TOILET PACKAGE

Allan Robinson, Roxbury, Mass.

Application July 25, 1939, Serial No. 236,413

3 Claims. (Cl. 132-79)

The present invention relates to an improvement in a toilet package which may contain various combinations of cosmetics, powder and paper tissues.

The object of the present invention is to provide a package which will contain the elements used for a lady's toilet in such a fashion that it may be used simply, conveniently, and may easily be preserved in the lady's hand bag without any danger of soiling anything in the hand bag, and besides be preserved for the necessary time until it is used.

The present packet or kit is designed to be used for a comparatively few number of times and may be made so cheaply and inexpensively that it can furnish the basis of advertising material and be dispensed as favors or compliments of some advertising sponsor.

In the preferred embodiment of the present invention, the package or kit preferably may contain some rouge which is preserved in a unique manner, and small tissues and papers, some of which may be of the powdered variety. In the present invention the elements making up the kit are assembled in a container, one portion of which is devoted to the containing of the rouge sealed separately and apart from the other elements contained within the package. It will be observed of course that various combinations of paper and rouge may be contained in the same package.

Without further describing the chief features of the present invention, the invention will be more fully described in connection with the drawing annexed to the specification, in which:

Figure 1 shows a face view of the package or kit of the present invention.

Figures 2 and 3 show a further modification of the face view shown in Figure 1.

Figure 4 shows a sectional view of a still further modification of the invention.

Figure 5 shows a sectional view of a still further modification of the invention in which paper tissues are contained within the package.

Figure 6 shows a detail of the manner in which the rouge is contained in the cover section of the package, and,

Figure 7 shows a detail for containing the rouge independently.

In Figure 1 the package shown is one similar to that for containing match papers having a back element 1, a flapped end 2, to which the articles are stapled by means of the stapling pins 3 and 3 and a top cover flap 4 which is adapted to go over

the front of the pad and fit in between the flap 2 of the articles attached therein.

The articles attached therein comprise a group of paper sheets 5 and an envelope 6, both of which are stapled by means of the staples 3 to the base of the container. The envelope 6 is so positioned to have an open flap 7 at the top and may contain as indicated in Figure 1 the paper pad or disc 8 for powder or other purposes. It will be noted that while the paper sheets 5 are fastened to the package itself, the arrangement is such as to allow the powder disc to be free within the envelope 6. By this means, not only will the powder in the paper be well preserved and clean, but also it will be easy to take out and use without dislodging the powder from the pores of the paper. In the top cover of the inside is an embossed portion 9 in which the rouge element 10 is contained. This embossed portion 9 is sealed over by means of the paper seal 11 which may be transparent if desired. The paper 4 for this purpose is made non-pervious to the materials of the rouge by being properly treated either wholly or around the embossed portion 9. The cover 11 completely seals the rouge against the back paper and therefore provides a sanitary container for this purpose. While the cover 11 is free and is not intended to be replaced after being used once, nevertheless, it can be adhered in such a manner by proper adhesive or by the rouge itself, that it may be put back in place and used a few times if that is desired.

In the modification shown in Figure 2 the arrangement is similar to that in Figure 1 as indicated by the corresponding figures, except for the arrangement in connection with the cover flap 4. In Figure 2 the cover flap 4 is provided with an extending or projecting tab 12 which has a circular body portion 13 corresponding to the rouge cover element of Figure 1. At the lower end of this disc or body portion 13, is a tab 14 by which the flap can be opened when desired. Between the flap 13 and the cover 14 the rouge may be contained between the two embossed places as shown in Figure 6 where the embossed section 15 on the flap 13 of the embossed portion on the back cover 4 provides a recess in which the rouge 17 is contained. This may also be made of impervious material so that the rouge will not stain the cover flap or the back flap of the package.

In Figure 3 the same sort of arrangement is shown as indicated in Figure 2 with a number of changes. In this case the elements contained at the base of the package are only the paper tissues 5. At the top of the package the back flap 4 is provided with a perforation 18 extend-

ing around the section in which the rouge and the outer flap for the cover of the rouge is contained. In this case therefore, while the rouge may be used only once and therefore may be torn out around the perforated portion 18, the rest of the container may still be employed for containing the paper tissues. This combination in Figure 3 may also be employed in connection with Figures 1 and 2. In Figures 4 and 5 are shown sections. The section in Figure 4 shows a completely folded flap 4 without a rouge container in it. This container however does show a paper pad 19 in a separate envelope 20 attached to the back wall 1 of the container by means of the stapling or sewing 21 at the base of the container and similar envelope 22 containing the rouge dab 23. These two elements are enclosed or covered by means of the outer flap 4 attached to the back flap as clearly indicated in Figure 4. Figure 5 shows a section which may be identified with the section of Figure 3. In this case it will be noted that the outer flap 4 attached to the back flap 1 comes down when folded to the base 2 completing the seal of the package and completely enclosing the paper tissues 5 contained within the package. If desired a separate rouge container may be used. This is shown in Figure 7 and comprises a back plate or paper sheet 24 with an embossed depression in which the rouge may be contained. This rouge dab 25 is covered by means of the flap 26 which has a rounded section 27 with a depression 28 corresponding to the depression for covering the dab 25 and a handle or tabbed element 29 by which the flap 26 may be raised when desired to use the rouge.

While various other modifications of the present invention may be used, the forms described above show the preferred combination and illustrate the advantages of the present invention.

40 Having now described my invention, I claim:

1. A toilet package of the match book type, comprising in combination a cover adapted to be

folded transversely across its long dimension at the mid-section thereof and having stapled at one end thereof a plurality of toilet tissues of a size not greater than the size of the portion of the cover from the end up to the fold, the other end of said cover having a depression therein containing a dab of lip stick rouge adhered to the inside of said cover, and a sealing paper sealing over said depression and said lip stick rouge and sealing said rouge from external exposure. 10

2. A toilet package of the match book type, comprising in combination a cover adapted to be folded transversely across its long dimension at the mid-section thereof and having stapled at one end thereof a plurality of toilet tissues of a size not greater than the size of the portion of the cover from the end up to the fold, the other end of said cover having a depression therein containing a dab of lip stick rouge adhered to the inside of said cover, a flap extending from the free end of said cover of a length sufficient to cover over said depression containing said rouge, and means contained thereon for sealing said rouge against exposure. 15

3. A toilet package of the match book type, comprising in combination a cover adapted to be folded transversely across its long dimension at the mid-section thereof and having stapled at one end thereof a plurality of toilet tissues of a size not greater than the size of the portion of the cover from the end up to the fold, the other end of said cover having a depression therein containing a dab of lip stick rouge adhered to the inside of said cover, a flap extending from the free end of said cover and having a sufficient length and shape to fit over and cover the lip stick rouge contained in said depression and a perforation in said cover extending from the end thereof about said lip stick depression and said flap whereby both elements as a unit may be detached from said package. 20 25 30 35 40

ALLAN ROBINSON.
