(54) Title: TAMPER RESISTANT IMMEDIATE RELEASE FORMULATIONS

(57) Abstract: Disclosed in certain embodiments is an immediate release solid oral dosage form comprising a plurality of particles, each particle comprising: (i) a core comprising a first active agent; (ii) a coating comprising a second active agent layered over the core; and (iii) a material that is sensitive to acidic pH layered over the coated core; wherein the dosage form releases at least about 70% of the second active agent within 45 minutes as measured by in-vitro dissolution in a USP Apparatus 2 (paddle) at 50 rpm in 500 ml 0.1 N HCl at 37° C.

**ANT IMMEDIATE RELF****FIELD OF THE INVENTION**

- 5    **[0001]**   The present invention relates to the field of pharmaceutical dosage forms that are resistant to tampering and abuse.

**BACKGROUND**

- 10   **[0002]**   Pharmaceutical products are sometimes the subject of abuse. For example, a particular dose of opioid agonist may be more potent when administered parenterally as compared to the same dose administered orally. Some formulations can be tampered with to provide the opioid agonist contained therein for illicit use. Opioid agonist formulations intended for oral use are sometimes crushed or subject  
15   to extraction with solvents (e.g., ethanol) by drug abusers to provide the opioid contained therein for non-prescribed illicit use (e.g., nasal or parenteral administration).

- [0003]**   There have previously been attempts in the art to control the abuse potential  
20   associated with immediate release opioid analgesics. For example, the combination of pentazocine and naloxone has been utilized in tablets available in the United States, commercially available as Talwin® Nx from Sanofi-Winthrop. Talwin® Nx contains pentazocine hydrochloride equivalent to 50 mg base and naloxone hydrochloride equivalent to 0.5 mg base. Talwin® Nx is indicated for the relief of  
25   moderate to severe pain. The amount of naloxone present in this combination has low activity when taken orally, and minimally interferes with the pharmacologic action of pentazocine. However, this amount of naloxone given parenterally has profound antagonistic action to narcotic analgesics. Thus, the inclusion of naloxone is intended to curb a form of misuse of oral pentazocine which occurs when the  
30   dosage form is solubilized and injected. Therefore, this dosage has lower potential for parenteral misuse than previous oral pentazocine formulations. A fixed combination therapy comprising tilidine (50 mg) and naloxone (4 mg) has been available in Germany for the management of severe pain since 1978 (Valoron® N,

- 2 -

Goedecke). The rationale for the combination of these drugs is effective pain relief and the prevention of tilidine addiction through naloxone-induced antagonisms at the morphine receptor. A fixed combination of buprenorphine and naloxone was introduced in 1991 in New Zealand (Temgesic® Nx, Reckitt & Colman) for the treatment of pain.

[0004] There exists a need in the art for an immediate release dosage form containing a drug susceptible to abuse that is resistant to parenteral and nasal abuse. In the case of opioid analgesics, there exists a need for a tamper resistant immediate release formulation that does not solely rely upon the inclusion of an antagonist in the formulation to deter parenteral and nasal abuse.

## SUMMARY OF THE INVENTION

[0005] It is an object of certain embodiments of the present invention to provide an immediate release solid oral dosage form comprising an active agent (e.g., an opioid analgesic) which is tamper resistant.

[0006] It is an object of certain embodiments of the present invention to provide an immediate release solid oral dosage form comprising an active agent (e.g., an opioid analgesic) which is subject to less parenteral abuse than other dosage forms.

[0007] It is an object of certain embodiments of the present invention to provide an immediate release solid oral dosage form comprising an active agent (e.g., an opioid analgesic) which is subject to less intranasal abuse than other dosage forms.

[0008] It is a further object of certain embodiments of the present invention to provide an immediate release solid oral dosage form comprising an active agent (e.g., an opioid analgesic) which is subject to less diversion than other dosage forms.

- 3 -

[0009] It is a further object of certain embodiments of the present invention to treat a disease or condition (e.g., pain) in human patients by administering an immediate release solid oral dosage form as disclosed herein to a patient in need thereof.

5 [0010] It is a further object of certain embodiments of the present invention to provide a method of treating pain in human patients with an immediate release solid oral dosage form comprising an opioid analgesic while reducing the abuse potential of the dosage form.

10 [0011] It is a further object of certain embodiments of the present invention to provide a method of manufacturing an immediate release solid oral dosage form of an active agent (e.g., an opioid analgesic) as disclosed herein.

15 [0012] It is a further object of certain embodiments of the present invention to provide a use of a medicament (e.g., an opioid analgesic) in the manufacture of a tamper-resistant dosage form as disclosed herein for the treatment of a disease state (e.g., pain).

20 [0013] The above objects of the present invention and others can be achieved by the present invention, which in certain embodiments is directed to an immediate release solid oral dosage form comprising a plurality of particles, each particle comprising (i) an active agent; and (ii) a material that is sensitive to acidic pH; wherein the dosage form releases at least about 70% of the active agent within 45 minutes as measured by in-vitro dissolution in a USP Apparatus 2 (paddle) at  
25 50 rpm in 500 ml 0.1N HCl at 37° C.

[0014] In certain embodiments, the material that is sensitive to acidic pH is less soluble in a pH range of between about 6 and about 8.5 than a pH range of between about 1 and about 5.

- 4 -

[0015] In certain embodiments, the plurality of particles are dispersed in a matrix and compressed into a tablet or contained within a pharmaceutically acceptable capsule. The matrix can contain at least one of a gelling agent, a disintegrant or a filler.

5

[0016] In certain embodiments, the solid oral dosage form disclosed herein releases at least about 70% by weight, or at least about 75% by weight, or at least about 80% by weight, or at least about 85% by weight, or at least about 90% by weight, or at least about 95% by weight of the drug (e.g., opioid agonist) within  
10 45 minutes as measured by in-vitro dissolution in a USP Apparatus 2 (paddle) at 50 rpm in 500 ml 0.1N HCl at 37° C.

[0017] In certain embodiments, the solid oral dosage form disclosed herein releases at least about 85% by weight, at least about 90% by weight, or at least about  
15 95% by weight, or at least about 98% by weight of the drug (e.g., opioid agonist) within 60 minutes as measured by in-vitro dissolution in a USP Apparatus 2 (paddle) at 50 rpm in 500 ml 0.1N HCl at 37° C.

[0018] In other embodiments, the viscosity resulting from mixing a unit dose of the  
20 dosage form with from about 0.5 to about 10 ml of distilled water prevents or reduces the ability of the drug (e.g., opioid agonist) from being drawn up into a syringe, or from being systemically absorbed, when administered by the parenteral or nasal route.

25 [0019] In embodiments with a first and second active agent, the viscosity resulting from mixing a unit dose of the dosage form with from about 0.5 to about 10 ml of distilled water prevents or reduces the ability of the first active agent, the second active agent, or both agents from being drawn up into a syringe, or from being systemically absorbed, when administered by the parenteral or nasal route.

30

- 5 -

[0020] In certain embodiments, the present invention is directed to an immediate release solid oral dosage form comprising a plurality of particles, each particle comprising (i) an opioid agonist; and (ii) a material that is sensitive to acidic pH; wherein the plurality of particles are dispersed in a matrix comprising (i) a gelling agent; and (ii) an optional disintegrant; wherein the dosage form releases at least about 70% of the opioid agonist within 45 minutes as measured by in-vitro dissolution in a USP Apparatus 2 (paddle) at 50 rpm in 500 ml 0.1N HCl at 37° C; and wherein the viscosity of the dosage form mixed with from about 0.5 to about 10 ml of distilled water prevents or reduces the ability of the opioid agonist from being drawn up into a syringe, or from being systemically absorbed, when administered by the parenteral or nasal route.

[0021] In certain embodiments, the present invention is directed to immediate release solid oral dosage forms comprising more than one active agent. By way of example, such an immediate release solid oral dosage form may comprise a plurality of particles, each particle comprising (i) a core comprising a first active agent; (ii) a coating comprising a second active agent layered over the core; and (iii) a material that is sensitive to acidic pH layered over the coated core; wherein the dosage form releases at least about 70% of the first active agent, the second active agent or both active agents, within 45 minutes as measured by in-vitro dissolution in a USP Apparatus 2 (paddle) at 50 rpm in 500 ml 0.1N HCl at 37° C. Contemplated active agent combinations include, but are not limited to, opioid analgesics and non-opioid analgesics. Exemplary combinations include oxycodone or a pharmaceutically acceptable salt thereof and acetaminophen; oxycodone or a pharmaceutically acceptable salt thereof and aspirin; oxycodone or a pharmaceutically acceptable salt thereof and ibuprofen; hydrocodone or a pharmaceutically acceptable salt thereof and acetaminophen; and hydrocodone or a pharmaceutically acceptable salt thereof and ibuprofen.

- 6 -

[0022] In certain embodiments, the present invention is directed to a solid oral dosage form comprising a plurality of particles, each particle comprising (i) an opioid agonist; and (ii) a material that is sensitive to acidic pH; wherein the plurality of particles are dispersed in a matrix comprising a gelling agent; and a disintegrant; 5 wherein the dosage form releases at least about 70% of the opioid agonist within 45 minutes as measured by in-vitro dissolution in a USP Apparatus 2 (paddle) at 50 rpm in 500 ml 0.1N HCl at 37° C; and wherein the viscosity of the dosage form mixed with from about 0.5 to about 10 ml of distilled water prevents the opioid agonist from being systemically absorbed, or reduces the ability of the opioid agonist 10 to be systemically absorbed, when administered by the parenteral or nasal route.

[0023] In certain embodiments, the present invention is directed to a solid oral dosage form comprising a plurality of particles, each particle comprising (i) a core comprising a first active agent ( e.g., a non-opioid analgesic such as acetaminophen, 15 ibuprofen or aspirin); (ii) a coating comprising a second active agent (e.g., an opioid agonist such as oxycodone, hydrocodone or a pharmaceutically acceptable salt thereof) layered over the core; and (iii) a material that is sensitive to acidic pH layered over the coated core; wherein the plurality of particles are dispersed in a matrix comprising a gelling agent; and a disintegrant; wherein the dosage form 20 releases at least about 70% of the opioid agonist within 45 minutes as measured by in-vitro dissolution in a USP Apparatus 2 (paddle) at 50 rpm in 500 ml 0.1N HCl at 37° C; and wherein the viscosity of the dosage form mixed with from about 0.5 to about 10 ml of distilled water prevents the opioid agonist from being systemically absorbed, or reduces the ability of the opioid agonist to be systemically absorbed, 25 when administered by the parenteral or nasal route.

[0024] In certain embodiments, the present invention is directed to a process for preparing an immediate release solid oral dosage form comprising (i) preparing a plurality of particles, each particle comprising an active agent and a material that is 30 sensitive to acidic pH; and (ii) dispersing the plurality of particles into a matrix;

- 7 -

wherein the dosage form releases at least about 70% of the active agent within 45 minutes as measured by in-vitro dissolution in a USP Apparatus 2 (paddle) at 50 rpm in 500 ml 0.1N HCl at 37° C.

5    **[0025]**   In certain embodiments, the present invention is directed to a process for preparing an immediate release solid oral dosage form comprising (i) granulating an active agent and a material that is sensitive to acidic pH to obtain a granulation; (ii) compressing the granulation into a tablet or containing the granulation in a capsule; wherein the dosage form releases at least about 70% of the active agent within  
10   45 minutes as measured by in-vitro dissolution in a USP Apparatus 2 (paddle) at 50 rpm in 500 ml 0.1N HCl at 37° C.

**[0026]**   In certain embodiments, the present invention is directed to a process for the preparation of a dosage form as disclosed herein that releases at least about 70%  
15   by weight, or at least about 75% by weight, or at least about 80% by weight, or at least about 85% by weight, or at least about 90% by weight, or at least about 95% by weight of the drug (e.g., opioid agonist) within 45 minutes as measured by in-vitro dissolution in a USP Apparatus 2 (paddle) at 50 rpm in 500 ml 0.1N HCl at 37° C.

20   **[0027]**   In certain embodiments, the present invention is directed to a process for the preparation of a solid oral dosage form as disclosed herein that releases at least about 85% by weight, or at least about 90% by weight, or at least about 95% by weight, or at least about 98% by weight of the drug (e.g., opioid agonist) within 60 minutes as measured by in-vitro dissolution in a USP Apparatus 2 (paddle) at  
25   50 rpm in 500 ml 0.1N HCl at 37° C.

**[0028]**   In certain embodiments, the present invention is directed to a process for the preparation of a solid oral dosage form as disclosed herein comprising (a) preparing a plurality of particles, each particle comprising (i) a core comprising a  
30   first active agent (e.g., an non-opioid analgesic); (ii) a coating comprising a second

- 8 -

active agent (e.g., an opioid analgesic); and (iii) a material that is sensitive to acidic pH layered over the coated core; wherein the dosage form releases at least about 70% of the first active agent, the second active agent or both active agents, within 45 minutes as measured by in-vitro dissolution in a USP Apparatus 2 (paddle) at 50 rpm in 500 ml 0.1N HCl at 37° C.

[0029] In other embodiments, the present invention is directed to a process for the preparation of a dosage form as disclosed herein wherein the viscosity resulting from mixing a unit dose of the dosage form (crushed or uncrushed) with from about 0.5 to about 10 ml of distilled water prevents or reduces the ability of the drug (e.g., opioid agonist) from being drawn up into a syringe, or from being systemically absorbed, when administered by the parenteral or nasal route.

[0030] In describing the present invention, the following terms are to be used as indicated below. As used herein, the singular forms "a," "an," and "the" include plural references unless the context clearly indicates otherwise. Thus, for example, reference to "an active agent" includes a single active agent as well as a mixture of two or more different active agents, and reference to a "gelling agent" includes a single gelling agent as well as a mixture of two or more different gelling agents, and the like.

[0031] As used herein, the terms "active agent," "active ingredient," "pharmaceutical agent," and "drug" refer to any material that is intended to produce a therapeutic, prophylactic, or other intended effect, whether or not approved by a government agency for that purpose. These terms with respect to specific agents include all pharmaceutically active forms of the agent, including the free base form of the agent, and all pharmaceutically acceptable salts, complexes, stereoisomers, crystalline forms, co-crystals, ether, esters, hydrates, solvates, and mixtures thereof, where the form is pharmaceutically active.

- 9 -

[0032] As used herein, the terms "therapeutically effective" refers to the amount of drug or the rate of drug administration needed to produce a desired therapeutic result.

[0033] As used herein, the terms "prophylactically effective" refers to the amount  
5 of drug or the rate of drug administration needed to produce a desired prophylactic result.

[0034] As used herein, the term "stereoisomers" is a general term for all isomers of individual molecules that differ only in the orientation of their atoms in space. It  
10 includes enantiomers and isomers of compounds with one or more chiral centers that are not mirror images of one another (diastereomers).

[0035] The term "enantiomer" or "enantiomeric" refers to a molecule that is non-superimposable on its mirror image and hence optically active wherein the  
15 enantiomer rotates the plane of polarized light in one direction by a certain degree, and its mirror image rotates the plane of polarized light by the same degree but in the opposite direction.

[0036] The term "chiral center" refers to a carbon atom to which four different  
20 groups are attached.

[0037] The term "racemic" refers to a mixture of enantiomers.

[0038] The term "resolution" refers to the separation or concentration or depletion  
25 of one of the two enantiomeric forms of a molecule.

[0039] The term "patient" means a subject, particularly a human, who has presented a clinical manifestation of a particular symptom or symptoms suggesting the need for treatment, who is treated preventatively or prophylactically for a  
30 condition, or who has been diagnosed with a condition to be treated. The term

- 10 -

"subject" is inclusive of the definition of the term "patient" and does not exclude individuals who are entirely normal in all respects or with respect to a particular condition.

5 [0040] "Pharmaceutically acceptable salts" include, but are not limited to, inorganic acid salts such as hydrochloride, hydrobromide, sulfate, phosphate and the like; organic acid salts such as formate, acetate, trifluoroacetate, maleate, tartrate and the like; sulfonates such as methanesulfonate, benzenesulfonate, p-toluenesulfonate and the like; amino acid salts such as arginate, asparaginate, glutamate and the like;  
10 metal salts such as sodium salt, potassium salt, cesium salt and the like; alkaline earth metals such as calcium salt, magnesium salt and the like; and organic amine salts such as triethylamine salt, pyridine salt, picoline salt, ethanolamine salt, triethanolamine salt, dicyclohexylamine salt, N,N'-dibenzylethylenediamine salt and the like.

15 [0041] The term "ppm" as used herein means "parts per million". Regarding 14-hydroxycodeinone, "ppm" means parts per million of 14-hydroxycodeinone in a particular sample product. The 14-hydroxycodeinone level can be determined by any method known in the art, preferably by HPLC analysis using UV detection.

20 [0042] The term "layered" means being completely or partially coated onto a substrate (e.g., an inert core).

[0043] The term "bioavailability" is defined for purposes of the present invention  
25 as the relevant extent to which the drug (e.g., oxycodone) is absorbed from the unit dosage forms. Bioavailability is also referred to as AUC (i.e., area under the plasma concentration/time curve).

[0044] The term " $C_{\max}$ " denotes the maximum plasma concentration obtained  
30 during the dosing interval.

- 11 -

[0045] The term " $T_{\max}$ " denotes the time to maximum plasma concentration ( $C_{\max}$ ).

5 [0046] The term "population of patients" or "population of subjects" or "population of healthy subjects" means that the discussion (or claim) is directed to the mean pharmacokinetic parameters of at least two patients, subjects, or healthy subjects; at least six patients, subjects or healthy subjects; or at least twelve patients, subjects or healthy subjects.

10 [0047] For purposes of the present invention, the formulations disclosed herein are preferably dose proportional. In dose proportional formulations, the pharmacokinetic parameters (e.g., AUC and  $C_{\max}$ ) and/or in-vitro release increase linearly from one dosage strength to another. Therefore, the pharmacokinetic and in-vitro parameters of a particular dose can be inferred from the parameters of a different dose of the  
15 same formulation.

## DETAILED DESCRIPTION

25 [0059] Particle based formulations of active agents have utilized various materials in order to control the release of the active agent after oral administration. For example, polymer based active agent formulations can be designed to release the active agent over a prolonged period of time or to target the release of the active agent at a specific point in the gastro-intestinal system based on a pH dependent differential release.

30

- 13 -

[0060] In addition, gelling agents have been contemplated for use in pharmaceutical formulations in order to deter the abuse of dosage forms containing a drug susceptible to abuse. One form of abuse is the crushing of a controlled release dosage form in order to liberate the drug contained therein for illicit use such as parenteral administration or through absorption across a mucosal surface. When a dosage form having a gelling agent is crushed and then mixed with a solution, a viscosity is obtained which may inhibit the drug from being drawn into a needle, thereby hindering parenteral abuse. Similarly, when the crushed dosage form is applied to a mucosal surface (e.g., the nasal cavity) the composition will gel upon contact with mucosal moisture, thereby inhibiting absorption.

[0061] Controlled release dosage forms of drugs of abuse have received considerable attention in an attempt to develop tamper-resistant technologies as the crushing of the dosage form may liberate an amount of active agent normally intended for prolonged release (e.g., 12 to 24 hours).

[0062] Immediate release dosage forms are also the subject of abuse and present public safety issues when administered by other than the intended route. One problem to overcome in incorporating a polymer and/or a gelling agent into an immediate release dosage form is controlled release characteristics that such an agent may impart to a dosage form when included in sufficient amounts to inhibit tampering.

[0063] In certain situations, an immediate release dosage form can be abused without crushing, e.g., by contacting the intact dosage form with a liquid to dissolve the active agent contained therein. This can be a particular issue with intact immediate release dosage forms that are in particulate form, given the larger surface area and increased dissolution of such dosage forms.

[0064] Immediate release dosage forms play a vital role in the management of both acute and chronic conditions (e.g., pain management with opioid analgesics). Therefore, it is important to provide a tamper-resistant dosage form of a drug susceptible to abuse that maintains an immediate release profile. In certain  
5 embodiments, the immediate release profile is such that the dosage form releases at least about 70% w/w of the drug within 45 minutes as measured by in-vitro dissolution in a USP Apparatus 2 (paddle) at 50 rpm in 500 ml 0.1N HCl or simulated gastric fluid without enzymes (SGF) at 37° C. In other embodiments, the immediate release profile is such that the dosage form releases at least about 70%  
10 w/w of the drug within 45 minutes as measured by in-vitro dissolution in a USP Apparatus 1 (basket) at 50 rpm in 900 ml distilled water at 37° C.

[0065] In certain embodiments, the present invention is directed to an immediate release solid oral dosage form comprising a plurality of particles, each particle  
15 comprising (i) an active agent; and (ii) a material that is sensitive to acidic pH; wherein the dosage form releases at least about 70% of the active agent within 45 minutes as measured by in-vitro dissolution in a USP Apparatus 2 (paddle) at 50 rpm in 500 ml simulated 0.1N HCl or simulated gastric fluid without enzymes (SGF) at 37° C. Alternatively, such embodiments can release at least about 70%  
20 w/w of the drug within 45 minutes as measured by in-vitro dissolution in a USP Apparatus 1 (basket) at 50 rpm in 900 ml distilled water at 37° C.

[0066] In certain embodiments, the present invention is directed to an immediate release solid oral dosage form comprising a plurality of particles, each particle  
25 comprising (i) an active agent susceptible to abuse (e.g., an opioid agonist); and (ii) a material that is sensitive to acidic pH; wherein the plurality of particles are dispersed in a matrix comprising (i) a gelling agent; and (ii) an optional disintegrant; wherein the dosage form releases at least about 70% of the active agent within 45 minutes as measured by in-vitro dissolution in a USP Apparatus 2 (paddle) at 50 rpm in 500 ml  
30 0.1N HCl or simulated gastric fluid without enzymes (SGF) at 37° C. Alternatively,

- 15 -

such embodiments can release at least about 70% w/w of the drug within 45 minutes as measured by in-vitro dissolution in a USP Apparatus 1 (basket) at 50 rpm in 900 ml distilled water at 37° C.

5    **[0067]**   In certain embodiments, the rate of release of the active agent (e.g., opioid agonist) is slower in water as compared to 0.1N HCL. For example, the amount of active agent released at one or more time points selected from 5, 10, 15, 30, 45 or 60 minutes as measured by in-vitro dissolution in a USP Apparatus 2 (paddle) at 50 rpm in 500 ml of distilled water at 37° C is less than the amount of active agent  
10   released at the same time point(s) as measured by in-vitro dissolution in a USP Apparatus 1 (basket) at 50 rpm in 900 ml of 0.1N HCl at 37° C. In certain embodiments the ratio of the amount released in water to the amount released in 0.1N HCl at each of the time point(s) is about 1:10 to less than 1:1; about 1:5 to about 9:10, about 3:10 to about 4:5, or about 2:5 to about 7:10 or about 1:2 to about  
15   3:5. In other embodiments, the ratio is about 1:10, about 9:10, about 3:10, about 9:10, about 1:2, about 9:10, about 7:10; about 9:10 or about 4:5 to about 9:10. In other embodiments, the ratio is about 1:10, about 1:5, about 3:10, about 2:5, about 1:2, about 3:5, about 7:10; about 4:5 or about 9:10.

20   **[0068]**   A unit dose of an immediate release dosage form of the present invention may include without limitation, from about 2 to about 75 particles; from about 10 to about 50 particles; or from about 15 to about 25 particles. In other embodiments, a unit dose of an immediate release dosage form of the present invention may include without limitation, from about 50 to about 500 particles; from about 75 to about  
25   350 particles; from about 100 to about 300 particles; or from about 150 to about 250 particles.

**[0069]**   The particles utilized in the present invention may have a mean diameter from about 0.1 mm to about 10 mm; from about 0.5 mm to about 8 mm; from about  
30   1 mm to about 6 mm; or from about 2 mm to about 4 mm.

- 16 -

[0070] In certain embodiments comprising a gelling agent, the viscosity of the dosage form (crushed or intact) mixed with from about 0.5 to about 10 ml of distilled water prevents or reduces the ability of the active agent from being drawn up into a syringe, or from being systemically absorbed, when administered by the parenteral or nasal route.

[0071] In certain embodiments, with regard to the plurality of particles of the present invention, each particle comprises (i) a core comprising the active agent; and (ii) the material that is sensitive to acidic pH layered on the core. In such embodiments, the core may comprise (i) an inert excipient (e.g., a sugar sphere) layered with the active agent or (ii) the active agent dispersed in a pharmaceutically acceptable excipient. Alternatively, the core can comprise the active agent without an excipient or with minimal excipient.

15

[0072] In other embodiments, with regard to the plurality of particles, each particle comprises (i) a core comprising an inert excipient; and (ii) a coating comprising both the active agent and the material that is sensitive to acidic pH layered on the core.

[0073] In further embodiments, with regard to the plurality of particles, each particle comprises the active agent dispersed in the material that is sensitive to acidic pH (e.g., in the form of a blend or a granulation). In such an embodiment, the particle may have an optional coating such as a film coat.

[0074] In other embodiments, each core of the plurality of particles can comprise an additional active agent in place of, or in addition to, an inert excipient. For example, a first active agent can be used as a substrate for coating a second active agent thereon. The first active agent can be a substantially pure active pharmaceutical ingredient or can be mixed with a pharmaceutically acceptable excipient prior to coating with the second active agent. The first active agent utilized

30

- 17 -

as a substrate can be in the form of, e.g., a powder or granules. The second active agent can be applied to the first active agent by any means such as spray-coating.

5 [0075] In other embodiments, the core may comprise a first active agent layered onto an inert excipient and the second active agent layered thereon. Alternatively, the first active agent can be dispersed in a pharmaceutically acceptable excipient to form a plurality of substrates and the second active agent can be layered thereon. An optional subcoat of a film forming material (e.g., hydroxypropylmethylcellulose or polyvinyl alcohol) can be layered between the first and second active agent.

10

[0076] In additional embodiments, the core may comprise an inert excipient layered with a coating comprising a mixture of the first active agent and the second active agent. Alternatively, the first active agent and the second active agent can both be dispersed in a pharmaceutically acceptable excipient to form a plurality of  
15 substrates and the material sensitive to acidic pH can be layered thereon.

[0077] The material that is sensitive to acidic pH of the present invention may be a polymer. In certain embodiments, the polymer is soluble in a pH of between about 1 and about 5. In other embodiments, the polymer is insoluble in a pH of between  
20 about 6 and about 8.5. In further embodiments, the polymer is less soluble in a pH range of between about 6 and about 8.5 than in a pH range of between about 1 and about 5.

[0078] In certain embodiments, the material that is sensitive to acidic pH provides  
25 less dissolution of active agent (e.g., opioid agonist) in an amount of solvent typically used for illicit extraction (e.g., 0.5 to about 10 ml of water) as compared to the dissolution in the gastric system upon administration. This can be tested by in-vitro dissolution in a USP Apparatus 2 (paddle) at 50 rpm in 500 ml of distilled water at 37° C and an in-vitro dissolution in a USP Apparatus 1 (basket) at 50 rpm in  
30 900 ml of 0.1N HCl at 37° C. The ratio of the amount released in water to the

- 18 -

amount released in 0.1N HCl at one or more time points selected from 5, 10, 15, 30, 45 or 60 is about 1:10 to less than 1:1; about 1:5 to about 9:10, about 3:10 to about 4:5, or about 2:5 to about 7:10 or about 1:2 to about 3:5. In other embodiments, the ratio is about 1:10, about 9:10, about 3:10, about 9:10, about 1:2, about 9:10, about 7:10; about 9:10 or about 4:5 to about 9:10. In other embodiments, the ratio is about 1:10, about 1:5, about 3:10, about 2:5, about 1:2, about 3:5, about 7:10; about 4:5 or about 9:10.

[0079] The polymer utilized in the present invention can be, e.g., a polyacrylate, a polysaccharide, an ion exchange resin, or a mixture thereof.

[0080] An example of a polyacrylate that can be utilized in the present invention is a copolymer comprising amino and/or alkylamino and/or dialkylamino groups such as copolymers comprising methyl methacrylate and diethylaminoethyl methacrylate such as commercially available as Kollicoat Smartseal 30 D® from BASF. Another example is a copolymer comprising methyl methacrylate, butyl methacrylate and dimethylaminoethyl methacrylate such as commercially available as Eudragit E 100® (granules) or Eudragit E PO® (powder) from Evonik. In certain embodiments, the polyacrylate is applied to the particles in an amount to provide a weight gain from about 10% (w/w) to about 90%(w/w); or from about 20%(w/w) to about 80%(w/w); or from about 30% (w/w) to about 70%(w/w); or from about 40% (w/w) to about 60%(w/w).

[0081] An example of a polysaccharide that can be utilized in the present invention is chitosan.

[0082] Examples of ion exchange resins that can be utilized in the present invention include polacrilex resin, polacrilin salt, sodium polystyrene sulfonate, cholestyramine resin or a mixture thereof.

- 19 -

[0083] In embodiments comprising a gelling agent in the matrix, the gelling agent may be in an amount from about 0.25% to about 50% (w/w) or from about 0.25% to about 10% (w/w) of the total dosage form.

5 [0084] The gelling agent utilized in the immediate release dosage forms of the present invention can be selected from sugars, sugar derived alcohols (e.g., mannitol, sorbitol, and the like), starch and starch derivatives, cellulose derivatives (e.g., microcrystalline cellulose, sodium carboxymethyl cellulose, methylcellulose, ethyl cellulose, hydroxyethyl cellulose, hydroxypropyl cellulose, and hydroxypropyl  
10 methylcellulose), attapulgites, bentonites, dextrans, alginates, carrageenan, gums (e.g., gum tragacanth, gum acacia, guar gum, and xanthan gum), pectin, gelatin, kaolin, lecithin, magnesium aluminum silicate, carbomers, carbopols, polyvinylpyrrolidone, polyethylene glycol, polyethylene oxide, polyvinyl alcohol, silicon dioxide, curdlan, furcelleran, egg white powder, lacto albumin, soy protein,  
15 chitosan, surfactants, mixed surfactant/wetting agent systems, emulsifiers, other polymeric materials, and mixtures thereof. In certain embodiments, the gelling agent is xanthan gum. In other embodiments, the gelling agent is pectin. The pectin or pectic substances include purified or isolated pectates and crude natural pectin from sources such as apple, citrus or sugar beet residues which have been subjected, when  
20 necessary, to esterification or de-esterification (e.g., by alkali or enzymes). The pectins may also be derived from citrus fruits such as lime, lemon, grapefruit, and orange. In particular embodiments, the gelling agent may be selected from the group consisting of pregelatinized starch (e.g., Swelstar® from Asahi Kasei), hydroxyethylcellulose (e.g., Natrosol® from Ashland Inc.), guar gum (e.g.,  
25 Supercol® from Ashland Inc.), xanthan gum, alginate, carrageenan, polyethylene oxide and a mixture thereof.

[0085] The gelling agent is preferably included in the dosage form such that the viscosity of the dosage form mixed (crushed or intact) with from about 0.5 to about  
30 10 ml of distilled water prevents or reduces the ability of the active agent (e.g.,

- 20 -

opioid agonist) from being drawn up into a syringe, or from being systemically absorbed when administered by the parenteral or nasal route. The viscosity can be, e.g., from about 10 cP to about 100 cP; from about 25 cP to about 75 cP; at least about 20 cP; at least about 40 cP or at least about 60 cP.

5

[0086] In certain embodiments, the weight amount of gelling agent contained in the immediate release dosage form of the present invention is not more than the weight amount of drug (e.g., opioid agonist). In other embodiments, the weight amount of gelling agent contained in the immediate release dosage forms of the present invention is less than the weight amount of drug. In further embodiments, the weight amount of gelling agent contained in the immediate release dosage forms of the present invention is more than the weight amount of drug.

[0087] In certain embodiments, the immediate release dosage forms of the present invention contain a weight ratio of gelling agent to drug (e.g., opioid agonist) from about 10:1 to about 1:10; from about 5:1 to about 1:5; from about 3:1 to about 1:3; from about 1:1 to about 1:1.5; from about 1.5:1 to about 1:1; about 1:1.25; or about 1.25:1.

[0088] In embodiments comprising a disintegrant in the matrix, the disintegrant may be in an amount from about 0.2% to about 25% (w/w) or from about 1% to about 10% (w/w) of the total dosage form.

[0089] The disintegrant can be selected from the group consisting of cross-linked sodium carboxymethylcellulose, starch, sodium starch glycolate, cross-linked polyvinylpyrrolidone, crospovidone and a mixture thereof.

[0090] In embodiments comprising a filler in the matrix, the filler may be in an amount from about 15% to about 95% (w/w) or from about 25% to about 50% (w/w) of the total dosage form.

30

- 21 -

[0091] The filler can be a saccharide, e.g., selected from the group consisting of sucrose, dextrose, lactose, fructose, mannitol, a cellulosic derivative and a mixture thereof. In particular embodiments, the filler can be lactose (e.g., Fast Flo® from  
5 Foremost Farms) or microcrystalline cellulose (e.g., Avicel® from FMC BioPolymer).

[0092] In certain embodiments, the particles of the dosage form can be layered with a barrier layer. The barrier layer can be included, e.g., to provide stability or to  
10 prevent the migration of the active agent into the matrix. In embodiments with a barrier layer, the material and/or amount of material utilized preferably will not substantially interfere with the release profile of the active agent from the dosage form. The material for the barrier layer can be, e.g., an acrylic polymer, a cellulosic polymer or a vinyl polymer. Preferred barrier layers of the present invention include  
15 hydroxypropylmethylcellulose, polyvinyl alcohol, povidone or a mixture thereof. In certain embodiments, the barrier layer is applied to the particles in an amount to provide a weight gain from about 1%(w/w) to about 10%(w/w); or from about 4%(w/w) to about 7%(w/w).

20 [0093] The dosage forms of the present invention can include an aversive agent to further deter the illicit use of the active agent contained therein. The aversive agent can be included in the plurality of particles, the matrix, or in both components of the dosage form. The aversive agent can be, e.g., an emetic, an antagonist, a bittering agent, an irritant, or a mixture thereof.

25 [0094] The emetic may be selected from, e.g., the group consisting of methyl cephaeline, cephaeline, emetine hydrochloride, psychotrine, O-methylpsychotrine, emetamine, ipecamine, hydro-ipecamine, ipecacunhic acid and a mixture thereof. In particular embodiments, the emetic is ipecac.

- 22 -

[0095] The antagonist may be selected from, e.g., the group consisting of naltrexone, naloxone, nalmefene, cyclazacine, levallorphan, pharmaceutically acceptable salts thereof and mixtures thereof.

5 [0096] The bittering agent may be selected from, e.g., the group consisting of flavor oils, flavoring aromatics, oleoresins, plant extracts, leaf extracts, flower extracts, fruit extracts, sucrose derivatives, chlorosucrose derivatives, quinine sulphate, denatonium benzoate and a mixture thereof. In certain embodiments, the bittering agent is spearmint oil, peppermint oil, eucalyptus oil, oil of nutmeg,  
10 allspice, mace, oil of bitter almonds, menthol or a mixture thereof. In other embodiments, the bittering agent extracted from a fruit selected from the group consisting of lemon, orange, lime, grapefruit and a mixture thereof. In a particular embodiment, the bittering agent is denatonium benzoate.

15 [0097] The irritant may be selected from, e.g., a surfactant, capsaicin or a capsaicin analog. The capsaicin analog can be selected from the group consisting of resiniferatoxin, tinyatoxin, heptanoylisobutylamide, heptanoyl guaiacylamide, an isobutylamide, a guaiacylamide, dihydrocapsaicin, homovanillyl octylester, nonanoyl vanillylamide and a mixture thereof.

20

[0098] The surfactant can be selected from the group consisting of poloxamer, a sorbitan monoester, a glyceryl monooleate, sodium lauryl sulfate and a mixture thereof.

25 [0099] In certain embodiments, the immediate release solid oral dosage form of the present invention releases, e.g., at least about 70%, at least about 75%, at least about 80%, at least about 85%, at least about 90% or at least about 95% of the active agent (e.g., opioid agonist) within 45 minutes as measured by in-vitro dissolution in a USP Apparatus 2 (paddle) at 50 rpm in 500 ml 0.1N HCl or simulated gastric fluid  
30 without enzymes (SGF) at 37° C.

- 23 -

[00100] In certain embodiments, the immediate release solid oral dosage form of the present invention releases, e.g., at least about 85%, at least about 90%, at least about 95% or at least about 98% of the active agent (e.g., opioid agonist) within 60 minutes  
5 as measured by in-vitro dissolution in a USP Apparatus 2 (paddle) at 50 rpm in 500 ml 0.1N HCl or simulated gastric fluid without enzymes (SGF) at 37° C.

[00101] In certain embodiments, the immediate release solid oral dosage form of the present invention releases, e.g., at least about 70%, at least about 75%, at least about  
10 80%, at least about 85%, at least about 90% or at least about 95% of the active agent (e.g., opioid agonist) within 45 minutes as measured by in-vitro dissolution in a USP Apparatus 1 (basket) at 50 rpm in 900 ml distilled water at 37° C.

[00102] In certain embodiments, the immediate release solid oral dosage form of the present invention releases, e.g., at least about 85%, at least about 90%, at least about  
15 95% or at least about 98% of the active agent (e.g., opioid agonist) within 60 minutes as measured by in-vitro dissolution in a USP Apparatus 1 (basket) at 50 rpm in 900 ml distilled water at 37° C.

[00103] In certain embodiments, the immediate release solid oral dosage form of the present invention releases, e.g., one or more of (i) at least about 15%, at least about 25%, or at least about 35% of the active agent (e.g., opioid agonist) at 15 minutes or  
20 (ii) at least about 25%, at least about 35% or at least about 45% of the active agent at 30 minutes as measured by in-vitro dissolution in a USP Apparatus 2 (paddle) at  
25 50 rpm in 500 ml distilled water at 37° C.

[00104] In certain embodiments, the immediate release solid oral dosage form of the present invention releases, e.g., (i) from about 15% to about 70% of the active agent  
(e.g., opioid agonist) at 15 minutes, (ii) from about 25% to about 80% of the active  
30 agent at 30 minutes, and at least about 90% of the active agent at 45 minutes as

- 24 -

measured by in-vitro dissolution in a USP Apparatus 2 (paddle) at 50 rpm in 500 ml 0.1N HCl or simulated gastric fluid without enzymes (SGF) at 37° C.

[00105] In certain embodiments, the immediate release solid oral dosage form of the present invention releases, e.g., one or more of (i) at least about 15%, at least about 25%, or at least about 35% of the active agent (e.g., opioid agonist) at 15 minutes or (ii) at least about 25%, at least about 35% or at least about 45% of the active agent at 30 minutes as measured by in-vitro dissolution in a USP Apparatus 1 (basket) at 50 rpm in 900 ml distilled water at 37° C.

[00106] In certain embodiments, the immediate release solid oral dosage form of the present invention releases, e.g., (i) from about 15% to about 70% of the active agent (e.g., opioid agonist) at 15 minutes, (ii) from about 25% to about 80% of the active agent at 30 minutes, and at least about 90% of the active agent at 45 minutes as measured by in-vitro dissolution in a USP Apparatus 1 (basket) at 50 rpm in 900 ml distilled water at 37° C.

[00107] The immediate release dosage form of the present invention can be in the form of a compressed tablet or contained within a pharmaceutically acceptable capsule.

[00108] In a particular embodiment as depicted in Figure 1, an immediate release dosage form (10) of the present invention may comprise a plurality of particles (11), each particle comprising (i) an active agent (12) (e.g., an opioid agonist); and (ii) a material that is sensitive to acidic pH (13) (e.g., chitosan, a polyacrylate or an ion exchange resin); wherein the plurality of particles are dispersed in a matrix (14) comprising (i) a gelling agent; (ii) a disintegrant; and (iii) a filler; wherein the dosage form releases at least about 85% of the active agent within 45 minutes as measured by in-vitro dissolution in a USP Apparatus 2 (paddle) at 50 rpm in 500 ml 0.1N HCl at 37° C; and wherein the viscosity of the dosage form mixed with from about 0.5 to

- 25 -

about 10 ml of distilled water which prevents or reduces the ability of the active agent from being drawn up into a syringe, or from being systemically absorbed, when administered by the parenteral or nasal route.

5 [00109] In certain embodiments, the recovery of the active agent (e.g., opioid agonist) is, e.g., less than about 10%, less than about 8%, less than about 6%, less than about 4%, less than about 2%, less than about 1%, less than about 0.8%, less than about 0.6%, less than about 0.4%, or less than less than about 0.2%, based on a syringability test whereby the dosage form is mixed or crushed and mixed with 5 mL  
10 solvent and the resultant solution is aspirated with a 27 1/2 gauge needle.

[00110] The solvent utilized in the syringability test can be, e.g., tap water, distilled water, sterile saline, vinegar or 40% ethanol. Also, during the syringability test, the solvent (before or after mixing with the dosage form) can be subject to heat from any  
15 source such as, e.g., by the use of a butane lighter.

[00111] In certain embodiments of the present invention, the recovery of the drug is, e.g., less than about 10%, less than about 8%, less than about 6%, less than about 4%, less than about 2%, less than about 1%, less than about 0.8%, less than about  
20 0.6%, less than about 0.4%, or less than less than about 0.2%, based on both heated and unheated syringability tests, whereby the dosage form is mixed or crushed and mixed with 5 mL solvent and the resultant solution is aspirated with a 27 1/2 gauge needle.

25 [00112] In certain embodiments, the ratio of extraction from an unheated stability test to a heated stability test is from about 1:5 to about 5:1; from about 1:4 to about 4:1; from about 1:3 to about 3:1; from about 1:2 to about 2:1; from about 1:1.5 to about 1.5:1; from about 1:1.3 to about 1.3:1 or from about 1:1.1 to about 1.1:1.

### Active Agents

[00113] In certain embodiments, the active agent used in the solid oral dosage form of the present invention is selected from the group consisting of ACE inhibitors, 5  
adenohypophyseal hormones, adrenergic neuron blocking agents, adrenocortical steroids, inhibitors of the biosynthesis of adrenocortical steroids, alpha-adrenergic agonists, alpha-adrenergic antagonists, selective alpha-two-adrenergic agonists, analgesics, anti-pyretics, anti-inflammatory agents, androgens, local and general  
10 anesthetics, anti-addictive agents, anti-androgens, anti-arrhythmic agents, anti-asthmatic agents, anti-cholinergic agents, anti-cholinesterase agents, anti-coagulants, anti-diabetic agents, anti-diarrheal agents, anti-diuretic, anti-emetic agents, prokinetic agents, anti-epileptic agents, anti-estrogens, anti-fungal agents, anti-hypertensive agents, anti-microbial agents, anti-migraine agents, anti-muscarinic  
15 agents, anti-neoplastic agents, anti-parasitic agents, anti-parkinson's agents, anti-platelet agents, anti-progestins, anti-schizophrenia agents, anti-thyroid agents, anti-tussives, anti-viral agents, atypical anti-depressants, azaspirodecanediones, barbiturates, benzodiazepines, benzothiadiazides, beta-adrenergic agonists, beta-adrenergic antagonists, selective beta-one-adrenergic antagonists, selective beta-two-  
20 adrenergic agonists, bile salts, agents affecting volume and composition of body fluids, butyrophenones, agents affecting calcification, calcium channel blockers, cardiovascular drugs, cannabinoids, catecholamines and sympathomimetic drugs, cholinergic agonists, cholinesterase reactivators, contraceptive agents, dermatological agents, diphenylbutylpiperidines, diuretics, ergot alkaloids, estrogens,  
25 ganglionic blocking agents, ganglionic stimulating agents, hydantoins, agents for control of gastric acidity and treatment of peptic ulcers, hematopoietic agents, histamines, histamine antagonists, hormones, 5-hydroxytryptamine antagonists, drugs for the treatment of hyperlipoproteinemia, hypnotics, sedatives, immunosuppressive agents, laxatives, methylxanthines, moncamine oxidase  
30 inhibitors, neuromuscular blocking agents, organic nitrates, opioid agonists, opioid

- 27 -

antagonists, pancreatic enzymes, phenothiazines, progestins, prostaglandins, agents for the treatment of psychiatric disorders, psychotropics, retinoids, sodium channel blockers, agents for spasticity and acute muscle spasms, succinimides, testosterone, thioxanthines, thrombolytic agents, thyroid agents, tricyclic antidepressants, inhibitors of tubular transport of organic compounds, drugs affecting uterine motility, vasodilators, vitamins, and mixtures thereof.

[00114] In certain embodiments, the active agent is susceptible to abuse (e.g., an opioid analgesic such as an opioid agonist). In such embodiments, the opioid analgesic is selected from the group consisting of alfentanil, allylprodine, alphaprodine, anileridine, benzylmorphine, bezitramide, buprenorphine, butorphanol, clonitazene, codeine, desomorphine, dextromoramide, dezocine, diampromide, diamorphine, dihydrocodeine, dihydromorphine, dimenoxadol, dimepheptanol, dimethylthiambutene, dioxaphetyl butyrate, dipipanone, eptazocine, ethoheptazine, ethylmethylthiambutene, ethylmorphine, etonitazene, fentanyl, heroin, hydrocodone, hydromorphone, hydroxypethidine, isomethadone, ketobemidone, levorphanol, levophenacymorphan, lofentanil, meperidine, meptazinol, metazocine, methadone, metopon, morphine, myrophine, nalbuphine, narceine, nicomorphine, norlevorphanol, normethadone, nalorphine, normorphine, norpipanone, opium, oxycodone, oxymorphone, papaveretum, pentazocine, phenadoxone, phenomorphan, phenazocine, phenoperidine, piminodine, piritramide, proheptazine, promedol, properidine, propiram, propoxyphene, sufentanil, tilidine, tramadol, pharmaceutically acceptable salts thereof, and mixtures thereof. In certain embodiments, the opioid agonist is selected from the group consisting of codeine, fentanyl, hydromorphone, hydrocodone, oxycodone, dihydrocodeine, dihydromorphine, morphine, tramadol, oxymorphone, pharmaceutically acceptable salts thereof, and mixtures thereof.

[00115] In certain embodiments, the opioid agonist is oxycodone or pharmaceutically acceptable salts thereof in an amount, e.g., of about 2.5 mg, 5 mg, 7.5 mg, 10 mg, 15 mg, 20 mg, 25 mg or 30 mg.

- 28 -

[00116] In certain embodiments of the present invention, wherein the active agent is oxycodone hydrochloride, oxycodone hydrochloride is used having a 14-hydroxycodeinone level of less than about 25 ppm, less than about 15 ppm, less than about 10 ppm, less than about 5 ppm, less than about 2 ppm, less than about 1 ppm, less than about 0.5 ppm or less than about 0.25 ppm.

[00117] WO 2005/097801 A1, U.S. Pat. No. 7,129,248 B2 and US 2006/0173029 A1, all of which are hereby incorporated by reference, describe a process for preparing oxycodone hydrochloride having low levels of 14-hydroxycodeinone.

[00118] In certain embodiments, the oral solid dosage form of the present invention comprises an active agent that is an opioid antagonist (with or without an opioid agonist). In such embodiments, the opioid antagonist is selected from the group consisting of amiphenazole, naltrexone, methylnaltrexone, naloxone, nalbuphine, nalorphine, nalorphine dinicotinate, nalmefene, nadide, levallorphan, cyclozocine, pharmaceutically acceptable salts thereof and mixtures thereof.

[00119] In certain embodiments, the solid oral dosage form of the present invention comprises an active agent that is a non-opioid analgesic. In such embodiments, the non-opioid analgesic is acetaminophen or a non-steroidal anti-inflammatory agent selected from the group consisting of aspirin, celecoxib, ibuprofen, diclofenac, naproxen, benoxaprofen, flurbiprofen, fenoprofen, flubufen, ketoprofen, indoprofen, piroprofen, carprofen, oxaprozin, pramoprofen, muprofen, trioxaprofen, suprofen, aminoprofen, tiaprofenic acid, fluprofen, bucloxic acid, indomethacin, sulindac, tolmetin, zomepirac, tiopinac, zidometacin, acemetacin, fentiazac, clidanac, oxpinac, mefenamic acid, meclofenamic acid, flufenamic acid, niflumic acid, tolfenamic acid, diflurisal, flufenisal, piroxicam, sudoxicam, isoxicam, pharmaceutically acceptable salts thereof and mixtures thereof.

- 29 -

[00120] In other embodiments, the present invention is directed to the dosage forms disclosed herein utilizing active agents such as benzodiazepines, barbiturates or amphetamines, their antagonists, or combinations thereof.

5 [00121] Benzodiazepines to be used in the present invention may be selected from alprazolam, bromazepam, chlordiazepoxide, clorazepate, diazepam, estazolam, flurazepam, halazepam, ketazolam, lorazepam, nitrazepam, oxazepam, prazepam, quazepam, temazepam, triazolam, and pharmaceutically acceptable salts, hydrates, and solvates and mixtures thereof. Benzodiazepine antagonists that can be used in  
10 the present invention include, but are not limited to, flumazenil and pharmaceutically acceptable salts, hydrates, and solvates.

[00122] Barbiturates to be used in the present invention include, but are not limited to, amobarbital, aprobarbital, butabarbital, butalbital, methohexital, mephobarbital,  
15 metharbital, pentobarbital, phenobarbital, secobarbital and pharmaceutically acceptable salts, hydrates, and solvates mixtures thereof. Barbiturate antagonists that can be used in the present invention include, but are not limited to, amphetamines and pharmaceutically acceptable salts, hydrates, and solvates.

20 [00123] Stimulants to be used in the present invention include, but are not limited to, amphetamines, such as amphetamine, dextroamphetamine resin complex, dextroamphetamine, methamphetamine, methylphenidate and pharmaceutically acceptable salts, hydrates, and solvates and mixtures thereof. Stimulant antagonists that can be used in the present invention include, but are not limited to,  
25 benzodiazepines, and pharmaceutically acceptable salts, hydrates, and solvates as described herein.

[00124] In embodiments comprising a first active agent and a second active agent as disclosed herein (e.g., the first active agent is a substrate for coating a second active  
30 agent thereon), the first active agent can be a non-opioid analgesic and the second

- 30 -

active agent can be an opioid agonist. Alternatively, the first active agent can be an opioid agonist and the second active agent can be a non-opioid analgesic. In particular embodiments, the non-opioid analgesic is acetaminophen or a non-steroidal anti-inflammatory agent (e.g., ibuprofen, aspirin or diclofenac) and the  
5 opioid agonist is oxycodone, hydrocodone or pharmaceutically acceptable salts thereof (e.g., oxycodone hydrochloride or hydrocodone bitartrate).

[00125] The immediate release solid oral dosage forms of the present invention may comprise, e.g., from about 2.5 mg to about 10 mg oxycodone or a pharmaceutically  
10 acceptable salt thereof; from about 2.5 mg to about 15 mg hydrocodone or a pharmaceutically acceptable salt thereof; from about 325 mg to about 650 mg acetaminophen; from about 100 mg to about 800 mg ibuprofen, or from about 325 mg to about 750 mg aspirin.

15 [00126] Specific formulations may comprise about 2.5 mg oxycodone or a pharmaceutically acceptable salt thereof and about 325 mg acetaminophen; about 5 mg oxycodone or a pharmaceutically acceptable salt thereof and about 325 mg acetaminophen; about 7.5 mg oxycodone or a pharmaceutically acceptable salt thereof and about 325 mg acetaminophen; about 10 mg oxycodone or a  
20 pharmaceutically acceptable salt thereof and about 325 mg acetaminophen; about 7.5 mg oxycodone or a pharmaceutically acceptable salt thereof and about 500 mg acetaminophen; about 10 mg oxycodone or a pharmaceutically acceptable salt thereof and about 650 mg acetaminophen; about 5 mg oxycodone or a pharmaceutically acceptable salt thereof and about 500 mg acetaminophen; about  
25 2.5 mg oxycodone or a pharmaceutically acceptable salt thereof and about 300 mg acetaminophen; about 5 mg oxycodone or a pharmaceutically acceptable salt thereof and about 300 mg acetaminophen; about 7.5 mg oxycodone or a pharmaceutically acceptable salt thereof and about 300 mg acetaminophen; about 10 mg oxycodone or a pharmaceutically acceptable salt thereof and about 400 mg acetaminophen; about  
30 2.5 mg oxycodone or a pharmaceutically acceptable salt thereof and about 400 mg

acetaminophen; about 5 mg oxycodone or a pharmaceutically acceptable salt thereof and about 400 mg acetaminophen; or about 7.5 mg oxycodone or a pharmaceutically acceptable salt thereof and about 400 mg acetaminophen.

- 5 [00127] Other formulations may comprise about 2.5 mg oxycodone or a pharmaceutically acceptable salt thereof and about 325 mg aspirin; about 5 mg oxycodone or a pharmaceutically acceptable salt thereof and about 325 mg aspirin; about 7.5 mg oxycodone or a pharmaceutically acceptable salt thereof and about 325 mg aspirin; about 10 mg oxycodone or a pharmaceutically acceptable salt thereof and about 325 mg aspirin; about 2.5 mg oxycodone or a pharmaceutically acceptable salt thereof and about 500 mg aspirin; about 5 mg oxycodone or a pharmaceutically acceptable salt thereof and about 500 mg aspirin; about 7.5 mg oxycodone or a pharmaceutically acceptable salt thereof and about 500 mg aspirin; about 10 mg oxycodone or a pharmaceutically acceptable salt thereof and about 500 mg aspirin. In certain embodiments, the formulation comprises about 4.8355 mg oxycodone or a pharmaceutically acceptable salt thereof and 325 mg aspirin.
- 10
- 15

- [00128] Further formulations may comprise about 5 mg hydrocodone or a pharmaceutically acceptable salt thereof and about 500 mg acetaminophen; about 10 mg hydrocodone or a pharmaceutically acceptable salt thereof and about 660 mg acetaminophen; about 7.5 mg hydrocodone or a pharmaceutically acceptable salt thereof and about 750 mg acetaminophen; about 5 mg hydrocodone or a pharmaceutically acceptable salt thereof and about 325 mg acetaminophen; about 7.5 mg hydrocodone or a pharmaceutically acceptable salt thereof and about 325 mg acetaminophen; about 10 mg hydrocodone or a pharmaceutically acceptable salt thereof and about 325 mg acetaminophen; about 7.5 mg hydrocodone or a pharmaceutically acceptable salt thereof and about 650 mg acetaminophen; about 10 mg hydrocodone or a pharmaceutically acceptable salt thereof and about 750 mg acetaminophen; about 10 mg hydrocodone or a pharmaceutically acceptable salt thereof and about 500 mg acetaminophen; about 5 mg hydrocodone or a
- 20
- 25
- 30

- 32 -

pharmaceutically acceptable salt thereof and about 400 mg acetaminophen; about 7.5 mg hydrocodone or a pharmaceutically acceptable salt thereof and about 400 mg acetaminophen; about 10 mg hydrocodone or a pharmaceutically acceptable salt thereof and about 400 mg acetaminophen.

5

[00129] Additional formulations may comprise about 2.5 mg hydrocodone or a pharmaceutically acceptable salt thereof and about 200 mg ibuprofen; about 5 mg hydrocodone or a pharmaceutically acceptable salt thereof and about 200 mg ibuprofen; about 7.5 mg hydrocodone or a pharmaceutically acceptable salt thereof and about 200 mg ibuprofen; or about 10 mg hydrocodone or a pharmaceutically acceptable salt thereof and about 200 mg ibuprofen.

10

#### Pharmacokinetic Parameters

15 [00130] In preferred embodiments, the formulations of the present invention comprise an opioid agonist (e.g., oxycodone hydrochloride) and preferably provide a T<sub>max</sub> from about 0.5 hour to about 6 hours, or from about 1 hour to about 5 hours, or from about 2 hours to about 4 hours, or from about 2 hours to about 3 hours, or from about 1 hour to about 3 hours, or about 2.5 hours.

20

[00131] In embodiments comprising oxycodone or a pharmaceutically acceptable salt thereof (e.g., oxycodone hydrochloride), the formulation preferably provides a C<sub>max</sub> of about 30 ng/mL to about 50 ng/mL, or about 35 ng/mL to about 45 ng/mL, or about 38 to about 42 ng/mL based on a single dose of about 15 mg to a subject; or a mean C<sub>max</sub> of about 30 ng/mL to about 50 ng/mL, or about 35 ng/mL to about 45 ng/mL, or about 38 to about 38 ng/mL based on a single dose of about 15 mg to a population of subjects.

25

[00132] In embodiments comprising oxycodone or a pharmaceutically acceptable salt thereof (e.g., oxycodone hydrochloride), the formulation preferably provides a

30

- 33 -

C<sub>max</sub> of about 20 ng/mL to about 35 ng/mL, or about 22 ng/mL to about 32 ng/mL, or about 25 to about 30 ng/mL based on a single dose of about 10 mg to a subject; or a mean C<sub>max</sub> of about 20 ng/mL to about 35 ng/mL, or about 22 ng/mL to about 32 ng/mL, or about 25 to about 30 ng/mL based on a single dose of about 10 mg to a population of subjects.

[00133] In embodiments comprising oxycodone or a pharmaceutically acceptable salt thereof (e.g., oxycodone hydrochloride), the formulation preferably provides a C<sub>max</sub> of about 8 ng/mL to about 20 ng/mL, or about 10 ng/mL to about 18 ng/mL, or about 12 to about 16 ng/mL based on a single dose of about 5 mg to a subject; or a mean C<sub>max</sub> of about 8 ng/mL to about 20 ng/mL, or about 10 ng/mL to about 18 ng/mL, or about 12 to about 16 ng/mL based on a single dose of about 5 mg to a population of subjects.

[00134] In embodiments comprising oxycodone or a pharmaceutically acceptable salt thereof (e.g., oxycodone hydrochloride), the formulation preferably provides a C<sub>max</sub> of about 4 ng/mL to about 12 ng/mL, or about 5 ng/mL to about 10 ng/mL, or about 6 to about 8 ng/mL based on a single dose of about 2.5 mg to a subject; or a mean C<sub>max</sub> of about 4 ng/mL to about 12 ng/mL, or about 5 ng/mL to about 10 ng/mL, or about 6 to about 8 ng/mL based on a single dose of about 2.5 mg to a population of subjects.

[00135] In embodiments comprising oxycodone or a pharmaceutically acceptable salt thereof (e.g., oxycodone hydrochloride), the formulation preferably provides a AUC<sub>0-t</sub> of about 150 ng\*h/mL to about 350 ng\*h/mL, or about 200 ng\*h/mL to about 300 ng\*h/mL, or about 225 ng\*h/mL to about 275 ng\*h/mL based on a single dose of about 15 mg to a subject; or a mean AUC<sub>0-t</sub> of about 150 ng\*h/mL to about 350 ng\*h/mL, or about 200 ng\*h/mL to about 300 ng\*h/mL, or about 225 ng\*h/mL to about 275 ng\*h/mL based on a single dose of about 15 mg to a population of subjects.

- 34 -

[00136] In embodiments comprising oxycodone or a pharmaceutically acceptable salt thereof (e.g., oxycodone hydrochloride), the formulation preferably provides a  $AUC_{0-t}$  of about 100 ng\*h/mL to about 300 ng\*h/mL, or about 120 ng\*h/mL to about 240 ng\*h/mL, or about 150 ng\*h/mL to about 200 ng\*h/mL based on a single dose of about 10 mg to a subject; or a mean  $AUC_{0-t}$  of about 100 ng\*h/mL to about 300 ng\*h/mL, or about 120 ng\*h/mL to about 240 ng\*h/mL, or about 150 ng\*h/mL to about 200 ng\*h/mL based on a single dose of about 10 mg to a population of subjects.

10

[00137] In embodiments comprising oxycodone or a pharmaceutically acceptable salt thereof (e.g., oxycodone hydrochloride), the formulation preferably provides a  $AUC_{0-t}$  of about 50 ng\*h/mL to about 150 ng\*h/mL, or about 60 ng\*h/mL to about 120 ng\*h/mL, or about 75 ng\*h/mL to about 100 ng\*h/mL based on a single dose of about 5 mg to a subject; or a mean  $AUC_{0-t}$  of about 50 ng\*h/mL to about 150 ng\*h/mL, or about 60 ng\*h/mL to about 120 ng\*h/mL, or about 75 ng\*h/mL to about 100 ng\*h/mL based on a single dose of about 5 mg to a population of subjects.

15

[00138] In embodiments comprising oxycodone or a pharmaceutically acceptable salt thereof (e.g., oxycodone hydrochloride), the formulation preferably provides a  $AUC_{0-t}$  of about 20 ng\*h/mL to about 100 ng\*h/mL, or about 25 ng\*h/mL to about 75 ng\*h/mL, or about 30 ng\*h/mL to about 50 ng\*h/mL based on a single dose of about 2.5 mg to a subject; or a mean  $AUC_{0-t}$  of about 20 ng\*h/mL to about 100 ng\*h/mL, or about 25 ng\*h/mL to about 75 ng\*h/mL, or about 30 ng\*h/mL to about 50 ng\*h/mL based on a single dose of about 2.5 mg to a population of subjects.

20

25

### Methods of Manufacture

[00139] The present invention is also directed to a process for preparing the immediate release solid oral dosage forms disclosed herein. In certain embodiments,

30

- 35 -

the process comprises (i) preparing a plurality of particles, each particle comprising an active agent and a material that is sensitive to acidic pH; and (ii) dispersing the plurality of particles into a matrix; wherein the dosage form releases at least about 85% of the active agent within 45 minutes as measured by in-vitro dissolution in a USP Apparatus 2 (paddle) at 50 rpm in 500 ml 0.1N HCl at 37° C.

[00140] In another embodiment, the process comprises dispersing a plurality of particles, each particle comprising an active agent and a material that is sensitive to acidic pH, into a matrix; wherein the dosage form releases at least about 85% of the active agent within 45 minutes as measured by in-vitro dissolution in a USP Apparatus 1 (paddle) at 50 rpm in 500 ml 0.1N HCl at 37° C.

[00141] In certain embodiments, the matrix can include one or more of a gelling agent, a disintegrant or a filler.

15

[00142] The particles can be prepared by layering a core comprising the active agent with the material that is sensitive to acidic pH. The core can be prepared by layering an inert excipient (e.g., a microcrystalline cellulose bead or a sugar sphere) with an active agent or by dispersing the active agent in a pharmaceutically acceptable excipient. Alternatively, an active agent (e.g., acetaminophen) can be used in place of the inert excipient with an additional active agent (e.g., an opioid agonist) layered thereon.

[00143] In other embodiments, the particles can be prepared by layering a core comprising an inert excipient with a coating comprising the active agent and the material that is sensitive to acidic pH. In alternative embodiments, the particles can be prepared by dispersing the active agent in the material that is sensitive to acidic pH.

25

- 36 -

[00144] In alternative embodiments, the immediate release dosage forms of the present invention can be prepared by (i) granulating an active agent and a material that is sensitive to acidic pH to obtain a granulation; (ii) compressing the granulation into a tablet or containing the granulation in a capsule; wherein the dosage form  
5 releases at least about 85% of the active agent within 45 minutes as measured by in-vitro dissolution in a USP Apparatus 1 (paddle) at 50 rpm in 500 ml 0.1N HCl at 37° C.

[00145] This process may also incorporate one or more of a gelling agent, a  
10 disintegrant or a filler. The filler can be spray dried with a solution comprising the active agent and the acid pH sensitive material to obtain a spray dried composition as depicted in Figures 2 and 3. The spray dried granulation may then be granulated with the gelling agent and the disintegrant and other excipients prior to compression into a unit dosage form as further depicted in Figures 2 and 3.

15

### Methods of Treatment

[00146] The present invention is further directed to a method of treating a disease or condition comprising administering any of the immediate release solid oral dosage  
20 forms described herein to a patient in need thereof. In certain embodiments, the patient is treated for pain, diarrhea, or constipation.

[00147] Types of pain that can be treated with the immediate release solid oral dosage forms of the present invention include pain caused by pancreatitis, kidney  
25 stones, headaches, dysmenorrhoea, musculoskeletal pain, sprains, visceral pain, ovarian cysts, prostatitis, cystitis, interstitial cystitis, inflammatory bowel disease, post-operative pain, dental pain, post-surgical pain, migraine, trigeminal neuralgia, pain from burns and/or wounds, pain associated with trauma, neuropathic pain, post-herpetic neuralgia, pain associated with musculoskeletal diseases, rheumatoid  
30 arthritis, osteoarthritis, ankylosing spondilitis, periarticular pathologies, oncological

- 37 -

pain, pain from bone metastase, pain from HIV or pain from myocardial infarction. In certain embodiments, the immediate release solid oral dosage forms of the present invention can be used to treat “break through” pain (i.e., pain that comes on suddenly for short periods of time and is not alleviated by the patients' normal pain management).

[00148] The method of treatment of the present invention may comprise administering the solid oral dosage form described herein in combination with another pharmaceutical composition. In certain embodiments, the other pharmaceutical composition is administered to treat the same condition or disease. In other embodiments, the other pharmaceutical composition is administered to treat a different condition or disease.

[00149] In certain embodiments, the method of treatment of the present invention further comprises monitoring the patient for how the patient metabolizes the active agent, or how the patient responds to the active agent. In certain embodiments, the method of treatment further comprises altering the dose of the solid oral dosage form in response to said monitoring. In certain embodiments, certain baseline measurements are taken from the patient prior to administering the oral solid dosage form to the patient.

[00150] The following examples are set forth to assist in understanding the invention and should not be construed as specifically limiting the invention described and claimed herein. Such variations of the invention, including the substitution of all equivalents now known or later developed, which would be within the purview of those skilled in the art, and changes in formulation or minor changes in experimental design, are to be considered to fall within the scope of the invention incorporated herein.

- 38 -

## Examples

### Example 1

- 5    **[00151]** Formulations 1A to 1O are gelling matrices that can be utilized in the present invention for dispersing active agent particles comprising a material sensitive to acidic pH. The formulations were prepared in accordance with the following general procedure (the procedures can be modified to use particles of the present invention in place of naloxone):

10

#### Procedure:

1. Pass items #1-5 (naloxone, lactose, microcrystalline cellulose (MCC), gelling polymer and croscopovidone, respectively) through a 20 Mesh screen and load into a V-blender and mix for 10 minutes.
- 15    2. Pass item #6 (magnesium stearate) through a 30 Mesh screen into the above V-blender and mix for 3 minutes.
3. Compress the mixture of step 2 above into tablets (round shape) at a target weight of 500 mg and a target hardness of 3-5 kp using a Stokes, Fette or Killian rotary press.

20

**[00152]** Tables 1A to 1O show the formulations of Examples 1A and 1O, respectively.

**Example 2**

5

**[00153]** Formulations 2A (Pellets) and 2B (Tablets) were prepared in accordance with the following general procedure:

Procedure for 2A & 2B:

- 10 1. Add item #2 (naloxone) and item #5 (talc) to item #6 (water) and mix for approximately 30 minutes in a mixing vessel, such as a V-blender.
2. While still stirring, add item #3 (aqueous dispersion of a co-polymer comprising methyl methacrylate and diethylaminoethyl methacrylate (Kollicoat Smartseal 30 D)) and item #4 (triethyl citrate) into the above drug suspension,
- 15 keep mixing for at least 2 hours. Homogenize for 5 minutes and screen through 200 Mesh screen before spraying.
3. Load item#1 (microcrystalline cellulose spheres) in a spray dryer (GPCG-3 fluid bed dryer). Set up the machine and spray step #2 coating suspension at about 5-15g/minutes.

- 47 -

4. After completing the spray process, continue to dry the resultant beads or pellets for approximately 30 minutes at about  $40\pm 5^{\circ}\text{C}$ .
  5. Collect the coated beads of Example 2A after passing through 40 Mesh and 100 Mesh screens consecutively to remove lumps and fines.
  - 5 6. Mix the coated beads with other excipients in Example 2B (lactose, microcrystalline cellulose, gelling polymer, crospovidone, and magnesium stearate and compress into tablets at a target weight of 500 mg and target hardness of 3-5 kP using a Stokes, Fette or Killian rotary press.
- 10 [00154] Tables 2A and 2B show the formulations of Examples 2A and 2B, respectively.

**Example 3**

5

**[00157]** Formulations 3A (Pellets) and 3B (Tablets) were prepared in accordance with the following general procedure:

Procedure for 3A & 3B:

- 10    1. Add item #5 (talc) to item #6 (water) and mix for approximately 30 minutes in a mixing vessel, such as a V-blender.
2. While stirring, add item #3 (aqueous dispersion of a co-polymer comprising methyl methacrylate and diethylaminoethyl methacrylate) and item #4 (triethyl citrate) to the above suspension. Continue to mix for at least 2 hours.
- 15    3. Divide the above coating suspension into two parts (500 ml Part I, and 2500 ml Part II). Add item #2 (naloxone) to Part I and keep mixing.
4. Homogenize both Parts I and II coating suspensions for approximately 5 minutes and screen through 200 Mesh before spraying.
5. Load item#1 (microcrystalline cellulose spheres) in a spray dryer (GPCG-3 fluid  
20    bed dryer) and set up the machine with appropriate process parameters. Spray

- 50 -

step 4 coating suspension at approximately 5-15g/minutes, beginning first with Part I, and then with Part II.

6. After completing the spray process, continue to dry the pellets for approximately 30 minutes at approximately  $40 \pm 5^\circ\text{C}$ .
- 5 7. Collect the coated beads of Example 3A after respectively screening through 40 Mesh and 100 Mesh sieves to remove lumps and fines.
8. Mix the coated beads with other excipients in Example #3B (lactose, microcrystalline cellulose, gelling polymer, crospovidone and magnesium stearate) and compress to make tablets at a target weight of 500 mg and a target
- 10 hardness of approximately 3-5 kp using a Stokes, Fette or Killian rotary press.

[00158] Tables 3A and 3B show the formulations of Examples 3A and 3B, respectively.

Example 4

5

[00161] Formulation 4A (Drug Layered Pellet), 4B (Acrylic Coated Pellets with Kollicoat Smartseal 30D), 4C (Acrylic Coated Pellets with Eudragit E100), 4D (Tablets) and 4E (Tablets) were prepared in accordance with the following general procedure:

10

Procedure for 4A, 4B, 4C, 4D & 4E:

4A: Drug layer coating

15 Dissolve item #3 (povidone) into item #4 (water) to make a binder solution, and add item #2 (naloxone) into the binder to prepare a coating solution. Spray the above coating solution onto item#1 (MCC spheres) using a GPCG-3. Use the drug layered pellets for the following examples 4B and 4C for further coating.

- 53 -

4B & 4D: Kollicoat Smartseal 30D top layered pellets and tablets

1. Add item #4 (talc) to item #5 (water) and mix for approximately 30 minutes.
2. While stirring, add items #2 (Kollicoat Smartseal 30D) and #3 (Triethyl Citrate)  
5 to the above suspension and continue mixing for at least 2 hours.
3. Homogenize the above coating suspension for about 5 minutes and screen through a 200 Mesh screen before spraying.
4. Load item #1 drug layered MCC sphere in a spray dryer (GPCG-3 fluid bed dryer). Spray #3 coating suspension at approximately 5-15g/minutes.
- 10 5. After completing the spraying process, continue to dry the pellets for approximately 30 minutes at  $40\pm 5^{\circ}\text{C}$ .
6. Collect the coated beads of Example 4B after sequentially screening through 40 Mesh and 100 Mesh screens to remove lumps and fines.
7. Mix the coated beads with other excipients in Example 4D (lactose,  
15 microcrystalline cellulose, gelling polymer, crospovidone and magnesium stearate) to make tablets at a target weight of approximately 500 mg at a target hardness of approximately 3-5 kp using a Stokes, Fette or Killian rotary press.

4C & 4E: Eudragit E 100 top layered pellets and tablets

- 20 1. Mix item #3, 4, and 5 (IPA, Acetone and Water) to make the solvent system.
2. Add Item #2 Eudragit E 100 into half of the solvent system from Step 1. Keep mixing until dissolved.
3. Add Items #6 and #7 (Triethyl Citrate and Talc) into the remaining half of the solvent system from Step #1 and homogenize for approximately 10 minutes.
- 25 4. Add Step #3 suspension to Step #2 solution and keep mixing. Pass the suspension through 0.5 mm sieve before spraying.
5. Load item #1 (drug layered MCC spheres) in a spray dryer (GPCG-3 fluid bed dryer). Spray step #4 coating suspension at approximately 5-15g/minutes.
6. After completing the spray process, continue to dry the beads for approximately  
30 30 minutes at  $40\pm 5^{\circ}\text{C}$ .

- 54 -

7. Collect the coated beads of Example 4C after consecutively passing them through 40 Mesh and 100 mesh screens to remove lumps and fines.
8. Mix the coated beads with other excipients in Example 4E (lactose, microcrystalline cellulose, gelling polymer, crospovidone and magnesium stearate) and compress into tablets at a target weight of 500 mg and at a target hardness of approximately 3-5 kp using a Stokes, Fette or Killian rotary press.

[00162] Tables 4A to 4E show the formulations of Examples 4A to 4E, respectively.

Example 5A

[00164] The formulations of Formula 5A (Oxycodone HCl Tablet, USP (5 mg and  
5 10 mg)) and 5B (Oxycodone HCl Tablets, USP (20 mg and 30 mg)) were prepared in  
accordance with the following general procedure:

1.: Drug Layer:

10 Oxycodone HCl and Povidone (PVP) are dissolved into purified water in a  
50-Gallon stainless steel tank using an overhead mixer to make the drug  
layered coating solution. The solution is applied to MCC spheres using a  
GPCG-60 with an 18" Wurster insert. The resulting drug layered pellets are  
screened using a Sweco sifter configured with US 140 mesh and US  
50 mesh screens.

15

2.: Polymer Coating:

A polymer coating suspension (Eudragit E PO, Sodium lauryl sulfate (SLS),  
Stearic acid and Talc) prepared in a 100-Gallon stainless steel tank using an  
overhead mixer, is applied onto Oxycodone HCl drug layered pellets using  
20 a GPCG-60 with an 18" Wurster insert. After the polymer coating is  
completed, the pellets are screened using a Sweco sifter configured with US  
140 mesh and US 40 mesh screens.

3.: Blending:

25 Polymer coated pellets and excipients (Lactose Monohydrate,  
Croscopovidone, Pregelatinized Starch (Swelstar MX-1), FD&C No. 6 Yellow  
(20 mg and 30 mg doses only)) are passed through a US 25 mesh screen  
into a 10 Cu. Ft. V-Blender and mixed for 10 minutes. Magnesium Stearate  
is passed through a US 30 mesh screen into the V-blender and lubricated for  
30 3 minutes to make the final blend.

- 59 -

## 4.:Compression:

The final blend is compressed into required tablet strengths using a Manesty 700 Rotary Tablet Press.

5

[00165] Tables 5A and 5B show the formulations for Formulations 5A and 5B, respectively.

Example 5C

5 [00168] Eighteen healthy subjects (8 male, 10 female) were enrolled and randomized to receive the Formulation 5A (15mg) and 17 (94.4 %) subjects completed the study as planned. Seventeen (94.4%) subjects received their assigned dose of test study drug and 18 (100%) subjects received their assigned dose of reference study drug. Eighteen subjects were included in the safety population, and 17 subjects were included in the pharmacokinetic (PK) population.

10

[00169] Demographics: Subjects were representative of a healthy adult male and female population, ranging from 18 to 43 years of age. Overall mean (SD) age was 29.6 (7.78) years and mean (SD) Body mass index (BMI) was 26.5 (2.64) kg/m<sup>2</sup>. Racial composition was 10 (55.6 %) Black and 8 (44.4%) White.

15

[00170] Methodology: This was a single-center, randomized, open-label, single-dose, two-period, crossover study to assess the pharmacokinetics (PK) and relative bioavailability of single doses of a test (T) formulation of oxycodone HCl immediate-release (IR) 15 mg tablets (Formula 5A) and Roxicodone® 15 mg tablets (Reference Drug) (R) in healthy adult male and female subjects under fed conditions. Each subject was randomized to one of two treatment sequences (T-R, R-T) according to a randomization schedule prepared prior to the start of the study.

25 [00171] There was a 7-day washout between each single dose administration. Subjects were dosed on the same day for Day 1 of Period 1, and crossed over to an alternate formulation to be dosed on the same day for Day 8 of Period 2.

[00172] Subjects received a single dose of naltrexone 50 mg with approximately 240 mL room temperature water 12 hours ( $\pm 1$  hour) and one hour ( $\pm 10$  minutes)

- 63 -

prior to, and 12 hours ( $\pm 30$  minutes) after receiving each study drug dose during Periods 1 and 2.

5 [00173] Following an overnight fast of at least 10 hours, subjects completed a high fat breakfast within approximately 5 minutes prior to dosing. Subjects then received a single oral dose of the reference or test formulation with approximately 240 mL room temperature water at approximately 0800 hours ( $\pm 1$  hour).

10 [00174] Serial blood samples for determination of oxycodone plasma concentrations and PK analysis were obtained on Day 1 at time 0 (within 90 minutes pre-dose) and 0.5, 1, 1.5, 2, 2.5, 3, 4, 6, 8, 10, 12, 16, 24 and 36 hours post-dose. Subjects were discharged from the research facility approximately 36 hours after receiving their dose of study drug. During Period 2, Day 8 following a washout period of 7 days, subjects crossed over to an alternate formulation and the same procedures were  
15 performed.

[00175] Subjects completing both treatment periods with no major protocol violations and providing plasma drug concentration data were included in the PK analysis population. Plasma oxycodone concentration levels are listed and  
20 summarized using descriptive statistics. PK parameters ( $AUC_{0-t}$ ,  $AUC_{0-inf}$ ,  $C_{max}$ ,  $t_{max}$ ,  $t_{1/2}$  and  $K_{el}$ ) of plasma oxycodone are listed and summarized by treatment. Relative bioavailability of the test and reference formulations was determined based on  $AUC_{0-}$ ,  $AUC_{0-inf}$  and  $C_{max}$  of oxycodone. Log-transformed PK parameters  $AUC_{0-}$ ,  $AUC_{0-inf}$  and  $C_{max}$  were analyzed using analysis of variance (ANOVA) including terms for  
25 sequence, formulation, and period as fixed effects, and subject nested within sequence as a random effect. The arithmetic means, geometric means, ratio of the geometric means and 90% confidence intervals (CIs) on the ratio of test to reference study drug are displayed.

- 64 -

[00176] Plots of mean concentration levels of plasma oxycodone versus time were generated for each treatment group and are shown in Figure 4 and Table 5D below.

**Table 5D**

Parameter	Geometric means		Ratio (T/R)	90% C.I. (T/R)
	Test	Reference		
C <sub>max</sub> (ng /mL)	40.88	40.51	1.01	(92.14, 110.56)
AUC <sub>0-t</sub> (ng*h /mL )	245.28	237.01	1.03	(99.04, 108.14)
AUC <sub>0-inf</sub> (ng*h /mL)	246.32	238.16	1.03	(98.99, 108.06)

5

[00177] The results from the pharmacokinetic parameters for the PK population are shown in Table 5E below.

**Table 5E**

Parameter (unit)	Statistic	Treatment Group	
		Test N=17	Reference N=17
C <sub>max</sub> (ng /mL)	Mean (SD)	41.7 (8.39)	42.4 (12.11)
AUC <sub>0-t</sub> (ng*h /mL)	Mean (SD)	252 (53.4)	248 (74.0)
AUC <sub>0-inf</sub> (ng*h/mL)	Mean (SD)	253 (53.9)	249 (74.5)
t <sub>max</sub> (h)	Median (Range)	2.50 (0.50-6.00)	2.00 (0.50-4.00)
t <sub>1/2</sub> (h)	Mean (SD)	4.78 (0.580)	4.66 (0.647)
K <sub>el</sub> (1/h)	Mean (SD)	0.147 (0.0184)	0.152 (0.0234)

10

[00178] The dissolution and pharmacokinetic results suggest the dosage form is identical in drug release rates compared with the reference drug product.

- 65 -

### Example 6

[00179] Formulations 6A (Drug Layered Granules), 6B (Eudragit E PO® coated  
5 Granules), and 6C (Tablets) were prepared in accordance with the following general procedure:

#### Procedure for Formulation 6A: Drug layer coating

10 Dissolve item #3 (povidone) into item #4 (water) to make a binder solution, and add item #2 (naloxone) into the binder solution to prepare a coating solution. Spray the above coating solution onto item# 1 (acetaminophen (APAP) Granules) using an appropriate spray dryer such as a Model GPCG-3 from Glatt Techniques.

15 Procedure for Formulation 6B: Eudragit E PO top layered Naloxone-APAP Granules (45% weight gain)

1. Use the drug layered APAP Granules as described in 5A for further coating.
2. Add item #3 and 4 (sodium lauryl sulfate (SLS) and Stearic acid) into item #6 (water) and keep mixing until dissolution.
- 20 3. Add item #2 (Eudragit E PO) into the above solution, keep mixing until a yellowish solution forms.
4. Add item #5 (Talc) into the above polymer solution and keep mixing for at least 30 minutes.
5. Load item#1 (drug layered APAP Granules) into a GPCG-3 fluid bed dryer, set  
25 up the machine and spray step #3 (coating suspension) at 5-15 g/minute. Collect samples as necessary.
6. After completing the spray process, continue to dry the granules for around 15 minutes at around  $40\pm 5^{\circ}\text{C}$ .
7. Collect the coated granules after passing through 40 mesh and 140 mesh screens  
30 to remove lumps and fines.

- 66 -

Procedure for Formulation 6C: Tablet containing Eudragit E PO top layered Naloxone-APAP Granules

1. Pass items #1-4 (Coated Naloxone-APAP Granules, Lactose, Pregelatinized Starch and Crospovidone) through a 20 Mesh screen and mix for 10 minutes.
2. Pass item #5 (Magnesium Stearate) through a 30 Mesh screen into the above blend and mix for about 3 minutes.
3. Compress into caplet shaped tablets at a target weight of about 750 mg and a target hardness of about 5-10 kp.

10

[00180] Tables 6A to 6C show the formulations for Formulations 6A to 6C, respectively. Table 6D shows the amounts of pregelatinized starch and crospovidone in various formulations prepared in accordance with Example 6C.

15

**Table 6A**

Ingredient		Liquid (g)	Solid (g)
1	APAP (Granules)		722.22

Example 7

[00181] Formulation 7 was prepared in accordance with the following general procedure:

5

Procedure:

1. Pass items #1-5 (Naloxone, APAP, Lactose, Pregelatinized Starch and Crospovidone) through a 20 Mesh screen and mix for about 10 minutes.
2. Pass item #6 (Magnesium Stearate) through a 30 Mesh screen into the above  
10 blend and mix for about 3 minutes.
3. Compress into caplet shaped tablets at a target weight of about 750 mg and a target hardness of about 5-10 kp.

[00182] Table 7 shows the formulation for Formulation 7. Table 7A shows the  
15 amounts of pregelatinized starch and crospovidone in various formulations prepared in accordance with Example 7.

**Table 7**

No.	Ingredients	mg/tab	Qty /Batch (g.)	%
1	Naloxone HCl Dihydrate	6.10	0.122	0.813
2	APAP (Granules)	361.11	7.22	48.15

<b>9</b>	1	5
<b>10</b>	1	15
<b>11</b>	2.5	5
<b>12</b>	2.5	15
<b>13</b>	5	5
<b>14</b>	5	15

**Example 8**

5

**[00183]** Dissolution was tested on Formulation 6B, Formulation 6C and Formulation 7 under the following conditions:

Method: USP apparatus 2 (Paddle)

10 Paddle speed: 50 rpm

Medium: Distilled water or 0.1N HCl

Volume: 900 mL

Sampling intervals: 5, 10, 15, 30, and 45 minutes

15 **[00184]** Tables 8A, 8B and 8C below (and Figures 5, 6 and 7) show the dissolution data of Formulations 6B, 6C and 7 in both water and 0.1N HCl.

**Table 8A (Formulation 6B: Eudragit E PO coated Naloxone-APAP Granules)**

Time (Minutes)	Dissolution of Naloxone-APAP in different media (%) (n=1)	
	Naloxone	
	Water	0.1N HCl
0	0	0
5	39	84
10	55	95
15	65	90
30	80	84
45	85	79

- [00185] Polymer Eudragit E PO coated Naloxone loaded APAP Granules (Formulation 6B) showed pH dependent dissolution profiles for Naloxone in varying dissolution media. Dissolution in 0.1N HCl releases >80% of Naloxone within 5 minutes. Dissolution in water is slower for Naloxone than in 0.1N HCl.

10 **Table 8B (Formulation 6C: Formulation containing Eudragit E PO coated Naloxone-APAP Granules, 1% Swelstar and 5% Crospovidone)**

Time (Minutes)	Dissolution of Naloxone-APAP in different media (%) (n=1)	
	Naloxone	
	Water	0.1N HCl
0	0	0
5	1	43
10	2	61
15	4	71
30	7	88
45	9	94

- [00186] Formulation 6C was prepared using coated Naloxone-APAP beads (Formulation 6B), 1% Swelstar, 5% Crospovidone and other excipients. The

- 71 -

dissolution in 0.1N HCl reaches 94% of Naloxone at 45 minutes. In water however, the dissolution study shows a release of 9% of Naloxone at 45 minutes.

**Table 8C (Formulation 7: Formulation containing uncoated Naloxone, APAP Granules, 5% Swelstar and 5% Crospovidone)**

Time (Minutes)	Dissolution of Naloxone-APAP in different media (%) (n=1)	
	Naloxone	
	Water	0.1N HCl
0	0	0
5	22	15
10	76	23
15	98	29
30	108	90
45	109	95

[00187] Formulation 7 was prepared using uncoated active agents (Naloxone and APAP), 5% Swelstar, 5% Crospovidone and other excipients. The dissolution in 0.1N HCl is slower than in water for Naloxone and suggests the gelling polymer alone may not be satisfactory enough to impart abuse deterrent properties based on preferential dissolution to the opioid combination drug product.

#### Example 9

[00188] Syringability and extractability of Oxycodone HCl Abuse-Deterrent Immediate Release tablets (Example 5A) of the present invention against Reference Listed Drug (RLD) product, Roxicodone® tablet (15mg) were evaluated. Roxicodone is a commercially available oxycodone hydrochloride immediate release tablets.

- 72 -

Materials and Equipment:

Small weigh boat

5 mL syringe

5 20 mL scintillation vial

Cotton

27&1/2 G needle

Clear glass mortar & pestle

Timer

10

Procedure:

Tablets were ground/blended using following method:

1. One (1) tablet or powder blend equivalence to one tablet was placed in a 2 oz. glass mortar.
- 15 2. The tablet was crushed and ground or blended 6-7 times using a glass pestle to break up the tablet or blend into small pieces.
3. The timer was started the pieces were ground using vigorous circular motions.
4. The material from the sides of the mortar was brought to the bottom by tapping the mortar on the counter while grinding.
- 20 5. Grinding continued for 1 minute to form a uniform fine powder.

[00189] 5 mL of appropriate extraction solvent was added to the vial and the timer started while shaking by hand for 30 seconds and then poured into a small weigh boat containing a pea-size piece of cotton. Using a 27&1/2 gauge needle and a 5 mL  
25 syringe, an attempt to syringe as much liquid as possible through the cotton was conducted and the volume aspirated during a 5 minute period (**T0 sample**) was recorded. Aspirated samples were submitted for assay. In cases of heated/boiled samples, the same instructions were followed above with heating the solution while shaking until it just starts to boil, then pour out into weigh boat containing cotton.

30

- 73 -

[00190] For the 10 minute time point (**T10 sample**): the same procedure as above was followed and the sampled boiled. Samples were allowed to remain in vial for 10 minutes before aspirating.

- 5 [00191] Extraction solvents used were Tap Water, Vinegar, 0.9% Saline and 40% Ethanol.

Results:

- 10 [00192] The following tables show the syringability and extraction study results on Oxycodone HCl Tablets 15mg in different medium.

**Table 9A. Syringability and Extraction study on Oxycodone HCl Tablets in Tap water (n=2)**

Sample	T0		T10	
	Extraction volume (ml)	Oxycodone extracted (%)	Extraction volume (ml)	Oxycodone extracted (%)
Roxicodone 15mg tablets (RLD)	4.6	77.4	Not needed; T0 exceeds Q value in Specifications	Not needed; T0 exceeds Q value in Specifications
Example 5A, 15mg	.4	8.44	3.60	28.57

- 74 -

**Table 9B. Syringability and Extraction study on Oxycodone HCl Tablets in Vinegar (n=2)**

Sample	T0		T10	
	Extraction volume (ml)	Oxycodone extracted (%)	Extraction volume (ml)	Oxycodone extracted (%)
Roxicodone 15mg tablets (RLD)	4.5	80.0	Not needed; T0 exceeds Q value in Specifications	Not needed; T0 exceeds Q value in Specifications
Example 5A, 15mg	0.15	4.42	3.10	46.83

**5 Table 9C. Syringability and Extraction study on Oxycodone HCl Tablets in 40% EtOH (n=2)**

Sample	T0		T10	
	Extraction volume (ml)	Oxycodone extracted (%)	Extraction volume (ml)	Oxycodone extracted (%)

Example 5A, 15mg	0.20	3.36	3.15	38.04

**Table 9D. Syringability and Extraction study on Oxycodone HCl Tablets in 0.9% Saline (n=2)**

Sample	T0		T10	
	Extraction volume (ml)	Oxycodone extracted (%)	Extraction volume (ml)	Oxycodone extracted (%)
Roxicodone 15mg tablets (RLD)	4.5	79.8	Not needed; T0 exceeds Q value in Specifications	Not needed; T0 exceeds Q value in Specifications
Example 5A, 15mg	0.85	3.78	1.80	15.30

10

[00193] Test formulation (Example 5A, 15mg) significantly improved both syringability and extractability compared with reference product (Roxicodone 15mg)

- 75 -

at T0 time point. The extraction volumes in different media were reduced from about 3.6-4.6 ml to a range of 0.15-1.4ml. Oxycodone extractions were also reduced from range of about 59.7-80.0% to range a range of 3.36-8.44%.

5

#### Example 10

### **Optimization Experiments**

#### Example 10A

10

[00194] Syringability and extractability of 15mg Naloxone HCl Blend (High dose Naloxone pellets with 1% Swelstar and 0.5% Xanthan Gum) was evaluated. The formulation was prepared in accordance with the above procedures (replacing a portion of Swelstar with Xanthan Gum) and is set forth in Table 10 below.

15

- 76 -

Table 10

Table : Example 10A: Naloxone Tablets (15 mg)				
No.	Ingredients	Percentage (%)	Quantity per batch (g)	Quantity per Tablet (mg)
1	Naloxone HCl	3.66	0.55	18.3
2	MCC Sphere (100-200 um)	35.18	5.28	175.90
3	Povidone K29/32, USP	1.41	0.21	7.05
4	Eudragit E PO	13.8	2.07	69
5	Sodium Lauryl Sulfate	1.38	0.21	6.9
6	Stearic acid	2.08	0.31	10.4
7	Talc	6.84	1.03	34.2
8	Lactose Monohydrate	18.35	2.75	91.75
9	Crospovidone	15.00	2.25	75
10	Swelstar MX-1	1.00	0.15	5
11	Xanthan Gum	0.50	0.08	2.5
12	Cab-O-Sil	0.50	0.08	2.5
13	FD&C No. 6 Yellow	0.05	0.01	0.25
14	Magnesium Stearate, NF	0.25	0.04	1.25
Total weight		100	15	500

[00195] Results were shown in Table 10A below.

**Table 10A. Syringability and Extraction study on the Naloxone HCl Tablets (60% weight gain of Eudragit EPO and 0.5% Xanthan gum) in different extraction media at T0 (n=2)**

Sample/Medium	Tap Water		0.9% Saline	
	Extraction volume (ml)	Naloxone extracted (%)	Extraction volume (ml)	Naloxone extracted (%)
Ex. 10A	<b>0.7</b>	<b>5.5</b>	<b>1.6</b>	<b>11.2</b>

[00196] Dissolution profiles of naloxone as a surrogate in this formulation are shown in Figure 11. Dissolution media and conditions were as follows: 500 ml Media, USP Apparatus 2 (Paddle), at 50 RPM. Drug loading was approximately 90% of the theoretical amount in tablets.

[00197] The formulations yield results demonstrating the use of a higher loading of the acid sensitive polymer Eudragit EPO at 60% and inclusion of 0.5% Xanthan Gum, coupled with the standard 1% Swelstar dramatically reduces extraction amounts of the opioid drug consistent with very low syringability results compared to other formulations as summarized below.

#### Example 10B

[00198] Syringability and extractability of 20mg Oxycodone HCl Blend (High dose Oxycodone pellets with different concentration of Swelstar) was evaluated. Results are shown in Tables 10B-10E below. The blends were prepared in accordance with example 5B except for the compression step.

**Table 10B. Syringability and Extraction study on 20mg oxycodone HCl blend in Tap water (n=2)**

Sample	T0		T10	
	Extraction volume (ml)	Oxycodone extracted (%)	Extraction volume (ml)	Oxycodone extracted (%)

10 [00200] The present invention is not to be limited in scope by the specific embodiments disclosed in the examples which are intended as illustrations of a few aspects of the invention and any embodiments that are functionally equivalent are within the scope of this invention. Indeed, various modifications of the invention in addition to those shown and described herein will become apparent to those skilled in the art and are intended to fall within the scope of the appended claims.

- 82 -

We claim:

1. An immediate release solid oral dosage form comprising a plurality of particles, each particle comprising:
  - 5 (i) an active agent; and
  - (ii) a material that is sensitive to acidic pH;wherein the dosage form releases at least about 70% of the active agent within 45 minutes as measured by in-vitro dissolution in a USP Apparatus 2 (paddle) at 50 rpm in 500 ml 0.1N HCl at 37° C.
- 10 2. The immediate release solid oral dosage form of claim 1, wherein the plurality of particles are dispersed in a matrix.
3. The immediate release solid oral dosage form of claim 2, wherein the matrix  
15 comprises a gelling agent.
4. The immediate release solid oral dosage form of claim 2 or 3, wherein the matrix comprises a disintegrant.
- 20 5. The immediate release solid oral dosage form of any one of claims 2, 3 or 4, wherein the matrix comprises a filler.
6. The immediate release solid oral dosage form of claim 1, wherein each particle comprises either (I) a core comprising the active agent and the material  
25 sensitive to acidic pH layered on the core; or (II) a core comprising a first active agent, a coating comprising a second active agent layered over the core and a material that is sensitive to acidic pH layered over the coated core.
7. The immediate release solid oral dosage form of claim 6, wherein the core  
30 comprises an inert excipient layered with the active agent.

- 83 -

8. The immediate release solid oral dosage form of claim 6, wherein the core comprises the active agent dispersed in a pharmaceutically acceptable excipient.
- 5 9. The immediate release solid oral dosage form of claim 1, wherein each particle comprises:
- (i) a core comprising an inert excipient; and
  - (ii) a coating comprising both the active agent and the material sensitive to acidic pH layered on the core.
- 10 10. The immediate release solid oral dosage form of claim 1, wherein each particle comprises the active agent dispersed in the material sensitive to acidic pH.
11. The immediate release solid oral dosage form of claim 10, wherein the
- 15 plurality of particles are in the form of a granulation.
12. The immediate release solid oral dosage form of claim 1, wherein the material sensitive to acidic pH is a polymer.
- 20 13. The immediate release solid oral dosage form of claim 12, wherein the polymer is soluble in a pH of between about 1 and about 5.
14. The immediate release solid oral dosage form of claim 12 or 13, wherein the polymer is insoluble in a pH of between about 6 and about 8.5.
- 25 15. The immediate release solid oral dosage form of claim 12, wherein the polymer is less soluble in a pH range of between about 6 and about 8.5 than a pH range of between about 1 and about 5.

- 84 -

16. The immediate release solid oral dosage form of claim 12, wherein the polymer is a polyacrylate, a polysaccharide, an ion exchange resin, or a mixture thereof.
- 5 17. The immediate release solid oral dosage form of claim 16, wherein the polymer is a polyacrylate.
18. The immediate release solid oral dosage form of claim 17, wherein the polyacrylate is a copolymer comprising methyl methacrylate and diethylaminoethyl  
10 methacrylate.
19. The immediate release solid oral dosage form of claim 17, wherein the polyacrylate is a copolymer comprising methyl methacrylate, butyl methacrylate and dimethylaminoethyl methacrylate.  
15
20. The immediate release solid oral dosage form of claim 16, wherein the polymer is a polysaccharide.
21. The immediate release solid oral dosage form of claim 20, wherein the  
20 polysaccharide is chitosan.
22. The immediate release solid oral dosage form of claim 16, wherein the polymer is an ion exchange resin.
23. The immediate release solid oral dosage form of claim 22, wherein the ion  
25 exchange resin is a polacrilex resin, a polacrilin salt, sodium polystyrene sulfonate, a cholestyramine resin or a mixture thereof.
24. The immediate release solid oral dosage form of claim 3, wherein the gelling  
30 agent is selected from the group consisting of sugars, sugar derived alcohols, starch,

- 85 -

starch derivatives, cellulose derivatives, attapulgites, bentonites, dextrans, alginates, carrageenan, gums, pectins, gelatin, kaolin, lecithin, magnesium aluminum silicate, carbomers, carbopols, polyvinylpyrrolidone, polyethylene glycol, polyethylene oxide, polyvinyl alcohol, silicon dioxide, curdlan, furcelleran, egg white powder,  
5 lacto albumin, soy protein, chitosan, surfactants, emulsifiers and mixtures thereof.

25. The immediate release solid oral dosage form of claim 3, wherein the gelling agent is selected from the group consisting of pregelatinized starch, hydroxyethylcellulose, guar gum, xanthan gum, alginate, carrageenan and mixtures  
10 thereof.

26. The immediate release solid oral dosage form of claim 3, wherein the viscosity of the dosage form mixed with from about 0.5 to about 10 ml of distilled water prevents the active agent from being systemically absorbed, or reduces the  
15 ability of the active agent to be systemically absorbed, when administered by the parenteral or nasal route.

27. The immediate release solid oral dosage form of claim 3, wherein the viscosity of the solid oral dosage form after crushing and mixing with from about 0.5  
20 to about 10 ml of distilled water prevents the active agent from being systemically absorbed, or reduces the ability of the active agent to be systemically absorbed, when administered by the parenteral or nasal route.

28. The immediate release solid oral dosage form of claim 26 or 27, wherein the  
25 viscosity after mixing with from about 0.5 to about 10 ml of distilled water is from about 10 cP to about 100 cP.

29. The immediate release solid oral dosage form of claim 26 or 27, wherein the  
30 viscosity after mixing with from about 0.5 to about 10 ml of distilled water is from about 25 cP to about 75 cP.

- 86 -

30. The immediate release solid oral dosage form of claim 4, wherein the disintegrant is selected from the group consisting of cross-linked sodium carboxymethylcellulose, starch, sodium starch glycolate, cross-linked  
5 polyvinylpyrrolidone and mixtures thereof.
31. The immediate release solid oral dosage form of claim 5, wherein the filler is a saccharide.
- 10 32. The immediate release solid oral dosage form of claim 31, wherein the saccharide is selected from the group consisting of sucrose, dextrose, lactose, fructose, mannitol, a cellulosic derivative and a mixture thereof.
33. The immediate release solid oral dosage form of claim 31, wherein the  
15 saccharide is lactose or microcrystalline cellulose.
34. The immediate release solid oral dosage form of claim 1 or 2, wherein each particle is layered with a barrier layer.
- 20 35. The immediate release solid oral dosage form of claim 34, wherein the barrier layer comprises a material selected from the group consisting of hydroxypropylmethylcellulose, polyvinyl alcohol, povidone and mixtures thereof.
36. The immediate release solid oral dosage form of claim 1, wherein the  
25 plurality of particles comprise a therapeutically effective amount of the active agent.
37. The immediate release solid oral dosage form of claim 1, wherein the active agent is selected from the group consisting of opioid agonists, tranquilizers, CNS depressants, CNS stimulants, sedative hypnotics, and mixtures thereof.

- 87 -

38. The immediate release solid oral dosage form of claim 1, wherein the active agent is an opioid agonist.

39. The immediate release solid oral dosage form of claim 38, wherein the opioid  
5 agonist is selected from the group consisting of codeine, morphine, oxycodone, oxymorphone, hydrocodone, hydromorphone, pharmaceutically acceptable salts thereof, and mixtures thereof.

40. The immediate release solid oral dosage form of claim 6, wherein the first  
10 active agent is a non-opioid analgesic and the second active agent is an opioid.

41. The immediate release solid oral dosage form of claim 40, wherein the non-opioid analgesic is acetaminophen, aspirin or ibuprofen or pharmaceutically acceptable salts thereof.

15

42. The immediate release solid oral dosage form of any one of claims 1, 2, 37 or 38, further comprising an aversive agent.

43. The immediate release solid oral dosage form of claim 42, wherein the  
20 aversive agent is contained in the plurality of particles and/or the matrix.

44. The immediate release solid oral dosage form of claim 42, wherein the aversive agent is selected from the group consisting of emetics, antagonists, bittering agents, irritants and mixtures thereof.

25

45. The immediate release solid oral dosage form of claim 44, wherein the aversive agent is an emetic selected from the group consisting of methyl cephaeline, cephaeline, emetine hydrochloride, psychotrine, O-methylpsychotrine, emetamine, ipecamine, hydro-ipecamine, ipecacunhic acid and mixtures thereof.

30

- 88 -

46. The immediate release solid oral dosage form of claim 44, wherein the emetic is ipecac.
47. The immediate release solid oral dosage form of claim 44, wherein the  
5 aversive agent is an antagonist selected from the group consisting of naltrexone, naloxone, nalmefene, cyclazacine, levallorphan, pharmaceutically acceptable salts thereof, and mixtures thereof.
48. The immediate release solid oral dosage form of claim 44, wherein the  
10 aversive agent is a bittering agent selected from the group consisting of flavor oils, flavoring aromatics, oleoresins, plant extracts, leaf extracts, flower extracts, fruit extracts, sucrose derivatives, chlorosucrose derivatives, quinine sulphate, denatonium benzoate and mixtures thereof.
- 15 49. The immediate release solid oral dosage form of claim 44, wherein the aversive agent is a bittering agent selected from the group consisting of spearmint oil, peppermint oil, eucalyptus oil, oil of nutmeg, allspice, mace, oil of bitter almonds, menthol and mixtures thereof.
- 20 50. The immediate release solid oral dosage form of claim 44, wherein the aversive agent is a bittering agent extracted from a fruit selected from the group consisting of lemon, orange, lime, grapefruit and mixtures thereof.
51. The immediate release solid oral dosage form of claim 44, wherein the  
25 aversive agent is denatonium benzoate.
52. The immediate release solid oral dosage form of claim 44, wherein the aversive agent is an irritant.

- 89 -

53. The immediate release solid oral dosage form of claim 52, wherein the irritant is a surfactant, capsaicin or a capsaicin analog.

54. The immediate release solid oral dosage form of claim 53, wherein the  
5 capsaicin analog is selected from the group consisting of resiniferatoxin, tinyatoxin, heptanoylisobutylamide, heptanoyl guaiacylamide, an isobutylamide, a guaiacylamide, dihydrocapsaicin, homovanillyl octylester, nonanoyl vanillylamide and mixtures thereof.

10 55. The immediate release solid oral dosage form of claim 53, wherein the surfactant is selected from the group consisting of poloxamer, a sorbitan monoester, a glyceryl monooleate, sodium lauryl sulfate and mixtures thereof.

15 56. The immediate release solid oral dosage form of claim 1, wherein the dosage form releases at least about 85% of the active agent within 45 minutes as measured by in-vitro dissolution in a USP Apparatus 2 (paddle) at 50 rpm in 500 ml 0.1N HCl at 37° C.

20 57. The immediate release solid oral dosage form of claim 1, wherein the dosage form releases at least about 90% of the active agent within 45 minutes as measured by in-vitro dissolution in a USP Apparatus 2 (paddle) at 50 rpm in 500 ml 0.1N HCl at 37° C.

25 58. The immediate release solid oral dosage form of claim 1, wherein the dosage form releases at least about 85% of the active agent within 60 minutes as measured by in-vitro dissolution in a USP Apparatus 2 (paddle) at 50 rpm in 500 ml 0.1N HCl at 37° C.

30 59. The immediate release solid oral dosage form of claim 1, wherein the dosage form releases at least about 90% of the active agent within 60 minutes as measured

- 90 -

by in-vitro dissolution in a USP Apparatus 2 (paddle) at 50 rpm in 500 ml 0.1N HCl at 37° C.

60. The immediate release solid oral dosage form of claim 1, wherein the dosage  
5 form releases at least about 95% of the active agent within 60 minutes as measured by in-vitro dissolution in a USP Apparatus 2 (paddle) at 50 rpm in 500 ml 0.1N HCl at 37° C.

61. The immediate release solid oral dosage form of claim 3, comprising the  
10 gelling agent in an amount from about 0.25% to about 50% (w/w) of the dosage form.

62. The immediate release solid oral dosage form of claim 61, comprising the  
15 gelling agent in an amount from about 0.25% to about 10% (w/w) of the dosage form.

63. The immediate release solid oral dosage form of claim 4, comprising the disintegrant in an amount from about 2% to about 25% (w/w) of the dosage form.

20 64. The immediate release solid oral dosage form of claim 63, comprising the disintegrant in an amount from about 2% to about 10% (w/w) of the dosage form.

65. The immediate release solid oral dosage form of claim 5, comprising the filler in an amount from about 15% to about 95% (w/w) of the dosage form.

25

66. The immediate release solid oral dosage form of claim 65, comprising the filler in an amount from about 25% to about 50% (w/w) of the dosage form.

67. The immediate release solid oral dosage form of claim 2, in the form of a  
30 compressed tablet.

- 91 -

68. The immediate release solid oral dosage form of claim 1 or 2, contained in a pharmaceutically acceptable capsule.

5 69. An immediate release solid oral dosage form comprising a plurality of particles, each particle comprising:

(i) an opioid agonist; and

(ii) a material that is sensitive to acidic pH;

wherein the plurality of particles are dispersed in a matrix comprising:

10 (i) a gelling agent; and

(ii) a disintegrant;

wherein the dosage form releases at least about 70% of the opioid agonist within 45 minutes as measured by in-vitro dissolution in a USP Apparatus 2 (paddle) at 50 rpm in 500 ml 0.1N HCl at 37° C; and

15 wherein the viscosity of the dosage form mixed with from about 0.5 to about 10 ml of distilled water prevents the opioid agonist from being systemically absorbed, or reduces the ability of the opioid agonist to be systemically absorbed, when administered by the parenteral or nasal route.

20 70. A process for preparing an immediate release solid oral dosage form comprising:

(i) preparing a plurality of particles, each particle comprising an active agent and a material that is sensitive to acidic pH; and

(ii) dispersing the plurality of particles into a matrix;

25 wherein the dosage form releases at least about 70% of the active agent within 45 minutes as measured by in-vitro dissolution in a USP Apparatus 2 (paddle) at 50 rpm in 500 ml 0.1N HCl at 37° C.

71. The process of claim 70, wherein the matrix comprises a gelling agent.

30

72. The process of claim 70 or 71, wherein the matrix comprises a disintegrant.

73. The process of any one of claims 70, 71 or 72, wherein the matrix comprises a filler.

5

74. The process of claim 70, wherein the particles are prepared by layering a core comprising the active agent with the material sensitive to acidic pH.

75. The process of claim 74, wherein the core comprises an inert excipient  
10 layered with the active agent.

76. The process of claim 74, wherein the core comprises the active agent dispersed in a pharmaceutically acceptable excipient.

15 77. The process of claim 70, wherein the particles are prepared by coating a core comprising an inert excipient with the active agent and the material sensitive to acidic pH.

78. The process of claim 70, wherein the particles are prepared by dispersing the  
20 active agent in the material sensitive to acidic pH.

79. A process for preparing an immediate release solid oral dosage form comprising:

25 (i) granulating an active agent and a material sensitive to acidic pH to obtain a granulation;

(ii) compressing the granulation into a tablet or containing the granulation in a capsule;

wherein the dosage form releases at least about 70% of the active agent within 45 minutes as measured by in-vitro dissolution in a USP Apparatus 2 (paddle)  
30 at 50 rpm in 500 ml 0.1N HCl at 37° C.

- 93 -

80. The process of claim 79, wherein the granulation and/or the compressed tablet further comprises a gelling agent, a disintegrant, a filler or a mixture thereof.

5 81. The process of claim 80, wherein the filler is spray-dried with a solution comprising the active agent and the material sensitive to acidic pH to obtain a spray-dried composition.

82. The process of claim 81, wherein the spray-dried composition is granulated  
10 with the gelling agent and the disintegrant.

83. A method of treating a disease or condition comprising administering to a patient in need thereof an immediate release solid oral dosage form according to any one of claims 1-70.

15

84. A method of treating pain comprising administering to a patient in need thereof, an immediate release solid oral dosage form according to any one of claims 38-41 and 79.

20 85. An immediate release solid oral dosage form comprising a plurality of particles, each particle comprising:

(i) an active agent; and

(ii) a material that is sensitive to acidic pH;

wherein the dosage form releases at least about 70% of the active agent

25 within 45 minutes as measured by in-vitro dissolution in a USP Apparatus 2 (paddle) at 50 rpm in 500 ml 0.1N HCl at 37° C.

86. An immediate release solid oral dosage form comprising a plurality of particles, each particle comprising:

30 (i) an opioid agonist; and

- 94 -

(ii) a material that is sensitive to acidic pH;

wherein the plurality of particles are dispersed in a matrix comprising:

(i) a gelling agent; and optionally

(ii) a disintegrant;

5 wherein the dosage form releases at least about 70% of the opioid agonist within 45 minutes as measured by in-vitro dissolution in a USP Apparatus 2 (paddle) at 50 rpm in 500 ml 0.1N HCl at 37° C; and provides a viscosity after mixing with from about 0.5 to about 10 ml of distilled water from about 10 cP to about 100 cP or from about 25 cP to about 75 cP.

10

87. The immediate release solid oral dosage form of claim 86 wherein the material that is sensitive to acidic pH provides for less dissolution of active agent from the dosage form in 500 ml distilled water after 5 minutes, preferably after 10 minutes as measured by in-vitro dissolution in a USP paddle Apparatus at 50 rpm and 37° C as compared to the dissolution in 900 ml.1 N HCl after 5 or 10 minutes, respectively, as measured by in-vitro dissolution in a USP basket Apparatus at 50 rpm and 37° C.

88. The immediate release solid oral dosage form of claim 87, wherein the ratio of the amount released in water to the amount released in 0.1N HCl is about 1:10 to less than 1:1; about 1:5 to about 9:10, about 3:10 to about 4:5, or about 2:5 to about 7:10 or about 1:2 to about 3:5. In other embodiments, the ratio is about 1:10, about 9:10, about 3:10, about 9:10, about 1:2, about 9:10, about 7:10; about 9:10 or about 4:5 to about 9:10. In other embodiments, the ratio is about 1:10, about 1:5, about 3:10, about 2:5, about 1:2, about 3:5, about 7:10; about 4:5 or about 9:10.

89. The immediate release solid oral dosage form of any one of claims 86 to 88, wherein the material that is sensitive to acidic pH is selected from the group of copolymers including amino-, and/or monoalkylamino-, and/or dialkylamino groups,

- 95 -

preferably a copolymer comprising methyl methacrylate, butylmethacrylate and demethylaminoethyl methacrylate.

90. The immediate release solid oral dosage form of any one of claims 86 to 89  
5 including a gelling agent selected from the group of sugars, sugar derived alcohols, starch and starch derivatives, cellulose derivatives, attapulgites, bentonites, dextrans, alginates, carrageenan, gums, pectin, gelatin, kaolin, lecithin, magnesium aluminum silicate, carbomers, carbopols, polyvinylpyrrolidone, polyethylene glycol, polyethylene oxide, polyvinyl alcohol, silicon dioxide, curdlan, furcelleran, egg  
10 white powder, lacto albumin, soy protein, chitosan, surfactants, mixed surfactant/wetting agent systems, emulsifiers, other polymeric materials, and mixtures thereof, preferably a mixture of pregelatinized starch and xanthan gum.

91. The immediate release solid oral dosage form of any one of claims 86 to 90  
15 wherein the viscosity of the dosage form mixed with from about 0.5 to about 10 ml of distilled water prevents the opioid agonist from being systemically absorbed, or reduces the ability of the opioid agonist to be systemically absorbed, when administered by the parenteral or nasal route.

20 92. The immediate release solid oral dosage form of any one of claims 86 to 91, wherein the active agent is susceptible to abuse.

93. The immediate release solid oral dosage form of any one of claims 86 to 91,  
25 wherein the active agent is an opioid analgesic.

94. The immediate release solid oral dosage form of any one of claims 86 to 91,  
wherein the active agent is oxycodone hydrochloride.

95. A process for preparing an immediate release solid oral dosage form  
30 comprising:

- 96 -

(i) preparing a plurality of particles, each particle comprising an active agent and a material that is sensitive to acidic pH; and

(ii) dispersing the plurality of particles into a matrix;

wherein the dosage form releases at least about 70% of the active agent

5 within 45 minutes as measured by in-vitro dissolution in a USP Apparatus 2 (paddle) at 50 rpm in 500 ml 0.1N HCl at 37° C.

96. A process for preparing an immediate release solid oral dosage form comprising:

10 (i) granulating an active agent and a material sensitive to acidic pH to obtain a granulation;

(ii) compressing the granulation into a tablet or containing the granulation in a capsule;

wherein the dosage form releases at least about 70% of the active agent

15 within 45 minutes as measured by in-vitro dissolution in a USP Apparatus 2 (paddle) at 50 rpm in 500 ml 0.1N HCl at 37° C.

97. A method of treating a disease or condition comprising administering to a patient in need thereof an immediate release solid oral dosage form according to any  
20 one of claims 85 to 91.

98. A method of treating pain comprising administering to a patient in need thereof, an immediate release solid oral dosage form according to any one of claims 86 to 91.

25

99. Use of an immediate release solid oral dosage form according to any one of claims 86 to 91 in a method of treating pain comprising administering said dosage form to a patient in need thereof.

- 97 -

100. Use of a polymer sensitive to acidic pH to impart tamper resistance in an immediate release solid oral dosage form.

101. Use of a polymer sensitive to acidic pH selected from the group of acrylic  
5 copolymers including amino-, and/or monoalkylamino-, and/or dialkylaminogroups to impart tamper resistance in an immediate release solid oral dosage form.

102. Use of a polymer sensitive to acidic pH in combination with a gelling agent to impart tamper resistance in an immediate release solid oral dosage form.
