Provided is a process for preparing valsartan and precursors thereof.
PROCESS FOR THE PREPARATION OF VALSARTAN

CROSS-REFERENCE OF RELATED APPLICATIONS

FIELD OF THE INVENTION

[0002] The present invention relates to a process for preparing valsartan and precursors thereof.

BACKGROUND

[0003] Valsartan, also known as (S)-N-(1-carboxy-2-propyl-1-yl)-N-pentanoyl-N-[2-[(1H-tetrazol-5-yl)biphenyl-4-ylmethyl-4-ylmethyl]-amine, has the following structure:

![Chemical Structure of Valsartan]

Formula: C_{24}H_{31}N_{5}O_{3}
Molecular Mass: 435.52
Exact Mass: 435.227040
Composition: C 66.19%, H 6.71%, N 16.08%, O 11.02%
Melting Range: 105-110°C.

and is marketed as the free acid under the name DIOVAN. DIOVAN is prescribed as oral tablets in dosages of 40 mg, 80 mg, 160 mg and 320 mg of valsartan.

[0005] Valsartan is an orally active specific angiotensin II antagonist acting on the AT1 receptor subtype. Valsartan is prescribed for the treatment of hypertension. U.S. Pat. No. 6,395,728 is directed to use of valsartan for treatment of diabetes related hypertension. U.S. Pat. Nos. 6,465,502 and 6,485,745 are directed to treatment of lung cancer with valsartan. U.S. Pat. No. 6,294,197 is directed to solid oral dosage forms of valsartan. These patents are incorporated herein by reference.

[0006] The synthesis of valsartan is discussed, inter alia, in U.S. Pat. No. 5,399,578, which is incorporated herein in its entirety by reference. In the synthesis disclosed therein, the final synthetic step (exclusive of work-up and purification) involves the reaction of a cyano group on the biphenyl ring with an azide, for example, tributyl tin azide. The reaction scheme of the 578 patent is as follows:

![Reaction Scheme of Valsartan Synthesis]
The starting compound in the '578 patent is made as follows:

[0007]

\[
\text{BrCH}_2 - \text{C}_6\text{H}_5 - \text{NC} \xrightarrow{\text{NaOAc}} \text{HOCH}_2 - \text{C}_6\text{H}_5 - \text{NC} \]

[0009] In Moenius, et al., J. Labelled Cpd. Radiopharm., 43(13) 1245-1252 (2000), various schemes for synthesis of valsartan are provided, with one being:

\[
\text{AcOCH}_2 - \text{C}_6\text{H}_5 - \text{NC} \xrightarrow{\text{NaOH}} \text{OCH} - \text{C}_6\text{H}_5 - \text{NC} \]

67%
[0010] Another paper, Qingzhong Jia, et. al., Zhongguo Yiyao Gongye Zazhi, 32(9) 385-387 (2001), discloses a synthesis scheme for valsartan as follows:

\[ \text{[Diagram of synthesis scheme]} \]
There is a need in the art for an improved synthetic process for the preparation of valsartan and precursors of valsartan.

OBJECTS AND SUMMARY OF THE INVENTION

In one embodiment, the present invention provides valsartan substantially free of its isoleucine analogue.

In another embodiment, the present invention provides a method for preparing valsartan substantially free of its isoleucine analogue. This method includes starting with a sample of valine or valine derivative, preferably L-valine methyl ester, comprising a sufficiently low level of the isoleucine derivative, preferably L-isoleucine methyl ester. Preferably, the amount of the isoleucine derivative in the valine or valine derivative sample is less than about 0.1% as area percentage GC. This method comprises:

- obtaining one or more samples of one or more batches of valine or its derivative;
- measuring the level of isoleucine or corresponding isoleucine derivative in each of the samples of step (a);
- selecting the valine or valine derivative batch that comprises a level of isoleucine or isoleucine derivative of less than about 0.1% as area percentage GC based on the measurement or measurements conducted in step (b);
- using the batch selected in step (c) to synthesize said valsartan.

In a preferred embodiment, the valine or valine derivative sample has an amount of less than about 0.07% as area percentage GC of its isoleucine analogue.

The level of the isoleucine derivative in the valine sample can be determined using standard analytical techniques known to those of ordinary skill in the art. For example, the level of the isoleucine derivative may be determined by GC.

Valsartan is synthesized by methods such as described in U.S. Pat. No. 5,399,578, hereby incorporated by reference.

In another aspect, the present invention provides a process for preparing valsartan comprising synthesizing valsartan from a sample of valine or a valine derivative, wherein the process analyzes the level of isoleucine or its derivative present in an initial sample of valine or its derivative at least at a single stage during the synthetic process to control amount of the corresponding isoleucine impurity present in valsartan.

In another aspect, the present invention provides a process for preparing valsartan comprising the steps of:

- analyzing a C1 to C4 alkyl ester of L-valine for presence of its isoleucine analogue as an impurity;
- selecting a sample that has NMT about 0.1% as area percentage GC of the isoleucine analogue of L-valine as determined by HPLC;
- reacting compound G2 with the L-valine ester in a first organic solvent to obtain a compound G3;
- reacting compound G3 with an acylating agent in a second organic solvent to obtain a compound G4;
- hydrolyzing compound G4 to obtain valsartan.

wherein \( A \) is a C1 to C4 alkyl ester, X is a trityl group and L is a leaving group.

DETAILED DESCRIPTION OF THE INVENTION

The levels of isoleucine analogue of valine were analyzed by GC. The levels of isoleucine analogue in valsartan were analyzed by HPLC.

The presence of impurities in valsartan may pose a problem for formulation in that impurities often affect the safety and shelf life of a formulation. The present invention provides a method for ameliorating the effect of a single impurity present in formulations of valsartan by reducing the amount of the impurity during synthesis. The impurity, the isoleucine analogue of L-valine, has not been disclosed in the literature and has the following structure:
Two samples of Valsartan were prepared by the described procedure (examples 1-3) of the present invention from Valine Methyl ester of different suppliers. The sample from supplier A contained 0.131% as area percentage GC of isoleucine methyl ester and the sample from supplier B (Kony Pharma China) contained 0.07% as area percentage GC of the ester by GC as area percentage (for method see analytical part). The Valsartan prepared from valine methyl ester of supplier A contained 0.13% as area percentage HPLC of the isoleucine analogue and valsartan prepared from supplier B contained 0.07% as area percentage HPLC of the isoleucine analogue (for HPLC method see analytical part). These results are in good correlation with GC data of the starting Valine Methyl Esters, suggesting that the isoleucine impurity present in the starting material would also be present in the final product in the same ratio.

Accordingly, the present invention provides a process for preparing valsartan having a low level of the isoleucine analogue as an impurity by checking for the impurity in the starting material and choosing starting material which has a low level of the impurity. See e.g. WO03/070246, incorporated herein by reference. In one embodiment, a sample of VLS-07 having a level of the impurity of NMT about 0.2% as area percentage GC, more preferably NMT about 0.07% is chosen. A relative retention time (RRT) of the isoleucine analogue of VLS-07 compared to VLS-02 is 1.2. Instead of choosing VLS-07, other batches of intermediates such as VLS-04 and VLS-05 may be tested for the amount of the impurity, and the batches discarded if the requisite amount of impurity is not met.

If the requisite amount of impurity is not met, it may be possible to purify the starting material or intermediates by techniques such as crystallization. See e.g. WO03/070246.

The method of the present invention may be applied to any synthesis method known in the art, such as that disclosed in U.S. Pat. No. 5,399,578. In a preferred embodiment illustrated in the present invention, the synthesis of valsartan is carried out by reacting a 5-(4'-bromomethylbiphenyl-2-yl)-1H-tetrazole with an L-valine derivative substantially free of its isoleucine analogue. The L-valine derivative may be any suitable derivative, including but not limited to addition salts, ethers and esters of L-valine. Preferred esters include methyl, ethyl, propyl, butyl (including t-butyl), benzyl and aryl esters. A most preferred ester is a C1 to C6 alkyl ester, particularly methyl or t-butyl ester.

The reaction is preferably carried out in an organic solvent. Examples of preferred organic solvents include, but are not limited to, N,N-dimethyl formamide (DMF), dimethyl acetamide (DMA), toluene, hexane, 1,2-dimethoxyethane (DME), diethoxymethane, tetrahydrofuran (THF), benzene, m-xylene, ethyl acetate, o-xylene, tetrols, formals, glymes and mixtures thereof. Other hydrocarbons useful in the practice of the present invention will be apparent to the skilled artisan.

The synthesis of valsartan of the present invention may include the step of reacting a 5-(4'-bromomethylbiphenyl-2-yl)-1H-tetrazole with an L-valine derivative. A preferred pentylbiphenyl-2-yl)-1H-tetrazole is 5-(4'-bromomethylbiphenyl-2-yl)-1H-tetrazole (VLS-02). A preferred L-valine derivative is L-valine methyl ester (VLS-07). The step is carried out in an organic solvent reaction system. To the organic solvent is added an amount of a basic material. The basic material may be a carbonate salt of an alkali metal or an organic base. Preferred salts of alkali metals include sodium carbonate and potassium carbonate. Preferred organic bases include triethanolamine, diethanolamine, triethylamine and diethylamine. As described above the organic solvent is preferably selected from DMF, DMA, toluene, hexane, DMF, diethoxymethane, THF, benzene, m-xylene, o-xylene, ethyl acetate, tetrols, formals, glymes and mixtures thereof. A most preferred organic solvent is acetonitrile. The reaction may optionally be carried out in the presence of a catalyst. Preferred solvents for use with a plasmas transfer catalyst are toluene and ethyl acetate. VLS-07 is added to the solvent/base mixture. VLS-02 is added, preferentially in three separate portions, to the reaction mixture, and the resulting reaction mixture is heated with agitation for a reaction time of between 1 to 6 hours.

After the reaction time, the reaction system is cooled, and the solvent is removed to yield the crude residue of N-valine methyl ester 5-(4'-methylbiphenyl-2-yl)-1-trityl-1H-tetrazole reaction product (VLS-04). Typically the solvent is removed by evaporation under reduced pressure.

In addition to bromine in VLS-02, other leaving groups may be utilized, including other halogens such as chlorine, or sulfonates. The acylation agent used may also include other leaving groups.

In a second step of the synthetic method of the present invention, the N-valine methyl ester 5-(4'-methylbiphenyl-2-yl)-1-trityl-1H-tetrazole reaction product (VLS-04) is reacted with an acylating agent to form a valsartan precursor such as (S)-N-(1-carboxyoximethyl-2-methyl-prop-1-yl)-N-pentanoyl-N-[2-(1-trityl-1H-tetrazol-5-yl)benzyl] (VLS-05). Crude residue produced in the synthetic step described above is dissolved in a suitable organic solvent. The organic solvent preferably contains an amount of an organic basic material. Preferred organic basic materials include triethylamine and tributylamine. Preferred organic solvents include toluene, DMA, DMF, hexane and acetonitrile. A most preferred organic solvent is dry toluene.

To the resulting solution is added an acylating agent. Preferably the acylating agent is valeryl chloride. The resulting mixture is agitated at room temperature for a period of from about 12 to about 24 hours. Preferably the reaction mixture is agitated for a period of about 20 hours. The time of the acylation reaction can be conveniently monitored using thin layer chromatography. Following completion of the reaction, the reaction mixture is neutralized with a molar excess of base, preferably aqueous NaHCO3, and the resulting two-phase reaction system is separated. The organic phase is washed and dried, and the reaction product, (S)-N-(1-carboxyoximethyl-2-methyl-prop-1-yl)-N-pentanoyl-N-[2-(1-trityl-1H-tetrazol-5-yl)biphenyl-4-yl methyl]amine (VLS-05), separated out. The separation may be carried out by any known method, but is typically carried out by evaporation under reduced pressure. The reaction product may be purified by, for example, chromatographic means, prior to further use in the synthesis.

In a third step of the synthetic method of the present invention the protecting groups, e.g., the trityl group attached to the tetrazole ring and the L-valine substituent (such as the methyl ester group of L-valine methyl ester (VLS-07)), can be cleaved to produce valsartan (VLS-00), or an analogue thereof. Crude residue produced in the synthetic step described above is dissolved in a suitable water-miscible solvent. A solvent is water miscible if it is miscible with water at least in any proportion from 80:20 to 20:80 (weight basis). Preferred water-miscible solvents include acetone, methyl
ethyl ketone (MEK), acetonitrile, tetrahydrofuran (THF), dioxane and C₂ to C₆ alcohols. Acetone is a most preferred water-miscible solvent. The resulting solution is acidified and agitated at a temperature of from about 0°C to about 40°C. Most preferably the temperature is about room temperature. The time of the cleavage reaction can be conveniently monitored using thin layer chromatography. An aqueous solution of a basic material is added and the water-miscible solvent is evaporated, preferably at reduced pressure. Suitable basic materials include potassium hydroxide, potassium carbonate and sodium hydroxide. The trityl alcohol formed is separated and the liquid phase is acidified by addition of a suitable acid to a pH of about 3. Preferred acids include mineral acids, hydrogen sulfate, trifluoroacetic acid, formic acid, hydrobromic acid and acetic acid. A most preferred acid is hydrochloric acid. The resulting suspension is extracted with ethyl acetate and the crude product, for example, (S)-N-(1-carboxymethoxy-2-methyl-prop-1-y1)-N-pentanoyl-N-[2-(11H-tetrazol-5-yl)biphenyl-4-yl methyl]-amine, (VLS-06), recovered by, for example, evaporation under reduced pressure. The resulting product is dissolved in an organic solvent. Preferred organic solvents include organic alcohols, acetone and acetonitrile. A most preferred solvent is acetone. The resulting solution is cooled to a temperature of about 10°C, and about 45°C. Preferably the resulting solution is cooled to a temperature of between about 0°C and about 4°C. The acid is neutralized with a molar excess of base, preferably aqueous KOH, and the water-miscible solvent is evaporated, preferably at reduced pressure. The time of the cleavage reaction can be conveniently monitored using thin layer chromatography or HPLC monitoring. The solution is extracted with ethyl acetate and acidified by addition of a suitable acid to a pH of about 3. Preferred acids include mineral acids, hydrogen sulfate, trifluoroacetic acid, formic acid, hydrobromic acid and acetic acid. A most preferred acid is hydrochloric acid. The resulting suspension is cooled and the product recovered by, for example, filtration. If desired, the isolated product can be washed with water, and dried, preferably at reduced pressure.

Some of the steps of the present invention may be carried out in one pot, as illustrated in the examples.

The valsartan synthesized may be obtained as various polymorphic forms in the solid state. Such forms are disclosed in U.S. Appl. No. 60/455,286, Filed on Mar. 17, 2003, entitled “Polymorphs of Valsartan and Processes for their Preparation”, which is incorporated herein by reference.

Crude valsartan may be crystallized from organic solvents such as dichloromethane, diethyl ether or ethyl acetate. In a preferred embodiment, valsartan is crystallized from ethyl acetate. When the crude material is crystallized out of ethyl acetate, the dry material may contain about 2.7% ethyl acetate by weight after conventional drying. The present invention provides for removing residual organic solvent such as ethyl acetate from the crude material. The crude valsartan, either wet or dry, preferably wet, containing residual solvent is triturated in water, in order to remove the residual solvent to acceptable levels (according to the ICH guidelines the level is limited to less than about 5000 ppm). In one embodiment, after trituration in water, the level of the residual solvent is 3600 ppm. Preferably the trituration is performed from about 4 to about 50EC, more preferably from about 25 to about 40EC. Preferably, the trituration is carried out for about 30 minutes to about 60 hours, more preferably from about 3 to about 20 hours.

Another manner to remove residual solvent, particularly ethyl acetate, is by performing a solvent exchange by contacting the solvate with humid gas in a fluidized bed apparatus. As used herein, the term “humid” refers to a relative humidity of at least 30%, more preferably at least about 50% and most preferably at least about 80%. A suitable fluidized bed apparatus is Retsch TG-100.

Pharmaceutical formulations/compositions of the present invention contain crystalline valsartan, such as one of those disclosed in U.S. Appl. No. 60/455,286, Filed on Mar. 17, 2003, entitled “Polymorphs of Valsartan and Processes for their Preparation”, or valsartan purely amorphous, optionally in mixture with other form(s) of valsartan. The valsartan prepared by the processes of the present invention are ideal for pharmaceutical formulation since they are substantially free of the isolucine analogue as an impurity. In addition to the active ingredient(s), the pharmaceutical compositions of the present invention may contain one or more excipients. Excipients are added to the composition for a variety of purposes.

Diluents increase the bulk of a solid pharmaceutical composition, and may make a pharmaceutical dosage form containing the composition easier for the patient and care giver to handle. Diluents for solid compositions include, for example, microcrystalline cellulose (e.g. Avicel®), microcrystalline cellulose, lactose, starch, pregelatinized starch, calcium carbonate, calcium sulfate, sugar, dextrose, dextrin, dextrose, dibasic calcium phosphate dihydrate, tripotassium phosphate, kaolin, magnesium carbonate, magnesium oxide, maltodextrin, mannitol, polyethylene glycol (e.g. Eudragit®), potassium chloride, powdered cellulose, sodium chloride, sorbitol and taurine.

Solid pharmaceutical compositions that are compacted into a dosage form, such as a tablet, may include excipients whose functions include helping to bind the active ingredient and other excipients together after compression. Binders for solid pharmaceutical compositions include acaia, alginic acid, carmeromer (e.g. carboxyl), carboxymethylcellulose sodium, dextrin, ethyl cellulose, gelatin, guar gum, hydrogenated vegetable oil, hydroxyethyl cellulose, hydroxypropyl cellulose (e.g. Klucel®), hydroxypropyl methylcellulose (e.g. Methocel®), liquid glucose, magnesium alumin silicate, maltodextrin, methylcellulose, polyethylene glycol, povidone (e.g. Kollidon® 6, Plasdone®), pregelatinized starch, sodium alginate and starch.

The dissolution rate of a compacted solid pharmaceutical composition in the patient’s stomach may be increased by the addition of a disintegrant to the composition. Disintegrants include alginic acid, carboxymethylcellulose sodium, carboxymethylcellulose (e.g. Ac-Di-Sol®, Primellose®), colloidal silicon dioxide, croscarmellose sodium, crospovidone (e.g. Kollidon® CL, Polysplasdone®), guar gum, magnesium alumin silicate, methylcellulose, microcrystalline cellulose, polacrilit potassium, powdered cellulose, pregelatinized starch, sodium alginate, sodium starch glycolate (e.g. Explomat®) and starch.

Glidants can be added to improve the flowability of a non-compacted solid composition and to improve the accuracy of dosing. Excipients that may function as glidants include colloidal silicon dioxide, magnesium trisilicate, powdered cellulose, starch, talc and trisodium phosphate.

When a dosage form such as a tablet is made by the compaction of a powdered composition, the composition is subjected to pressure from a punch and die. Some excipients
and active ingredients have a tendency to adhere to the surfaces of the punch and dye, which can cause the product to have pitting and other surface irregularities. A lubricant can be added to the composition to reduce adhesion and ease the release of the product from the dye. Lubricants include magnesium stearate, calcium stearate, glyceryl monostearate, glyceryl palmitostearate, hydrogenated castor oil, hydrogenated vegetable oil, mineral oil, polyethylene glycol, sodium benzoate, sodium lauryl sulfate, sodium stearyl fumarate, stearic acid, talc and zinc stearate.

Flavoring agents and flavor enhancers make the dosage form more palatable to the patient. Common flavoring agents and flavor enhancers for pharmaceutical products that may be included in the composition of the present invention include maltol, vanillin, ethyl vanillin, menthol, citric acid, fumaric acid, ethyl maltol and tartaric acid.

Solid and liquid compositions may also be dyed using any pharmaceutically acceptable colorant to improve their appearance and/or facilitate patient identification of the product and unit dosage level.

In liquid pharmaceutical compositions of the present invention, valsalan and any other solid excipients are dissolved or suspended in a liquid carrier such as water, vegetable oil, alcohol, polyethylene glycol, propylene glycol or glycerin.

Liquid pharmaceutical compositions may contain emulsifying agents to disperse uniformly throughout the composition an active ingredient or other excipient that is not soluble in the liquid carrier. Emulsifying agents that may be useful in liquid compositions of the present invention include, for example, gelatin, egg yolk, casein, cholesterol, acacia, tragacanth, chondrus, pectin, methyl cellulose, carborner, cetostearyl alcohol and cetyle alcohol.

Liquid pharmaceutical compositions of the present invention may also contain a viscosity enhancing agent to improve the mouth-feel of the product and/or coat the lining of the gastrointestinal tract. Such agents include aecacia, algic acid bentonite, carborner, carboxymethylcellulose calcium or sodium, cetostearyl alcohol, methyl cellulose, ethylcellulose, gelatin guar gum, hydroxyethyl cellulose, hydroxypropyl cellulose, hydroxypropyl methyl cellulose, maltodextrin, polyvinyl alcohol, povidone, propylene carbonate, polyethylene glycol alginate, sodium alginate, sodium starch glycolate, starch tragacanth and xanthan gum.

Sweetening agents such as sorbitol, saccharin, sodium saccharin, sucrose, aspartame, fructose, mannitol and invert sugar may be added to improve the taste.

Preservatives and chelating agents such as alcohol, sodium benzoate, butylated hydroxy toluene, butylated hydroxyanisole and ethylenediamine tetracetate acid may be added at levels safe for ingestion to improve storage stability.

According to the present invention, a liquid composition may also contain a buffer such as gluconic acid, lactic acid, citric acid or acetic acid, sodium gluconate, sodium lactate, sodium citrate or sodium acetate. Selection of excipients and the amounts used may be readily determined by the formulation scientist based upon experience and consideration of standard procedures and reference works in the field.

The solid compositions of the present invention include powders, granulates, aggregates and compacted compositions. The dosages include dosages suitable for oral, buccal, rectal, parenteral (including subcutaneous, intramuscular, and intravenous), inhalant and ophthalmic administration. Although the most suitable administration in any given case will depend on the nature and severity of the condition being treated, the most preferred route of the present invention is oral. The dosages may be conveniently presented in unit dosage form and prepared by any of the methods well-known in the pharmaceutical arts.

Dosage forms include solid dosage forms like tablets, powders, capsules, suppositories, sachets, troches and lozenges, as well as liquid syrups, suspensions and elixirs.

The dosage form of the present invention may be a capsule containing the composition, preferably a powder or granulated solid composition of the invention, within either a hard or soft shell. The shell may be made from gelatin and optionally contain a plasticizer such as glycerin and sorbitol, and an opacifying agent or colorant.

The active ingredient and excipients may be formulated into compositions and dosage forms according to methods known in the art.

A composition for tabletting or capsule filling may be prepared by wet granulation. In wet granulation, some or all of the active ingredients and excipients in powder form are blended and then further mixed in the presence of a liquid, typically water, that causes the powders to clump into granules. The granule is screened and/or milled, dried and then screened and/or milled to the desired particle size. The granulate may then be tableted, or other excipients may be added prior to tabletting, such as a glidant and/or a lubricant.

A tabletting composition may be prepared conventionally by dry blending. For example, the blended composition of the actives and excipients may be compacted into a slug or a sheet and then comminuted into compacted granules. The compacted granules may subsequently be compressed into a tablet.

As an alternative to dry granulation, a blended composition may be compressed directly into a compacted dosage form using direct compression techniques. Direct compression produces a more uniform tablet without granules. Excipients that are particularly well suited for direct compression tabletting include microcrystalline cellulose, spray dried lactose, dicalcium phosphate dihydrate and colloidal silica. The proper use of these and other excipients in direct compression tabletting is known to those in the art with experience and skill in particular formulation challenges of direct compression tabletting.

A capsule filling of the present invention may comprise any of the aforementioned blends and granulates that were described with reference to tabletting, however, they are not subjected to a final tableting step.

The solid compositions of the present invention include powders, granulates, aggregates and compacted compositions. The dosages include dosages suitable for oral, buccal, rectal, parenteral (including subcutaneous, intramuscular, and intravenous), inhalant and ophthalmic administration. Although the most suitable route in any given case will depend on the nature and severity of the condition being treated, the most preferred route of the present invention is oral. The dosages can be conveniently presented in unit dosage form and prepared by any of the methods well-known in the pharmaceutical arts.

The active ingredient and excipients may be formulated into compositions and dosage forms according to methods known in the art. The solid oral dosage forms disclosed in U.S. Pat. Nos. 6,458,745 and 6,395,728 may be used as a guidance. The dosages and formulation of DIOVAN may also be used for guidance. The dosage is preferably from about 10
mg to about 1280 mg, more preferably from about 20 mg to about 640 mg, and most preferably from about 40 mg to about 320 mg.

The present invention can be illustrated in one of its embodiments by the following non-limiting examples.

Preparation of Valsartan

EXAMPLE 1

VLS-02 (30.0 g, 54.0 mmol) was added in one portion to the suspension of L-Valine methyl ester (free base, VLS-07, 10.6 g, 81.0 mmol, 1.5 eq) and K₂CO₃ (59.5 g, 43 mol, 8 eq) in dry Acetonitrile (200 mL) preheated to 50-60°C. The reaction was stirred for 2-3 h at 70°C. under Argon, cooled to 0°C. and filtered. The filtrate was evaporated under reduced pressure to give 36.0 g of crude VLS-04 as sticky yellow oil that was used in the next step without any purification.

EXAMPLE 2

VLS-05 (15.0 g, 21.7 mmol) was dissolved in Acetone (90 mL), H₂SO₄ (98%, 3.5 mL, ~3 eq) in Water (20 mL) was slowly added and the resulted cloud solution was...
stirred for 5 h at room temperature (TLC or HPLC monitoring). A solution of NaOH (5.2 g, 130.2 mmol, 6 eq) in Water (10 mL) was slowly added, the resulting suspension was stirred for 12 h at room temperature and Acetone was evaporated under reduced pressure. The precipitate (TPM) was filtered and washed with Water (20 mL); the combined aqueous filtrate washed twice with total 50 mL of EtOAc and slowly acidified to pH 2.5 with 3N aqueous H₂SO₄. The resultant suspension was extracted twice with EtOAc (total 120 mL), the combined organics were washed with brine and concentrated to 50 mL volume under reduced pressure. This solution was cooled down to 0-4°C, stirred for 2 h and filtered to give 7.2 g of crude VLS-00 as a white solid. The crude was recrystallized from EtOAc afforded about 6.5 g of Valsartan as white powder.

**EXAMPLE 4**

[0078] Two samples of VLS-07 were tested for the level of isoleucine impurity by gas chromatography. One sample showed an impurity of 0.07%, another sample 0.30%. The sample with 0.07% was selected for preparation of valsartan according to examples 1-3.

**EXAMPLE 5**

[0079] Two samples of L-valine were tested for the level of isoleucine impurity by gas chromatography. One sample shows an impurity of 0.07%, another sample 0.30%. The sample with 0.07% is selected for preparation of valsartan according to process of U.S. Pat. No. 5,399,578.

**EXAMPLE 6**

[0080] Two samples of VLS-07 are tested for the level of isoleucine impurity by gas chromatography. One sample shows an impurity of 0.07%, another sample 0.09%. Both samples are selected for preparation of valsartan according to examples 1-3.

What is claimed is:

1. Valsartan substantially free of its isoleucine analogue produced by a process comprising the steps of:
   a) obtaining one or more samples of at least a single valine or valine derivative batch;
   b) measuring the level of isoleucine or corresponding isoleucine derivative in each of the samples of step (a);
   c) selecting the batch of valine or its derivative that comprises a level of isoleucine or isoleucine derivative of less than about 0.1% as area percentage GC based on the measurement or measurements conducted in step (b);
   d) using the batch selected in step (c) to synthesize said valsartan.

2. The process of claim 1, wherein the valsartan contains less than about 0.1% as area percentage HPLC of its corresponding isoleucine derivative.

3. The process of claim 2, wherein the level is 0.07%.

4. The process of claim 1, wherein the level of the isoleucine or the corresponding isoleucine derivative in the batch of valine or its derivative of step (c) is less than about 0.07% as area percentage GC.

5. The process of claim 1, wherein the analysis is carried out of the valine derivative in regard to its corresponding isoleucine derivative.

6. Valsartan produced by a process comprising synthesizing valsartan from an initial sample of valine or a valine derivative, wherein the process analyzes the level of isoleucine or corresponding isoleucine derivative present in the initial sample at least at a single stage during the synthetic
process to control amount of an impurity having the following structure:

being present in valsartan.

7. The process of claim 6 wherein the desirable level of the isoleucine analogue is NMT 0.1% as area percentage HPLC.

8. The process of claim 6, wherein the analysis is carried out of the valine derivative in regard to its corresponding isoleucine derivative.

9. The process of claim 8, wherein the derivative that is analyzed is a methyl ester.

10. Valsartan produced by a process comprising the steps of:

   a) analyzing a C₁ to C₄ alkyl ester of L-valine for presence of its isoleucine analogue as an impurity;

b) selecting a sample that has NMT about 0.1% as area percentage GC of the isoleucine analogue of L-valine as determined by HPLC;

c) reacting compound G2:

with the L-valine ester in a first organic solvent to obtain a compound G3:

reacting compound G3 with an acylating agent in a second organic solvent to obtain a compound G4:

and

e) hydrolyzing compound G4 to obtain valsartan.

wherein A is a C₁ to C₄ alkyl ester, X is a trityl group and L is a leaving group.

11. The process of claim 10, wherein the first and second organic solvents are independently selected from the group consisting of acetonitrile, toluene, acetone, ethyl acetate, dimethyl acetamide, DMF, hexane and mixtures thereof.

12. The process of claim 10, wherein step (c) is carried out in acetonitrile.

13. The process of claim 10, wherein the valsartan contains less than 0.1% of its corresponding isoleucine derivative as area percentage HPLC.

14. A pharmaceutical composition of valsartan comprising valsartan substantially free of its isoleucine analogue and a pharmaceutically acceptable excipient.

15. A method of lowering systematic blood pressure in a human in need thereof comprising the step of administering the pharmaceutical composition of claim 14 to the human.
