DIAMINO-FUNCTIONAL CHALCONES

FIELD OF THE INVENTION

The present invention relates to a novel class of chalcone derivatives and analogues and to their use as pharmaceutically active agents, in particular against bacterial and parasitic infections.

Furthermore, the invention relates to a method of predicting whether a chemical compound has a potential inhibitory effect against an organism such as Helicobacter pylori and Plasmodium falciparum. The prediction is based on the ability of the chemical compound to act as an inhibitor of the enzyme dihydroorotate dehydrogenase which is involved in the synthesis of pyrimidine in prokaryotic as well as eukaryotic cells such as bacteria, parasites, fungi, helminths and any type of mammalian cells such as human cells.

BACKGROUND OF THE INVENTION

Chalcones, e.g., for use against parasitic infections are known from earlier patent applications assigned to the applicant, e.g. WO 93/17671 and WO 99/00114. Moderate antibacterial activity has been reported for a limited number of chalcones in earlier publications e.g. Haraguchi, H. et al Phytochemistry 1998, 48, 125-129 and Hatano, T. et al Chem. Pharm. Bull (Tokyo) 2000,48, 1286-92.

The bioavailability of the known, neutral chalcones is low/not detectable due to the low solubility of the compounds. The compounds do not typically dissolve in the intestine and are therefore not available for absorption.

The spread of antimicrobial resistance determinants particular among nosocomial bacterial pathogens is an increasing problem. Such resistant pathogens include Staphylococcus aureus resistant to methicillin and thus to all β-lactam-antibiotics and Enterococci resistant to vancomycin (VRE). Such resistant bacteria pose a significant therapeutic challenge and bacterial strains resistant to all currently available antimicrobials are emerging.

Furthermore, bacterial species intrinsically resistant to commonly employed antimicrobials are being recognized as important opportunistic pathogens in the setting of long-term immunocompromized patients. An example of this is Stenotrophomonas maltophilia which possesses a β-lactamase rendering the bacteria intrinsically resistant to carbapenems. As cross-resistance within a given class of antibiotics often occurs the development of new classes of antibiotics is a neccisity to counter the emerging threat of bacterial resistance.

The resistance of Plasmodium falciparum to chloroquine and other antimalarial drugs have created an urgent need for new drugs that are safe and effective for the prophylaxis and treatment of malaria.
Furthermore, the increasing appearance of resistance to first line antileishmanial drugs, e.g. Pentostam or Glucantime, emphasizes the need for new drugs for the treatment of Leishmania infections.

Thus, there is a need for chalcone derivatives with improved therapeutic or prophylactic activity against parasites and bacteria.

Figure 4 illustrates a time-kill curve of B143 against S.aureus ATCC29213. Bacterial growth is inhibited at concentrations at or above the MIC (MIC=9.4 μM). As CFU counts per ml decreases at concentrations of compound above the MIC, the compound is bactericidal. The reduction in CFU/ml is faster as the concentration of test compound increases above the MIC. This indicates that the bactericidal action of the compound is primarily dependent on the concentration of the test compound.

Figure 5 illustrates a time-kill curve of B041 against S.aureus ATCC29213. Bacterial growth is inhibited at concentrations of test compound at or above the MIC (MIC=9.4 μM). As CFU counts per ml decreases at concentrations of compound above the MIC, the compound is bactericidal. The rate of reduction of CFU/ml is not significantly affected by increasing concentrations of test compound. Thus, the bactericidal action of the compound is primarily dependent on incubation time.

DESCRIPTION OF THE INVENTION

The present inventors have found that the diamino-functional chalcones defined herein exhibit interesting biological properties combined with improved metabolic and physicochemical properties which make the compound useful as drug substances, in particular as antiparasitic agents, bacteriostatic agents, and bactericidal agents.

It is believed that the diamino group or groups of the diamino-functional chalcone will be charged according to pH of the medium and the pKa of the compound. The solubility of the charged compounds is many times higher than the solubility of the neutral compounds. As the diamino-functional chalcones will be partially charged (i.e. soluble) at the pH in the intestine, they will dissolve in the gastric juices and be available for absorption. The bioavailability of the diamino-functional chalcones will therefore be improved many times compared to the known neutral chalcones making the compounds generally useful as drug candidates. Also, the diamino-functional chalcones have different pKa values which enable the selection of a chalcone derivative with optimal charged/non-charged ratio at a given pH value.

The usefulness of the known chalcones as drug candidates have been limited by the metabolism of the compounds resulting in short half-lives in vivo. The inventors have now found that introduction of a diamino group in the chalcone derivative changes the metabolic properties and the compounds prepared show improved metabolic stability.

The introduction of an alifatic amino-group and hence a positive charge (at the pH value of the target site) affects the mode of interaction with the biological target. It is anticipated that the compounds interact with the target in a different way than neutral chalcones, due to the possibility of strong electrostatic interactions (attraction as well as repulsion). This is indeed reflected in the activity of the compounds, being more potent than the previously described neutral chalcones.

Of particular interest, the present inventors have found that the amino-functional chalcones defined herein are far more potent against malaria and leishmania parasites
than the earlier described neutral chalcone compounds, and that they exhibit excellent
bacteriocidal and bacteriostatic properties, even against multi-resistant bacteria strains.

Thus, the present invention provides chalcone derivatives and analogues as defined in

and salts thereof.

The substituents \( R^1 \) and \( R^2 \) carried by the one nitrogen atom of the diamino substituent,
and \( R^3 \) carried by the other nitrogen atom of the diamino substituent are believed to
slightly alter the pK\( a \) value of the chalcone derivative. Thus, the particular selection of the
groups \( R^1 \), \( R^2 \) and \( R^3 \) may be used to fine-tune the pK\( a \) value in view of the particular

In another embodiment, \(R^1\) and \(R^2\), together with the nitrogen atom to which they are attached \((-N(R^1)R^2)\), may form an optionally substituted nitrogen-containing heterocyclic ring.

In a further embodiment, \(R^3\) may be selected from hydrogen or methyl, in particular methyl.

In still a further embodiment, \(X^1\) and \(X^2\) may independently designate 0-4, such as 0-3, e.g. 0-2, substituents, where such optional substituents independently may be selected from optionally substituted \(C_{1-12}\)-alkyl, hydroxy, optionally substituted \(C_{1-12}\)-alkoxy, optionally substituted \(C_{2-12}\)-alkenylxoy, carboxy, optionally substituted \(C_{1-12}\)-alkylcarbonyl, formyl, \(C_{1-6}\)-alkylsulphonylamino, optionally substituted aryl, optionally substituted arylxoycarbonyl, optionally substituted arylxoy, optionally substituted arylcarbonyl, optionally substituted arylamino, arylsulphonlamino, optionally substituted heteroaryl, optionally substituted heteroarylaminio, optionally substituted heteroarylcarbonyl, optionally substituted heteroarylxoy, heteroarylsulphonylamino, optionally substituted heterocyolyl, optionally substituted heterocyloxy, optionally substituted heterocyloylamino, amino, mono- and di(\(C_{1-6}\)-alkyl)amino, carbamoyl, mono- and di(\(C_{1-6}\)-alkyl)aminocarbonyl, amino-\(C_{1-6}\)-alkyl-aminocarbonyl, mono- and di(\(C_{1-6}\)-alkyl)amino-\(C_{1-6}\)-alkyl-aminocarbonyl, \(C_{1-6}\)-alkylcarbonylamino, amino-\(C_{1-6}\)-alkyl-carbonylamino, mono- and di(\(C_{1-6}\)-alkyl)amino-\(C_{1-6}\)-alkyl-carbonylamino, guanidino, carbamido, \(C_{1-6}\)-alkylsulphonyl, \(C_{1-6}\)-alkylsulphonylamino, optionally substituted \(C_{1-6}\)-alkylthio, aminosulfonyl, mono- and di(\(C_{1-6}\)-alkyl)aminosulfonyl, or halogen, where any nitrogen-bound \(C_{1-6}\)-alkyl may be substituted with hydroxy, \(C_{1-6}\)-alkoxy, and/or halogen, in particular, \(X^1\) and \(X^2\) may independently designate 0-3, e.g. 0-2, substituents, where such optional substituents independently may be selected from optionally substituted \(C_{1-6}\)-alkyl, hydroxy, optionally substituted \(C_{1-6}\)-alkoxy, carboxy, optionally substituted \(C_{1-6}\)-alkylcarbonyl, \(C_{1-6}\)-alkylsulphonylamino, optionally substituted aryl, optionally substituted arylamino, arylsulphonylamino, optionally substituted heteroaryl, optionally substituted heteroarylaminio, heteroarylsulphonylamino, amino, mono- and di(\(C_{1-6}\)-alkyl)amino, carbamoyl, \(C_{1-6}\)-alkylcarbonylamino, guanidino, carbamido, optionally substituted \(C_{1-6}\)-alkylthio, optionally substituted heterocyolyl, optionally substituted heterocyloxy, optionally substituted heterocyloylamino or halogen, where any nitrogen-bound \(C_{1-6}\)-alkyl may be substituted with hydroxy, \(C_{1-6}\)-alkoxy, and/or halogen.

The group V is relevant with respect to the spatial orientation of the rings Ar\(^1\) and Ar\(^2\). Thus, the group V may be -CH\(_2\)-CH\(_2\)-, -CH=CH- or -C=C-. In a currently preferred embodiment V designates -CH=CH-.

In the context of the present invention the expression “chalcone derivative” has been assigned to the compounds of the above formula in that the overall structure namely Ar\(^1\)-C(=O)-C-C-Ar\(^2\) resembles that of the chalcone structure. This being said, Ar\(^1\) and Ar\(^2\) are
selected from aromatic rings and heteroaromatic rings. It is currently believed that particularly interesting compounds are those where at least one of Ar₁ and Ar², preferably both, are aryl, in particular phenyl. This being said, the inventors envisage that the functionality of the compounds may be substantially preserved (or even improved) when one or both of Ar₁ and Ar² are heteroaromatic rings.

In one embodiment, at least one of Ar₁ and Ar² is selected from thiazolyl, pyrrolyl, imidazolyl, pyrazolyl, pyridinyl, pyrimidinyl, pyrazinyl, pyridazinyl, thienyl, quinolyl, isoquinolyl, and indolyl.

In another embodiment, both of Ar₁ and Ar² are phenyl rings and Y¹ represent at least one diamino-functional substituent, e. g. m is 1 or 2, and p is 0..

In a further embodiment, X² represents at least one substituent selected from C₁₋₆-alkyl, C₁₋₆-alkoxy, C₁₋₆-alkylcarbonyl, optionally substituted aryl, optionally substituted aryloxy, optionally substituted arylamino, optionally substituted heteroaryl, optionally substituted heteroarylamino, mono- and di(C₁₋₆-alkyl)amino, C₁₋₆-alkylcarbonylamino, optionally substituted C₁₋₆-alkylthio, optionally substituted heterocyclyl, optionally substituted heterocyclylamino or halogen, in particular, X² represents at least two halogen atoms.

The Z group represents the biradical between the two nitrogen atoms of the diamino functionality. This group Z is typically a biradical -(C(R³)₃)₂)n⁻, wherein n is an integer in the range of 1-6, preferably 2-4, such as 2-3, where each R³ is independently selected from hydrogen and C₁₋₆-alkyl, or two R³ on the same carbon atom may designate =O. A particular example of Z is -(CH₂)₄⁻ wherein n is 2-4, such as 2-3.

Thus, in a particular embodiment, one of Y¹ and Y² represents a substituent of the formula

-NR³₂-(CH₂)₂₋₃-N(R¹)R²

wherein R³ is selected from hydrogen and methyl, and R¹ and R² are selected from hydrogen and C₁₋₆-alkyl. Furthermore, V is preferably -CH=CH₂, and Ar¹ and Ar² are optionally substituted phenyl.

In a further embodiment, one of Y¹ and Y² represents a substituent of the formula

-NR³₂-C(=O)-(CH₂)₁₋₄-N(R¹)R²

wherein R³ is selected from hydrogen and methyl, and R¹ and R² are selected from hydrogen and C₁₋₆-alkyl. Furthermore, V is preferably -CH=CH₂, and Ar¹ and Ar² are optionally substituted phenyl.
In one preferred embodiment, m is 1 and p is 0. In another preferred embodiment m is 0 and p is 1. In a further interesting embodiment, m and p are both 1.

In a still further interesting embodiment, one or both of \( X^1 \) and \( X^2 \) may independently designate one optionally substituted C\(_{1-12}\)-alkyl group of the formula

\[-A-N(R^1)R^m\]

wherein A is a biradical \(-\{C(R^m)\}_{n}\)\(-\), wherein n is an integer in the range of 1-6, preferably 1-4, such as 1-3, and each \( R^m \) is independently selected from hydrogen and C\(_{1-6}\)-alkyl, and \( R^1 \) and \( R^m \) may independently be selected from hydrogen, optionally substituted C\(_{1-12}\)-alkyl, optionally substituted C\(_{2-12}\)-alkenyl, optionally substituted C\(_{4-12}\)-alkadienyl, optionally substituted C\(_{6-12}\)-alkatrienyl, optionally substituted C\(_{2-12}\)-alkynyl, optionally substituted C\(_{1-12}\)-alkoxy carbonyl, optionally substituted C\(_{1-12}\)-alkyl carbonyl, optionally substituted aryl, optionally substituted aryl oxycarbonyl, optionally substituted aroylcarbonyl, optionally substituted aroyl, optionally substituted heteroaryl, optionally substituted heteroaryl oxycarbonyl, optionally substituted heteroaryl carbonyl, aminocarbonyl, mono- and di(C\(_{1-6}\)-alkyl)aminocarbonyl, amino-C\(_{1-6}\)-alkyl-aminocarbonyl, or mono- and di(C\(_{1-6}\)-alkyl)amino-C\(_{1-6}\)-alkyl-aminocarbonyl; or \( R^k \) and \( R^m \) together with the nitrogen atom to which they are attached (-N(R^k)R^m) may form an optionally substituted nitrogen-containing heterocyclic ring.

According to the present invention, highly preferred compounds of the general formula above may be selected from the group comprising:

While the above-mentioned group of compounds is intended to include all stereoisomers, including optical isomers, and mixtures thereof, as well as pure, partially enriched, or, where relevant, racemic forms, the embodiment in which the enone moiety has the $E$-configuration is generally preferred.

In another aspect the invention provides combinatorial libraries, mixtures and kits for screening compounds as defined above.

In one embodiment, a combinatorial library comprising at least two compounds of the general formula is provided. Such library may be in the form of an equimolar mixture, or in a mixture of any stoichiometry. Typical embodiments comprise at least two, such as at least 10, such as at least 100, such as at least 1000, such as at least 10000, such as at least 100000 compounds as defined above.

In another embodiment, combinatorial compound collections in the form of kits for screening for biologically or pharmacologically active compounds are provided. Such kits comprise at least two topologically distinct singular compounds of the general formula defined above. Typical kits comprise at least 10, such as at least 100, such as at least 1000, such as at least 10000, such as at least 100000 compounds as defined above. Kits are preferably provided in the form of solutions of the compounds in appropriate solvents.

Further provided are methods for screening for pharmacologically active compounds, especially bacteriostatic, bacteriocidal and antiparasitic agents, consisting of the steps of preparing a kit or library comprising at least two compounds of the general formula defined above, contacting said kit or library with a target molecule, such as a protein or nucleic acid, a target tissue, or a target organism, such as a bacterium or parasite, and detecting a biological or pharmacological response caused by at least one compound.

Optionally, the steps may be repeated as appropriate to achieve deconvolution.

Definitions

In the present context, the term "bacteriostatic" is intended to describe an antimicrobial activity of a test compound, characterized by an inhibition of bacterial growth in the absence of a reduction of viable bacteria (bacterial kill) during incubation with the test compound, as evidenced in the killing curve determination by a stationary number of colony forming units (CFU) during incubation time.

In the present context, the term "bacteriocidal" is intended to describe an antimicrobial activity of a test compound, characterized by the reduction of viable bacteria (bacterial kill) during incubation with the test compound, as evidenced in the killing curve determination by a reduction of colony forming units (CFU) during incubation time.
In the present context, the term "antiparasitic" is intended to describe the ability of a test compound to upon incubation in vitro with a culture of parasites, e.g. Leishmania major or Plasmodium falciparum, to inhibit metabolic labelling of the parasites by at least 50% compared to mock treated control cultures.

In the present context, the term "C_{1-12}-alkyl" is intended to mean a linear, cyclic or branched hydrocarbon group having 1 to 12 carbon atoms, such as methyl, ethyl, propyl, iso-propyl, cyclopropyl, butyl, tert-butyl, iso-butyl, cyclobutyl, penty, cyclopentyl, hexyl, cyclohexyl, etc. Analogously, the term "C_{4-6}-alkyl" is intended to mean a linear, cyclic or branched hydrocarbon group having 1 to 6 carbon atoms, such as methyl, ethyl, propyl, iso-propyl, penty, cyclopentyl, hexyl, cyclohexyl, and the term "C_{1,4}-alkyl" is intended to cover linear, cyclic or branched hydrocarbon groups having 1 to 4 carbon atoms, e.g. methyl, ethyl, propyl, iso-propyl, cyclopropyl, butyl, iso-butyl, tert-butyl, cyclobutyl.

Whenever the term "C_{1,12}-alkyl" is used herein, it should be understood that a particularly interesting embodiment thereof is "C_{1,4}-alkyl".

Similarly, the terms "C_{2-12}-alkenyl", "C_{4-12}-alkadienyl", and "C_{6-12}-alkatrienyl" are intended to cover linear, cyclic or branched hydrocarbon groups having 2 to 12, 4 to 12, and 6 to 12, carbon atoms, respectively, and comprising one, two, and three unsaturated bonds, respectively. As is evident from the formulae defined herein and the definitions associated therewith, embodiment of compounds of the present invention are chiral. Moreover, the presence of certain cyclic fragments or multiple stereogenic atoms provides for the existence of diastereomeric forms of some of the compounds. The invention is intended to include all stereoisomers, including optical isomers, and mixtures thereof, as well as pure, partially enriched, or, where relevant, racemic forms.

20 Embodiments where V is -CH=CH- may comprise E- and Z-stereoisomers, or mixtures of such isomers, which may exist in a dynamic equilibrium is solution. The E-isomers are generally preferred.

It should furthermore be understood that the compounds defined herein include possible salts thereof, of which pharmaceutically acceptable salts are of course especially relevant for the therapeutic applications. Salts include acid addition salts and basic salts. Examples of acid addition salts are hydrochloride salts, fumarate, oxalate, etc. Examples of basic salts are salts where the (remaining) counter ion is selected from alkali metals, such as sodium and potassium, alkaline earth metals, such as calcium salts, potassium salts, and ammonium ions ("N(R)₄⁺", where the R"s independently designates optionally substituted C₁-C₅-alkyl, optionally substituted C₂-C₅-alkenyl, optionally substituted aryl, or optionally substituted heteroaryl). Pharmaceutically acceptable salts are, e.g., those described in Remington's - The Science and Practice of Pharmacy, 20th Ed. Alfonso R. Gennaro (Ed.), Lippincott, Williams & Wilkins; ISBN: 0683306472, 2000, and in Encyclopedia of Pharmaceutical Technology. However, generally preferred salt forming agents for application in the present invention are organic dicarboxylic acids such as oxalic, fumaric, and maleic acid, and the like.

Thus, chalcones with diamino groups can be prepared in their salt-forms thereby making the compounds particularly useful for pharmaceutical formulations. The use of appropriate selected salt form can be used to control the dissolution rate in vivo. Furthermore, the
different salt forms have different bulk-properties which is of importance for the manufacturing process.

Preparation of compounds

The diamino-functional chalcones defined herein may be produced by methods known per se for the preparation of chalcones or methods which are analogous to such methods. Examples of excellent methods for preparing compounds of the 1,3-bis-aromatic-prop-2-enone or the 1,3-bis-aromatic-prop-2-ynone types are given in the following. Further examples of methods for the preparation of the compound used according to the present invention are described in WO 95/06628 and WO 93/17671 and in the references cited therein.

Compounds of the general formula I in which V is -CH=CH- can be prepared by reacting a ketone (an acetophenone in the case where Ar¹ is phenyl)

\[(Y^1)_m\text{-Ar}^1(X^1)\text{-C(=O)-CH}_3\]

with an aldehyde (a benzaldehyde in the case where Ar² is phenyl)

\[\text{HCO-Ar}^2(X^2)-(Y^2)_p\]

wherein Ar¹, Ar², X¹, X², Y¹, Y², m, and p refer to the definitions given elsewhere herein.

This reaction, which is a condensation reaction, is suitably carried out under acid or base catalysed conditions. A review of such processes may be found in Nielsen, A.T., Houlihahn, W.J., Org. React. 16, 1968, p 1-444. In particular the method described by Wattanasin, S. and Murphy, S., Synthesis (1980) 647 has been found quite successful. The reaction may suitably be carried out in protic organic solvents, such as lower alcohols (e.g. methanol, ethanol, or tert-butanol), or lower carboxylic acids (formic, glacial acetic, or propionic acid), or in aprotic organic solvents such as ethers (e.g. tetrahydrofuran, dioxane, or diethyl ether), liquid amines (e.g. dimethylformamide or hexamethylphosphoridiamide), dimethylsulfoxide, or hydrocarbons (e.g. toluene or benzene), or mixtures of such solvents. When carrying out the reaction under base catalysed conditions, the catalyst may be selected from sodium, lithium, potassium, barium, calcium, magnesium, aluminum, ammonium, or quaternary ammonium hydroxides, lower alkoxides (e.g. methoxides, ethoxides, tert-butoxides), carbonates, borates, oxides, hydrides, or amides of lower secondary amines (e.g. diisopropyl amides or methylphenyl amides). Primary aromatic amines such as aniline, free secondary amines such as dimethyl amine, diethyl amine, piperidine, or pyrrolidine as well as basic ion exchange resins may also be used.

Acid catalysts may be selected from hydrogen chloride, hydrogen bromide, hydrogen iodide, sulfuric acid, sulfonic acids (such as paratoluenesulfonic or methanesulfonic acid), lower carboxylic acids (such as formic, acetic or propionic acid), lower halogenated
carboxylic acids (such as trifluoroacetic acid), Lewis acids (such as BF$_3$, POCl$_3$, PCl$_5$, or FeCl$_3$), or acid ion exchange resins.

A drawback of the base catalysed condensation is the poor yield obtained if the aromatic ring in which the ketone or the aldehyde or both is substituted with one or more hydroxy groups. This drawback can be overcome by masking the phenolic group as described by T. Hidetsugu et al. in EP 0 370 461. Deprotection is easily performed by mineral acids such as hydrochloric acid.

The reaction is typically carried out at temperatures in the range of 0-100°C, e.g. at room temperature. Reaction times are typically from 30 min to 24 hours.

The starting materials for the synthesis (acetophenone and aldehyde), may be obtained from chemical sources or may be synthesised according to well-known methods. The diamino-benzaldehydes can be synthesized by Palladium catalysed reaction of bromobenzaldehyde diethyl acetal and diamine followed by acidic work up. Alternatively, the 2-diamino-benzaldehydes can be prepared by nucleophilic aromatic substitution using 2-fluorobenzaldehyde and diamine. The diamino-acetophenones can be synthesized by Palladium catalysed reaction of bromoacetophenone ketal and diamine followed by acidic work up. Alternatively the 2′-diamino-acetophenones can be synthesized by nucleophilic aromatic substitution using 2′-fluoracetophenone and diamine.

Compounds of the general formula I in which V is -C=C- may be prepared by reacting an activated derivative of a carboxylic acid of the general formula

$$(Y^1)_m$\text{-Ar}^1(X^1)^p$-COOH

with an ethyne derivative

$$\text{H-C=\text{C}}\text{-Ar}^2(X^2)^p(Y^2)_n$$

wherein $\text{Ar}^1$, $\text{Ar}^2$, $X^1$, $X^2$, $Y^1$, $Y^2$, $m$, and $p$ refer to the definitions given elsewhere herein.

Reactions of this type are described by Tohda, Y., Sonogashihara, K., Hagihara, N., Synthesis 1977, p 777-778. It is contemplated that the activated derivative of the carboxylic acid may be an activated ester, an anhydride or, preferably, an acid halogenide, in particular the acid chloride. The reaction is normally carried out using the catalysts described by Tohda, Y. et al. cited above, namely copper(I)iodide/triphenylphosphine-palladium dichloride. The reaction is suitably carried out in triethylamine, a mixture of triethylamine and pyridine or triethylamine and toluene under a dry inert atmosphere such as nitrogen or argon. The reaction is generally carried out at reduced temperature such as in the range from -80°C to room temperature, the reaction time typically being from 30 minutes to 6 hours.
In the above reactions, it may be preferred or necessary to protect various sensitive or reactive groups present in the starting materials to prevent said groups from interfering with the reactions. Such protection may be carried out in a well-known manner, e.g. as described in "Protective Groups in Organic Chemistry" by Wuts and Greene, Wiley-Interscience; ISBN: 0471160199; 3rd edition (May 15, 1999). For example, in the reaction between the activated acid derivative and the acetylene derivative, a hydroxy group on Ar¹ and/or Ar² may be protected in the form of the methoxymethyl ether, N,N-dimethylcarbamoyl ester, or allyl ether. The protecting group may be removed after the reaction in a manner known per se.

The ethyne derivative may be prepared by standard methods, e.g. as described by Nielsen, S. F. Et al., Bioorg. Med. Chem. 6, pp 937-945 (1998). The carboxylic acids may likewise be prepared by standard procedures, e.g. as described by Nakayama, T. Chem. Pharm. Bull. 41, pp 117-125 (1993).

Compounds of the general formula I in which V is –CH₂–CH₂– can be prepared by ionic hydrogenation of the corresponding α,β-unsaturated compound where V is –CH=CH₂ as it has been described by the inventors in Nielsen, S.F. et al. Tetrahedron, 53, pp 5573-5580 (1997). Alternatively, it is possible to prepare such compounds from the corresponding fluoro (or bromo) chalcones using H₂/Pt followed by nucleophilic aromatic amination (see Figure 3).

Further possible synthetic routes for the preparation of the saturated variants are described in "Advanced Organic Chemistry" by Jerry March, 3rd ed. (especially chapter 15, pages 691-700) and references cited therein. Thus, it is possible to obtain a large variety of compounds of the 1,3-bis-aromatic-propan-1-one type from the corresponding prop-2-en-1-ones.

Formulation of pharmaceutical compositions

The chalcone derivatives are typically formulated in a pharmaceutical composition prior to use as a drug substance.

5

The administration route of the compounds (diamino-functional chalcones) as defined herein may be any suitable route which leads to a concentration in the blood or tissue corresponding to a therapeutic concentration. Thus, e.g., the following administration routes may be applicable although the invention is not limited thereto: the oral route, the parenteral route, the cutaneous route, the nasal route, the rectal route, the vaginal route and the ocular route. It should be clear to a person skilled in the art that the administration route is dependant on the particular compound in question, particularly, the choice of administration route depends on the physico-chemical properties of the compound together with the age and weight of the patient and on the particular disease or condition and the severity of the same.

10

The compounds as defined herein may be contained in any appropriate amount in a pharmaceutical composition, and are generally contained in an amount of about 1-95% by weight of the total weight of the composition. The composition may be presented in a dosage form which is suitable for the oral, parenteral, rectal, cutaneous, nasal, vaginal and/or ocular administration route. Thus, the composition may be in form of, e.g., tablets, capsules, pills, powders, granulates, suspensions, emulsions, solutions, gels including hydrogels, pastes, ointments, creams, plasters, drenches, delivery devices, suppositories, enemas, injectables, implants, sprays, aerosols and in other suitable form.

15

The pharmaceutical compositions may be formulated according to conventional pharmaceutical practice, see, e.g., "Remington's Pharmaceutical Sciences" and "Encyclopedia of Pharmaceutical Technology", edited by Swarbrick, J. & J. C. Boylan, Marcel Dekker, Inc., New York, 1988. Typically, the compounds defined herein are formulated with (at least) a pharmaceutically acceptable carrier or excipient. Pharmaceutically acceptable carriers or excipients are those known by the person skilled in the art.

20

Thus, the present invention provides a pharmaceutical composition comprising a compound as defined herein in combination with a pharmaceutically acceptable carrier.

Pharmaceutical compositions according to the present invention may be formulated to release the active compound substantially immediately upon administration or at any substantially predetermined time or time period after administration. The latter type of compositions are generally known as controlled release formulations.

25

In the present context, the term "controlled release formulation" embraces i) formulations which create a substantially constant concentration of the drug within the body over an extended period of time, ii) formulations which after a predetermined lag time create a
substantially constant concentration of the drug within the body over an extended period of time, iii) formulations which sustain drug action during a predetermined time period by maintaining a relatively, constant, effective drug level in the body with concomitant minimization of undesirable side effects associated with fluctuations in the plasma level of the active drug substance (sawtooth kinetic pattern), iv) formulations which attempt to localize drug action by, e.g., spatial placement of a controlled release composition adjacent to or in the diseased tissue or organ, v) formulations which attempt to target drug action by using carriers or chemical derivatives to deliver the drug to a particular target cell type.

Controlled release formulations may also be denoted "sustained release", "prolonged release", "programmed release", "time release", "rate-controlled" and/or "targeted release" formulations.

Controlled release pharmaceutical compositions may be presented in any suitable dosage forms, especially in dosage forms intended for oral, parenteral, cutaneous nasal, rectal, vaginal and/or ocular administration. Examples include single or multiple unit tablet or capsule compositions, oil solutions, suspensions, emulsions, microcapsules, microspheres, nanoparticles, liposomes, delivery devices such as those intended for oral, parenteral, cutaneous, nasal, vaginal or ocular use.

Preparation of solid dosage forms for oral use, controlled release oral dosage forms, fluid liquid compositions, parenteral compositions, controlled release parenteral compositions, rectal compositions, nasal compositions, percutaneous and topical compositions, controlled release percutaneous and topical compositions, and compositions for administration to the eye can be performed essentially as described in the applicant's earlier International application No. WO 99/00114, page 29, line 9, to page 40, line 3. Also, and more generally, the formulation and preparation of the above-mentioned compositions are well-known to those skilled in the art of pharmaceutical formulation. Specific formulations can be found in "Remington's Pharmaceutical Sciences".

Dosages

The compound are preferably administered in an amount of about 0.1-50 mg per kg body weight per day, such as about 0.5-25 mg per kg body weight per day.

For compositions adapted for oral administration for systemic use, the dosage is normally 2 mg to 1 g per dose administered 1-4 times daily for 1 week to 12 months depending on the disease to be treated.

The dosage for oral administration for the treatment of parasitic diseases is normally 1 mg to 1 g per dose administered 1-2 times daily for 1-4 weeks, in particular the treatment of malaria is to be continued for 1-2 weeks whereas the treatment of leishmaniasis will normally be carried out for 3-4 weeks.
The dosage for oral administration for the treatment of bacterial diseases is normally 1 mg to 1 g per dose administered 1-4 times daily for 1 week to 12 months; in particular, the treatment of tuberculosis will normally be carried out for 6-12 months.

The dosage for oral administration of the composition in order to prevent diseases is normally 1 mg to 75 mg per kg body weight per day. The dosage may be administered once or twice daily for a period starting 1 week before the exposure to the disease until 4 weeks after the exposure.

For compositions adapted for rectal use for preventing diseases, a somewhat higher amount of the compound is usually preferred, i.e. from approximately 1 mg to 100 mg per kg body weight per day.

For parenteral administration, a dose of about 0.1 mg to about 50 mg per kg body weight per day is convenient. For intravenous administration a dose of about 0.1 mg to about 20 mg per kg body weight per day administered for 1 day to 3 months is convenient. For intraarticular administration a dose of about 0.1 mg to about 20 mg per kg body weight per day is usually preferable. For parenteral administration in general, a solution in an aqueous medium of 0.5-2% or more of the active ingredients may be employed.

For topical administration on the skin, a dose of about 1 mg to about 5 g administered 1-10 times daily for 1 week to 12 months is usually preferable.

In many cases, it will be preferred to administer the compound defined herein together with another antiparasitic, antimycotic or antibiotic drug, thereby reducing the risk of development of resistance against the conventional drugs, and reducing the amount of each of the drugs to be administered, thus reducing the risk of side effects caused by the conventional drugs. Important aspects of this is the use of the compound against Leishmania, where the compound I is combined with another antileishmanial drug, or the antimalarial use of the compound I where the compound I is used together with another antimalarial drug.

Method of prediction

In a separate aspect, the present invention also provides a method of predicting whether a chemical compound has a potential inhibitory effect against a microorganism selected from Helicobacter pylori and Plasmodium falciparum, said method comprising preparing a mixture of a dihydroorotate dehydrogenase, a substrate for dihydroorotate dehydrogenase and the chemical compound, measuring the enzymatic activity of dihydroorotate dehydrogenase (A), comparing the enzymatic activity of dihydroorotate dehydrogenase (A) with the standard activity of dihydroorotate dehydrogenase (B) corresponding to the activity of a dihydroorotate dehydrogenase in a similar sample, but without the chemical compound, predicting that the chemical compound has a potential inhibitory effect against Helicobacter pylori and Plasmodium falciparum if A is significantly lower than B.
The method can be performed as described under DHODH Assay in the Examples section. It should be noted that the method is not only applicable for the chalcone derivatives defined herein, but can be generally applied to predict the potential inhibitory effect of any compound. Preferably, however, the chemical compound is a chalcone derivative, e.g. a chalcone derivative as defined herein.

Determination of metabolic stability

Incubations were performed with Wistar rat liver microsomes (0.25 mg/ml) in 2% sodium bicarbonate solution. NADP (0.13 mg/ml), glucose-6-phosphate (0.63 mg/ml) and glucose-6-phosphate dehydrogenase (0.38 units/ml) were used as NADPH generation system and UDPGA (0.48 mg/ml) was added to include the phase II reaction, glucuronic acid conjugation, in the assay. After 5 minutes of pre-incubation the reaction was started by addition of the test article to give a final concentration of 20µM. Samples were incubated for 15 min at 37°C and the reactions were terminated by addition of equal volumes of acetonitrile. Blank incubations were performed at the same concentration but without addition of microsomes. Both blank and microsome-containing samples were made in replicates of three. Prior to analysis samples were centrifuged for 10 min. at 3500 rpm,HPLC system:

The fraction of compound metabolised during the 15 min of incubation was determined by comparison of blank and microsome-containing samples using a Waters Alliance 2690 separation module and Waters 996 PDA-detector(Waters. Milford, MA, USA.) Separation was performed on a XTerra MS C18 column (150*2.1 mm I.D., 3,5 µm particle size) (Waters Milford, MA, USA) by. Initial conditions were 40% mobile phase A (acetonitrile) and 60% mobile phase B (10 mM ammonium acetate pH 9.5). During the first 20 minutes, the mobile phase was changed via a linear gradient to 90% A and 10% B. This was followed by a 5 minutes linear gradient to initial conditions, which were maintained for 5 min. The flow rate was 0.20 ml/min and injection volume 10 µl.

Determination of solubility

Solubility of the compounds was determined by preparing a saturated solution of compound in 0.3 M phosphate buffer (pH 7.4 ± 0.3) in a brown glass tube. The suspensions were rotated slowly for 24 hours. Aliquots were centrifuged for 10 minutes at 14,000 rpm and supernatants were diluted in 40% (v/v) acetonitrile in water prior to HPLC analysis. Concentrations of analytes were quantified against a standard curve and used as term of solubility.

The HPLC-UV method used for the assessment of solubility is the same as used in the in vitro metabolism assay.

Pharmacokinetic Studies

Evaluation of the pharmacokinetic properties of the compounds was done using female NMRI mice (weighing app. 30 g). Test articles were administrated intravenously and orally as a cassette dose formulation containing three compounds or as individual compounds. Samples of serum were taken at defined timepoints.

Standards and QC-samples in plasma were prepared and the serum concentrations of the test compounds quantified by HPLC-MS.
Prior to analysis, proteins were precipitated by deluding the samples (1:1) (v/v) with 100 % acetonitrile followed by centrifugation at 14,000 rpm in 10 min. The supernatant was used for the analysis.

5 HPLC-MS system:

A Waters Alliance HPLC-system (Milford, MA, USA) was coupled to a Quatro Micro triple quadrupol mass spectrometer (Micromass, Manchester, UK) operating in positive (ESI) mode. Separation was performed on a X Terra MS C18 column (150*2.1 mm I.D., 3.5 μm particle size) (Waters Milford, MA, USA).

A linear gradient to 10% A and 90 % B this was maintained till 11 min, 11-13 linear gradient to 70% A and 30% B this was maintained till 18 min. The flow rate was 0.20 ml/min, injection volume 10 μl.

15 Biological testing

General methods

In vitro microbiological testing

20 MIC determination in broth microdilution assay

Compounds were screened for activity against a panel of 10 different non-fastidious bacteria growing aerobically (Staphylococcus aureus ATCC29213; Staphylococcus aureus ATCC33591; Staphylococcus intermedii #2357 (clinical isolate from the Copenhagen area); Enterococcus faecalis ATCC29212; Enterococcus faecium #17501 (vancomycin-resistant clinical isolate); Streptococcus pneumoniae #998 (clinical isolate); Streptococcus pyogenes #14813 (clinical isolate); Streptococcus agalactiae #19855 (clinical isolate); Escherichia coli ATCC29522 and Escherichia coli ESS). The screening assay was done in 200 μl MH-broth cultures in microtitre plates. For compounds exhibiting activity in the initial screen MIC was determined in a microdilution assay using MH-broth as described by NCLLS (National Committee for Clinical Laboratory Standards. Methods for Dilution Antimicrobial Susceptibility Tests for Bacteria That Grow Aerobically; Approved Standard – Fifth Edition. M7-A5 NCCLS 2000) modified to include uninoculated dilution series of test compounds to facilitate MIC determination if the test compound should precipitate. MIC was determined as the lowest concentration of test compound able to inhibit visible growth of bacteria. MICs for ATCC type strains fell within the limits posted by the NCCLS (National Committee for Clinical Laboratory Standards. Performance Stadards for Antimicrobial Susceptibility Testing; Eleventh Informational Supplement. M100-S11 NCCLS 2001) when tested against vancomycin, tetracycline, gentamycin.

MIC and MBC determination in broth macrodilution assay
MIC and MBC of test compounds were determined in a broth macrodilution assay using 2 ml MH-broth cultures and an inoculum of approximately 5x10E5 CFU/ml as described by Amsterdam (Amsterdam, D. Susceptibility testing of antimicrobials in liquid media. In V.Lorian (ed.): Antibiotics in Laboratory Medicine 4. edition. Williams & Wilkins 1996). MIC was determined as the minimal concentration of test compound able to inhibit visible growth of bacteria. Samples from cultures inhibited by test compound were plated onto unselective blood agar plates. MBC was determined as the minimal concentration of test compound able to decrease colony count on these plates below 0.1% compared to the original inoculum.

**Killing Curve determination**

For the determination of the killing curve of a test compound a dilution series of test compound was made and inoculated with approximately 5x10E5 CFU/ml as described for the MIC macrodilution assay above. At the timepoints indicated 100 µl samples were withdrawn from the test tubes, serially diluted and spotted in duplicate on unselective agar plates to determine CFU. Test compounds with bactericidal activity is capable of decreasing surviving colony counts (CFU/ml) when incubated with bacteria. Bactericidal activity may be either primarily dependent on concentration of test compound or on incubation time with test compound. An example of a bactericidal compound (B143), which is primarily dependent on the concentration of the test compound is shown in Figure 4. An example of a bactericidal compound (B041) which is primarily dependent on the incubation time with the compound is shown in Figure 5.

**MIC determination against Helicobacter pylori**

Six strains of *Helicobacter pylori* were used in an agar dilution assay according to the standards of NCCLS (National Committee for Clinical Laboratory Standards. Methods for Dilution Antimicrobial Susceptibility Tests for Bacteria That Grow Aerobically; Approved Standard – Fifth Edition. M7-A5 NCCLS 2000). MH-agar plates supplemented with 5% horse blood and containing a dilution series of the test compound were inoculated in duplicate with 10 µl spots of a 2 Mcf suspension of the different strains of *H. pylori*. This inoculum corresponds to approximately 10E6 CFU/spot. Plates were then incubated in a microaerophilic atmosphere at 35°C for 72 hours. The MIC endpoint was determined as the lowest concentration of test compound able to completely inhibit or most significantly reduce growth compared to growth control plates not containing test compounds.

**Activity determination against anaerobic bacteria**

Screening for activity against anaerobic bacteria was done against two isolates of *Bacteroides fragilis*, an isolate of *Clostridium difficile* and an isolate of *Clostridium perfringens* in an agar dilution assay as described by NCCLS (National Committee for Clinical Laboratory Standards. Methods for Antimicrobial Susceptibility Testing of Anaerobic Bacteria; Approved Standard – Fifth Edition. M11-A5 NCCLS 2000) with the exception that
Mueller-Hinton agar was used in place of supplemented Brucella broth. Plates containing test compound at a single concentration (either 100 or 150 μM) were prepared in duplicate along with appropriate control plates. Activity was present if growth in the presence of test substance was absent or most significantly reduced compared to growth control plates not containing test compound.

*Leishmania promastigote assay*

A WHO reference vaccine strain of *L. major* originally isolated from a patient in Iran were cultured in Medium 199 with Hanks’ Salts containing 0.02 mg/ml gentamycin, 25 mM HEPES, 4 mM L-glutamine, and 10% heat inactivated fetal calf serum (FCS). Incubation was carried out at 27°C. Promastigotes were harvested at day 3 of culture and used for the assay of inhibition of parasite growth. The effect of test compounds on promastigotes was assessed by a method modified from Pearson et al. Briefly, promastigotes (0.8x10^7/well) were incubated in 200 µl duplicate cultures either with a dilution series of test compound or medium alone in 96 wells flat bottom microtiter plates. After 2h of incubation, 1.5 µCi of 3H-thymidine was added to each well and further incubated for 18 hours. The cultures were then harvested on Unifilter-GF/C microtiter filter plates (Packard Instruments), washed extensively and counted in a TopCount-NXT microplate scintillation counter (Packard Instruments).

*Plasmodium falciparum assay*

*Plasmodium falciparum* 3D7 was maintained in culture by a modification of the method originally described by Trager and Jensen. In brief, the parasites were grown in suspensions of human blood group 0 erythrocytes (RBC) maintained in RPMI1640 medium supplemented with 4.5 g/l Albumax II (Invitrogen), 10 mM hypoxantine, 1.4 mM L-glutamine and 0.05 mg/ml gentamicin. Cultures were incubated at 37°C in atmosphere of 92.5% nitrogen, 5.5% carbon dioxide, and 2% oxygen. To obtain synchronized cultures og parasites erythrocytes infected with late trophozoite and schizont stages were separated from ring stages and uninfected RBC by magnet-activated cell sorting (MACS; Miltenyi Biotec) (Staal soo, T., H.A. Giha, D. Dodoo, T.G. Theander, and L. Hvid. 1999. Detection of antibodies to variant antigens on *Plasmodium falciparum*-infected erythrocytes by flow cytometry. Cytometry 35:329-336). Because of their high content of paramagnetic haemoglobin, erythrocytes infected with late developmental stages of malaria parasites are specifically retained within the column. The column was washed with PBS supplemented with 2% foetal calf serum and then the column was removed from the magnet and the retained late developmental stages of parasites were eluted and cultured for an additional 18 hours. At this time the culture is highly synchronous containing more than 90% ring stages.

These synchronized cultures of ring stage parasites were used to assay for antimalarial parasites. Briefly, cultures of ring stage parasites were adjusted to 1% parasitemia by addition of uninfected RBC. Then, these were incubated in 125 µl duplicate cultures
containing 2.5x10^7 RBC/well with either a dilution series of test compound or with medium alone. Plates were then incubated at 37°C for 24 hours when cultures were labelled by the addition 1.1 μCi 3H-phenyalanine and incubated overnight. Then, the cultures were harvested on UniFilter-GF/C microfilter plates (Packard Instruments) and washed extensively with water followed by a wash with 10% H_2O_2 to bleach hemoglobin. Filter plates were counted in a TopCount-NXT microplate scintillation counter (Packard Instruments).

DHODH Assay

100 μl chalcone or 0.1 M Tris-HCl pH 8.0 is added to a well in a 96-wells microtiter plate. Then 50 μl enzyme dilution is added. The microtiter plate is placed in the Powerwave_s430 and the enzymatic reactions starts when adding 100 μl assay mixture. The reaction are measured every 20 sec. for 10 min. The samples with chalcones are compared with the samples with 0.1 M Tris-HCl pH 8.0 and the percent inhibition is calculated.

Enzyme dilution: The solution of recombinant purified enzyme is dissolved in 0.1 M Tris-HCl pH 8 to give an initial velocity of 0.04 - 0.05 ΔA/min.

2,6-dichlorophenolindophenol (DCIP)-stock solution: 40 mg DCIP and 10 ml 99 % Ethanol are mixed for 10 min at RT. Then 100 μl 1.0 M Tris-HCl pH 8 and miliQ H_2O are added to a final volume of 100 ml. The A_600 of the DCIP-stock solution are measured in a microtiter plate on the Powerwave_s430 (Bio-Tek instruments, Inc.)

Dihydoorotot dehydrogenase (DHODH)-stock solution: 25 mM dihydroorotate stock-solution is prepared by first dissolving in the same amount of mol NaOH and then miliQ H_2O is added to the final volume.

Assay mix (10 ml solution): 600 μl of DHODH-stock solution and X ml (depending on the A_600 value of stock-solution) DCIP to a final A_600 = 2.5 are mixed. Then 0.1 M Tris-HCl pH 8.0 are added to a final volume of 10 ml.

Preparation of compound soluton: A 10 mM stock-solution of compound (e.g. a chalcone derivative) is made in dimethysulfoxid (DMSO). The compound is then diluted in 0.1 M Tris-HCl pH 8 to the test concentrations. The final DMSO concentration in the sample is 10%

35 Effect of Chalcones Following Multiple Intra venous Administration in Plasmodium berghei K173 Infected NMRI Female Mice.

Animals in groups of 6 were inoculated intra peritoneally with 1x10^6 infected red blood cells (RBC). On day 4 after infection, when the parsitaemia was 2-5%, treatment was initiated and the animals were dosed, according to the body weight recorded, once daily for 3 consecutive days (day 4-7). The doses stated were administered intra venously as solutions in a suitable vehicle. Parasitaemia, as percentage infected blood cells, was determined by counting 500 RBCs in stained (Giemsa) blood smears, prepared from blood samples from the tail vein taken on day 4 to 9 after infection.
Effect of Chalcones Following Multiple Oral Administrations in Plasmodium berghei K173 Infected NMRI Female Mice.

Animals in groups of 4 were inoculated intra peritoneally with $1 \times 10^6$ infected red blood cells (RBC). 2 hours after infection, treatment was initiated and the animals were dosed, according to the body weight recorded, twice daily for 3 consecutive days (day 0-3). The doses stated were administered orally as solutions in a suitable vehicle. Parasitaemia, as percentage infected blood cells, was determined by counting 500 RBCs in stained (Giemsa) blood smears, prepared from blood samples from the tail vein taken on day 6 after infection.

Treatment of leishmania donovani infected mice.
On Day -7 the animals (BALB/c female mice, app. 20 g, app. 8 weeks of age) were infected with the L. donovani amastigotes (ATCC 50127) collected from the spleen of a heavily infected donor mouse. Each mouse was inoculated intravenously in the tail vein with $1.5 \times 10^7$ amastigotes in 0.2 ml inoculation solution.

In order to check that the infection had been established before treatment was initiated the mice in Group 1 was sacrificed. The liver and spleen were removed and the infection load assessed in Giemsa-stained spleen impression smears using Stauber method (1. Protozool. 5(4), 269-273, 1958). The results were expressed as Leishmania Donovani Units (LDU): (Mean number of amastigotes per liver or spleen cell) x (mg liver or spleen).

The animals of Group 2 was left untreated until they were sacrificed on day 7, and the animals of Group 3 were treated with a saline solution. Groups 5 and 6 were administered B208 (10 mg/kg and 20 mg/kg) and group 4 were given Pentostam® (45 mg/kg).

Treatment of animals in Groups 3, 4, 5 and 6 occurred once daily on five consecutive (Days 0-4).

The compounds were administered intravenously (Groups 3, 5, and 6) or subcutaneously (Group 4). The dosing volume being 10 ml/kg for all treated groups.

The animals in Groups 2, 3, 4, 5 and 6, were sacrificed on Day 7 and the infection load was assessed as previously described.

35 Biological Results

Licochalcone A (LicA) and 4′methoxy chalcone (4′MC) described in WO 93/17671 are used as reference compounds in the following discussion.

40 Activity against non-fastidious bacteria

Licochalcone A exhibit moderate bactericidal activity against common pathogenic Gram-positive non-fastidious bacteria including Staphylococcus aureus, Enterococcus faecalis, Enterococcus faecium, Streptococcus pneumoniae, Streptococcus pyogenes, and Streptococcus agalactiae. Licochalcone A maintains its activity also against antibiotic resistant bacteria, e.g. Staphylococcus aureus ATCC33591 (resistant to meticillin) and
Enterococcus faecium #17051 (resistant to vancomycin). In contrast, Licochalcone A have only modest or no activity against the prototype pathogenic Gram-negative bacterium, Escherica coli. 4'MC as a representative of non-hydroxyl chalcones exhibit no antibacterial effect at all.

In comparison with Licochalcone A, diaminochalcones retain the activity of Licochalcone A against pathogenic Gram-positive bacteria including antibiotic-resistant strains (cf. Table 1). The diaminochalcones exhibit increased potency against Gram-positive pathogens (e.g. B101, B102, B115). In contrast to Licochalcone A, diaminochalcones exhibit activity against Escherica coli. Thus, several diaminochalcones e.g. B116 exhibits high activity against E.coli ATCC25922 and against the general more susceptible ESS strain of E.coli (cf. Table 1). This indicates the potential use of diaminochalcones in the treatment of infections with Gram-negative bacteria.

In the treatment of severe infections in immunocompromised patients bactericidal action of a antibiotic is a necessity. As exemplified in Figures 4 and 5, diaminochalcones retain the bactericidal action of Licochalcone A. For some diaminochalcones the bactericidal action is predominantly dependent on the concentration of the compound (e.g. B143; cf. Figure 4); for others the bactericidal action is predominantly dependent on the time of incubation with the compound (e.g. B041; cf. Figure 5). This knowledge is helpful when designing dosing regimens for in vivo efficacy trials.

Activity against Helicobacter pylori

Colonization of the gastric mucosa with *Helicobacter pylori* is an important pathogenic determinant for the development of gastritis and peptic ulcer. Diaminochalones exhibit activity against *Helicobacter pylori*. Several diaminochalones (e.g. B019, B029, B039, B048, B060, B061, B067, B073, B195, B102) exhibit MICs in the range between 25 μM and 100 μM when tested against a panel of six strains *Helicobacter pylori*, that includes strains resistant to metronidazole. Metronidazole is an antibiotic commonly included in treatment regimens designed to eradicate *Helicobacter* colonization for the treatment of peptic ulcer. The activity of diaminochalones against both metronidazole-resistant and sensitive *Helicobacter pylori* clearly indicates the potential use of these compounds in the treatment of *Helicobacter* infections.

Activity against anaerobic bacteria

Diaminochalones have been assayed in a single concentration of compound (100 μM) for activity against a panel of anaerobic bacteria containing common human pathogenic bacteria (*Bacteroides fragilis, Clostridium perfringens, Clostridium difficile*). Several diaminochalones (e.g. B022, B033, B035, B038, B039, B041, B046, B060 and B073) exhibit activity against all microorganisms within the test panel. This clearly indicates the potential use of diaminochalones in treatment of infection caused by anaerobic bacteria.

Activity against protozoa:

25 **Activity against Plasmodium falciparum**

*Plasmodium falciparum* is a protozoan parasite transmitted by the mosquito, *Anopheles*, and causing malignant or severe malaria in humans. Licochalcone A exhibit activity against *Plasmodium falciparum in vitro* and protects mice from infection with *P.yoelii* and *P.berghei* (Chen et al., 1994). Diaminochalones exhibit activity in vitro against Plasmodium falciparum and several diaminochalones exhibit improved potency compared to Licochalcone A (cf. Table 2 and Figure 6). Futhermore the compounds are potent against chloroquine resistant parasites as shown in Table 3. The results clearly indicate the potential use of diaminochalones in the treatment of malaria.

5 Activity against *Leishmania major*

*Leishmania major* is a protozoan parasite transmitted by the sandfly, *Phlebotomus*, and causing cutaneous leishmaniasis or kala-azar in humans. Licochalcone A exhibits activity against *Leishmania* parasites and has shown efficacy in experimental animal models of cutaneous and visceral *Leishmania* infection (Chen et al., 1994). Diaminochalcones exhibit activity *in vitro* against *Leishmania major* with significantly improved potency compared to Licochalcone A and 4'MC (cf. Table 4). The results clearly indicate the potential use of diaminochalcones in the treatment of *Leishmania* infection.

Metabolism

The usefulness of chalcones as drug candidates have been limited by the metabolism of the compounds resulting in short half-lives *in vivo* (LicA: 100% turn-over *in vitro* and t½= 10 min *in vivo*).

The introduction of a diamino group in the chalcone changes the metabolic properties; this is clear from Table 6 where the metabolic turn-over of a number of diamino-chalcones are compared to LicA. The diamino-chalcones prepared are expected to show low or no metabolism *in vivo* as the metabolic turn-over are between 0-10% (compared to 100%
turn-over for Lica). Consequently the half-life of a diamino-chalcone will be longer, reducing the dose needed for treatment.

**Solubility**
The solubility of the neutral chalcones descibed in WO 93/17671 was very low. A representative chalcone 4'-methoxy-chalcone has a solubility <0.05 mg/ml. A few chalcones have a higher solubility due to (metabolically unstable) hydroxyl groups in the molecule. LicA has a solubility of approximately 0.01 mg/ml.

The diamino-chalcones described in this application are by far superior having solubility numbers in mg/ml. Representative examples are shown in table 7.

The high aqueous solubility means that dissolution and hence absorption will be no problem. This will inevitably cause a dramatic reduction of the dose needed making the diamino-chalcones very usefull as drug candidates.

**Bioavailability**
The bioavailability of the diamino chalcones in mice is in general very high (e.g. 50% for B098). As the mouse is a very fast metabolizer of the amino chalcones compared to rat and human (e.g. B119 mice: 75%; rat: 8.6%; human: in general lower than rat) the bioavailability in rat and man is expected to be even higher due to limited first pass metabolism.

**In vivo results**
A number of amino-chalcones significantly reduce parasaitemia in plasmodium infected mice as illustrated on figures 8 and 10. The compounds are superior to pentostam treatment for visceral leishmaniasis as illustrated on figure 9.

**Conclusion**
The use of chalcones as drug candidates for the treatment of parasitic or bacterial infections have been limited by the low in vivo potency (50mg/kg for LicA) of the compounds and a narrow spectrum of activity.
Several factors contribute to the low in vivo potency: Fast metabolism resulting in short half-lives in vivo; Low/no solubility in the intestine and consequently low/no absorption; Medium potency of the compounds against parasites and no activity against bacteria (except for LicA).

The diamino-chalcones in this application are expected to fulfill the criteria for a drug candidate. The metabolism is low, the solubility is high and the compounds are potent against parasites as well as (resistant) Gram positive and Gram negative bacteria.
