHz): δ 9.67 (s, 1H), 8.06 (m, 4H), 7.49 (m, 4H), 5.13 (s, 2H), 5.02 (s, 2H), 3.63 (m, 2H), 2.86 (s, 3H), 2.51 (m, 2H), 2.29 (s, 6H).

N,N'-bis(p-Nitrobenzylxoycarbonyl)-N,N-Dimethylamino Intermediate 135

[0327] A clean round-bottomed flask was charged with 132 (320 mg, 0.71 mmol), N,N-dimethylethanolamine (64 mg, 0.71 mmol), triphenylphosphine (375 mg, 1.43 mmol) and dry THF (10 mL). After cooled to 0°C, the mixture was treated dropwise over a 1 h period with a solution of diisopropylazodicarboxylate (289 mg, 1.43 mmol) in THF (4 mL). The mixture was aged for 16 h with gradual warming to rt and then concentrated under vacuum. The resulting orange gum was purified by chromatography over silica gel with 5% water in acetonitrile to give 135 (185 mg, 50%) as a white solid.

[0328] 1H NMR (CDCl3, 300 MHz): δ 8.19 (d, J=9.0 Hz, 4H), 7.53 (d, J= 9.0 Hz, 2H), 7.50 (d, J= 9.0 Hz, 2H), 5.21 (s, 2H), 5.19 (s, 2H), 3.87 (t, J= 6.3 Hz, 2H), 2.33 (m, 2H), 2.45 (s, 3H), 2.34 (s, 6H).
Synthesis of the Nucleophile Intermediates and Supporting Reagents:

**Part IV:** The following sequence was used to synthesize the nucleophilic intermediates for the S-attached guanidine analog 57.

![Chemical Structures]

*TBS-Protected Thioethyl Guanidine Intermediate 136*

[0329] Percent yield: 76%; $^1$H NMR (CDCl$_3$, 300MHz); $\delta$ 8.17 (dd, $J = 2.7$, 6.3 Hz, 1H), 7.68 (d, $J = 8.7$ Hz, 1H), 7.56 (t, $J = 5.7$ Hz, 1H), 7.43 – 7.31 (m, 2H), 6.88 (d, $J = 6.9$ Hz, 1H), 7.40 – 6.40 (bs, 3H), 4.16 (s, 2H), 3.14 (m, 2H), 2.65 (m, 2H), 1.08 (s, 9H), 0.27 (s, 6H).

[0331] Percent yield; 87%: $^1$H NMR (CDCl$_3$, 300MHz); $\delta$ 9.40 (bs, 1H), 9.19 (bs, 1H), 8.17 (d, $J = 8.4$ Hz, 2H), 8.16 (d, $J = 8.1$ Hz, 1H), 8.10 (d, $J = 9.0$ Hz, 2H), 7.62 (d, $J = 7.5$ Hz, 1H), 7.48 (d, $J = 8.7$ Hz, 2H), 7.46 (d, $J = 8.4$ Hz, 1H), 7.44 (d, $J = 8.4$ Hz, 2H), 7.33 – 7.26 (m, 2H), 6.83 (d, $J = 6.9$ Hz, 1H), 5.47 (bs, 1H), 5.26 (s, 2H), 5.23 (s, 2H), 4.26 (t, $J = 6.9$ Hz, 2H), 4.20 (s, 2H), 2.74 (t, $J = 8.4$ Hz, 2H).

**Synthesis of the Nucleophile Intermediates and Supporting Reagents:**

**Part V: Preparation of Other Nucleophile Intermediates**

The following procedure was used to synthesize the nucleophilic intermediate for the N,N-Dimethylaminoacetamide analog 34.

![Diagram 138](image)

[0332] A mixture of bromoacetamide (1.37g, 10mmole) and dimethylamine (6 mL, 2M in THF) in acetonitrile (15 mL) was stirred for 3 h at rt, and the mixture was concentrated under vacuum and re-dissolved in THF (20 mL). The mixture was treated with Na$_2$CO$_3$ for neutralization overnight and filtered through celite to afford 139 as a white solid (800 mg, 78%).

[0333] $^1$H NMR (D$_2$O, 300MHz); $\delta$ 3.03 (s, 2H), 2.21 (s, 6H).

The following procedure was used to synthesize the nucleophilic intermediate for the N,N-Dimethylamino thioguanidine analog 36.

![Diagram 139](image)

[0334] Formaldehyde (1.5 mL, 54.5mmole) was added to a suspension of dimethylamine (5 mL, 2M in THF) and activated molecular sieve (3.5g) in methanol (12 mL) at 0°C. After 3h, thiourea (760mg, 10mmole) was added and the mixture was
gradually warmed up to rt overnight. The mixture was filtered through Celite and concentrate to afford **140** as a white solid (1.3 g, 98%).

[0335] $^1$H NMR (CD$_3$OD, 300MHz); δ 4.88 (bs, 3H), 3.33 (s, 2H), 2.27 (bs, 6H).

![Diagram of compound 141](image)

[0336] Percent yield; 78; $^1$H NMR (CDCl$_3$, 300 MHz); δ 8.22 (d, $J$ = 8.7 Hz, 2H), 7.52 (d, $J$ = 8.4 Hz, 2H), 5.23 (s, 2H), 3.42 (q, $J$ = 7.2 Hz, 2H), 3.0 (s, 1.6H), 2.97 (s, 1.4H), 2.47 (m, 2H), 2.30 (s, 3.2 H), 2.25 (s, 2.8H).

**Examples of Amino-substituted Naphthol CP Analogs:**

*Preparation of the 5-Amino-1-Naphthol Sidechains*

**Discussion:**

The following experimental procedures serve as examples of the aminonaphthol series of carbapenem analogs prepared in our labs. In general, these analogs were prepared by first synthesizing the functionalized aminonaphthol sidechains, coupling these sidechains to CPI 5 with palladium catalyst, and, lastly, deprotecting the resulting TES- and PNB-protected intermediates in two synthetic steps.

**Experimental:**

*Synthesis of Silylether 142*

![Diagram of synthesis](image)

[0337] To a suspension of 5-Amino-1-naphthol (15.92g, 100mmol) in dry chloroform (500mL) were added TEA (28mL, 200mmol) and TBDPS chloride (44mL, 170mmol) and heated at reflux until TLC indicated the absence of starting material (3 days). The cooled mixture was quenched with 300 mL ice / water, diluted with DCM (100mL) and washed with water. The solvent was evaporated under reduced pressure and the residue was purified on a flash column (5% - 12% EtOAc / Hexanes) to afford the desired protected naphthol 142 (22.5g, 57% yield) as a pink foam.
[0338] $^1$H NMR (CDCl$_3$, 300MHz); $\delta$ 1.17 (s, 9H), 6.43 (d, $J = 7.2$ Hz, 1H), 6.86 (d, $J = 7.2$ Hz, 1H), 6.98 (t, $J = 9.0$, 7.2 Hz, 1H), 7.38 (m, 8H), 7.76 (dd, $J = 1.3$, 1.3 Hz, 4H), 8.01 (d, $J = 7.8$ Hz, 1H).

Example 40

**Preparation of Side chain 145**

[0339] To a solution of naphthol 142 (0.25g, 0.63mmol) in dry DCE (10mL) were added sodium sulfate (0.13g, 0.94mmol) and pyridine-4-carboxaldehyde (0.075mL, 0.82mmol) and the mixture was heated at 60°C until TLC indicated the absence of starting material (2 days). The sodium sulfate was filtered off and dichloroethane was evaporated under reduced pressure to afford crude desired imine 143 (0.30g, 100% yield)

$^1$H NMR (CDCl$_3$, 300MHz); $\delta$ 1.20 (s, 9H), 6.51 (d, $J = 8.4$ Hz, 1H), 7.06 (t, $J = 8.4$ Hz, 1H), 7.13 (d, $J = 7.2$ Hz, 1H), 7.39 (m, 6H), 7.54 (t, $J = 7.2$ Hz, 1H), 7.80 (m, 5H), 7.89 (d, $J = 5.5$ Hz, 2H), 8.46 (d, $J = 8.1$ Hz, 1H), 8.57 (s, 1H), 8.80 (d, $J = 5.5$ Hz, 2H).

[0340] To a solution of imine 143 (1.28g, 2.6mmol) in absolute ethanol (25mL) was added sodium borohydride (0.15g, 3.9mmol) and the mixture was aged overnight at room temperature. The mixture was then quenched with water and solvent evaporated under reduced pressure. The residue was then taken up in dichloromethane and washed with brine, then the organic layer was dried over MgSO$_4$, filtered and the solvent was concentrated to afford desired amine 144 (1.13g, 89% yield).

$^1$H NMR (CDCl$_3$, 300MHz); $\delta$ 1.17 (s, 9H), 4.60 (d, $J = 3.9$ Hz, 2H), 6.48 (t, $J = 8.1$ Hz, 2H), 7.01 (t, $J = 8.1$ Hz, 1H), 7.39 (m, 10H), 7.74 (m, 5H), 7.98 (d, $J = 8.1$ Hz, 1H), 8.58 (d, $J = 6.6$ Hz, 1H).

[0341] To a solution of amine 144 (1.44g, 3.0mmol) in dry THF (25mL) at 0°C was added 1M solution TBAF in THF (5.91mL, 3.9mmol) and the mixture was aged 45
minutes at room temperature. THF was removed under reduced pressure and the
residue was taken up in dichloromethane and washed with brine, dried over MgSO₄,
filtered, and the solvent was concentrated to afford the desired naphthalmine 145
(0.316g, 43% yield) as a light brown solid.

[0342] ¹H NMR (DMSO-d₆, 300MHz); δ 4.49 (d, J = 5.5 Hz, 2H), 6.22 (d, J = 7.2 Hz,
1H), 6.83 (m, 2H), 7.06 (t, J = 7.2 Hz, 1H), 7.22 (t, J = 8.1 Hz, 1H), 7.34 (m, 3H),
7.64 (d, J = 8.1 Hz, 1H), 8.45 (d, J = 5.5 Hz, 1H).

TES-Protected Aminonaphthol Intermediate 146

[0343] To dry DMF (60mL) were added Pd₂dba₂·CHCl₃ (0.04g, 0.038mmol), and
triethyl phosphate (0.04mL, 0.229mmol), and the solution was aged for 5 minutes at
room temperature. The mixture was degassed with 3 nitrogen/vacuum cycles and
stirred for 30 minutes until solution became yellow. Then the naphthalmine 145
(0.20g, 0.80mmol), CPI 5 (0.52g, 0.88mmol), and 2,6-lutidine (0.046mL, 0.4mmole)
were added to the reaction solution and the resulting mixture was aged for 3 hours.
Solvent was removed under reduced pressure and crude residue was purified by flash
column chromatography with 97:3 CH₂Cl₂/MeOH to afford the desired couple
product 146 as a yellow oil (0.47g, 82% yield).

[0344] ¹H NMR (CDCl₃, 300MHz) δ: 0.60 (q, J = 7.8 Hz, 6H), 0.90 (t, J = 7.8 Hz,
9H), 1.15 (d, J = 6.1 Hz, 3H), 1.18 (d, J = 7.4 Hz, 4H), 3.30 (m, 1H), 3.55 (m, 1H),
4.30 (m, 2H), 4.65 (s, 2H), 4.85 (d, J = 13.5 Hz, 1H), 5.30 (d, J = 17.1 Hz, 1H), 5.50 (d,
J = 17.1 Hz, 1H), 5.60 (d, J = 13.5 Hz, 1H), 6.50 (d, J = 7.2 Hz, 1H), 6.85 (d, J = 7.5 Hz,
1H), 7.25 (m, 6H), 7.65 (d, J = 7.5 Hz, 2H), 8.10 (d, J = 7.5 Hz, 2H), 8.60 (d, J = 5.5
Hz, 1H).

PNB-Protected Aminonaphthol Intermediate 147
[0345] To a solution of 146 (0.47g, 0.65mmol) in dry THF (30mL) at 0°C, were added acetic acid (0.18mL, 1.35mmol) and 1M solution of TBAF in THF (2.06mL, 2.06mmol). The reaction mixture was aged for 4 hours at 0°C, quenched with 0.25M sodium phosphate buffer (pH 7.0, 30mL), stirred for several minutes. The mixture was then extracted with EtOAc (90mL), dried over MgSO₄, filtered, and concentrated to give a yellow oil. The oil was purified by flash column chromatography with 9:1 CH₂Cl₂/MeOH to afford alcohol 147 as a yellow solid (0.32g, 80% yield).

[0346] ¹H NMR (CDCl₃, 300MHz): δ 1.20 (d, J= 7.4 Hz, 3H), 1.25 (d, J= 7.5 Hz, 3H), 3.38 (m, 1H), 3.58 (m, 1H), 4.22 (m, 2H), 4.50 (s, 2H), 4.90 (d, J= 13.5 Hz, 1H), 5.20 (d, J= 17.0 Hz, 1H), 5.50 (d, J= 17.1 Hz, 1H), 5.8 (d, J= 13.5 Hz, 1H), 6.40 (d, J= 7.2 Hz, 1H), 6.80 (d, J= 7.2 Hz, 1H), 7.30 (m, 6H) 7.60 (d, J= 7.5 Hz, 2H), 8.05 (d, J= 7.5 Hz, 2H), 8.30 (s, 2H).

1,5-Aminonaphthol Analog 148

[0347] In a round bottom flask equipped with a side arm, compound 147 (60mg, 0.098mmol) was dissolved in THF/IPA (2mL/4mL). 0.25M Sodium phosphate buffer solution (pH 7.0, 6mL) was added in 1 mL increments so as to maintain a homogeneous system and the resulting mixture was cooled down to 0°C. 5% Pt/C (50mg) was added and the reaction flask was purged with H₂, and the resulting mixture was aged for 6h at 0°C (monitored by TLC). Ethyl acetate (15mL) and DI H₂O (15mL) were then added and the resulting mixture was stirred for several minutes at 0°C, filtered over celite, and the celite pad was washed well with DI H₂O (20mL) and EtOAc (20mL). The aqueous phase was then lyophilized and the crude product was purified on SP207 resin column with water/IPA. Lyophilization of the column fractions produced CP 148 (20mg, 46% yield) as an off-white solid.

[0348] ¹H NMR (D₂O, 400MHz) δ: 0.65 (d, J= 7.3 Hz, 3H), 0.85 (d, J= 7.7 Hz, 3H), 2.78 (m, 1H), 2.98 (m, 1H), 3.49 (m, 1H), 3.86 (m, 3H), 4.65 (d, 1H), 5.39 (d, 1H), 5.78 (s, 1H), 6.78 (m, 3H), 7.15 (m, 3H), 7.29 (m, 2H), 7.09 (m, 2H).

Example 43

Aminonaphthol Sidechain 159

[0357] To a clean, dry round bottom flask were added dry ACN (40mL) and naphthylamine 142 (3mmol, 1.2g), and the resulting solution stirred under N$_2$ atmosphere at room temperature (rt). α-Bromoacetamide (3mmol, 420mg), and sodium carbonate (3.3mmol, 350mg) were then added and the resulting mixture heated at reflux for 48 hr (additional sodium carbonate (3.3mmol, 350mg) was added after 24 hr). Upon completion (monitored by TLC, R$_f$=0.2 in 1:1 EtOAc:hexanes), the mixture was quenched with water (50mL), extracted with EtOAc (50mL) and

120
concentrated under vacuum. The crude product was purified by column chromatography with 50-80% EtOAc in hexanes to give naphtholamide 158 (0.9g, 66% yield).

[0358] $^1$H NMR (CDCl$_3$, 300 MHz): δ 8.05 (d, J=8.4 Hz, 1H), δ 7.76 (dd, J=1.4, 9.0 Hz, 4H), δ 7.40 (m, 8H), δ 7.03 (t, J=8.2 Hz, 1H), δ 6.64 (d, J=7.2 Hz, 1H), δ 6.55 (m, 1H), δ 6.47 (d, J=7.2 Hz, 1H), δ 5.46 (m, 1H), δ 4.02 (s, 2H), δ 1.18 (s, 9H).

[0359] To a clean, dry round bottom flask were added dry THF (40mL) and silyl ether 158 (2mmol, 0.9g), and the resulting solution cooled to 0 °C under N$_2$ atmosphere. TBAF (1.0M solution in THF, 2.5mmol, 2.5mL) was then added dropwise, the resulting mixture aged for 30 minutes (monitored by TLC, R$_f$=0.25 in EtOAc) and quenched with water (20mL) and 0.5M phosphate buffer solution (pH=7.0, 20mL). The resulting heterogeneous mixture was partitioned between EtOAc (50mL) and brine (20mL) and the organic layer concentrated to dryness. Crystallization of the crude product from DCM produced naphthol 159 (350mg, 87% yield).

[0360] $^1$H NMR (DMSO-d$_6$, 300 MHz): δ 9.85 (bs, 1H), δ 7.42 (m, 2H), δ 7.16 (m, 2H), δ 6.79 (d, J=7.5 Hz, 1H), δ 6.28 (m, 2H), δ 3.70 (d, J=5.4 Hz, 2H).

Example 47

1,5-Aminonaphthol Sidechain 177

Preparation on Intermediate 176

[0379] To a solution of 5-amino-1-naphthol (1.24mmol, 208mg) in dry DMF (10mL) was added 1.3mL of LHMDS (1 M in Hexane) at -40 °C and the resulting solution was stirred for 1 h under N$_2$ atmosphere. α-Chloroacetamide (116mg, 1.24mmole) was added, and the solution was warmed slowly to rt over 2h. The mixture was concentrated and purified by a flash chromatography with mixtures of CH$_2$Cl$_2$/EtOH/EtOAc (85/10/5) to afford aminonaphthalene 176 (165mg, 62% yield).

[0380] $^1$H NMR (CDCl$_3$, 300MHz): $\delta$ 7.62 (d, $J = 8.3$ Hz, 1H), 7.50 (d, $J = 7.5$ Hz, 1H), 7.46 (d, $J = 16.7$ Hz, 2H), 7.21 (t, $J = 8.4$ Hz, 1H), 7.16 (t, $J = 8.0$ Hz, 1H), 6.77 (d, $J = 8.5$ Hz, 1H), 6.67 (d, $J = 7.4$ Hz, 1H), 5.62 (s, 2H), 4.53 (s, 2H).

Sidechain 177

127
[0381] $^1$H NMR (CDCl$_3$, 300MHz): $\delta$ 9.74 (br s, 1H), 8.25 (d, $J = 9.0$ Hz, 2H), 8.21 (d, $J = 8.7$ Hz, 1H), 7.70 – 7.61 (m, 5H), 7.49 – 7.38 (m, 3H), 6.89 (d, $J = 8.1$ Hz, 1H), 5.30 (s, 2H), 4.60 (s, 2H).

Dilution Antimicrobial Susceptibility Tests

[0403] The agar dilution method for determining the antimicrobial susceptibility was carried out using an agar dilution method with Mueller-Hinton agar (see, M7-A5, Vol. 20 (2), 2000). A final inoculum of 104 CFU was applied with a replicating device. Broth dilution tests were performed with 5 x 105 CFU in tubes containing 1 mL of broth. Incubation of test tubes containing agar and broth was done at 35 C for 18h. The susceptibilities of streptococci were determined by Mueller-Hinton agar supplemented with 5% sheep blood, and the susceptibility of anaerobic species was determined with brucella agar supplemented with 5% sheep blood, hemin, and vitamin K. Incubation of anaerobic cultures was done for 48 h in jars. The susceptibilities of methicillin-resistant staphylococci were determined on Mueller-Hinton agar or in broth supplemented with 3 % NaCl. All assays were run with the indicated control strains, available from the American Type Culture Collection, Rockville, MD). Results of the antimicrobial susceptibility tests of compounds 22-197 against Gram-positive organisms are shown in Tables 1 and 2.

[0404] All of the compositions, methods and/or processes disclosed and claimed herein can be made and executed without undue experimentation in light of the present disclosure. While the compositions and methods of this invention have been described in terms of certain embodiments, it will be apparent to those of skill in the art that variations may be applied to the compositions, methods and/or processes and in the steps or in the sequence of steps of the methods described herein without departing from the concept and scope of the invention. More specifically, it will be apparent that certain agents which are both chemically and physiologically related may be substituted for the agents described herein while the same or similar results would be achieved. All such similar substitutes and modifications apparent to those skilled in the art are deemed to be within the scope and concept of the invention.
CLAIMS

Claim 1. A carbapenem compound of the formula (I), (II), (III) or (IV):

or a pharmaceutically acceptable salt or prodrug thereof, wherein:
R¹ is either H or alkyl;
CO₂M is independently a carboxylic acid, a carboxylate anion, a pharmaceutically acceptable ester group or a carboxylic acid protected by a protecting group;
P is independently hydrogen, hydroxyl, F or hydroxyl protected by a hydroxyl-protecting group;
X is independently O, S, S(O)ₓ, wherein x is 0, 1 or 2, phosphate, carbonyl, thiocarbonyl, iminyl, P(O)₂, P(O)₃, C(O), C(O)O, OC(O), C(O)NH, C(O)NR, NH(C)(O), NRC(O), amine, NH, or NR;
each R is independently H or alkyl;

each and is independently a 5- or 6-membered monocyclic aromatic or heteroaromatic ring;
Z is selected from the group consisting of a bond, C=CR₂, C=CY¹, O, S, carbonyl, thiocarbonyl, iminyl, C(O), C(O)O, OC(O), C(O)NH, C(O)NR, NH(C)(O), NRC(O), N(A-(CH₂)ₙ-N)C(O), CON(A-(CH₂)ₙ-N), C(=NH), C(=NR), C(=N-A-(CH₂)ₙ-N), amine, NH, NR, or N(A-(CH₂)ₙ-N);
each Y¹ and Y² is independently selected from the group consisting of hydrogen; halo; -CN; -NO₂; -NR²R³; -OR³; -SR³; -C(O)NR²R³; -C(O)OR³; S(O)R³; -SO₂R³; -SO₂NR²R³; -NR²SO₂R³; -C(O)R³; -OC(O)R³; OC(O)NR²R³; -NR³C(O)NR²R³; -NR³CO₂R³; -OCO₂R³; NR³C(O)R³; -C₁₆ straight- or branched-chain alkyl, -C₂₆
straight- or branched-chain alkenyl, or -C_{2-6} straight- or branched-chain alkynyl, unsubstituted or substituted with 1 to 4 \text{R}^d groups; -A-(CH_2)_n-Q; -(CH_2)_nA-Q; -[(CH_2)_nA]_m(CH_2)_pQ; -CH_2N-Q; and -C_{3,7} cycloalkyl, unsubstituted or substituted with one to four \text{R}^e groups;

A is O, S, NH, NCH_3, NR, or -CH_2-;

each m, n, and p is independently 0, 1, 2 or 3;

each \text{R}^a, \text{R}^b and \text{R}^c is independently selected from hydrogen, -C_{1-6} straight- or branched-chain alkyl, unsubstituted or substituted with one to four \text{R}^d groups, or -C_{3,7} cycloalkyl, unsubstituted or substituted with one to four \text{R}^d groups;

or \text{R}^e and \text{R}^b taken together with any intervening atoms form a 4-6 membered saturated ring optionally interrupted by one or more of O, S, NR, or -C(O)-, said ring being unsubstituted or substituted with one to four \text{R}^i groups;

or \text{R}^b and \text{R}^c taken together with any intervening atoms form a 4-6 membered saturated ring optionally interrupted by one to three of O, S, NR, or -C(O)-, said ring being unsubstituted or substituted with one to four \text{R}^i groups;

each \text{R}^d is independently selected from the group consisting of halo; -CN; -NO_2; -NR^eR^f; -OR^e; -SR^e; -CONR^eR^f; -COOR^e; -SOR^e; -SO_2R^e; -SO_2NR^eR^f; -NR^eSO_2R^f; -COR^e; -NR^eCOR^f; -OCOR^e; -OCONR^eR^f; NR^eCONR^eR^f; -NR^eCO_2R^b; -OCO_2R^b; -C(NR^e)NR^eR^f; NR^eC(NH)NR^eR^f or -NR^eC(NR^e)R^g;

each \text{R}^c, \text{R}^f and \text{R}^g is independently selected from hydrogen; -R; -C_{1-6} straight- or branched-chain alkyl unsubstituted or substituted with one to four \text{R}^i groups;

or \text{R}^e and \text{R}^f taken together with any intervening atoms form a 4-6 membered saturated ring optionally interrupted by one to three of O, S, -C(O)- or NR^e, said ring being unsubstituted or substituted with one to four \text{R}^i groups;

each \text{R}^i is independently selected from halo; -CN; -NO_2; phenyl; -NHSO_2R^h; -OR^h; -SR^h; -N(R^h)_2; -N^+(R^h)_3; -C(O)N(R^h)_2; SO_2N(R^h)_2; heteroaryl; heteroarylium; -CO_2R^h; -C(O)R^h; -OCOR^h; NHCOR^h; guanidiny; carbamimidoyl or ureido;

each \text{R}^h is independently selected from hydrogen, a -C_{1-6} straight or branched-chain alkyl group, a -C_3-C_6 cycloalkyl group or phenyl, or when two \text{R}^h groups are present, said \text{R}^h groups can form a 4-6 membered saturated ring, optionally interrupted by one or two of O, S, SO_2, -C(O)-, NH and NCH_3;
each Q is selected from the group consisting of:

\[
\text{\begin{align*}
\text{(CH}_2\text{)}_b
\end{align*}}\]

wherein:

a and b are 1, 2 or 3;

L\text{"} is a pharmaceutically acceptable counterion;

\(\alpha\) is O, S or NR\text{"};

\(\beta\), \(\delta\), \(\lambda\), \(\mu\), and \(\sigma\) are independently selected from CR\text{"}, N or N\text{"}R\text{"}, provided that no more than one of \(\beta\), \(\delta\), \(\lambda\), \(\mu\), and \(\sigma\) is N\text{"}R\text{"};

each R\text{"} is independently selected from hydrogen; phenyl or C\text{1-6} straight- or branched-chain alkyl, unsubstituted or substituted with one to four R\text{'i} groups;

each R\text{'i} is independently selected from hydrogen; halo; phenyl; -CN; -NO\text{2}; -NR\text{"}R\text{"}; -OR\text{"}; -SR\text{"}; -CONR\text{"}R\text{"}; -COOR\text{"}; -SOR\text{"}; -SO\text{2}R\text{"}; -SO\text{2}NR\text{"}R\text{"}; -NR\text{"}SO\text{2}R\text{"}; -COR\text{"}; -NR\text{"}COR\text{"}; -OCOR\text{"}; -OCONR\text{"}R\text{"}; -NR\text{"}CO\text{2}R\text{"}; -NR\text{"}CONR\text{"}R\text{"}; -OCO\text{2}R\text{"}; -C\text{1-6} straight- or branched-chain alkyl, unsubstituted or substituted with one to four R\text{'i} groups;

each R\text{"} and R\text{"} is independently hydrogen or -C\text{1-6} straight- or branched-chain alkyl, unsubstituted or substituted with one to four R\text{'i} groups;

or R\text{"} and R\text{"} together with any intervening atoms form a 4-6 membered saturated ring optionally interrupted by one or more of O, S, NRW or -C(O)-, said ring being unsubstituted or substituted with one to four R\text{'i} groups;

each R\text{"} is independently hydrogen; -C\text{1-6} straight- or branched-chain alkyl, unsubstituted or substituted with one to four R\text{'i} groups; C\text{3-6} cycloalkyl optionally substituted with one to four R\text{'i} groups; phenyl optionally substituted with one to four R\text{'i} groups, or heteroaryl optionally substituted with 1-4 R\text{'i} groups; or R\text{\text{h}} and R\text{\text{w}} taken together with any intervening atoms represent a 5-6 membered saturated ring, optionally interrupted by one or two of O, S, SO\text{2}, NH or NCH\text{3};

R\text{"} is independently hydrogen or a C\text{1-8} straight- or branched chain alkyl, optionally interrupted by one or two of O, S, SO\text{2}, NR\text{w}, N\text{"}R\text{\text{h}} R\text{w}, or -C(O)-, said chain being unsubstituted or substituted with one to four of halo, CN, NO\text{2}, OR\text{w}, SR\text{w}, SOR\text{w}, SO\text{2}R\text{w}, NR\text{h} R\text{w}, N\text{"}(R\text{\text{h}})\text{2} R\text{w}, -C(O)-R\text{w}, C(O)NR\text{h} R\text{w}, SO\text{2}NR\text{h} R\text{w}, CO\text{2} R\text{w}, OC(O)R\text{w}, OC(O)NR\text{h} R\text{w}, NR\text{h} C(O)R\text{w}, NR\text{h} C(O)NR\text{h} R\text{w}, or a phenyl or heteroaryl
group which is in turn optionally substituted with from one to four $R^1$ groups or with one to two $C_{1-3}$ straight- or branched- chain alkyl groups, said alkyl groups being unsubstituted or substituted with one to four $R^1$ groups;

$R^2$ and $R^3$ are independently hydrogen; phenyl; -$C_{1-6}$ straight or branched chain alkyl, unsubstituted or substituted with one to four $R^1$ groups, and optionally interrupted by O, S, NR, NR, N$^+$R$^+$R$^+$ or -C(O)-;

or $R^2$ and $R^3$ together with any intervening atoms form a 4-6 membered saturated ring optionally interrupted by O, S, SO$_2$, NR, N$^+$R$^+$R$^+$ or -C(O)-, unsubstituted or substituted with 1 - 4 $R^1$ groups,

and when $R^2$ and $R^3$ together form a 4-6 membered ring, $R^2$ is as defined above or $R^2$ represents an additional saturated 4-6 membered ring fused to the ring represented by $R^2$ and $R^3$ taken together, optionally interrupted by O, S, NR or -C(O)-, said rings being unsubstituted or substituted with one to four $R^1$ groups;

wherein if the compound is of formula (III), X is O and R is CH$_3$, then the substituent

Claim 2. The compound of claim 1 wherein the compound is of the formula (Va):

or a pharmaceutically acceptable salt thereof wherein X is O or NH.

Claim 3. The compound of claim 2 wherein $P'$ is hydrogen or hydroxyl and $R^{1'}$ is hydrogen or methyl.
Claim 4. The compound of claim 3 wherein X is O.

Claim 5. The compound of claim 3 wherein X is NH.

Claim 6. The compound of claim 3 wherein P' is hydroxyl and R' is methyl.

Claim 7. The compound of claim 3 wherein P' is hydroxyl, R' is methyl, and Y^2 is -(CH_2)_n-X-C(=NH)-NH_2.

Claim 8. The compound of claim 7 wherein n is either 1 or 2 and X is either S or NH.

Claim 9. The compound of claim 1 wherein at least one of Y^1 and Y^2 is not hydrogen.

Claim 10. The compound of claim 9 wherein Y^1 is hydrogen and Y^2 is not hydrogen.

Claim 11. The compound of claim 1 wherein the carbapenem is of the formula (Vb):

![Chemical structure](image)

(Vb)

or a pharmaceutically acceptable salt thereof; wherein

P' is hydrogen or hydroxyl,

R' is hydrogen or methyl, and

Y^2 is -(CH_2)_{n_1}-A-(CH_2)_{n_2}-Q wherein n_1 and n_2 are independently 0-4, A is selected from the group consisting of O, S, NH, NHR^2, and N(R^2)_2, wherein each R^2 is independently C_1-C_4 alkyl, and Q is -NH-C(=NR^3)-N(R^3)_2, -S-C(=NR^3)-N(R^3)_2, or -NR^3-SO_2-N(R^3)_2, wherein each R^3 is independently C_1-C_4 alkyl or H.
Claim 12. The compound of claim 1 wherein the carbapenem is of the formula (Vd):

![Chemical structure image](image)

(Vd)

or a pharmaceutically acceptable salt thereof; wherein

- P' is hydrogen or hydroxyl,
- R'' is hydrogen or methyl, and
- Y^2 is -(CH_2)_n-Q wherein n is 0-4 and Q is either -NH-C(=NR^3)-N(R^3)_2, -S-C(=NR^3)-N(R^3)_2, or -NR^2-SO_2-N(R^3)_2, wherein R^3 is independently C_1-C_4 alkyl or H.

Claim 13. The compound of claim 1 wherein the carbapenem is of the formula (Vc):

![Chemical structure image](image)

(Vc)

or a pharmaceutically acceptable salt thereof; wherein, independently, n_1=1 or 2, n_2=1, 2, or 3, and X is either S or NH.
Claim 14. The compound of claim 1 wherein the carbapenem is of the formula (Ve):

or a pharmaceutically acceptable salt thereof; wherein
P’ is hydrogen or hydroxyl,
R’’ is hydrogen or methyl, and
Y^2 is -(CH_2)_n-A-(CH_2)_n2-Q wherein n_1 and n_2 are independently 0-4, A is
selected from the group consisting of O, S, NH, NHR^2, and N(R^2)_2, wherein
each R^2 is independently C_1-C_4 alkyl, and Q is -NH-C(=NR^3)_2-N(R^3)_2 or -S-
C(=NR^3)_2-N(R^3)_2, wherein each R^3 is independently C_1-C_4 alkyl or H.

Claim 15. The compound of claim 1 wherein the carbapenem is of the formula (Vf):

or a pharmaceutically acceptable salt thereof; wherein
P’ is hydrogen or hydroxyl,
R’’ is hydrogen or methyl, and
Y^2 is -(CH_2)_n-Q wherein n=0-4 and Q is either -NH-C(=NR^3)_2-N(R^3)_2 or -S-
C(=NR^3)_2-N(R^3)_2, wherein R^3 is C_1-C_4 alkyl or H.

Claim 16. The compound of claim 1 wherein the carbapenem is compound 24:
or a pharmaceutically acceptable salt thereof.

Claim 17. The compound of claim 1 wherein the carbapenem is compound 69:

or a pharmaceutically acceptable salt thereof.

Claim 18. The compound of claim 1 wherein the carbapenem is compound 26:

or a pharmaceutically acceptable salt thereof.

Claim 19. The compound of claim 1 wherein the carbapenem is compound 28:

or a pharmaceutically acceptable salt thereof.

Claim 20. The compound of claim 1 wherein the carbapenem is compound 43:

or a pharmaceutically acceptable salt thereof.

Claim 21. The compound of claim 1 wherein the carbapenem is compound 53:
or a pharmaceutically acceptable salt thereof.

Claim 22. The compound of claim 1 wherein the carbapenem is compound 30:

or a pharmaceutically acceptable salt thereof.

Claim 23. The compound of claim 1 wherein the carbapenem is compound 32:

or a pharmaceutically acceptable salt thereof.

Claim 24. The compound of claim 1 wherein the carbapenem is compound 63:

or a pharmaceutically acceptable salt thereof.

Claim 25. The compound of claim 1 wherein the carbapenem is compound 79:

or a pharmaceutically acceptable salt thereof.
Claim 26. The compound of claim 1 wherein the carbapenem is of the formula (VI):

| ![Chemical Structure](image) |

(VI)

or a pharmaceutically acceptable salt and/or prodrug thereof.

X is O or NH; and

Y¹ is -(CH₂)n-Q wherein n=1-3 and Q is selected from the group consisting of -NH-C(=NR³)-N(R³)₂, -S-C(=NR³)-N(R³)₂ and -S-O₂-N(R³)₃, wherein R³ is independently C₁-C₄ alkyl or H.

Claim 27. The compound of claim 26 wherein the compound is selected from compound 194 or 197:

| ![Compounds 194 and 197](image) |

, or a pharmaceutically acceptable salt or prodrug thereof.

Claim 28. A pharmaceutical composition comprising a compound of claim 1 and a pharmaceutically acceptable carrier.

Claim 29. The composition of claim 28 wherein X is O.

Claim 30. The composition of claim 28 wherein the carbapenem is of the formula (Vb):

| ![Chemical Structure](image) |

(Vb)

or a pharmaceutically acceptable salt thereof; wherein

P' is hydrogen or hydroxyl,
R¹′ is hydrogen or methyl, and
Y² is -(CH₂)n₁-A-(CH₂)n₂-Q wherein n₁ and n₂ are independently 0-4, A is selected from the group consisting of O, S, NH, NHR² and N(R²)₂, wherein each R² is independently C₁-C₄ alkyl, and Q is -NH-C(=R³₂)-N(R³)₂ or -S-C(=NR³)-N(R³)₂, wherein each R³ is independently C₁-C₄ alkyl or H.

Claim 31. The composition of claim 28 wherein the carbapenem is of the formula (Vd):

or a pharmaceutically acceptable salt thereof; wherein
P’ is hydrogen or hydroxyl,
R¹′ is hydrogen or methyl, and
Y² is -(CH₂)n-Q wherein n=0-4 and Q is -NH-C(=NR³₂)-N(R³)₂, -S-C(=NR³)-N(R³)₂, or -NR³-SO₂-N(R³)₂, wherein each R³ is independently C₁-C₄ alkyl or H.

Claim 32. The composition of claim 28 wherein the carbapenem is of the formula (Vc):

or a pharmaceutically acceptable salt thereof; wherein, independently, n₁=1 or 2, n₂=1, 2, or 3, and X is S or NH.
Claim 33. The composition of claim 28 wherein the carbapenem is of the formula (Ve):

\[ \text{Formula Image} \]

or a pharmaceutically acceptable salt thereof; wherein
- \( P' \) is hydrogen or hydroxyl,
- \( R'' \) is hydrogen or methyl, and
- \( Y^2 \) is \((-\text{CH}_2)_n\text{-A-(CH}_2)_n\text{-Q}\) wherein \( n_1 \) and \( n_2 \) are independently 0-4, \( A \) is selected from the group consisting of O, S, NH, NHR\(^2\) and N(R\(^2\))\(_2\), wherein each R\(^2\) is independently C\(_1\)-C\(_4\) alkyl, and Q is \(-\text{NH-C(=NR}^3\text{-N(R}^3\text{)}\(_2\)\text{-S-C(=NR}^3\text{-N(R}^3\text{)}\(_2\)\text{-S-C(=NR}^3\text{-N(R}^3\text{)}\(_2\)\text{-H.}

Claim 34. The composition of claim 28 wherein the carbapenem is of the formula (Vf):

\[ \text{Formula Image} \]

or a pharmaceutically acceptable salt thereof; wherein
- \( P' \) is hydrogen or hydroxyl,
- \( R'' \) is hydrogen or methyl, and
- \( Y^2 \) is \((-\text{CH}_2)_n\text{-Q}\) wherein \( n=0-4 \) and \( Q \) is \(-\text{NH-C(=NR}^3\text{-N(R}^3\text{)}\(_2\)\text{-S-C(=NR}^3\text{-N(R}^3\text{)}\(_2\)\text{-H.}

Claim 35. The composition of claim 28 wherein the carbapenem is selected from the group consisting of:
or a pharmaceutically acceptable salt thereof.

Claim 36. The composition of claim 28 wherein the composition is suitable for intravenous administration.

Claim 37. The composition of claim 28 wherein the composition further comprises at least one additional antibacterial agent.

Claim 38. Use of a therapeutically effective amount of a compound of claim 1, optionally in a pharmaceutically acceptable carrier, in the manufacture of a medicament for preventing or treating an infection by a gram positive bacteria in a host.

Claim 39. The use of claim 38 wherein X is O.
Claim 40. The use of claim 38 wherein the carbapenem is of the formula (Vb):

\[
\text{\vphantom{Vb}}
\]

(Vb)

or a pharmaceutically acceptable salt thereof; wherein

P' is hydrogen or hydroxyl,

R^{1'} is hydrogen or methyl, and

Y^2 is \(-(\text{CH}_2)_n\)-A-(\text{CH}_2)_{n2}-Q wherein \(n_1\) and \(n_2\) are independently 0-4, A is selected from the group consisting of \(\text{O}, \text{S}, \text{NH}, \text{NHR}^2\) and \(\text{N}(\text{R}^2)_2\), wherein each \(R^2\) is independently \(\text{C}_1-\text{C}_4\) alkyl, and Q is \(-\text{NH}-\text{C}(=\text{NR}^3)\)-N(\text{R}^3)_2, \(-\text{S}-\text{C}(=\text{NR}^3)\)-N(\text{R}^3)_2, or \(-\text{NR}^3\)-SO\(_2\)-N(\text{R}^3)_2, wherein each \(R^3\) is independently \(\text{C}_1-\text{C}_4\) alkyl or H.

Claim 41. The use of claim 38 wherein the carbapenem is of the formula (Vd):

\[
\text{\vphantom{Vd}}
\]

(Vd)

or a pharmaceutically acceptable salt thereof; wherein

P' is hydrogen or hydroxyl,

R^{1'} is hydrogen or methyl, and

Y^2 is \(-(\text{CH}_2)_n\)-Q wherein \(n=0-4\) and Q is \(-\text{NH}-\text{C}(=\text{NR}^3)\)-N(\text{R}^3)_2, \(-\text{S}-\text{C}(=\text{NR}^3)\)-N(\text{R}^3)_2, or \(-\text{NR}^3\)-SO\(_2\)-N(\text{R}^3)_2, wherein each \(R^3\) is independently \(\text{C}_1-\text{C}_4\) alkyl or H.
Claim 42. The use of claim 38 wherein the carbapenem is of the formula (Vc):

![Chemical Structure (Vc)]

or a pharmaceutically acceptable salt thereof; wherein, independently, $n_1=1$ or 2, $n_2=1, 2, \text{ or } 3$, and X is S or NH.

Claim 43. The use of claim 38 wherein the carbapenem is of the formula (Ve):

![Chemical Structure (Ve)]

or a pharmaceutically acceptable salt thereof; wherein

- $P'$ is hydrogen or hydroxyl,
- $R'$ is hydrogen or methyl, and
- $Y^2$ is -(CH$_2$)$_{n_1}$-A-(CH$_2$)$_{n_2}$-Q wherein $n_1$ and $n_2$ are independently 0-4, A is selected from the group consisting of O, S, NH, NHR$^2$ and N(R$^3$)$_2$, wherein each R$^2$ is independently C$_1$-C$_4$ alkyl and Q is -NH-C(=NR$^3$)-N(R$^3$)$_2$ or -S-C(=NR$^3$)-N(R$^3$)$_2$, wherein each R$^3$ is independently C$_1$-C$_4$ alkyl or H.

Claim 44. The use of claim 38 wherein the carbapenem is of the formula (Vf):

![Chemical Structure (Vf)]
or a pharmaceutically acceptable salt thereof; wherein

P is hydrogen or hydroxyl,

R' is hydrogen or methyl, and

Y is -(CH$_2$)$_n$-Q wherein n=0-4 and Q is -NH-$C(=NR^3)$-$N(R^3)_2$, or -S-$C(=NR^3)$-$N(R^3)_2$, wherein each R is independently C$_1$-C$_4$ alkyl or H.

Claim 45. The use of claim 38 wherein the carbapenem is selected from the group consisting of:

Claim 46. The use of claim 38 wherein the host is a human.
Claim 47. The use of claim 38 wherein the infection is by a drug resistant bacterial strain.

Claim 48. The use of claim 38 wherein the infection is by a multiple-drug resistant strain.

Claim 49. The use of claim 47 or 48 wherein the strain is selected from a methicillin resistant Staphylococcus aureus (MRSA), a methicillin resistant Staphylococcus epidermidis (MRSE), a methicillin resistant coagulase negative Staphylococci (MRCNS), a vancomycin resistant Enterococcus faecalis, and vancomycin resistant Enterococcus faecium.

Claim 50. The use of claim 38 wherein the compound is administered in combination or alternation with at least one other antimicrobial agent.

Claim 51. The use of claim 38 wherein the compound is administered in combination with a β-lactamase inhibiting agent.
