Orally administrable composition comprising fatty acids, wherein at least 50% by weight of the fatty acids comprise omega-3 fatty acids, salts or derivatives thereof, wherein the omega-3 fatty acids comprise eicosapentaenoic acid (EPA; C20:5-n3), docosapentaenoic acid (DPA; C22:5-n3), and docosahexaenoic acid (DHA; C22:6-n3), wherein the ratio of DHA to EPA (DHA:EPA) is less than 1:20, and wherein the ratio of DHA to DPA (DHA:DPA) is less than 2:1 are provided. These compositions can be used for the treatment or prophylaxis of dyslipidemic, cardiovascular, CNS, inflammatory, and other diseases/conditions or risk factors therefore.

OMEGA-3 PENTAENOIC ACID COMPOSITIONS AND METHODS OF USE

RELATED APPLICATIONS

FIELD OF INVENTION

[0002] The present invention relates to a method comprising administering omega-3 fatty acid compositions for the reduction of fasting lipid parameters, such as triglycerides, total cholesterol, low density lipoprotein (LDL) cholesterol, free fatty acids, and other lipids. The present invention also relates to a method comprising administration of omega-3 fatty acid compositions for the increase of high density lipoprotein (HDL) cholesterol. The methods of the present invention may be useful in the treatment of a condition selected from the group consisting of: hypertriglyceridemia; hypercholesterolemia; mixed dyslipidemia; coronary heart disease (CHD); vascular disease; cardiovascular disease; acute coronary syndrome; atherosclerotic disease and related conditions; heart failure; cardiac arrhythmias; coagulatory conditions associated with cardiac arrhythmias; ischemic dementia; vascular dementia; hypertension; coagulation related disorders; nephropathy; kidney or urinary tract disease; retinopathy; cognitive and other CNS disorders; autoimmune diseases; inflammatory diseases; asthma or other respiratory disease; dermatological disease; metabolic syndrome; diabetes, diabetes mellitus or other form of metabolic disease; liver disease; non-alcoholic fatty liver disease; disease of the gastrointestinal tract; disease of the male or female reproductive system or related secondary sexual organs; a cancer of any type, including lymphomas and myelomas; an infection caused by a virus, bacterium, fungus, protozoa or other organism; and the treatment and/or prevention and/or reduction of cardiac events and/or cardiovascular events and/or vascular events and/or symptoms. The present invention also relates to treatment of such conditions in with concomitant treatments regimes or combination products with other active pharmaceutical ingredients.

BACKGROUND OF THE INVENTION

[0003] In humans, cholesterol and triglycerides are part of lipoprotein complexes in the bloodstream, and can be separated via ultracentrifugation into high-density lipoprotein (HDL), intermediate-density lipoprotein (IDL), low-density lipoprotein (LDL) and very-low-density lipoprotein (VLDL) fractions. Cholesterol and triglycerides are synthesized in the liver, incorporated into VLDL, and released into the plasma. High levels of total cholesterol (total-C), LDL-cholesterol, and apolipoprotein B (a membrane complex for LDL-cholesterol and VLDL-cholesterol, as well as LDL-cholesterol in rare individuals suffering from a disorder resulting in significant LDL-cholesterol levels) promote human atherosclerosis; these elevated levels are often referred to as hypercholesterolemia. Decreased levels of HDL-cholesterol and its transport complex, apolipoprotein A, as well as elevated levels of apolipoprotein C-III and serum triglycerides (TG) are also associated with the development of atherosclerosis. Further, cardiovascular morbidity and mortality in humans can vary directly with the level of total-C, LDL-cholesterol and TG and inversely with the level of HDL-cholesterol. In addition, researchers have found that non-HDL-cholesterol is an important indicator of hypertriglyceridemia (elevated triglycerides), vascular disease, atherosclerotic disease and related conditions. Therefore, non-HDL-cholesterol and fasting TG reduction has also been specified as a treatment objective in NCEP ATP III. Fasting TG is commonly used as a key measure for TG in lipid management, because it minimizes the confounding factor of TG recently absorbed from meals, including the high variability of the content of meals and high variability of post-prandial (post-prandial) spikes in TG. In some preferred embodiments, we refer to fasting TG levels when we refer to triglycerides or TG.

[0004] The NCEP ATP III treatment guidelines identify HMG-CoA reductase inhibitors (“statins”) as the primary treatment option for hypercholesterolemia. In patients with TG<500 mg/dL, LDL-cholesterol is the primary treatment parameter. Many patients, however, have increased LDL-cholesterol combined with high TG and low HDL-cholesterol, a condition also known as mixed dyslipidemia. Patients with hypercholesterolemia or mixed dyslipidemia often present with high blood levels of LDL-cholesterol (i.e. greater than 190 mg/dL) and TG (i.e. levels of 200 mg/dL or higher). The use of diet and single-drug therapy does not always decrease LDL-cholesterol and TG adequately enough to reach targeted values in patients with mixed dyslipidemia with or without a concomitant increase in triglycerides. In these patients, a combined therapy regimen of a statin and a second anti-dyslipidemic agent is often desired. This second agent has historically been a fibrate (i.e. gemfibrozil, bezafibrate, or fenofibrate) or extended release niacin. Over the few years, the use omega-3 fatty acid concentrates in combination with a statin has been growing rapidly due to concerns about the lack of outcome benefits with fibrates (i.e. the FIELD study) or extended release niacin (i.e. the AIM-HIGH study). In patients with isolated hypertriglyceridemia, the use of omega-3 fatty acid concentrates has also grown versus fibrates and extended release niacin.

[0005] Marine oils, also commonly referred to as fish oils, are a good source of the two main omega-3 fatty acids, eicosapentaenoic acid (EPA) and docosahexaenoic acid (DHA), which have been found to regulate lipid metabolism. Omega-3 fatty acids have been found to have beneficial effects on the risk factors for cardiovascular diseases, especially mild hypertension, hypertriglyceridemia and on the coagulation factor VII phospholipid complex activity. Omega-3 fatty acids lower serum triglycerides (TG), increase serum HDL-cholesterol, lower systolic and diastolic blood pressure and the pulse rate, and lower the activity of the blood coagulation factor VII-phospholipid complex. Further, omega-3 fatty acids seem to be well tolerated, without giving rise to any severe side effects.

[0006] The table directly below lists the most common omega-3 fatty acids, including their 3-letter abbreviation code. In this application, the use of any of the 3-letter abbreviations shall refer to the omega-3 fatty acid, unless otherwise indicated (e.g. DPA or DPA 22:5 (n-3) or DPA 22:5-n3 or DPA 22:5-n3 or DPA-n3, which all refer to the omega-3 isomer of docosapentaenoic acid).
One form of omega-3 fatty acids is a concentrate of omega-3, long chain, polyunsaturated fatty acids from fish oil containing DHA ethyl esters, EPA ethyl esters as well as ethyl esters of other omega-3 fatty acids (described in US patent for LOVAZA®) and is sold under the trademarks OMACOR® and LOVAZA®. Such a form of omega-3 fatty acids comprises at least 90% omega-3 fatty acids of which at least 80% EPA+DHA (in a ratio of 1:2:1) and is described, for example, in U.S. Pat. Nos. 5,502,077, 5,656,667 and 5,698,594. LOVAZA® (omega-3 acid ethyl esters) is indicated for the treatment of patients with hypertriglyceridemia with TG levels of 500 mg/dL or higher.

Another form of omega-3 fatty acid concentrate is sold under the trademark EPADEL® for the treatment of dyslipidemia. This product is described as 98% EPA ethyl ester in Lancet (Vol. 369; Mar. 31, 2007; 1090-1098) report.

In another study with AMR101/VASCEPA®, the ANCHOR study, it was found that four 1-gram capsules of AMR101/VASCEPA® significantly reduced fasting TG in patients with very high triglycerides (TG>500 mg/dL) (March 2011, ACC poster reporting top-line results of the MARINE study), similar to four 1-gram capsules of LOVAZA® but in a less potent manner (LOVAZA® prescribing information, December 2010). In this same study, AMR101 slightly and non-significantly changed LDL-C while LOVAZA® shows a large significant increase in this same population, putting the latter at a disadvantage. Table A directly below compares these profiles.

NS = Not Significant

[0014] The resulting lipid profile of AMR101 versus LOVAZA® in highly similar patient populations indicates that there are significant benefits of using an almost pure EPA oil composition as opposed to an omega-3 mixture as in LOVAZA®. These benefits translate into better non-HDL-cholesterol reduction with the pure EPA form, where these benefits are less or, in the case of the LDL-C effect, the opposite.

[0015] The recently released results from Omthera’s EVOLVE trial with EPANOVA™, in patients with very high triglycerides (TG≥500 mg/dL), described a TG reduction of 31% versus baseline for the 4 gram per day dose and 26% versus baseline for the 2 gram per day dose, with 10% and 8% non-HDL cholesterol reduction respectively. It appears that the TG-reducing potency of EPANOVA™ is similar to the potency of AMR101. No data were reported by Omthera on the LDL-C effect in the EVOLVE trial.

[0016] The recently released results from Omthera’s ESPRIT trial with EPANOVA™, in patients with high triglycerides (TG 200-499 mg/dL) while on statin therapy, described a TG reduction of 21% versus baseline for the 4 gram per day dose and 15% versus baseline for the 2 gram per day dose, with 7% and 4% non-HDL cholesterol reduction respectively. It appears that the TG-reducing potency of EPANOVA™ is similar to the potency of AMR101. No data were reported by Omthera on the LDL-C effect in the ESPRIT trial.

[0017] From the comparison of LOVAZA® versus AMR101 data, there appears to be a benefit of using pure EPA concentrates for dyslipidemia treatment over omega-3 mixtures with regard to LDL-Cholesterol and non-HDL-cholesterol effects. With the NCEP ATP III guidelines placing LDL-cholesterol and non-HDL-cholesterol reduction at the top of the treatment hierarchy for patients with TG<500 mg/dL, AMR101 is clearly superior to LOVAZA® in this patient category.

[0018] In another example, in the ECLIPSE Study, the bioavailability of EPANOVA™ is compared to LOVAZA® under high fat meal and low fat meal dosing conditions.

[0019] In the ECLIPSE study it is found that EPANOVA™ is significantly more bioavailable than LOVAZA® after single dose administration (four capsules of 1 gram for both products), both by Cmax (maximum concentration) and AUC (area under curve) measures (see Table C below, where Cmax and AUC are estimated from the data points in FIGS. 1 and 2). Relative to LOVAZA® under high fat meal conditions, EPANOVA™ is 1.17× more bioavailable by Cmax and 1.27 by AUC comparison. Under low fat meal conditions, LOVAZA® has only 15% AUC and 12% Cmax of the bioavailability versus LOVAZA® under high fat meal conditions, whereas EPANOVA™ under low fat meal conditions has 78% AUC and 53% Cmax of the bioavailability versus LOVAZA® under high fat meal conditions. EPANOVA™ under low fat meal conditions has 62% AUC and 46% Cmax of the bioavailability versus EPANOVA™ under high fat meal conditions.

---

**[0020]** Omega-3 fatty acids are known to be “essential fatty acids”. There are two series of essential fatty acids (EFAs) in humans. They are termed “essential” because they cannot be synthesized de novo in mammals. These fatty acids can be interconverted within a series, but the omega-6 (n-6) series cannot be converted to the omega-3 (n-3) series nor can the omega-3 (n-3) series be converted to the omega-6 series in humans. The main EFAs in the diet are linoleic acid of the omega-6 series and alpha-linolenic acid of the omega-3 series. However, to fulfill most of their biological effects these “parent” EFAs must be metabolised to the other longer chain fatty acids. Each fatty acid probably has a specific role in the body. The scientific literature suggests that particularly important in the n-6 series are dihomo-gammalinolenic acid (DGLA, 20:3-n6) and arachidonic acid (ARA, 20:4-n6), while particularly important in the n-3 series are eicosapentaenoic acid (EPA, 20:5-n3) and docosahexaenoic acid (DHA, 22:6-n3).

**[0021]** U.S. Pat. No. 6,479,544 describes an invention in which it is found that ARA is highly desirable rather than undesirable and it may be helpful to administer ARA in association with EPA. This invention provides pharmaceutical formulations containing eicosapentaenoic acid or any appropriate derivative (hereinafter collectively referred to as EPA) and arachidonic acid (ARA), as set out in the granted claims for this patent. ARA may be replaced by one or more of its precursors, DGLA or GLA. In this reference, the ratio of EPA to ARA is preferably between 1:1 and 20:1.

**[0022]** Patent application PCT/GH 2004/000242 describes the treatment or prevention of psoriasis with a formulation comprising more than 95% EPA and less than 2% DHA. In another embodiment of this invention the EPA is replaced with DPA.

**[0023]** Patent application PCT/NL 2006/050291 (WO/2007/058538, GB 0301701.9) describes combinations of indigestible carbohydrates and long chain poly-unsaturated fatty acids such as ARA, EPA, DHA, and combinations thereof to improve intestinal barrier integrity, improving barrier function, stimulating gut maturation and/or reducing intestinal barrier permeability.

**[0024]** Lindeborg et al. (Prostag Leukot Ess, 2013, 88:315-319) discloses a study evaluating postprandial metabolism of docosapentaenoic acid (DPA) and eicosapentaenoic acid (EPA) in humans.

**[0025]** Holub et al. (Lipids, 2011, 46:399-407) discloses a study assessing the effect of oral supplementation with docosapentaenoic acid (DPA) on levels of serum and tissue lipid classes and their fatty acid compositions in rat liver, heart, and kidney.

**[0026]** Given the highly beneficial efficacy and side-effect profile of omega-3 fatty acid concentrates, these compositions are increasingly popular for the treatment of patients with dyslipidemias. However, with the increased popularity of omega-3 fatty acid concentrates, there is an unmet medical need for omega-3 fatty acid containing compositions with improved bioavailability and a more optimal ratio of potency in reducing TG versus the resulting cholesterol profile. Specifically, agents with both a higher potency than AMR101/EPADEL® and lesser increase in LDL-C or further decrease in LDL-C and non-HDL-C than LOVZA® are required.

**[0027]** Fasting triglyceride levels have been found to be correlated with the risk of cardiovascular diseases and conditions. For example, high fasting triglyceride levels have been associated with an increased risk of myocardial infarction. Gazzano et al. (Circulation, 1997; 96:2520-2525) discusses fasting triglyceride levels as a risk factor for coronary heart disease. Love-Osborne et al. (Pediatr Diabetes, 2006: 7:205-210) discloses the role of elevated fasting triglyceride levels in the development of type 2 diabetes mellitus.

**[0028]** All references cited herein are incorporated by reference in their entirety.

**SUMMARY OF THE INVENTION**

**[0029]** The present invention provides a composition comprising fatty acids, wherein at least 50% by weight of the fatty acids comprise omega-3 fatty acids, salts, esters, or derivatives thereof, wherein the omega-3 fatty acids comprise eicosapentaenoic acid (EPA; C20:5-n3) and docosapentaenoic acid (DPA; C22:5-n3), wherein the ratio of DHA to EPA (DHA:EPA) is less than 1:10, and wherein the ratio of DHA to DPA (DHA:DPA) is less than 2:1. In some embodiments, the composition comprises additional fatty acids, such as heneicosapentaenoic acid (HPEA), arachidonic acid (ARA), and omega-6 docosapentaenoic acid (n-6 DPA), tetracosapentaenoic acid (TPA), and/or gamma-linolenic acid (GLA). These compositions can be used for the treatment of prophylaxis of dyslipidemic, cardiovascular, central nervous system (CNS), inflammatory, and other diseases/conditions or risk factors therefore. These compositions may also be used for the reduction of symptoms associated with these conditions.

**[0030]** The present invention provides a pharmaceutical composition comprising eicosapentaenoic acid (EPA) in an amount between about 70% to about 95% of the total amount of fatty acids and docosapentaenoic acid (DPA), wherein the composition comprises no more than 5% docosahexaenoic acid (DHA) of the total amount of fatty acids, and wherein the ratio of DHA:DPA is 1:1 or lower. The present invention
provides compositions comprise about 80% to about 90%, alternatively about 81% to about 88%, alternatively about 82% to about 88%, alternatively about 83% to about 87%, alternatively about 84% to about 86%, alternatively about 85% EPA relative to the total amount of fatty acids present in the composition. % The present invention provides a pharmaceutical composition comprising eicosapentaenoic acid (EPA) in a daily dosage amount of between about 1000 mg to about 5000 mg, and further comprising docosapentaenoic acid (DPA) and docosahexaenoic acid (DHA), wherein the composition comprises no more than 5% DHA of the total amount of fatty acids, and wherein the ratio of DHA:DPA is 1:1 or lower.

[0031] The present invention also provides compositions having an improved profile versus very high purity EPA compositions which contain low levels of omega-6 fatty acids and low levels of omega-3 fatty acids other than EPA, ETA, HPA, TPA, and DPA.

[0032] The present invention provides methods of reducing lipid parameters, such as triglyceride levels, in subjects in need thereof, comprising administering to the subject an orally administrable composition comprising at least 50% by weight of the fatty acids comprise omega-3 fatty acids, salts, esters, or derivatives thereof, wherein the omega-3 fatty acids comprise eicosapentaenoic acid (EPA; C20:5-n3), docosapentaenoic acid (DPA; C22:5-n3), and docosahexaenoic acid (DHA; C22:6-n3), wherein the ratio of DHA to EPA (DHA:EPA) is less than 1:20, and wherein the ratio of DHA to DPA (DHA:DPA) is less than 2:1.

[0033] The present invention also provides methods of reducing one or more of the following lipid parameter levels from a baseline lipid parameter level: triglycerides, apolipoprotein B (apo B), apolipoprotein C-III (apo C-III), VLDL cholesterol, total cholesterol, and non-HDL cholesterol, comprising administration of any of the compositions of the present invention. The present invention also provides methods of increasing the following lipid parameter levels from a baseline lipid parameter level: HDL cholesterol and apolipoprotein A-I (apo A-I), comprising administration of any of the compositions of the present invention.

BRIEF DESCRIPTION OF THE DRAWINGS

[0034] FIG. 1 shows the fasting plasma lipid values after seven days of dosing, relating to the study described in Example 35.

[0035] FIG. 2 shows the fasting plasma insulin levels after 28 days of administration, relating to the study described in Example 35.

[0036] FIG. 3 shows the relative liver gene expression following 28 days of administration, relating to the study described in Example 35.

DETAILED DESCRIPTION OF THE INVENTION

[0037] The present invention provides an orally administrable composition comprising fatty acids, wherein at least 50% by weight of the fatty acids comprise omega-3 fatty acids, salts, esters, or derivatives thereof, wherein the omega-3 fatty acids comprise eicosapentaenoic acid (EPA; C20:5-n3), docosapentaenoic acid (DPA; C22:5-n3), and docosahexaenoic acid (DHA; C22:6-n3), wherein the ratio of DHA to EPA (DHA:EPA) is less than 1:20, and wherein the ratio of DHA to DPA (DHA:DPA) is less than 2:1.

[0038] In some embodiments, the compositions of the present invention comprise at least 50% omega-3 fatty acids, alternatively at least 55%, alternatively at least 60%, alternatively at least 65%, alternatively at least 70%, alternatively at least 75%, alternatively at least 80%, alternatively at least 85%, alternatively at least 95%, most preferably at least 90% omega-3 fatty acids of the total amount of fatty acids. In some embodiments, the composition comprises at least about 92% to about 95%, alternatively about 93% to about 98%, alternatively about 94% to about 98%, omega-3 fatty acids of the total amount of fatty acids.

[0039] In other embodiments, EPA and DPA are jointly present in the compositions of the present invention at between 55% and 100% of total fatty acids, alternatively between 60% and 100%, alternatively between 65% and 100%, alternatively between 70% and 100%, alternatively between 75% and 100%, alternatively between 80% and 100%, alternatively between 85% and 95%, alternatively between 85% and 97%, alternatively between 88% and 95%, alternatively between 88% and 97%, alternatively between 90% and 95%, alternatively between 90% and 97% of the total amount of fatty acids.

[0040] The fatty acids, such as EPA and DPA, may be present in free fatty acid form, or as a salt, ester, or derivative. The fatty acids are preferably composed as a triglyceride, an ester (such as an ethyl ester) or free fatty acid. Other forms of the fatty acids which may be useful include salts, esters of any type, amides, mono-, di- or triglycerides, phospholipids or any other form which can lead to metabolism of the fatty acids (such as EPA and/or DPA), or the incorporation of the fatty acids (such as EPA and/or DPA) into body fluids, tissues or organs.

[0041] Omega-3 fatty acids may be grouped by the number of double bonds contained in the fatty acid chain. For instance, hexadecatrienoic acid (HHA), alpha-linolenic acid (ALA) and eicosatrienoic acid (ETA) are omega-3-trienoic acids; stearidonic acid (SDA) and eicosatetraenoic acid (ETA) are omega-3-tetraenoic acids; EPA, heneicosapentaenoic acid (HPA), DPA and tetracosapentaenoic acid (TPA) are omega-3-pentaenoic acids; and DHA and tetracosahexaenoic acid (THA) are omega-3-hexaenoic acids. In preferred embodiments, the term omega-3-pentaenoic acids will refer to a mixture of at least two omega-3-pentaenoic acids in a ratio of at least 1:25, more preferably in a ratio of at least 1:50, more preferably in a ratio of at least 1:75, more preferably in a ratio of at least 1:100, more preferably in a ratio of at least 1:125, more preferably in a ratio of at least 1:150, more preferably in a ratio of at least 1:200. In some embodiments, the ratio refers to the ratio of the least prevalent omega-3-pentaenoic acid in the mixture to the most prevalent omega-3-pentaenoic acid in the mixture.

[0042] In some embodiments, the compositions of the present invention comprise EPA, HPA, DPA and TPA, alternatively EPA and DPA, and alternatively the compositions of the present invention comprise EPA, HPA and DPA.

[0043] In some embodiments, the omega-3-pentaenoic acids in the compositions of the present invention comprise no more than 99.5% of a single omega-3-pentaenoic acid, alternatively no more than 99%; alternatively no more than 98.5%; alternatively no more than 98%; alternatively no more than 97.5%; alternatively no more than 96%; alternatively no more than 95%; alternatively no more than 94%; alternatively no more than 93%; alternatively no more than 92%; alternatively no more than 91%; alternatively no more than 90%.
alternatively no more than 88%; alternatively no more than 85%; alternatively no more than 80%; alternatively no more than 75%; alternatively no more than 70%; alternatively no more than 65%; alternatively no more than 60%; alternatively no more than 55%; alternatively no more than 50%; alternatively no more than 45%; alternatively no more than 40%; alternatively no more than 30%.

In some embodiments, the compositions of the present invention comprise no more than 99% of fatty acids in the composition, alternatively at least 99% of fatty acids, alternatively at least 98% of fatty acids, alternatively at least 97% of fatty acids, alternatively at least 95% of fatty acids, alternatively at least 93% of fatty acids, alternatively at least 91% of fatty acids, alternatively at least 89% of fatty acids, alternatively at least 87% of fatty acids, alternatively at least 85% of fatty acids, alternatively at least 83% of fatty acids, alternatively at least 81% of fatty acids, alternatively at least 79% of fatty acids, alternatively at least 77% of fatty acids, alternatively at least 75% of fatty acids, alternatively at least 73% of fatty acids, alternatively at least 71% of fatty acids, alternatively at least 69% of fatty acids, alternatively at least 67% of fatty acids, alternatively at least 65% of fatty acids, alternatively at least 63% of fatty acids, alternatively at least 61% of fatty acids, alternatively at least 59% of fatty acids, alternatively at least 57% of fatty acids, alternatively at least 55% of fatty acids, alternatively at least 53% of fatty acids, alternatively at least 51% of fatty acids, alternatively at least 49% of fatty acids, alternatively at least 47% of fatty acids, alternatively at least 45% of fatty acids, alternatively at least 43% of fatty acids, alternatively at least 41% of fatty acids, alternatively at least 39% of fatty acids, alternatively at least 37% of fatty acids, alternatively at least 35% of fatty acids, alternatively at least 33% of fatty acids, alternatively at least 31% of fatty acids, alternatively at least 29% of fatty acids, alternatively at least 27% of fatty acids, alternatively at least 25% of fatty acids, alternatively at least 23% of fatty acids, alternatively at least 21% of fatty acids, alternatively at least 19% of fatty acids, alternatively at least 17% of fatty acids, alternatively at least 15% of fatty acids, alternatively at least 13% of fatty acids, alternatively at least 11% of fatty acids, alternatively at least 9% of fatty acids, alternatively at least 7% of fatty acids, alternatively at least 5% of fatty acids, alternatively at least 3% of fatty acids, alternatively at least 1% of fatty acids.

In some embodiments, the compositions of the present invention comprise no more than 0.01% of fatty acids in the composition, alternatively no more than 0.05% of fatty acids, alternatively no more than 0.10% of fatty acids, alternatively no more than 0.15% of fatty acids, alternatively no more than 0.2% of fatty acids, alternatively no more than 0.3% of fatty acids, alternatively no more than 0.4% of fatty acids, alternatively no more than 0.5% of fatty acids, alternatively no more than 0.75% of fatty acids, alternatively no more than 1% of fatty acids, alternatively no more than 1.5% of fatty acids, alternatively no more than 2% of fatty acids, alternatively no more than 3% of fatty acids, alternatively no more than 5% of fatty acids, alternatively no more than 10% of fatty acids, alternatively no more than 20% of fatty acids, alternatively no more than 30% of fatty acids, alternatively no more than 40% of fatty acids, alternatively no more than 50% of fatty acids, alternatively no more than 60% of fatty acids, alternatively no more than 70% of fatty acids, alternatively no more than 80% of fatty acids, alternatively no more than 85% of fatty acids, alternatively no more than 90% of fatty acids.

In some embodiments, the compositions of the present invention comprise no more than 1 mg/g of fatty acids in the composition, alternatively no more than 3 mg/g of fatty acids, alternatively no more than 5 mg/g of fatty acids, alternatively no more than 7 mg/g of fatty acids, alternatively no more than 9 mg/g of fatty acids, alternatively no more than 11 mg/g of fatty acids, alternatively no more than 13 mg/g of fatty acids, alternatively no more than 15 mg/g of fatty acids, alternatively no more than 17 mg/g of fatty acids, alternatively no more than 19 mg/g of fatty acids, alternatively no more than 21 mg/g of fatty acids, alternatively no more than 23 mg/g of fatty acids, alternatively no more than 25 mg/g of fatty acids.

In some embodiments, the compositions of the present invention comprise no more than 10% omega-3 fatty acids that are not omega-3-pentanoic acids, alternatively no more than 9%, alternatively no more than 8%, alternatively no more than 7%, alternatively no more than 6%, alternatively no more than 5%, alternatively no more than 4%, alternatively no more than 3%, alternatively no more than 2%, alternatively no more than 1%, alternatively no more than 0.75%, alternatively no more than 0.5%, alternatively no more than 0.4%, alternatively no more than 0.3%, alternatively no more than 0.2%, alternatively the compositions of the present invention comprise no more than 0.1% omega-3 fatty acids that are not omega-3-pentanoic acids.

In the embodiments of the present invention, the compositions comprise EPA and DPA in an EPA:DPA ratio between 99:1 and 1:99, alternatively between 90:1 and 1:90, alternatively between 60:1 and 1:60, alternatively between 40:1 and 1:40, alternatively between 20:1 and 1:20, alternatively between 10:1 and 1:10, alternatively between 5:1 and 1:5, alternatively between 2.5:1 and 1:2.5, alternatively between 2:1 and 1:2, alternatively between 1.5:1 and 1:1.5, alternatively between 1:1 and 1:1, alternatively between 0.5:1 and 1:0.5, alternatively between 0:1 and 1:10.

In some embodiments, the compositions of the present invention comprise no more than 5% EPA, alternatively no more than 4%, alternatively no more than 3%, alternatively no more than 2%, alternatively no more than 1%, alternatively no more than 0.9%, alternatively no more than 0.8%, alternatively no more than 0.7%, alternatively no more than 0.6%, alternatively no more than 0.5%, alternatively no more than 0.4%, alternatively no more than 0.3%, alternatively no more than 0.2%, alternatively no more than 0.1%, alternatively no more than 0.05%, alternatively no more than 0.01%, alternatively no more than 0.005%, alternatively no more than 0.001%, alternatively no more than 0.0005%.

In the embodiments of the present invention, the compositions comprise EPA and DPA in an EPA:DPA ratio between 99:1 and 1:99, alternatively between 90:1 and 1:90, alternatively between 60:1 and 1:60, alternatively between 40:1 and 1:40, alternatively between 20:1 and 1:20, alternatively between 10:1 and 1:10, alternatively between 5:1 and 1:5, alternatively between 2.5:1 and 1:2.5, alternatively between 2:1 and 1:2, alternatively between 1.5:1 and 1:1.5, alternatively between 1:1 and 1:1, alternatively between 0.5:1 and 1:0.5, alternatively between 0:1 and 1:10.

In some embodiments, the compositions of the present invention comprise no more than 55% to 90%, alternatively no more than 50% to 95%, alternatively no more than 45% to 100%, alternatively no more than 40% to 95%, alternatively no more than 35% to 100%, alternatively no more than 30% to 95%, alternatively no more than 25% to 100%, alternatively no more than 20% to 95%, alternatively no more than 15% to 100%, alternatively no more than 10% to 100%, alternatively no more than 5% to 100%, alternatively no more than 1% to 100%, alternatively no more than 0.5% to 100%. In some embodiments, the compositions of the present invention comprise no more than 830 mg/g to 870 mg/g, alternatively no more than 840 mg/g to 865 mg/g, alternatively no more than 845 mg/g to 860 mg/g.
mg/g, alternatively 846 mg/g to about 860 mg/g, alternatively 847 mg/g to about 859 mg/g, alternatively about 848 mg/g to about 858 mg/g, alternatively about 849 mg/g to about 857 mg/g, alternatively about 850 mg/g to about 856 mg/g, alternatively about 851 mg/g to about 855 mg/g, alternatively about 852 mg/g to about 854 mg/g, alternatively about 853 mg/g EPA.

[0049] In other embodiments of the present invention, the compositions comprise DPA in an amount between 1% and 99% relative to the total amount of fatty acids present in the composition, alternatively between 1% and 95%, alternatively between 1% and 90%, alternatively between 1% and 85%, alternatively between 1% and 80%, alternatively between 1% and 75%, alternatively between 1% and 70%, alternatively between 1% and 65%, alternatively between 1% and 60%, alternatively between 1% and 55%, alternatively between 1% and 50%, alternatively between 1% and 45%, alternatively between 1% and 40%, alternatively between 1% and 35%, alternatively between 1% and 30%, alternatively between 1% and 25%, alternatively between 1% and 20%, alternatively between 1% and 15%, alternatively between 1% and 10%, alternatively between 1% and 5%, alternatively between 2% and 99%, alternatively between 2% and 95%, alternatively between 2% and 90%, alternatively between 2% and 85%, alternatively between 2% and 80%, alternatively between 2% and 75%, alternatively between 2% and 70%, alternatively between 2% and 65%, alternatively between 2% and 60%, alternatively between 2% and 55%, alternatively between 2% and 50%, alternatively between 2% and 45%, alternatively between 2% and 40%, alternatively between 2% and 35%, alternatively between 2% and 30%, alternatively between 2% and 25%, alternatively between 2% and 20%, alternatively between 2% and 15%, alternatively between 2% and 10%, alternatively between 2% and 5%, alternatively between 3% and 99%, alternatively between 3% and 95%, alternatively between 3% and 90%, alternatively between 3% and 85%, alternatively between 3% and 80%, alternatively between 3% and 75%, alternatively between 3% and 70%, alternatively between 3% and 65%, alternatively between 3% and 60%, alternatively between 3% and 55%, alternatively between 3% and 50%, alternatively between 3% and 45%, alternatively between 3% and 40%, alternatively between 3% and 35%, alternatively between 3% and 30%, alternatively between 3% and 25%, alternatively between 3% and 20%, alternatively between 3% and 15%, alternatively between 3% and 10%, alternatively between 3% and 5%, alternatively between 4% and 99%, alternatively between 4% and 95%, alternatively between 4% and 90%, alternatively between 4% and 85%, alternatively between 4% and 80%, alternatively between 4% and 75%, alternatively between 4% and 70%, alternatively between 4% and 65%, alternatively between 4% and 60%, alternatively between 4% and 55%, alternatively between 4% and 50%, alternatively between 4% and 45%, alternatively between 4% and 40%, alternatively between 4% and 35%, alternatively between 4% and 30%, alternatively between 4% and 25%, alternatively between 4% and 20%, alternatively between 4% and 15%, alternatively between 4% and 10%, alternatively between 4% and 5%, alternatively between 5% and 99%, alternatively between 5% and 95%, alternatively between 5% and 90%, alternatively between 5% and 85%, alternatively between 5% and 80%, alternatively between 5% and 75%, alternatively between 5% and 70%, alternatively between 5% and 65%, alternatively between 5% and 60%, alternatively between 5% and 55%, alternatively between 5% and 50%, alternatively between 5% and 45%, alternatively between 5% and 40%, alternatively between 5% and 35%, alternatively between 5% and 30%, alternatively between 5% and 25%, alternatively between 5% and 20%, alternatively between 5% and 15%, alternatively between 5% and 12%, alternatively between 5% and 10%, alternatively between 6% and 99%, alternatively between 6% and 95%, alternatively between 6% and 90%, alternatively between 6% and 85%, alternatively between 6% and 80%, alternatively between 6% and 75%, alternatively between 6% and 70%, alternatively between 6% and 65%, alternatively between 6% and 60%, alternatively between 6% and 55%, alternatively between 6% and 50%, alternatively between 6% and 45%, alternatively between 6% and 40%, alternatively between 6% and 35%, alternatively between 6% and 30%, alternatively between 6% and 25%, alternatively between 6% and 20%, alternatively between 6% and 15%, alternatively between 6% and 12%, alternatively between 6% and 11%, alternatively between 6% and 10%, alternatively between 7% and 99%, alternatively between 7% and 95%, alternatively between 7% and 90%, alternatively between 7% and 85%, alternatively between 7% and 80%, alternatively between 7% and 75%, alternatively between 7% and 70%, alternatively between 7% and 65%, alternatively between 7% and 60%, alternatively between 7% and 55%, alternatively between 7% and 50%, alternatively between 7% and 45%, alternatively between 7% and 40%, alternatively between 7% and 35%, alternatively between 7% and 30%, alternatively between 7% and 25%, alternatively between 7% and 20%, alternatively between 7% and 15%, alternatively between 7% and 12%, alternatively between 7% and 11%, alternatively between 7% and 10%, alternatively between 8% and 99%, alternatively between 8% and 95%, alternatively between 8% and 90%, alternatively between 8% and 85%, alternatively between 8% and 80%, alternatively between 8% and 75%, alternatively between 8% and 70%, alternatively between 8% and 65%, alternatively between 8% and 60%, alternatively between 8% and 55%, alternatively between 8% and 50%, alternatively between 8% and 45%, alternatively between 8% and 40%, alternatively between 8% and 35%, alternatively between 8% and 30%, alternatively between 8% and 25%, alternatively between 8% and 20%, alternatively between 8% and 15%, alternatively between 8% and 12%, alternatively between 9% and 95%, alternatively between 9% and 90%, alternatively between 9% and 85%, alternatively between 9% and 80%, alternatively between 9% and 75%, alternatively between 9% and 70%, alternatively between 9% and 65%, alternatively between 9% and 60%, alternatively between 9% and 55%, alternatively between 9% and 50%, alternatively between 9% and 45%, alternatively between 9% and 40%, alternatively between 9% and 35%, alternatively between 9% and 30%, alternatively between 9% and 25%, alternatively between 9% and 20%, alternatively between 9% and 15%, alternatively between 9% and 12%, relative to the total amount of fatty acids present in the composition. In some embodiments, the compositions comprise DPA in an amount between about 5% to about 15%, alternatively about 6% to about 12%, alternatively about 7% to about 11%, alternatively about 8% to about 10% relative to the total amount of fatty acids present in the composition. In some embodiments, the compositions comprise DPA in an amount of about 60 mg/g to about 120 mg/g, alternatively about 70 mg/g to about 100 mg/g, 75 mg/g to about 90 mg/g, alternatively about 77 mg/g to about 85 mg/g, alternatively about 78 mg/g to about 84 mg/g, alternatively about 79 mg/g
to about 83 mg/g, alternatively about 80 mg/g to about 82 mg/g, alternatively about 81 mg/g to about 82 mg/g of DPA.

[0050] In some embodiments, a relatively small amount of DHA as compared to EPA is present. In some embodiments, the compositions of the present invention comprise no more than 1:5 of DHA:EPA, alternatively no more than 1:6 of DHA:EPA, alternatively no more than 1:7 of DHA:EPA, alternatively no more than 1:8 of DHA:EPA, alternatively no more than 1:9 of DHA:EPA, alternatively no more than 1:10 of DHA:EPA, alternatively no more than 1:12 of DHA:EPA, alternatively no more than 1:15 of DHA:EPA, alternatively no more than 1:20 of DHA:EPA, alternatively no more than 1:25 of DHA:EPA, alternatively no more than 1:30 of DHA:EPA, alternatively no more than 1:40 of DHA:EPA, alternatively no more than 1:50 of DHA:EPA, alternatively no more than 1:75 of DHA:EPA, alternatively no more than 1:90 of DHA:EPA, alternatively no more than 1:99 of DHA:EPA. Alternatively, DHA may be present in the compositions of this invention at a relative amount of ratio less than 1% than the amount of EPA. Alternatively, DHA may be present in the compositions of this invention at a DHA:EPA ratio of less than 1:99.

[0051] In some embodiments, a relatively small amount of DHA relative to the total amount of fatty acids present in the composition is present. In some embodiments, the compositions of the present invention comprise no more than 20% DHA, alternatively no more than 15% DHA, alternatively no more than 12% DHA, alternatively no more than 10% DHA, alternatively no more than 8% DHA, alternatively no more than 7% DHA, alternatively no more than 6% DHA, alternatively no more than 5% DHA, alternatively no more than 4% DHA, alternatively no more than 3% DHA, alternatively no more than 2% DHA, alternatively no more than 1% DHA relative to the total amount of fatty acids present in the composition. In some embodiments, the composition comprises about 5 mg/g to about 20 mg/g, alternatively about 8 mg/g to about 18 mg/g, alternatively about 9 mg/g to about 15 mg/g, alternatively about 10 mg/g to about 14 mg/g, alternatively about 11 mg/g to about 13 mg/g, alternatively about 12 mg/g to about 13 mg/g of DHA.

[0052] In some embodiments, the ratio of EPA:HPA is about 1500:1 to 25:1, alternatively 1000:1 to 50:1, alternatively 800:1 to 60:1, alternatively 500:1 to 60:1, alternatively 250:1 to 75:1, and alternatively 100:1 to 80:1. In some preferred embodiments, the ratio of EPA:HPA is about 30:1. In some embodiments, the ratio of DPA:HPA is about 20:1 to 1:1, alternatively 200:1 to 2:1, alternatively 150:1 to 3:1, alternatively 100:1 to 4:1, alternatively 50:1 to 5:1, alternatively 25:1 to 6:1, and alternatively 10:1 to 7:1. In some preferred embodiments, the ratio of DPA:HPA is about 8:1. In some embodiments, the ratio of DPA:HPA is about 3:0.

[0053] In other embodiments, a relatively small amount of DHA as compared to EPA is present. In these embodiments, the compositions of the present invention comprise no more than 1:5 of DHA:DPA, alternatively no more than 12:1 of DHA:DPA, alternatively no more than 10:1 of DHA:DPA, alternatively no more than 8:1 of DHA:DPA, alternatively no more than 5:1 of DHA:DPA, alternatively no more than 3:1 of DHA:DPA, alternatively no more than 2:1 of DHA:DPA, alternatively no more than 1:1 of DHA:DPA, alternatively no more than 1:2 of DHA:DPA, alternatively no more than 1:3 of DHA:DPA, alternatively no more than 1:5 of DHA:DPA, alternatively no more than 1:8 of DHA:DPA, alternatively no more than 1:10 of DHA:DPA, alternatively no more than 1:15 of DHA:DPA, alternatively no more than 1:20 of DHA:DPA, alternatively no more than 1:25 of DHA:DPA, alternatively no more than 1:50 of DHA:DPA, alternatively no more than 1:75 of DHA:DPA, alternatively no more than 1:90 of DHA:DPA, alternatively no more than 1:95 of DHA:DPA, alternatively no more than 1:100 of DHA:DPA. In some embodiments, the ratio of DHA:DPA is preferably less than 2:1.

[0054] In other embodiments, a relatively small amount of DHA as compared to HPA is present. In these embodiments, the compositions of the present invention comprise no more than 15:1 of DHA:HPA, alternatively no more than 12:1 of DHA:HPA, alternatively no more than 10:1 of DHA:HPA, alternatively no more than 8:1 of DHA:HPA, alternatively no more than 5:1 of DHA:HPA, alternatively no more than 3:1 of DHA:HPA, alternatively no more than 2:1 of DHA:HPA, alternatively no more than 1:1 of DHA:HPA, alternatively no more than 1:2 of DHA:HPA, alternatively no more than 1:3 of DHA:HPA, alternatively no more than 1:5 of DHA:HPA, alternatively no more than 1:8 of DHA:HPA, alternatively no more than 1:10 of DHA:HPA, alternatively no more than 1:15 of DHA:HPA, alternatively no more than 1:20 of DHA:HPA, alternatively no more than 1:25 of DHA:HPA, alternatively no more than 1:50 of DHA:HPA, alternatively no more than 1:75 of DHA:HPA, alternatively no more than 1:90 of DHA:HPA, alternatively no more than 1:95 of DHA:HPA, alternatively no more than 1:100 of DHA:HPA. In some embodiments, the ratio of DHA:HPA is preferably less than 2:1.

[0055] In yet other embodiments, the compositions of the present invention comprise no more than 10% omega-6 fatty acids relative to the total amount of fatty acids, alternatively no more than 9%, alternatively no more than 8%, alternatively no more than 7%, alternatively no more than 6%, alternatively no more than 5%, alternatively no more than 4.5%, alternatively no more than 4%, alternatively no more than 3.5%, alternatively no more than 3%, alternatively no more than 2.5%, alternatively no more than 2%, alternatively no more than 1.7%, alternatively no more than 1.5%, alternatively no more than 1.2%, alternatively no more than 1%, alternatively no more than 0.5% omega-6 fatty acids versus the total amount of fatty acids comprised by the compositions of the present invention.

[0056] Omega-6 fatty acids include, but are not limited to: linoleic acid (LA; C18:2- n6); gamma-linoleic acid (GLA; C18:3- n6); eicosadienoic acid (C20:2- n6); dihomogamma-linoleic acid (DGLA; C20:3- n6); arachidonic acid (ARA; C20:4- n6), and omega-6 docosapentaenoic acid (DPA; C22: 5- n6).

[0057] In further embodiments, the compositions of the present invention comprise no more than 10% omega-6 fatty acids relative to the total amount of omega-3 fatty acids plus omega-6 fatty acids, alternatively no more than 9%, alternatively no more than 8%, alternatively no more than 7%, alternatively no more than 6%, alternatively no more than 5%, alternatively no more than 4.5%, alternatively no more than 4%, alternatively no more than 3.5%, alternatively no more than 3%, alternatively no more than 2.5%, alternatively no more than 2%, alternatively no more than 1.7%, alternatively no more than 1.5%, alternatively no more than 1.2%, alternatively no more than 1%, alternatively no more than 0.5% omega-6 fatty acids versus the total amount of omega-3 fatty acids plus omega-6 fatty acids comprised by the compositions of the present invention.

[0058] In yet other embodiments, the compositions of the present invention comprise no more than 8% arachidonic acid (ARA; C20:4- n6) relative to the total amount of omega-3 fatty acids plus omega-6 fatty acids comprised by the compositions of the present invention.
fatty acids plus omega-6 fatty acids, alternatively no more than 7%, alternatively no more than 6%, alternatively no more than 5%, alternatively no more than 4.5%, alternatively no more than 4%, alternatively no more than 3.5%, alternatively no more than 3%, alternatively no more than 2.5%, alternatively no more than 2%, alternatively no more than 1.7%, alternatively no more than 1.5%, alternatively no more than 1.2%, alternatively no more than 1%, alternatively no more than 0.5% arachidonic acid (ARA; C20:4-n6) versus the total amount of omega-3 fatty acids plus omega-6 fatty acids comprised by the compositions of the present invention.

[0059] In some embodiments, a relatively small amount of omega-3 fatty acids in aggregate other than EPA, ETA, HPA and DPA (alternatively indicated as non-EPA, non-ETA, non-HPA and non-DPA omega-3 fatty acids in aggregate) relative to the total amount of fatty acids present in the composition is present. In some embodiments, the compositions of the present invention comprise no more than 20% non-EPA, non-ETA, non-HPA and non-DPA omega-3 fatty acids, alternatively no more than 15% non-EPA, non-ETA, non-HPA and non-DPA omega-3 fatty acids, alternatively no more than 12% non-EPA, non-ETA, non-HPA and non-DPA omega-3 fatty acids, alternatively no more than 10% non-EPA, non-ETA, non-HPA and non-DPA omega-3 fatty acids, alternatively no more than 8% non-EPA, non-ETA, non-HPA and non-DPA omega-3 fatty acids, alternatively no more than 6% non-EPA, non-ETA, non-HPA and non-DPA omega-3 fatty acids, alternatively no more than 5% non-EPA, non-ETA, non-HPA and non-DPA omega-3 fatty acids, alternatively no more than 4% non-EPA, non-ETA, non-HPA and non-DPA omega-3 fatty acids, alternatively no more than 3% non-EPA, non-ETA, non-HPA and non-DPA omega-3 fatty acids, alternatively no more than 2% non-EPA, non-ETA, non-HPA and non-DPA omega-3 fatty acids, alternatively no more than 1% non-EPA, non-ETA, non-HPA and non-DPA omega-3 fatty acids in aggregate relative to the total amount of fatty acids present in the composition.

[0060] In some embodiments, a relatively small amount of the sum of ALA, SDA and DHA relative to the total amount of fatty acids present in the composition is present, while at the same time large amounts of the sum of EPA, DPA-n3, HPA and ETA are present. In some embodiments, the compositions of the present invention comprise no more than 20% of the sum of ALA, SDA and DHA, alternatively no more than 15% of the sum of ALA, SDA and DHA, alternatively no more than 12% of the sum of ALA, SDA and DHA, alternatively no more than 10% of the sum of ALA, SDA and DHA, alternatively no more than 8% of the sum of ALA, SDA and DHA, alternatively no more than 7% of the sum of ALA, SDA and DHA, alternatively no more than 6% of the sum of ALA, SDA and DHA, alternatively no more than 5% of the sum of ALA, SDA and DHA, alternatively no more than 4% of the sum of ALA, SDA and DHA, alternatively no more than 3% of the sum of ALA, SDA and DHA, alternatively no more than 2% of the sum of ALA, SDA and DHA, alternatively no more than 1% of the sum of ALA, SDA and DHA relative to the total amount of fatty acids present in the composition, while at the same time contain more than 40% the sum of EPA, DPA-n3, HPA and ETA, alternatively more than 50% the sum of EPA, DPA-n3, HPA and ETA; alternatively more than 60% the sum of EPA, DPA-n3, HPA and ETA; alternatively more than 70% the sum of EPA, DPA-n3, HPA and ETA, alternatively more than 75% the sum of EPA, DPA-n3, HPA and ETA, alternatively more than 80% the sum of EPA, DPA-n3, HPA and ETA, alternatively more than 85% the sum of EPA, DPA-n3, HPA and ETA, alternatively more than 90% the sum of EPA, DPA-n3, HPA and ETA, alternatively more than 95% the sum of EPA, DPA-n3, HPA and ETA, alternatively between 80% and 98% the sum of EPA, DPA-n3, HPA and ETA, alternatively between 80% and 96% the sum of EPA, DPA-n3, HPA and ETA, alternatively between 85% and 98% the sum of EPA, DPA-n3, HPA and ETA, alternatively between 85% and 96% the sum of EPA, DPA-n3, HPA and ETA, alternatively between 90% and 98% the sum of EPA, DPA-n3, HPA and ETA, alternatively between 90% and 96% the sum of EPA, DPA-n3, HPA and ETA, alternatively between 90% and 95% the sum of EPA, DPA-n3, HPA and ETA, alternatively between 90% and 95% the sum of EPA, DPA-n3, HPA and ETA, relative to the total amount of fatty acids present in the composition is present.

[0061] In further embodiments, the compositions of the present invention comprise no more than 8% arachidonic acid (ARA; C20:4-n6) relative to the total amount of fatty acids, alternatively no more than 7%, alternatively no more than 6%, alternatively no more than 5%, alternatively no more than 4.5%, alternatively no more than 4%, alternatively no more than 3.5%, alternatively no more than 3%, alternatively no more than 2.5%, alternatively no more than 2%, alternatively no more than 1.7%, alternatively no more than 1.5%, alternatively no more than 1.2%, alternatively no more than 1%, alternatively no more than 0.5% arachidonic acid (ARA; C20:4-n6) relative the total amount of fatty acids comprised by the compositions of the present invention.

[0062] In other embodiments, the compositions of the present invention comprise no more than 2.5% arachidonic acid (ARA; C20:4-n6), no more than 0.4% omega-6-docosapentaenoic acid (DPA; C22:5-n6) and no more than 0.2% gamma-linoleic acid (GLA; C18:3-n6) relative the total amount of fatty acids comprised by the compositions of the present invention.

[0063] Further embodiments provide fatty acid compositions comprising no more than 2.5% arachidonic acid (ARA; C20:4-n6), no more than 0.3% omega-6 docosapentaenoic acid (DPA; C22:5-n6) and no more than 0.1% gamma-linoleic acid (GLA; C18:3-n6) relative the total amount of fatty acids comprised by the compositions of the present invention.

[0064] In yet other embodiments, the active ingredient of the formulations of the present invention consists essentially wholly of the EPA and DPA or precursors thereof (ethyl ester, triglyceride, or any other pharmaceutically acceptable salt or derivative thereof). In that case, no large amounts (preferably less than 15%, alternatively less than 12%, alternatively less than 10%, alternatively less than 9%, alternatively less than 8%, alternatively less than 7%, alternatively less than 6%, alternatively less than 5%, alternatively less than 4%, alternatively less than 3%, alternatively less than 2%, alternatively less than 1%, alternatively less than 0.5%, alternatively less than 0.25%) of any other fatty acids are present.

[0065] In further embodiments, the active ingredient of the formulations of the present invention consists essentially wholly of omega-3-pentaenoic acids or precursors thereof (ethyl ester, triglyceride, or any other pharmaceutically acceptable salt or derivative thereof). In that case, no large amounts (preferably less than 15%, alternatively less than 12%, alternatively less than 10%, alternatively less than 9%, alternatively less than 8%, alternatively less than 7%, alternatively less than 6%, alternatively less than 5%, alternatively less than 4%, alternatively less than 3%, alternatively less than 2%, alternatively less than 1%, alternatively less than 0.5%, alternatively less than 0.25%) of any other fatty acids are present.
natively less than 4%, alternatively less than 4%, alternatively less than 4%, alternatively less than 4%, alternatively less than 2%, alternatively less than 1%, alternatively less than 0.5%, alternatively less than 0.25%) of any other fatty acids are present.

[0066] The fatty acid percentage is determined on a weight/weight, mol/mol, or chromatography area percent basis relative to all fatty acids present in the composition as determined by methods such as disclosed in the European Pharmacopoeia monograph for omega-3 fatty acid concentrates. European Pharmacopoeia monograph for omega-3-acid ethyl esters 90%, or European Pharmacopoeia monograph method 2.4.29, USP monograph for fish oil dietary supplements, USP 35 omega-3-acid ethyl esters (LOVAZ®) monograph, or any essentially equivalent methods (whether by gas chromatography, HPLC, FPLC or any other chromatographic method).

[0067] In some embodiments, the fatty acid percentage is determined not as a percentage of all fatty acids present in the composition but as a specific type of fatty acid ethyl esters as percentage of all fatty acid ethyl esters present in the composition, thus excluding from the fatty acid percentage determination such fatty acids present as, for instance: free fatty acids; mono-, di-, and tri-glycerides; or fatty acids present in phospholipids (such as phosphatidylserine or phosphatidylcholine) or polysorbates (such as Tween 80, Tween 20, or polysorbate 40).

[0068] In other embodiments, the fatty acid percentage is determined not as a percentage of all fatty acids present in the composition but as a specific type of free fatty acid as percentage of all free fatty acids present in the composition, thus excluding from the fatty acid percentage determination such fatty acids present as, for instance: fatty acid ethyl esters; mono-, di-, and tri-glycerides; or fatty acids present in phospholipids (such as phosphatidylserine or phosphatidylcholine) or polysorbates (such as Tween 80, Tween 20, or polysorbate 40).

[0069] In yet other embodiments, the fatty acid percentage is determined not as a percentage of all fatty acids present in the composition but as a specific type of glycerol fatty acid ester as percentage of all glycerol fatty acid esters present in the composition, thus excluding from the fatty acid percentage determination such fatty acids present as, for instance: fatty acid ethyl esters; free fatty acids; or fatty acids present in phospholipids (such as phosphatidylserine or phosphatidylcholine) or polysorbates (such as Tween 80, Tween 20, or polysorbate 40).

[0070] In further embodiments, the fatty acid percentage is determined not as a percentage of all fatty acids present in the composition but as di- or tri-fatty acid esters with glycerol as percentage of all glycerol di- and tri-fatty acid esters present in the composition, thus excluding from the fatty acid percentage determination such fatty acids present as, for instance: glycerol-mono-fatty acid esters; fatty acid ethyl esters; free fatty acids; or fatty acids present in phospholipids (such as phosphatidylserine or phosphatidylcholine) or polysorbates (such as Tween 80, Tween 20, or polysorbate 40).

[0071] In yet other embodiments, the fatty acid percentage is determined not as a percentage of all fatty acids present in the composition but as a tri-fatty acid esters with glycerol as percentage of all glycerol tri-fatty acid esters present in the composition, thus excluding from the fatty acid percentage determination such fatty acids present as, for instance: mono- and di-fatty acid esters of glycerol; fatty acid ethyl esters; free fatty acids; or fatty acids present in phospholipids (such as phosphatidylserine or phosphatidylcholine) or polysorbates (such as Tween 80, Tween 20, or polysorbate 40).

[0072] The EPA, HPA, DPA, or omega-3-pentaenoic acids may be derived from any appropriate source including plant seed oils, microbial oils from algae or fungal or marine oils from fish or other marine animals. Certain species are a particular good source of oils containing DPA, for example seal oil. They may be used in the form of the natural oil, if that oil meets the required purity requirements of the present invention, or may be purified to give products containing the fatty acid composition of the present invention.

[0073] The compositions of the present invention may be produced through a range of the methods. Such methods may include: distillation, including short path distillation; urea precipitation; enzymatic conversion concentration; conventional chromatography; HPLC/FPLC; supercritical carbondioxide extraction; supercritical carbondioxide chromatography; simulated moving bed chromatography; supercritical carbondioxide simulated moving bed chromatography; or chemical conversion methods such as iodolactonization. Such methods are generally known to those skilled in the art of purifying and isolating omega-3 fatty acids.

[0074] Typically, the omega-3 fatty acid concentration/purification process is initiated by esterifying the fatty acids comprised by the marine oil raw material (such as crude fish oil) with ethanol (to form fatty acid ethyl esters) in order to separate omega-3 fatty acids from other fatty acids covalently bound together in the natural triglyceride molecules of the source oil. Subsequently, the material may be distilled once or several times to achieve omega-3-acid ethyl ester concentrations above 60%-70%. Alternatively, enzymatic concentration, urea precipitation or supercritical extraction may be used alone or in conjunction with distillation to reach omega-3 levels above 70%-90%. In order to prepare a highly pure concentrate of a single omega-3 fatty acid, methods such as chromatography, supercritical chromatography, simulated moving bed chromatography, supercritical simulated moving bed chromatography, or chemical conversion methods such as iodolactonization are typically most practical to reach levels above 50%, alternatively above 60%, alternatively above 70%, alternatively above 80%, alternatively above 90%, alternatively above 95%, of a single omega-3 fatty acid such as ETA, EPA, HPA, DPA, TPA, or HHA.

[0075] Those skilled in the art will be able to design processes suited to prepare a certain omega-3 fatty acid composition as desired, based on the methods described above. Such processes are flexible enough to affect the relative proportions between the long chain C18, C20, C21 and C22 fatty acids which occur naturally in available fish oil raw materials and other marine oils. It provides not only for the concentration of the individual omega-3 fatty acids, but the ratio between them will remain within a pattern of variation caused by variations in nature. However, suitable methods compensate for sometimes extreme variations which may occur naturally. Thus, for those skilled in the art, it will be possible to make a product with a constant and predetermined composition.

[0076] EPA is relatively abundant in fish oils or other marine oils and can be relatively easy obtained through the application of concentration and purification technologies from such fish or marine oils. DPA and HPA are present at much lower concentrations. In order to prepare the compositions of the present invention, DPA or HPA may be concen-
trated and purified from fish or other marine oils according to the methods referred to above, either alone or DPA combined with EPA and/or HPA. Alternatively, the DPA or HPA may be chemically prepared from a high purity EPA concentrate by elongation of the EPA fatty-acid chain with two or one hydrogen-saturated carbons (C2-elongation or C1-elongation) on the carboxyl side of the molecule (for instance with a method similar to or alternate methods with equivalent results such as described by Kuklev DV. and Smith WL in Chem Phys Lipids, 2006; 144(2): 172-177). In another alternative approach, a high purity EPA concentrate may be partially converted to DPA (or HPA) using a method for C2-elongation (or C1-elongation) of EPA similar to those described above, thus directly yielding compositions of the present invention or intermediates therefore.

Once the oils containing one or more of the desired fatty acids have been obtained, and purified as necessary, these oils may be blended to give the desirable relative amounts of EPA, DPA, HPA, DHA, TPA, other omega-3 fatty acids and omega-6 fatty acids to obtain the compositions of the present invention described in detail above.

Fish oils may also contain by-products and contaminants such as pesticides, chlorinated or brominated hydrocarbons, heavy metals, cholesterol and vitamins. During the production of the concentrate, the concentrations of these components are significantly reduced compared to untreated fish oils. Such reduction is inherent due to the nature of purification methods and their ability to concentrate of several or specific omega-3 fatty acids, thus removing other compounds.

Triglycerides comprising more than 60% of the omega-3 fatty acids in the composition may be produced from ethyl esters and glycerol by well known, published, or alternative chemical synthesis or enzymatic procedures. The free acids may be produced from ethyl esters by well known hydrolization or saponification procedures. Methods for converting ethyl esters to triglycerides, free fatty acids, and other molecular forms comprising fatty acids, are generally known to those skilled in the art chemically or enzymatically converting omega-3 fatty acids from one form to another.

In some embodiments, the compositions of the present invention have improved pharmacological features as demonstrated by improved bioavailability in a mammal of EPA, HPA, DPA, DHA, EPA+DPA, EPA+DHA, or EPA+HPA+DPA combined, total omega-3-pentaenoic acids, or total omega-3 fatty acids. Key parameters for determining bioavailability are maximum concentration of a therapeutic compound or a metabolite thereof (Cmax), the time from administration to maximum concentration (Tmax), and the area under the concentration curve over time (AUC). Such parameters may be determined under single dose or multiple dose administration regimens. Methods to determine comparative bioavailability in mammals are generally known to those skilled in the art. When comparing Tmax, Cmax, and AUC for embodiments of the present invention to LOVAZAR®, EPIANOVA™, and AMR101 throughout this application, such comparison will be on the basis of an equal dose of 4 capsules of 1 gram each for each of these products. The comparative parameters, however, do apply to all essentially equivalent dosing modes comparing embodiments of the present invention to LOVAZAR®, EPIANOVA™, and AMR101.

Meal conditions during administration to a subject of omega-3 fatty acid compositions or omega-3 fatty acid formulations are of special significance for absorption and bioavailability of omega-3 fatty acids. The meal conditions typically considered are: fasting (no food at all prior for 8-12 hours prior to administration and 2-3 hours post administration of the treatment); a low fat meal (a meal typically containing less than 25 gram of fat [350-600 Kcal] consumed just before or after the administration of the treatment; typically within a 15-30 minute range); or a high fat meal (a meal containing 40 gram to 75 gram of fat [700-1000 Kcal] consumed just before or after the administration of the treatment; typically within a 15-30 minute range).

In some embodiments of the present invention, compositions of the present invention are more rapidly absorbed as measured by the time to reach the maximum concentration (Tmax) in blood, serum or plasma of EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids. In preferred embodiments of the present invention, Tmax under high fat meal administration conditions is less than 8 hours, alternatively less than 6 hours, alternatively approximately 5 hours, alternatively 4 hours or less. In other preferred embodiments of the present invention, Tmax under low fat meal administration conditions is less than 8 hours, alternatively less than 6 hours, alternatively approximately 5 hours, alternatively 4 hours or less. In yet other preferred embodiments of the present invention, Tmax under fasting administration conditions is less than 8 hours, alternatively less than 6 hours, alternatively approximately 5 hours, alternatively 4 hours or less. In further embodiments of the present invention, Tmax for EPA, DPA, DHA, EPA+DPA, EPA+DHA, or total omega-3 fatty acids are equal or less than Tmax for LOVAZAR® for EPA, DPA, DHA, EPA+DPA, EPA+DHA, or total omega-3 fatty acids under high fat meal, low fat meal, and fasting administration conditions. In other embodiments of the present invention, Tmax for EPA, DPA, DHA, EPA+DPA, EPA+DHA, or total omega-3 fatty acids are less than Tmax for LOVAZAR® for EPA, DPA, DHA, EPA+DPA, EPA+DHA, or total omega-3 fatty acids under either low fat meal, fasting, or both administration conditions.

In yet other embodiments of the present invention, Tmax for EPA, DPA, DHA, EPA+DPA, EPA+DHA, or total omega-3 fatty acids are equal or less than Tmax for AMR101 for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids under high fat meal, low fat meal, and fasting administration conditions. Finally, in other embodiments of the present invention, Tmax for EPA, DPA, DHA, EPA+DPA, EPA+DHA, or total omega-3 fatty acids are less than Tmax for AMR101 for EPA+DHA and to EPA, DPA, DHA, EPA+DPA, EPA+DHA, or total omega-3 fatty acids under either low fat meal, fasting, or both administration conditions.

In other embodiments of the present invention, compositions of the present invention are better absorbed than LOVAZAR® as measured by the maximum concentration (Cmax) in blood, serum or plasma of EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids.

In preferred embodiments of the present invention, Cmax for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids under high fat meal administration conditions are preferably at least 1.1x(110% of) Cmax for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids for LOVAZAR®, alternatively at least 1.2x(120% of),
alternatively at least $1.3 \times (130\%\text{ of})$, alternatively at least $1.4 \times (140\%\text{ of})$, alternatively at least $1.5 \times (150\%\text{ of})$ Cmax for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids for LOVAZA®.

In other preferred embodiments of the present invention, Cmax for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids under low fat meal administration conditions are preferably at least $1.5 \times (150\%\text{ of})$ Cmax for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids for LOVAZA®; alternatively at least $2 \times (200\%\text{ of})$, alternatively at least $3 \times (300\%\text{ of})$, alternatively at least $4 \times (400\%\text{ of})$, alternatively at least $5 \times (500\%\text{ of})$, alternatively at least $6 \times (600\%\text{ of})$, alternatively at least $7 \times (700\%\text{ of})$ AUC for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids for LOVAZA®.

In other embodiments of the present invention, compositions of the present invention are better absorbed than AMR101 as measured by the maximum concentration (Cmax) in blood, serum or plasma of EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids.

In preferred embodiments of the present invention, Cmax for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids under high fat meal administration conditions are preferably at least $1.1 \times (110\%\text{ of})$ Cmax for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids for AMR101, alternatively at least $1.2 \times (120\%\text{ of})$, alternatively at least $1.3 \times (130\%\text{ of})$, alternatively at least $1.4 \times (140\%\text{ of})$, alternatively at least $1.5 \times (150\%\text{ of})$ Cmax for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids for LOVAZA®.

In other embodiments of the present invention, compositions of the present invention are better absorbed than LOVAZA® as measured by the area under the concentration curve over time (AUC) in blood, serum or plasma of EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids.

In preferred embodiments of the present invention, AUC for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids under high fat meal administration conditions are preferably at least $1.1 \times (110\%\text{ of})$ AUC for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids for LOVAZA®, alternatively at least $1.2 \times (120\%\text{ of})$, alternatively at least $1.3 \times (130\%\text{ of})$, alternatively at least $1.4 \times (140\%\text{ of})$, alternatively at least $1.5 \times (150\%\text{ of})$ AUC for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids for LOVAZA®.

In preferred embodiments of the present invention, AUC for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids under low fat meal administration conditions are preferably at least $1.5 \times (150\%\text{ of})$ AUC for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids for LOVAZA®; alternatively at least $2 \times (200\%\text{ of})$, alternatively at least $3 \times (300\%\text{ of})$, alternatively at least $4 \times (400\%\text{ of})$, alternatively at least $5 \times (500\%\text{ of})$, alternatively at least $6 \times (600\%\text{ of})$, alternatively at least $7 \times (700\%\text{ of})$ for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids for LOVAZA®.

In preferred embodiments of the present invention, AUC for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids under high fat meal administration conditions are preferably at least $1.1 \times (110\%\text{ of})$ AUC for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids for AMR101, alternatively at least $1.2 \times (120\%\text{ of})$, alternatively at least $1.3 \times (130\%\text{ of})$, alternatively at least $1.4 \times (140\%\text{ of})$, alternatively at least $1.5 \times (150\%\text{ of})$ AUC for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids for AMR101.

In preferred embodiments of the present invention, compositions of the present invention are better absorbed than AMR101 as measured by the area under the concentration curve over time (AUC) in blood, serum or plasma of EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids. In preferred embodiments of the present invention, AUC for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids under high fat meal administration conditions are preferably at least $1.1 \times (110\%\text{ of})$ AUC for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids for AMR101, alternatively at least $1.2 \times (120\%\text{ of})$, alternatively at least $1.3 \times (130\%\text{ of})$, alternatively at least $1.4 \times (140\%\text{ of})$, alternatively at least $1.5 \times (150\%\text{ of})$ AUC for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids for AMR101.
DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids for AMR101. 0097. In other preferred embodiments of the present invention, AUC for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids under low fat meal administration conditions are preferably at least 1.5x(150% of) AUC for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids for AMR101, alternatively at least 2x(200% of), alternatively at least 3x(300% of), alternatively at least 4x(400% of), alternatively at least 5x(500% of), alternatively at least 6x(600% of) AUC for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids for AMR101.

0098. In other preferred embodiments of the present invention, AUC for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids under fasting administration conditions are preferably at least 1.5x(150% of) AUC for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids for AMR101, alternatively at least 2x(200% of), alternatively at least 3x(300% of), alternatively at least 4x(400% of), alternatively at least 5x(500% of), alternatively at least 6x(600% of), alternatively at least 7x(700% of) AUC for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids for AMR101.

0099. In other embodiments of the present invention, compositions of the present invention are better absorbed than EPANOVA™ as measured by the maximum concentration (Cmax) in blood, serum or plasma of EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids.

0100. In preferred embodiments of the present invention, Cmax for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids under high fat meal administration conditions are preferably approximately 1.0x(100% of) Cmax (or non-significant difference) for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids for EPANOVA™, alternatively at least 1.05x(105% of), alternatively at least 1.1x(110% of), alternatively at least 1.2x(120% of), alternatively at least 1.3x(130% of) Cmax for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids for EPANOVA™.

0101. In other preferred embodiments of the present invention, Cmax for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids under low fat meal administration conditions are preferably approximately 1.0x(100% of) Cmax (or non-significant difference) for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids for EPANOVA™, alternatively at least 0.95x(95% of), alternatively at least 1.05x(105% of), alternatively at least 1.1x(110% of), alternatively at least 1.2x(120% of), alternatively at least 1.3x(130% of) Cmax for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids for EPANOVA™.

0102. In other preferred embodiments of the present invention, Cmax for EPA+DHA, total omega-3-pentaenoic acids, and total omega-3 fatty acids under fasting administration conditions are preferably approximately 1.0x(100% of) Cmax (or non-significant difference) for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids for EPANOVA™, alternatively at least 1.05x(105% of), alternatively at least 1.1x(110% of), alternatively at least 1.2x(120% of), alternatively at least 1.3x(130% of) Cmax for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids for EPANOVA™.

0103. In other embodiments of the present invention, compositions of the present invention are better absorbed than EPANOVA™ as measured by the area under the concentration curve over time (AUC) in blood, serum or plasma of EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids.

0104. In preferred embodiments of the present invention, AUC for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids under high fat meal administration conditions are preferably approximately 1.0x(100% of) AUC (or non-significant difference) for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids for EPANOVA™, alternatively at least 1.05x(105% of), alternatively at least 1.1x(110% of), alternatively at least 1.2x(120% of), alternatively at least 1.3x(130% of) AUC for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids for EPANOVA™.

0105. In other preferred embodiments of the present invention, AUC for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids under low fat meal administration conditions are preferably approximately 1.0x(100% of) AUC (or non-significant difference) for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids for EPANOVA™, alternatively at least 1.05x(105% of), alternatively at least 1.1x(110% of), alternatively at least 1.2x(120% of), alternatively at least 1.3x(130% of) AUC for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids for EPANOVA™.

0106. In other preferred embodiments of the present invention, AUC for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids under fasting administration conditions are preferably approximately 1.0x(100% of) AUC (or non-significant difference) for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids for EPANOVA™, alternatively at least 1.05x(105% of), alternatively at least 1.1x(110% of), alternatively at least 1.2x(120% of), alternatively at least 1.3x(130% of) AUC for EPA, DPA, DHA, EPA+DPA, EPA+DHA, total omega-3-pentaenoic acids, or total omega-3 fatty acids for EPANOVA™.

0107. In some embodiments, the improved bioavailability features described above are apparent upon single dose administration, while in other embodiments the improved bioavailability features described above are apparent upon multiple dose administration of formulations according to the present invention as compared to referenced comparator products above or substantial equivalent forms thereof.

0108. The compositions of the present invention may be used for the treatment of patients by administering an effective amount of such compositions to a subject in need thereof, such as a subject prone to or afflicted with a disease or condition or in need of treatment for a disease or condition. The present invention provides methods of treating, preventing, and reducing symptoms associated with a disease or condition comprising administration of a composition of the present invention. Exemplary diseases or conditions include, but are not limited to: hypertriglyceridemia (for example, by
those skilled in the art typically established by assessing fasting triglyceride (TG) levels; hypertriglyceridemia with TG ≥ 500 mg/dL (VHGT); hypertriglyceridemia with TG 200-499 mg/dL; hypertriglyceridemia with TG 200-499 mg/dL while on statin treatment (HTG); hypercholesterolemia; mixed dyslipidemia; coronary heart disease (CHD); vascular disease; atherosclerotic disease and related conditions; heart failure; cardiac arrhythmias; blood coagulatory conditions associated with cardiac arrhythmias; hypertension; coagulation related disorders, including post-surgical deep vein thrombosis or other high risk thrombosis conditions; nephropathy; kidney or urinary tract disease; retinopathy; cognitive, psychiatric, neurological and other CNS disorders, including but not limited to schizophrenia, depression, bipolar disorder and any form of dementia (including ischemic dementia and vascular dementia); autoimmune diseases; inflammatory diseases; asthma, COPD or other respiratory disease; dermatological disease; metabolic syndrome; diabetes or other forms of metabolic disease; liver diseases including fatty liver disease; diseases affecting the senses, including those affecting vision and hearing; diseases of the gastrointestinal tract; diseases of the male or female reproductive system or related secondary sexual organs; an infection or any type, including lymphomas, myelomas and solid tumors; any infections caused by a virus, bacterium, fungus, protozoa or other organism. The present invention also provides for the treatment and/or prevention of cardiovascular events and/or cardiovascular events and/or vascular events and/or symptoms. The present invention also provides for the reduction of number of such events, as well as a reduction or amelioration of symptoms associated with such events.

[0109] Cardiovascular and/or cardiac events may include, but are not limited to: myocardial infarction, ischemic cardiac attack, ischemic attack, acute angina, hospitalization due to acute angina, stroke, transient ischemic cerebral attack, cardiac revascularization, cardiac revascularization with stent placement, carotid artery revascularization, carotid artery revascularization with stent placement, peripheral artery revascularization, peripheral artery revascularization with stent placement, plaque rupture, death due to cardiovascular event, and hospitalization due to cardiovascular event. Cardiovascular and/or cardiac events may also include other events deemed to fall in such category by those skilled in the art.

[0110] The present invention also provides method for increasing high-lipoprotein (HDL) cholesterol levels. The methods related to lipid parameters measured in fed or fasted state. Fasting lipid levels refer to levels of the lipids in the plasma of a subject after a fasting period, which is a period of about 8 to 12 hours without food.

[0111] In some embodiments, the baseline fasting triglyceride level in the subject prior to administration of a composition of the present invention is greater than 150 mg/dL. In some embodiments, the baseline fasting triglyceride level is 150 mg/dL to 199 mg/dL, alternatively 200-499 mg/dL, alternatively over 500 mg/dL.

[0112] In some embodiments, the methods of the present invention relate to reducing or decreasing plasma lipid parameters in a subject in need thereof. Lipid parameters include triglycerides, low-density lipoprotein (LDL) cholesterol, total cholesterol, free fatty acids, and non-high-lipoprotein cholesterol (non-HDL) cholesterol. The lipid parameters may be measured in a fasting state or a fed state. In some embodiments, the methods comprise administration of EPA and/or DPA in the free fatty acid form or a salt, ester, or derivative form. In some embodiments, the methods comprise a reduction in triglyceride levels of at least 10%, alternatively at least 15%, alternatively at least 20%, alternatively at least 25%, alternatively at least 30%, alternatively at least 35%, alternatively at least 40%, alternatively at least 45%, and alternatively at least 50% compared to baseline. In some embodiments, the methods comprise a reduction in total cholesterol levels of at least 1%, alternatively at least 2%, alternatively at least 3%, alternatively at least 4%, alternatively at least 5%, alternatively at least 6%, alternatively at least 7%, alternatively at least 8%, alternatively at least 9%, alternatively at least 10% compared to baseline. In some embodiments, the methods comprise a reduction in low-density lipoprotein (LDL) cholesterol levels of at least 1%, alternatively at least 15%, alternatively at least 20%, alternatively at least 25%, alternatively at least 30%, alternatively at least 35%, alternatively at least 40%, alternatively at least 45%, and alternatively at least 50% compared to baseline. In some embodiments, the methods comprise a reduction in free fatty acid levels of at least 5%, alternatively at least 7%, alternatively at least 10%, alternatively at least 15%, alternatively at least 20% compared to baseline. In some embodiments, the methods comprise a reduction in non-HDL cholesterol levels of at least 1%, alternatively at least 2%, alternatively at least 3%, alternatively at least 4%, alternatively at least 5%, alternatively at least 6%, alternatively at least 7%, alternatively at least 8%, alternatively at least 9%, alternatively at least 10%, alternatively at least 20%, alternatively at least 25%, alternatively at least 30% compared to baseline. In some embodiments, the methods comprise an increase in high density lipoprotein (HDL) cholesterol levels of at least 1%, alternatively at least 2%, alternatively at least 3%, alternatively at least 4%, alternatively at least 5%, alternatively at least 6%, alternatively at least 7%, alternatively at least 8%, alternatively at least 9%, alternatively at least 10% compared to baseline. In some embodiments, this change in lipid parameters can be achieved after a period of daily administration, such as one week, alternatively one month, alternatively two months, alternatively three months or more.

[0113] The present invention provides methods of treatment for hypertriglyceridemia (either TG≥ 500 mg/dL, TG≥ 200 mg/dL, TG≥ 150 mg/dL, TG≥ 100 mg/dL, TG≥ 50 mg/dL, or TG≥ 350 mg/dL), mixed dyslipidemia, or any other diseases or medical conditions as specified above, by dosing to a subject in need thereof omega-3 docosapentaenoic acid (DPA-n3) or its glycerol or ethyl esters. Such method of treatment provide a dose of at least 60 mg DPA-N3 per day, alternatively at least 80 mg DPA-N3 per day, alternatively at least 90 mg DPA-N3 per day, alternatively at least 120 mg DPA-N3 per day, alternatively at least 150 mg DPA-N3 per day, alternatively at least 160 mg DPA-N3 per day, alternatively at least 180 mg DPA-N3 per day, alternatively at least 200 mg DPA-N3 per day, alternatively at least 250 mg DPA-N3 per day, alternatively at least 300 mg DPA-N3 per day, alternatively at least 350 mg DPA-N3 per day, alternatively at least 400 mg DPA-N3 per day, alternatively at least 500 mg DPA-N3 per day, alternatively at least 600 mg DPA-N3 per day, alternatively at least 800 mg DPA-N3 or its glycerol or ethyl esters per day.

[0114] In some embodiments, the compositions of the present invention, which may comprise significant amounts of omega-3 docosapentaenoic acid (DPA-n3) or its glycerol or ethyl esters, may be used for the treatment of hypertriglyc-
eridemia (either TG≥500 mg/dL, TG≥200 mg/dL, TG≥150 mg/dL, TG200-499 mg/dL, TG300-499 mg/dL, TG350-499 mg/dL, or TG150-199 mg/dL), mixed dyslipidemia, or any other diseases or medical conditions specified above. Such method of treatment provides to a subject in need thereof a dose of at least 20 mg DPA-N3 per day, alternatively at least 25 mg DPA-N3 per day, alternatively at least 30 mg DPA-N3 per day, alternatively at least 40 mg DPA-N3 per day, alternatively at least 50 mg DPA-N3 per day, alternatively at least 60 mg DPA-N3 per day, alternatively at least 70 mg DPA-N3 per day, alternatively at least 80 mg DPA-N3 per day, alternatively at least 90 mg DPA-N3 per day, alternatively at least 100 mg DPA-N3 per day, alternatively at least 120 mg DPA-N3 per day, alternatively at least 150 mg DPA-N3 per day, alternatively at least 160 mg DPA-N3 per day, alternatively at least 200 mg DPA-N3 per day, alternatively at least 250 mg DPA-N3 per day, alternatively at least 300 mg DPA-N3 per day, alternatively at least 350 mg DPA-N3 per day, alternatively at least 400 mg DPA-N3 per day, alternatively at least 500 mg DPA-N3 per day, alternatively at least 600 mg DPA-N3 per day, alternatively at least 800 mg DPA-N3 or its glycerol or ethyl esters per day.

[0115] In other embodiments, the compositions of the present invention, which may comprise significant amounts of omega-3 docosapentaenoic acid (DPA-n3) or its glycerol or ethyl esters and which comprise relatively small amounts of omega-3 docosahexaenoic acid (DHA-n3), may be used for the treatment of hypertriglyceridemia (either TG≥500 mg/dL, TG≥200 mg/dL, TG≥150 mg/dL, TG200-499 mg/dL, TG300-499 mg/dL, TG350-499 mg/dL, or TG150-199 mg/dL), mixed dyslipidemia, or any other diseases or medical conditions specified above. Such method of treatment provides to a subject in need thereof a dose of at least 20 mg DPA-N3 per day, alternatively at least 25 mg DPA-N3 per day, alternatively at least 30 mg DPA-N3 per day, alternatively at least 40 mg DPA-N3 per day, alternatively at least 50 mg DPA-N3 per day, alternatively at least 60 mg DPA-N3 per day, alternatively at least 80 mg DPA-N3 per day, alternatively at least 100 mg DPA-N3 per day, alternatively at least 120 mg DPA-N3 per day, alternatively at least 150 mg DPA-N3 per day, alternatively at least 180 mg DPA-N3 per day, alternatively at least 200 mg DPA-N3 per day, alternatively at least 250 mg DPA-N3 per day, alternatively at least 300 mg DPA-N3 per day, alternatively at least 350 mg DPA-N3 per day, alternatively at least 400 mg DPA-N3 per day, alternatively at least 500 mg DPA-N3 per day, alternatively at least 600 mg DPA-N3 per day, alternatively at least 800 mg DPA-N3 or its glycerol or ethyl esters per day, while providing a relatively small amount of DHA-N3 such that the DHA:DPA dose ratio is no more than 15:1 of DHA:DPA, alternatively no more than 12:1 of DHA:DPA, alternatively no more than 10:1 of DHA:DPA, alternatively no more than 8:1 of DHA:DPA, alternatively no more than 5:1 of DHA:DPA, alternatively no more than 3:1 of DHA:DPA, alternatively no more than 2:1 of DHA:DPA, alternatively no more than 1:1 of DHA:DPA, alternatively no more than 1:2 of DHA:DPA, alternatively no more than 1:3 of DHA:DPA, alternatively no more than 1:5 of DHA:DPA, alternatively no more than 1:8 of DHA:DPA, alternatively no more than 1:10 of DHA:DPA, alternatively no more than 1:15 of DHA:DPA, alternatively a relative daily dose of no more than 1:20 of DHA:DPA.

[0117] The present invention provides methods of reducing triglycerides and treating hypertriglyceridemia (either TG≥500 mg/dL, TG≥200 mg/dL, TG≥150 mg/dL, TG200-499 mg/dL, TG300-499 mg/dL, TG350-499 mg/dL, or TG150-199 mg/dL), mixed dyslipidemia, or any other diseases or medical conditions as specified above, by dosing to a subject in need thereof omega-3 docosapentaenoic acid (DPA-n3) or its glycerol or ethyl esters. Such method of treatment provides a dose of at least 10 mg HPA-N3 per day, alternatively at least 15 mg HPA-N3 per day, alternatively at least 20 mg HPA-N3 per day, alternatively at least 25 mg HPA-N3 per day, alternatively at least 30 mg HPA-N3 per day, alternatively at least 40 mg HPA-N3 per day, alternatively at least 50 mg HPA-N3 per day, alternatively at least 60 mg HPA-N3 per day, alternatively at least 70 mg HPA-N3 per day, alternatively at least 80 mg HPA-N3 per day, alternatively at least 90 mg HPA-N3 per day, alternatively at least 100 mg HPA-N3 per day, alternatively at least 120 mg HPA-N3 per day, alternatively at least 150 mg HPA-N3 per day, alternatively at least 180 mg HPA-N3 per day, alternatively at least 200 mg HPA-N3 per day, alternatively at least 250 mg HPA-N3 per day, alternatively at least 300 mg HPA-N3 per day, alternatively at least 350 mg HPA-N3 per day, alternatively at least 400 mg HPA-N3 per day, alternatively at least 500 mg HPA-N3 per day, alternatively at least 600 mg HPA-N3 per day, alternatively at least 800 mg HPA-N3 or its glycerol or ethyl esters per day, while providing a relatively small amount of HPA-N3 such that the HPA:DPA dose ratio is no more than 15:1 of HPA:DPA, alternatively no more than 12:1 of HPA:DPA, alternatively no more than 10:1 of HPA:DPA, alternatively no more than 8:1 of HPA:DPA, alternatively no more than 5:1 of HPA:DPA, alternatively no more than 3:1 of HPA:DPA, alternatively no more than 2:1 of HPA:DPA, alternatively no more than 1:1 of HPA:DPA, alternatively no more than 1:2 of HPA:DPA, alternatively no more than 1:3 of HPA:DPA, alternatively no more than 1:5 of HPA:DPA, alternatively no more than 1:8 of HPA:DPA, alternatively no more than 1:10 of HPA:DPA, alternatively no more than 1:15 of HPA:DPA, alternatively a relative daily dose of no more than 1:20 of HPA:DPA.
least 180 mg HPA-N3 per day, alternatively at least 200 mg HPA-N3 per day, alternatively at least 250 mg HPA-N3 per day, alternatively at least 300 mg HPA-N3 per day, alternatively at least 350 mg HPA-N3 per day, alternatively at least 400 mg HPA-N3 per day, alternatively at least 500 mg HPA-N3 per day, alternatively at least 600 mg HPA-N3 per day, alternatively at least 800 mg HPA-N3 or its glycerol or ethyl esters per day.

[0118] In some embodiments, the compositions of the present invention, which may comprise significant amounts of omega-3 docosahexaenoic acid (HPA-n3) or its glycerol or ethyl esters, may be used for the treatment of hypertriglyceridemia (either TG≥500 mg/dL, TG≥200 mg/dL, TG≥150 mg/dL, TG200-499 mg/dL, TG300-499 mg/dL, TG350-499 mg/dL, or TG150-199 mg/dL), mixed dyslipidemia, or any other diseases or medical conditions specified above. Such method of treatment provides to subject in need thereof a dose of at least 10 mg HPA-N3 per day, alternatively at least 15 mg HPA-N3 per day, alternatively at least 20 mg HPA-N3 per day, alternatively at least 25 mg HPA-N3 per day, alternatively at least 30 mg HPA-N3 per day, alternatively at least 40 mg HPA-N3 per day, alternatively at least 50 mg HPA-N3 per day, alternatively at least 60 mg HPA-N3 per day, alternatively at least 70 mg HPA-N3 per day, alternatively at least 80 mg HPA-N3 per day, alternatively at least 90 mg HPA-N3 per day, alternatively at least 100 mg HPA-N3 per day, alternatively at least 120 mg HPA-N3 per day, alternatively at least 150 mg HPA-N3 per day, alternatively at least 160 mg HPA-N3 per day, alternatively at least 180 mg HPA-N3 per day, alternatively at least 200 mg HPA-N3 per day, alternatively at least 250 mg HPA-N3 per day, alternatively at least 300 mg HPA-N3 per day, alternatively at least 350 mg HPA-N3 per day, alternatively at least 400 mg HPA-N3 per day, alternatively at least 500 mg HPA-N3 per day, alternatively at least 600 mg HPA-N3 per day, alternatively at least 800 mg HPA-N3 or its glycerol or ethyl esters per day.

[0119] In other embodiments, the compositions of the present invention, which may comprise significant amounts of omega-3 docosahexaenoic acid (HPA-n3) or its glycerol or ethyl esters and which comprise relatively small amounts of omega-3 docosahexaenoic acid (DHA-n3), may be used for the treatment of hypertriglyceridemia (either TG≥500 mg/dL, TG≥200 mg/dL, TG≥150 mg/dL, TG200-499 mg/dL, TG300-499 mg/dL, TG350-499 mg/dL, or TG150-199 mg/dL), mixed dyslipidemia, or any other diseases or medical conditions specified above. Such method of treatment provides to subject in need thereof a dose of at least 20 mg HPA-N3 per day, alternatively at least 25 mg HPA-N3 per day, alternatively at least 30 mg HPA-N3 per day, alternatively at least 40 mg HPA-N3 per day, alternatively at least 50 mg HPA-N3 per day, alternatively at least 60 mg HPA-N3 per day, alternatively at least 70 mg HPA-N3 per day, alternatively at least 80 mg HPA-N3 per day, alternatively at least 90 mg HPA-N3 per day, alternatively at least 100 mg HPA-N3 per day, alternatively at least 120 mg HPA-N3 per day, alternatively at least 150 mg HPA-N3 per day, alternatively at least 160 mg HPA-N3 per day, alternatively at least 180 mg HPA-N3 per day, alternatively at least 200 mg HPA-N3 per day, alternatively at least 250 mg HPA-N3 per day, alternatively at least 300 mg HPA-N3 per day, alternatively at least 350 mg HPA-N3 per day, alternatively at least 400 mg HPA-N3 per day, alternatively at least 500 mg HPA-N3 per day, alternatively at least 600 mg HPA-N3 per day, alternatively at least 800 mg HPA-N3 or its glycerol or ethyl esters per day, while providing less than 1500 mg of DHA, alternatively less than 1200 mg of DHA, alternatively less than 1000 mg of DHA, alternatively less than 800 mg of DHA, alternatively less than 700 mg of DHA, alternatively less than 600 mg of DHA, alternatively less than 500 mg of DHA, alternatively less than 400 mg of DHA, alternatively less than 350 mg of DHA, alternatively less than 300 mg of DHA, alternatively less than 250 mg of DHA, alternatively less than 200 mg of DHA or its glycerol or ethyl esters per day, alternatively less than 150 mg of DHA, alternatively less than 120 mg of DHA, alternatively less than 100 mg of DHA, alternatively less than 80 mg of DHA, alternatively less than 60 mg of DHA, alternatively less than 40 mg of DHA, alternatively less than 30 mg of DHA, alternatively less than 25 mg of DHA, alternatively less than 20 mg of DHA or its glycerol or ethyl esters per day.

[0120] In further embodiments, the compositions of the present invention, which may comprise significant amounts of omega-3 docosahexaenoic acid (HPA-n3) or its glycerol or ethyl esters and which comprise relatively small amounts of omega-3 docosahexaenoic acid (DHA-n3), may be used for the treatment of hypertriglyceridemia (either TG≥500 mg/dL, TG≥200 mg/dL, TG≥150 mg/dL, TG200-499 mg/dL, TG300-499 mg/dL, TG350-499 mg/dL, or TG150-199 mg/dL), mixed dyslipidemia, or any other diseases or medical conditions specified above. Such method of treatment provides to subject in need thereof a dose of at least 10 mg HPA-N3 per day, alternatively at least 15 mg HPA-N3 per day, alternatively at least 160 mg HPA-N3 per day, alternatively at least 180 mg HPA-N3 per day, alternatively at least 25 mg HPA-N3 per day, alternatively at least 30 mg HPA-N3 per day, alternatively at least 40 mg HPA-N3 per day, alternatively at least 50 mg HPA-N3 per day, alternatively at least 60 mg HPA-N3 per day, alternatively at least 70 mg HPA-N3 per day, alternatively at least 80 mg HPA-N3 per day, alternatively at least 90 mg HPA-N3 per day, alternatively at least 100 mg HPA-N3 per day, alternatively at least 120 mg HPA-N3 per day, alternatively at least 150 mg HPA-N3 per day, alternatively at least 160 mg HPA-N3 per day, alternatively at least 180 mg HPA-N3 per day, alternatively at least 200 mg HPA-N3 per day, alternatively at least 250 mg HPA-N3 per day, alternatively at least 300 mg HPA-N3 per day, alternatively at least 350 mg HPA-N3 per day, alternatively at least 400 mg HPA-N3 per day, alternatively at least 500 mg HPA-N3 per day, alternatively at least 600 mg HPA-N3 per day, alternatively at least 800 mg HPA-N3 or its glycerol or ethyl esters per day, while providing less than 1500 mg of DHA, alternatively less than 1200 mg of DHA, alternatively less than 1000 mg of DHA, alternatively less than 800 mg of DHA, alternatively less than 700 mg of DHA, alternatively less than 600 mg of DHA, alternatively less than 500 mg of DHA, alternatively less than 400 mg of DHA, alternatively less than 350 mg of DHA, alternatively less than 300 mg of DHA, alternatively less than 250 mg of DHA, alternatively less than 200 mg of DHA or its glycerol or ethyl esters per day, alternatively less than 150 mg of DHA, alternatively less than 120 mg of DHA, alternatively less than 100 mg of DHA, alternatively less than 80 mg of DHA, alternatively less than 60 mg of DHA, alternatively less than 40 mg of DHA, alternatively less than 30 mg of DHA, alternatively less than 25 mg of DHA, alternatively less than 20 mg of DHA or its glycerol or ethyl esters per day.

[0121] The present invention, incorporates methods of treatment for hypertriglyceridemia (either TG≥500 mg/dL,
TG≤200 mg/dL, TG150 mg/dL, TG200-499 mg/dL, TG300-499 mg/dL, or TG150-199 mg/dL), mixed dyslipidemia, or any other diseases or medical conditions as specified above, by dosing to a subject in need thereof omega-3-pentaenoic acids or their glycerol or ethyl esters. These methods provide to a subject in need thereof significant amounts of omega-3-pentaenoic acids or their glycerol or ethyl esters and while providing only small amounts of omega-3 docosahexaenoic acid (DHA-n3). Such methods of treatment provides to a subject in need thereof a dose of at least 100 mg omega-3-pentaenoic acids per day, alternatively at least 200 mg omega-3-pentaenoic acids per day, alternatively at least 300 mg omega-3-pentaenoic acids per day, alternatively at least 500 mg omega-3-pentaenoic acids per day, alternatively at least 700 mg omega-3-pentaenoic acids per day, alternatively at least 900 mg omega-3-pentaenoic acids per day, alternatively at least 1000 mg omega-3-pentaenoic acids per day, alternatively at least 1500 mg omega-3-pentaenoic acids per day, alternatively at least 2000 mg omega-3-pentaenoic acids per day, alternatively at least 2500 mg omega-3-pentaenoic acids per day, alternatively at least 3000 mg omega-3-pentaenoic acids per day, alternatively at least 3500 mg omega-3-pentaenoic acids per day, alternatively at least 4000 mg omega-3-pentaenoic acids per day, alternatively at least 4000 mg omega-3-pentaenoic acids per day or their glycerol or ethyl esters, while providing a relatively small amount of DHA-n3 such that the DHA:DPA ratio is no more than 15:1 of DHA:DPA, alternatively no more than 12:1 of DHA:DPA, alternatively no more than 10:1 of DHA:DPA, alternatively no more than 8:1 of DHA:DPA, alternatively no more than 5:1 of DHA:DPA, alternatively no more than 3:1 of DHA:DPA, alternatively no more than 2:1 of DHA:DPA, alternatively no more than 1:1 of DHA:DPA, alternatively no more than 1:2 of DHA:DPA, alternatively no more than 1:1 of DHA:DPA, alternatively no more than 1:3 of DHA:DPA, alternatively no more than 1:5 of DHA:DPA, alternatively no more than 1:8 of DHA:DPA, alternatively no more than 1:10 of DHA:DPA, alternatively no more than 1:15 of DHA:DPA, or alternatively a relative amount of no more than 1:20 of DHA:DPA.

[0123] In other embodiments, the compositions of the present invention, which may comprise significant amounts of omega-3-pentaenoic acids or their glycerol or ethyl esters and which comprise relatively small amounts of omega-3 docosahexaenoic acid (DHA-n3), may be used for the reduction of triglycerides and treatment of hypertriglyceridemia (either TG≤500 mg/dL, TG<200 mg/dL, TG200-499 mg/dL, TG300-499 mg/dL, or TG150-199 mg/dL), mixed dyslipidemia, or any other diseases or medical conditions specified above. Such method of treatment provides to a subject in need thereof a dose of at least 100 mg omega-3-pentaenoic acids per day, alternatively at least 200 mg omega-3-pentaenoic acids per day, alternatively at least 300 mg omega-3-pentaenoic acids per day, alternatively at least 500 mg omega-3-pentaenoic acids per day, alternatively at least 700 mg omega-3-pentaenoic acids per day, alternatively at least 900 mg omega-3-pentaenoic acids per day, alternatively at least 1000 mg omega-3-pentaenoic acids per day, alternatively at least 1500 mg omega-3-pentaenoic acids per day, alternatively at least 2000 mg omega-3-pentaenoic acids per day, alternatively at least 2500 mg omega-3-pentaenoic acids per day, alternatively at least 3000 mg omega-3-pentaenoic acids per day, alternatively at least 3500 mg omega-3-pentaenoic acids per day, alternatively at least 4000 mg omega-3-pentaenoic acids per day, alternatively at least 4000 mg omega-3-pentaenoic acids per day or their glycerol or ethyl esters, while providing a relatively small amount of DHA-n3 such that the DHA:DPA ratio is no more than 15:1 of DHA:DPA, alternatively no more than 12:1 of DHA:DPA, alternatively no more than 10:1 of DHA:DPA, alternatively no more than 8:1 of DHA:DPA, alternatively no more than 5:1 of DHA:DPA, alternatively no more than 3:1 of DHA:DPA, alternatively no more than 2:1 of DHA:DPA, alternatively no more than 1:1 of DHA:DPA, alternatively no more than 1:2 of DHA:DPA, alternatively no more than 1:3 of DHA:DPA, alternatively no more than 1:5 of DHA:DPA, alternatively no more than 1:8 of DHA:DPA, alternatively no more than 1:10 of DHA:DPA, alternatively no more than 1:15 of DHA:DPA, or alternatively a relative amount of no more than 1:20 of DHA:DPA.

[0122] In other embodiments, the compositions of the present invention, which comprise significant amounts of omega-3-pentaenoic acids or their glycerol or ethyl esters and which comprise relatively small amounts of omega-3 docosahexaenoic acid (DHA-n3), may be used for the treatment of hypertriglyceridemia (either TG≤500 mg/dL, TG<200 mg/dL, TG200-499 mg/dL, TG300-499 mg/dL, or TG150-199 mg/dL), mixed dyslipidemia, or any other diseases or medical conditions specified above. Such method of treatment provides to a subject in need thereof a dose of at least 100 mg omega-3-pentaenoic acids per day, alternatively at least 200 mg omega-3-pentaenoic acids per day, alternatively at least 300 mg omega-3-pentaenoic acids per day, alternatively at least 500 mg omega-3-pentaenoic acids per day, alternatively at least 700 mg omega-3-pentaenoic acids per day, alternatively at least 900 mg omega-3-pentaenoic acids per day, alternatively at least 1000 mg omega-3-pentaenoic acids per day, alternatively at least 1500 mg omega-3-pentaenoic acids per day, alternatively at least 2000 mg omega-3-pentaenoic acids per day, alternatively at least 2500 mg omega-3-pentaenoic acids per day, alternatively at least 3000 mg omega-3-pentaenoic acids per day, alternatively at least 3500 mg omega-3-pentaenoic acids per day, alternatively at least 4000 mg omega-3-pentaenoic acids per day, alternatively at least 4000 mg omega-3-pentaenoic acids per day or their glycerol or ethyl esters, while providing a relatively small amount of DHA-n3 such that the DHA:HGA ratio is no more than 15:1 of DHA:HGA, alternatively no more than 12:1 of DHA:HGA, alternatively no more than 10:1 of DHA:HGA, alternatively no more than 8:1 of DHA:HGA, alternatively no more than 5:1 of DHA:HGA, alternatively no more than 3:1 of DHA:HGA, alternatively no more than 2:1 of DHA:HGA, alternatively no more than 1:1 of DHA:HGA, alternatively no more than 1:2 of DHA:HGA, alternatively no more than 1:3 of DHA:HGA, alternatively no more than 1:5 of DHA:HGA, alternatively no more than 1:8 of DHA:HGA, alternatively no more than 1:10 of DHA:HGA, alternatively no more than 1:15 of DHA:HGA, or alternatively a relative amount of no more than 1:20 of DHA:HGA.
more than 1:3 of DHA:HPA, alternatively no more than 1:5 of DHA:HPA, alternatively no more than 1:8 of DHA:HPA, alternatively no more than 1:10 of DHA:HPA, alternatively no more than 1:15 of DHA:HPA, alternatively a relative amount of no more than 1:20 of DHA:HPA.

[0124] In further embodiments, the compositions of the present invention, which may comprise significant amounts of omega-3-pentaenoic acids or their glycerol or ethyl esters and which comprise relatively small amounts of omega-3 docosahexaenoic acid (DHA-n3), may be used for the reduction of triglycerides and treatment of hypertriglyceridemia (either Tg≥500 mg/dL, Tg≥200 mg/dL, Tg≥150 mg/dL, Tg≥200-499 mg/dL, Tg≥300-499 mg/dL, Tg≥500-999 mg/dL, or Tg≥1000-199 mg/dL), mixed dyslipidemia, or any other diseases or medical conditions specified above. Such method of treatment provides to a subject in need thereof a dose of at least 100 mg omega-3-pentaenoic acids per day, alternatively at least 200 mg omega-3-pentaenoic acids per day, alternatively at least 300 mg omega-3-pentaenoic acids per day, alternatively at least 500 mg omega-3-pentaenoic acids per day, alternatively at least 700 mg omega-3-pentaenoic acids per day, alternatively at least 900 mg omega-3-pentaenoic acids per day, alternatively at least 1000 mg omega-3-pentaenoic acids per day, alternatively at least 1500 mg omega-3-pentaenoic acids per day, alternatively at least 1900 mg omega-3-pentaenoic acids per day, alternatively at least 2000 mg omega-3-pentaenoic acids per day, alternatively at least 2500 mg omega-3-pentaenoic acids per day, alternatively at least 2900 mg omega-3-pentaenoic acids per day, alternatively at least 3000 mg omega-3-pentaenoic acids per day, alternatively at least 3500 mg omega-3-pentaenoic acids per day, alternatively at least 3900 mg omega-3-pentaenoic acids per day, alternatively at least 4000 mg omega-3-pentaenoic acids per day, alternatively at least 4100 mg omega-3-pentaenoic acids per day, alternatively at least 5000 mg omega-3-pentaenoic acids per day, alternatively at least 5500 mg omega-3-pentaenoic acids per day, alternatively at least 6000 mg omega-3-pentaenoic acids per day or their glycerol or ethyl esters, while providing a relatively small amount of DHA-N3 as compared to the amount of omega-3-pentaenoic acids (N3:S-enoicFA) such that the DHA:N3:S-enoicFA ratio is no more than 15:1 of DHA:N3:S-enoicFA, alternatively no more than 12:1 of DHA:N3:S-enoicFA, alternatively no more than 10:1 of DHA:N3:S-enoicFA, alternatively no more than 8:1 of DHA:N3:S-enoicFA, alternatively no more than 5:1 of DHA:N3:S-enoicFA, alternatively no more than 3:1 of DHA:N3:S-enoicFA, alternatively no more than 2:1 of DHA:N3:S-enoicFA, alternatively no more than 1:1 of DHA:N3:S-enoicFA, alternatively no more than 1:2 of DHA:N3:S-enoicFA, alternatively no more than 1:3 of DHA:N3:S-enoicFA, alternatively no more than 1:5 of DHA:N3:S-enoicFA, alternatively no more than 1:8 of DHA:N3:S-enoicFA, alternatively no more than 1:10 of DHA:N3:S-enoicFA, alternatively no more than 1:15 of DHA:N3:S-enoicFA, alternatively a relative amount of no more than 1:20 of DHA:N3:S-enoicFA.

[0125] In some embodiments, the improved profile of the compositions of the present invention may be demonstrated upon treatment of a subject by differentially altering the ratio between blood platelets and fragments thereof (also known as platelet microparticles). Such fragments may be evaluated as a whole or examined and described as fragment sub-categories.

[0126] In other embodiments, the improved profile of the compositions of the present invention may be demonstrated upon treatment of a subject by differentially altering the surface charge of blood platelets and fragments thereof, either in resting state (non-activated platelets) or activated stage.

[0127] In yet other embodiments, treatment of a subject or patient with compositions of the present invention affect the coagulatory cascade and differentially alter coagulation or bleeding times or platelet aggregation times and density.

[0128] In further embodiments, treatment with compositions of the present invention improves the vascular healing process in response to athrogenic disease. Such healing may be demonstrated by reduced stenosis and/or restenosis over time, reduced or lesser increase in intima-media thickness (IMT) of the human size, reduced vascular diameter at vascular sites with stenosis or clot built-up, as determined by either by intravascular ultrasound (IVUS), radiographic, radiologic, non-invasive ultrasound, tomography, magnetic resonance interference (MRI), or other acceptable methods. In other embodiments, such improved healing may be demonstrated by the vascular wall composition, such as a reduced foam cell presence or fibrillated tissue in the vessel wall. In yet other embodiments, such improved vascular healing is demonstrated by improved inflammatory markers in the vascular wall.

[0129] The improved profile resulting from treatment with the compositions of the present invention may also be demonstrated by a differentiated impact on blood/plasma lipid and lipoprotein levels in a mammal; these include, but are not limited to: Triglycerides (TG), total-cholesterol, non-HDL-cholesterol, LDL-cholesterol, VLDL-cholesterol, apolipoprotein B, apolipoprotein A1, apolipoprotein B, and Lp-PLA2. The compositions of the present invention may also be used to provide a beneficial impact on the one or more of the following: apolipoprotein A-1 (apo A-1), apolipoprotein B (apo B), apo A-1/apo B ratio, lipoprotein(a) (Lp[a]), lipoprotein-associated phospholipase A2 (Lp-PLA2), low density lipoprotein (LDL) particle number and size, oxidized LDL, C-reactive protein (CRP), high sensitivity C-reactive protein (hsCRP), intracellular adhesion molecule-1 (ICAM-1), E-selectin, P-selectin, vascular cell adhesion molecule 1 (VCAM-1) or cluster of differentiation 106 (CD106), interleukin-1β (IL-1β), interleukin-2 (IL-2), interleukin-6 (IL-6), interleukin-8 (IL-8), interleukin-10 (IL-10), interleukin-12 (IL-12), interleukin-15 (IL-15), interleukin-18 (IL-18), tumor necrosis factor-alpha (TNF-α), tumor necrosis factor-beta (TNF-β), plasminogen activator inhibitor-1 (PAI-1), homocysteine, thromboxane B2 (TXB2), thromboxane A2 (TXA2), 2,3-dinor thromboxane B2, free fatty acids (FFA), serum amyloid A1, serum amyloid A2, serum amyloid A3, serum amyloid A4, thiobarbituric acid (TBA) reacting material, adiponectin (GBP-28), hemoglobin A1c (HbA1c), macrophage colony stimulating factor (M-CSF), granulocyte macrophage colony stimulating factor (GM-CSF), fibrinogen, fibrin D-dimer, platelet derived-microparticles, mean platelet volume (MPV), platelet subpopulations, heart rate, systolic and diastolic blood pressure, nuclear factor kappa-light-chain enhancer of activated B cells (NF-κB), adenosine diphosphate induced platelet aggregation, platelet endothelial cell adhesion molecule (PECAM-1), vitronectin receptor (αvβ3, αvβ5), and glycoprotein IIb/IIIa (gpllb/IIIa). The compositions of the present invention may also be used in methods of treating, preventing, and reducing symptoms associated with conditions associated with the above.
Methods to determine comparative blood/serum/plasma lipid and lipoprotein levels and therapeutic effects on these levels in mammals are generally known to those skilled in the art and are typically based on fasting lipid and lipoprotein levels. Differences of active treatment versus placebo are generally assessed on a group of subjects versus another group of subjects basis, with significant changes noted if the p-value for the appropriate statistical comparison is equal to or less than 0.05. P-values larger than 0.05 but equal to or less than 0.10 may be considered borderline significant (B.S.). P-values larger than 0.10 are generally considered not significant (NS). In one embodiment, treatment with the compositions of the present invention is more potent than other omega-3 compositions known in the prior art (such as LOVAZA®, EPANOVA™ or AMR101) in reducing as compared to placebo or baseline: TG levels, Total-cholesterol levels, non-HDL-cholesterol levels, LDL-cholesterol levels, apolipoprotein B levels, apolipoprotein C-III levels, Lp-PLA2 levels, or any combinations thereof. In other embodiments, such more potent effects in reducing these parameters are achieved in patients with baseline TG over 500 mg/dL, in patients on statin treatment with baseline TG in the 200-499 mg/dL range, in patients not on statin treatment with baseline LDL-cholesterol of 190 mg/dL or higher and with TG in the 300-750 mg/dL range, in patients not on statin treatment with baseline LDL-cholesterol of 190 mg/dL or higher and with TG in the 350-750 mg/dL range, in patients not on statin treatment with baseline LDL-cholesterol of 190 mg/dL or higher and with TG in the 350-750 mg/dL range, or in patients not on baseline statin treatment with baseline non-HDL-cholesterol of 200 mg/dL or higher and with TG in the 300-750 mg/dL range, or in patients not on baseline statin treatment with baseline non-HDL-cholesterol of 200 mg/dL or higher and with TG in the 350-750 mg/dL range, or in patients not on baseline statin treatment with baseline non-HDL-cholesterol of 200 mg/dL or higher and with TG in the 350-750 mg/dL range, or in patients not on baseline statin treatment with baseline non-HDL-cholesterol of 200 mg/dL or higher and with TG in the 350-750 mg/dL range.

The present invention also provides methods of reducing triglycerides levels in a subject, wherein the non-HDL-cholesterol levels, such as LDL-cholesterol levels, of the subject are reduced or not significantly increased from, for example, baseline levels before treatment. In some embodiments, treatment with the compositions of the present invention results in a minor (less than 10% change from baseline, alternatively less than 5%) and/or non-significant change in non-HDL-cholesterol levels (such as LDL-cholesterol levels) as compared to placebo in patients with baseline TG levels above 500 mg/dL. In another embodiment, treatment with the compositions of the present invention results in reductions of LDL-cholesterol levels as compared to placebo in patients with baseline TG levels above 500 mg/dL. In some embodiments, the methods involve coadministration of a statin.

In another embodiment, treatment with the compositions of the present invention as compared to placebo does not increase LDL-cholesterol levels in patients with baseline TG levels of 200-499 mg/dL while on statin therapy.

In yet another embodiment, treatment with the compositions of the present invention as compared to placebo results in significant reductions in LDL-cholesterol levels in patients with baseline TG levels of 200-499 mg/dL while on statin therapy.

In a further embodiment, the compositions of the present invention as compared to placebo result in significant reductions in LDL-cholesterol levels in patients not on statin treatment with LDL-cholesterol of 190 mg/dL or higher and with TG in the 300-750 mg/dL range, in patients not on statin treatment with LDL-cholesterol of 190 mg/dL or higher and with TG in the 350-750 mg/dL range, or in patients not on statin treatment with baseline LDL-cholesterol of 200 mg/dL or higher and with TG in the 300-750 mg/dL range, or in patients not on statin treatment with baseline LDL-cholesterol of 200 mg/dL or higher and with TG in the 350-750 mg/dL range, or in patients not on statin treatment with baseline LDL-cholesterol of 200 mg/dL or higher and with TG in the 350-750 mg/dL range. Finally, another embodiment, the compositions of the present invention as compared to placebo result in significant reductions in LDL-cholesterol levels in patients not on statin treatment with baseline LDL-cholesterol of 200 mg/dL or higher and with TG in the 300-750 mg/dL range, in patients not on statin treatment with baseline LDL-cholesterol of 200 mg/dL or higher and with TG in the 350-750 mg/dL range, in patients not on statin treatment with baseline LDL-cholesterol of 200 mg/dL or higher and with TG in the 350-750 mg/dL range, or in patients not on statin treatment with baseline LDL-cholesterol of 200 mg/dL or higher and with TG in the 350-750 mg/dL range.

In another embodiment, treatment with the compositions of the present invention together with statin therapy results in significant reductions in LDL-cholesterol levels as compared to placebo in patients not on statin treatment at baseline with baseline LDL-cholesterol of 190 mg/dL or higher and with TG in the 350-750 mg/dL range, in patients not on baseline statin treatment with baseline LDL-cholesterol of 190 mg/dL or higher and with TG in the 350-750 mg/dL range, or in patients not on baseline statin treatment with baseline LDL-cholesterol of 190 mg/dL or higher and with TG in the 350-750 mg/dL range, or in patients not on baseline statin treatment with baseline LDL-cholesterol of 190 mg/dL or higher and with TG in the 350-750 mg/dL range, or in patients not on baseline statin treatment with baseline LDL-cholesterol of 190 mg/dL or higher and with TG in the 350-750 mg/dL range.
baseline LDL-cholesterol of 190 mg/dL or higher and with TG in the 300-750 mg/dL range, or in patients not on baseline statin treatment with baseline LDL-cholesterol of 190 mg/dL or higher and with TG in the 350-750 mg/dL range.

Finally, another embodiment, treatment with the compositions of the present invention together with statin therapy results in significant reductions in LDL-cholesterol levels as compared to placebo in patients not on baseline statin treatment with baseline non-HDL-cholesterol of 200 mg/dL or higher and with TG in the 500-700 mg/dL range, in patients not on baseline statin treatment with baseline non-HDL-cholesterol of 200 mg/dL or higher and with TG in the 350-700 mg/dL range, in patients not on baseline statin treatment with baseline non-HDL-cholesterol of 200 mg/dL or higher and with TG in the 350-700 mg/dL range, or in patients not on baseline statin treatment with baseline Non-HDL-cholesterol of 200 mg/dL or higher and with TG in the 350-750 mg/dL range.

In another embodiment, the compositions of the present invention are more potent than other omega-3 compositions known in the prior art (such as LOVAZA®, EPANOVA™ or AMR101) in increasing as compared to placebo or baseline HDL-cholesterol levels, apolipoprotein-A levels, or a combination thereof.

In another embodiment, the compositions of the present invention are more potent than other omega-3 compositions known in the prior art (such as LOVAZA®, EPANOVA™ or AMR101) in decreasing as compared to placebo or baseline Apolipoprotein-B (Apo-B) levels, Apolipoprotein-CIII levels, Lp-PLA2 levels or any combination thereof.

In further embodiments, the compositions of the present invention as compared to placebo or baseline are more potent than other omega-3 compositions known in the prior art (such as LOVAZA®, EPANOVA™ or AMR101) in reducing TG while causing a lesser increase in LDL-cholesterol, a lesser non-significant increase in LDL-cholesterol, no increase in LDL-cholesterol at all, or a more potent reduction in LDL-cholesterol at in patients with baseline TG levels above 500 mg/dL.

In some embodiments, the use of the compositions of the present invention may allow for a reduction in the dose of the statin required for a subject. For example, the coadministration of the composition of the present invention in a subject receiving statin therapy may allow for the reduction of the dose of the statin, compared to subject not being coadministered a composition of the present invention. In some embodiments, the dose of the statin may be reduced by at least 10%, alternatively at least 25%, alternatively at least 50%, or alternatively at least 75%.

In some embodiments, the use of the compositions of the present invention may reduce the time needed for a subject to reach the recommended blood levels. For example, the administration of compositions of the present invention may allow a subject to reach goal lipid levels, for example, those described in the NCEP ATP III Guidelines, or any levels recommended by a health care practitioner. In some embodiments, the reduction of time is greater than 5%, alternatively greater than 15%, alternatively greater than 25%, alternatively greater than 50%, and alternatively greater than 75%.

The compositions of the present invention are also useful to treat coronary heart disease (CHD), vascular disease, atherosclerotic disease or related conditions. The compositions of the present invention may also be use for the treatment and/or prevention and/or reduction of cardiac events and/or cardiovascular events and/or vascular events and/or symptoms. Determination of such cardiovascular diseases/conditions and prevention of events/symptoms in mammals and methods to determine treatment and preventative/therapeutic effects therefore are generally known to those skilled in the art.

The present invention also relates to treatment of such conditions in with concomitant treatments regimes or combination products with other active pharmaceutical ingredients. Such concomitant or fixed combination treatments may include a statin, an anticoagulant (such as aspirin or clopidogrel), an antihypertensive (such as a diuretic, beta-blocker, calcium channel blocker, ACE-inhibitor, angiotensin II receptor (ARB) antagonist), or other treatments for cardiovascular diseases.

The present invention also includes pharmaceutical compositions, for example, a unit dosage, comprising one or more HMG-CoA reductase inhibitors ("statins") and the omega-3 fatty acid composition of the present invention. The present invention may incorporate now known or future known statins in an amount generally recognized as safe. There are currently seven statins that are widely available: atorvastatin, rosuvastatin, fluvastatin, lovastatin, pravastatin, pitavastatin, and simvastatin. An eight statin, cerivastatin, has been removed from the U.S. market at the time of this writing. However, it is conceivable to one skilled in the art that cerivastatin may be used in conjunction with some embodiments of the present invention if cerivastatin is ultimately determined to be safe and effective in certain treatment regimens. Such statins are typically used at their common daily doses, which include, but are not limited to lovastatin 10 mg, 20 mg, 40 mg; pravastatin 10 mg, 20 mg, 40 mg, 80 mg; simvastatin 5 mg, 10 mg, 20 mg, 40 mg, 80 mg; fluvastatin 20 mg, 40 mg, 80 mg; atorvastatin 10 mg, 20 mg, 40 mg, 80 mg; rosuvastatin 5 mg, 10 mg, 20 mg, 40 mg; and pitavastatin 1 mg, 2 mg, 4 mg, 8 mg.

Generally, the effect of statins is dose dependent, i.e., the higher the dose, the greater the therapeutic effect. However, the effect of each statin is different, and therefore the level of therapeutic effect of one statin cannot be necessarily be directly correlated to the level of therapeutic effects of other statins. For example, bioavailability varies widely among the statins. Specifically, it has been shown that simvastatin is less than 5% bioavailable, while fluvastatin is approximately 24% bioavailable. Statins are absorbed at rates ranging from about 30% with lovastatin to 98% with fluvastatin. First-pass metabolism occurs in all statins except pravastatin. Pravastatin is also the least protein-bound of the statins (about 50%), compared with the others, which are more than 90% protein-bound. Accordingly, the statins possess distinct properties from one another. The combination products of this invention involving each statin or a plurality of statins are also distinct.

The present invention also includes methods of treatment, comprising dosing of one or more statins and the omega-3 fatty acid composition of the present invention, either as concomitant therapy or in a fixed dose combination product comprising both a statin and the composition of the present invention. This method of treatment combines the administration of one or more statins at its common dose or an alternative dose with the composition of the present invention.
In some embodiments, the compositions of the present invention, which comprise significant amounts of omega-3 docosapentaenoic acid (DPA-n3) or its glycerol or ethyl esters, together with a common or alternative statin dose, may be used for the treatment of hypertriglyceridemia (either TG ≥ 500 mg/dL, TG ≥ 200 mg/dL, or TG ≥ 150 mg/dL), TG 200–499 mg/dL, TG 300–499 mg/dL, or TG 150–199 mg/dL), mixed dyslipidemia, or any other diseases or medical conditions specified above. Such methods of treatment provide to a subject in need thereof a dose of at least 30 mg DPA-N3 per day, alternatively at least 40 mg DPA-N3 per day, alternatively at least 50 mg DPA-N3 per day, alternatively at least 60 mg DPA-N3 per day, alternatively at least 70 mg DPA-N3 per day, alternatively at least 80 mg DPA-N3 per day, alternatively at least 90 mg DPA-N3 per day, alternatively at least 100 mg DPA-N3 per day, alternatively at least 120 mg DPA-N3 per day, alternatively at least 150 mg DPA-N3 per day, alternatively at least 160 mg DPA-N3 per day, alternatively at least 180 mg DPA-N3 per day, alternatively at least 200 mg DPA-N3 per day, alternatively at least 250 mg DPA-N3 per day, alternatively at least 300 mg DPA-N3 per day, alternatively at least 350 mg DPA-N3 per day, alternatively at least 400 mg DPA-N3 per day, alternatively at least 500 mg DPA-N3 per day, alternatively at least 600 mg DPA-N3 per day, alternatively at least 800 mg DPA-N3 per day, or its glycerol or ethyl esters per day, while providing less than 2000 mg of DHA, alternatively less than 1900 mg of DHA, alternatively less than 1500 mg of DHA, alternatively less than 1200 mg of DHA, alternatively less than 1000 mg of DHA, alternatively less than 800 mg of DHA, alternatively less than 700 mg of DHA, alternatively less than 600 mg of DHA, alternatively less than 500 mg of DHA, alternatively less than 400 mg of DHA, alternatively less than 350 mg of DHA, alternatively less than 300 mg of DHA, alternatively less than 250 mg of DHA, alternatively less than 200 mg of DHA, alternatively less than 150 mg of DHA, alternatively less than 120 mg of DHA, alternatively less than 100 mg of DHA, alternatively less than 80 mg of DHA, alternatively less than 60 mg of DHA, alternatively less than 50 mg of DHA, alternatively less than 40 mg of DHA, alternatively less than 30 mg of DHA, alternatively less than 25 mg of DHA, alternatively less than 20 mg of DHA, alternatively less than 15 mg of DHA, alternatively at least 20 mg HPA-N3 per day, alternatively at least 25 mg HPA-N3 per day, alternatively at least 30 mg HPA-N3 per day, alternatively at least 40 mg HPA-N3 per day, alternatively at least 50 mg HPA-N3 per day, alternatively at least 60 mg HPA-N3 per day, alternatively at least 80 mg HPA-N3 per day, alternatively at least 90 mg HPA-N3 per day, alternatively at least 120 mg HPA-N3 per day, alternatively at least 150 mg HPA-N3 per day, alternatively at least 160 mg HPA-N3 per day, alternatively at least 180 mg HPA-N3 per day, alternatively at least 200 mg HPA-N3 per day, alternatively at least 250 mg HPA-N3 per day, alternatively at least 300 mg HPA-N3 per day, alternatively at least 350 mg HPA-N3 per day, alternatively at least 400 mg HPA-N3 per day, alternatively at least 500 mg HPA-N3 per day, alternatively at least 600 mg HPA-N3 per day, alternatively at least 800 mg HPA-N3 per day, or its glycerol or ethyl esters per day.

In other embodiments, the compositions of the present invention, which comprise significant amounts of omega-3 docosapentaenoic acid (DPA-n3) or its glycerol or ethyl esters and which comprise relatively small amounts of omega-3 docosahexaenoic acid (DHA-n3), together with a common or alternative statin dose, may be used for the treatment of hypertriglyceridemia (either TG ≥ 500 mg/dL, TG ≥ 200 mg/dL, or TG ≥ 150 mg/dL), TG 200–499 mg/dL, TG 300–499 mg/dL, or TG 150–199 mg/dL), mixed dyslipidemia, or any other diseases or medical conditions specified above. Such method of treatment provides to a subject in need thereof a common or alternative statin dose together with a dose of at least 30 mg DPA-N3 per day, alternatively at least 40 mg DPA-N3 per day, alternatively at least 50 mg DPA-N3 per day, alternatively at least 60 mg DPA-N3 per day, alternatively at least 80 mg DPA-N3 per day, alternatively at least 90 mg DPA-N3 per day, alternatively at least 120 mg DPA-N3 per day, alternatively at least 150 mg DPA-N3 per day, alternatively at least 160 mg DPA-N3 per day, alternatively at least 180 mg DPA-N3 per day, alternatively at least 200 mg DPA-N3 per day, alternatively at least 250 mg DPA-N3 per day, alternatively at least 300 mg DPA-N3 per day, alternatively at least 350 mg DPA-N3 per day, alternatively at least 400 mg DPA-N3 per day, alternatively at least 500 mg DPA-N3 per day, alternatively at least 600 mg DPA-N3 per day, alternatively at least 800 mg DPA-N3 per day, or its glycerol or ethyl esters per day, while providing less
than 2000 mg of DHA, alternatively less than 1900 mg of DHA, alternatively less than 1500 mg of DHA, alternatively less than 1200 mg of DHA, alternatively less than 1000 mg of DHA, alternatively less than 800 mg of DHA, alternatively less than 700 mg of DHA, alternatively less than 600 mg of DHA, alternatively less than 500 mg of DHA, alternatively less than 400 mg of DHA, alternatively less than 350 mg of DHA, alternatively less than 300 mg of DHA, alternatively less than 250 mg of DHA, alternatively less than 200 mg of DHA, alternatively less than 150 mg of DHA, alternatively less than 120 mg of DHA, alternatively less than 100 mg of DHA, alternatively less than 80 mg of DHA, alternatively less than 60 mg of DHA, alternatively less than 50 mg of DHA, alternatively less than 40 mg of DHA, alternatively less than 30 mg of DHA, alternatively less than 25 mg of DHA, alternatively less than 20 mg of DHA or its glycerol or ethyl esters per day.

In further embodiments, the compositions of the present invention, which comprise significant amounts of omega-3 docosapentaenoic acid (DPA-n3) or its glycerol or ethyl esters and which comprise relatively small amounts of omega-3 docosahexaenoic acid (DHA-n3), together with a common or alternative statin dose, may be used for the treatment of hypertriglyceridemia (either TG≥500 mg/dL, TG≥400 mg/dL, TG≥300 mg/dL, or TG 150-199 mg/dL), mixed dyslipidemia, or any other diseases or medical conditions specified above. Such method of treatment provides to a subject in need thereof a common or alternative statin dose together with a dose of at least 20 mg HPA-N3 per day, alternatively at least 25 mg HPA-N3 per day, alternatively at least 30 mg HPA-N3 per day, alternatively at least 40 mg HPA-N3 per day, alternatively at least 50 mg HPA-N3 per day, alternatively at least 60 mg HPA-N3 per day, at least 70 mg HPA-N3 per day, at least 80 mg HPA-N3 per day, at least 90 mg HPA-N3 per day, at least 100 mg HPA-N3 per day, at least 120 mg HPA-N3 per day, at least 150 mg HPA-N3 per day, at least 160 mg HPA-N3 per day, at least 180 mg HPA-N3 per day, at least 200 mg HPA-N3 per day, at least 250 mg HPA-N3 per day, at least 300 mg HPA-N3 per day, at least 400 mg HPA-N3 per day, at least 500 mg HPA-N3 per day, at least 600 mg HPA-N3 per day, at least 800 mg HPA-N3 per day, at least 1000 mg HPA-N3 per day, at least 1200 mg HPA-N3 per day, at least 1500 mg HPA-N3 per day, or its glycerol or ethyl esters per day, while providing a relatively small amount of DHA-N3 such that the DHA:HPA dose ratio is no more than 1:1 of DHA:HPA, alternatively no more than 1:2 of DHA:HPA, alternatively no more than 1:5 of DHA:HPA, alternatively no more than 1:10 of DHA:HPA, alternatively no more than 1:15 of DHA:HPA, alternatively a relative daily dose of no more than 1:20 of DHA:HPA.

In yet other embodiments, the compositions of the present invention, which comprise significant amounts of omega-3-pentaenoic acids or their glycerol or ethyl esters and which comprise relatively small amounts of omega-3 docosahexaenoic acid (DHA-n3), together with a common or alternative statin dose, may be used for the treatment of hypertriglyceridemia (either TG≥500 mg/dL, TG≥400 mg/dL, TG≥300 mg/dL, or TG 150-199 mg/dL), mixed dyslipidemia, or any other diseases or medical conditions specified above. Such methods of treatment provides to a subject in need thereof a common or alternative statin dose and a dose of at least 100 mg omega-3-pentaenoic acids per day, alternatively at least 200 mg omega-3-pentaenoic acids per day, alternatively at least 300 mg omega-3-pentaenoic acids per day, alternatively at least 500 mg omega-3-pentaenoic acids per day, alternatively at least 700 mg omega-3-pentaenoic acids per day, alternatively at least 900 mg omega-3-pentaenoic acids per day, alternatively at least 1000 mg omega-3-pentaenoic acids per day, alternatively at least 1500 mg omega-3-pen-
taenoic acids per day, alternatively at least 1900 mg omega-3-pentaenoic acids per day, alternatively at least 2000 mg omega-3-pentaenoic acids per day, alternatively at least 2500 mg omega-3-pentaenoic acids per day, alternatively at least 3000 mg omega-3-pentaenoic acids per day, alternatively at least 3500 mg omega-3-pentaenoic acids per day, alternatively at least 4000 mg omega-3-pentaenoic acids per day, alternatively at least 4500 mg omega-3-pentaenoic acids per day, alternatively at least 5000 mg omega-3-pentaenoic acids per day, alternatively at least 5500 mg omega-3-pentaenoic acids per day, alternatively at least 6000 mg omega-3-pentaenoic acids per day, alternatively at least 1500 mg of DHA, alternatively less than 1200 mg of DHA, alternatively less than 1000 mg of DHA, alternatively less than 800 mg of DHA, alternatively less than 700 mg of DHA, alternatively less than 600 mg of DHA, alternatively less than 500 mg of DHA, alternatively less than 400 mg of DHA, alternatively less than 350 mg of DHA, alternatively less than 300 mg of DHA, alternatively less than 250 mg of DHA, alternatively less than 200 mg of DHA, alternatively less than 150 mg of DHA, alternatively less than 120 mg of DHA, alternatively less than 100 mg of DHA, alternatively less than 80 mg of DHA, alternatively less than 40 mg of DHA, alternatively less than 30 mg of DHA, alternatively less than 20 mg of DHA or its glycerol or ethyl esters per day.

[0154] In other embodiments, the compositions of the present invention, which comprise significant amounts of omega-3-pentaenoic acids including EPA or their glycerol or ethyl esters and which comprise relatively small amounts of omega-3 docosahexaenoic acid (DHA-n3), together with a common or alternative statin dose, may be used for the treatment of hypertriglyceridemia (either TG≥500 mg/dL, TG≥200 mg/dL, TG≥150 mg/dL, TG 200-499 mg/dL, TG 300-499 mg/dL, TG 150-199 mg/dL), mixed dyslipidemia, or any other diseases or medical conditions specified above. Such methods of treatment provide to a subject in need thereof with a common or alternative statin dose and a dose of at least 100 mg omega-3-pentaenoic acids per day, alternatively at least 200 mg omega-3-pentaenoic acids per day, alternatively at least 300 mg omega-3-pentaenoic acids per day, alternatively at least 500 mg omega-3-pentaenoic acids per day, alternatively at least 700 mg omega-3-pentaenoic acids per day, alternatively at least 900 mg omega-3-pentaenoic acids per day, alternatively at least 1000 mg omega-3-pentaenoic acids per day, alternatively at least 1500 mg omega-3-pentaenoic acids per day, alternatively at least 1900 mg omega-3-pentaenoic acids per day, alternatively at least 2000 mg omega-3-pentaenoic acids per day, alternatively at least 2500 mg omega-3-pentaenoic acids per day, alternatively at least 2900 mg omega-3-pentaenoic acids per day, alternatively at least 3500 mg omega-3-pentaenoic acids per day, alternatively at least 3900 mg omega-3-pentaenoic acids per day, alternatively at least 4100 mg omega-3-pentaenoic acids per day, alternatively at least 4500 mg omega-3-pentaenoic acids per day, alternatively at least 5000 mg omega-3-pentaenoic acids per day, alternatively at least 5500 mg omega-3-pentaenoic acids per day, alternatively at least 6000 mg omega-3-pentaenoic acids per day, or their glycerol or ethyl esters, while providing a relatively small amount of DHA-N3 such that the DHA: DPA ratio is no more than 15:1 of DHA:DPA, alternatively no more than 12:1 of DHA:DPA, alternatively no more than 10:1 of DHA:DPA, alternatively no more than 8:1 of DHA:DPA, alternatively no more than 5:1 of DHA:DPA, alternatively no more than 3:1 of DHA:DPA, alternatively no more than 2:1 of DHA:DPA, alternatively no more than 1:1 of DHA:DPA, alternatively no more than 1:2 of DHA:DPA, alternatively no more than 1:3 of DHA:DPA, alternatively no more than 1:5 of DHA:DPA, alternatively no more than 1:8 of DHA:DPA, alternatively no more than 1:10 of DHA:DPA, alternatively no more than 1:20 of DHA:DPA.
no more than 1:15 of DHA:HPA, alternatively a relative amount of no more than 1:20 of DHA:HPA. In further embodiments, the compositions of the present invention, which comprise significant amounts of omega-3-pentenoic acids or their glycerol or ethyl esters and which comprise relatively small amounts of omega-3 docosahexaenoic acid (DHA-n3), together with a common or alternative statin dose, may be used for the treatment of hypertriglyceridemia (either TG≥500 mg/dL, TG≥200 mg/dL, TG≥150 mg/dL, TG 200-499 mg/dL, TG300-499 mg/dL, TG350-499 mg/dL, or TG 150-199 mg/dL), mixed dyslipidemia, or any other diseases or medical conditions specified above.

Such methods of treatment provides to a subject in need thereof with a common or alternative statin dose and a dose of at least 100 mg omega-3-pentanoic acids per day, alternatively at least 200 mg omega-3-pentanoic acids per day, alternatively at least 300 mg omega-3-pentanoic acids per day, alternatively at least 500 mg omega-3-pentanoic acids per day, alternatively at least 700 mg omega-3-pentanoic acids per day, alternatively at least 900 mg omega-3-pentanoic acids per day, alternatively at least 1000 mg omega-3-pentanoic acids per day, alternatively at least 1900 mg omega-3-pentanoic acids per day, alternatively at least 2000 mg omega-3-pentanoic acids per day, alternatively at least 2500 mg omega-3-pentanoic acids per day, alternatively at least 2900 mg omega-3-pentanoic acids per day, alternatively at least 3000 mg omega-3-pentanoic acids per day, alternatively at least 3500 mg omega-3-pentanoic acids per day, alternatively at least 3900 mg omega-3-pentanoic acids per day, alternatively at least 4000 mg omega-3-pentanoic acids per day, alternatively at least 4100 mg omega-3-pentanoic acids per day, alternatively at least 4500 mg omega-3-pentanoic acids per day, alternatively at least 5000 mg omega-3-pentanoic acids per day, alternatively at least 5500 mg omega-3-pentanoic acids per day, alternatively at least 6000 mg omega-3-pentanoic acids per day or their glycerol or ethyl esters, while providing a relatively small amount of DHA-n3 as compared to the amount of omega-3-pentanoic acids (N3-5enoiCA) such that the DHA-n3:5enoiCA ratio is no more than 15:1 of DHA:n3:5enoiCA, alternatively no more than 12:1 of DHA:n3:5enoiCA, alternatively no more than 10:1 of DHA:n3:5enoiCA, alternatively no more than 8:1 of DHA:n3:5enoiCA, alternatively no more than 5:1 of DHA:n3:5enoiCA, alternatively no more than 3:1 of DHA:n3:5enoiCA, alternatively no more than 2:1 of DHA:n3:5enoiCA, alternatively no more than 1:1 of DHA:n3:5enoiCA, alternatively no more than 1:2 of DHA:n3:5enoiCA, alternatively no more than 1:3 of DHA:n3:5enoiCA, alternatively no more than 1:5 of DHA:n3:5enoiCA, alternatively no more than 1:8 of DHA:n3:5enoiCA, alternatively no more than 1:10 of DHA:n3:5enoiCA, alternatively no more than 1:15 of DHA:n3:5enoiCA, alternatively a relative amount of no more than 1:20 of DHA:n3:5enoiCA.

[0157] In some embodiments, the composition of the present invention further comprises TPA at concentration of at least 0.05%. In some embodiments, the TPA concentration is about 0.01% to about 5%, alternatively about 0.05% to about 2%, alternatively about 0.1% to about 1%, alternatively about 0.2% to about 0.8%, alternatively about 0.4% to about 0.6%, alternatively about 0.5%.

[0158] The compositions of the present invention may also be taken as a general nutritional supplement.

[0159] On a EPA daily dose basis, the compositions of the present invention are preferably provided in a dose of between 100 mg and 10,000 mg/day, alternatively between 200 mg and 8,000 mg/day, alternatively between 300 mg and 6,000 mg/day, alternatively between 400 mg and 5,000 mg/day, alternatively between 500 mg and 4,000 mg/day.

[0160] In some embodiments, the compositions of the present invention are provided in a dose of between about 1000 mg/day to about 5000 mg/day, alternatively about 1200 mg/day to about 3000 mg/day, alternatively about 1500 mg/day to about 2500 mg/day, alternatively 1600 mg/day to about 1950 mg/day, alternatively about 1735 mg/day to about 1855 mg/day, alternatively about 1740 mg/day to about 1840 mg/day, alternatively about 1745 mg/day to about 1820 mg/day, alternatively about 1750 mg/day to about 1800 mg/day, alternatively about 1755 mg/day to about 1790 mg/day, alternatively about 1760 mg/day to about 1780 mg/day, alternatively about 1770 mg/day to about 1770 mg/day of EPA. In some embodiments, the compositions of the present invention are provided in a dose of between about 2300 mg/day to about 3000 mg/day, alternatively about 2400 mg/day to about 2800 mg/day, alternatively about 2520 mg/day to about 2780 mg/day, alternatively about 2600 mg/day to about 2700 mg/day, alternatively about 2610 mg/day to about 2680 mg/day, alternatively about 2620 mg/day to about 2670 mg/day, alternatively about 2630 mg/day to about 2655 mg/day, alternatively about 2640 mg/day to about 2660 mg/day, alternatively about 2650 mg/day of EPA. In some embodiments, the compositions of the present invention are provided in a dose of between about 3200 mg/day to about 3900 mg/day, alternatively about 3300 mg/day to about 3800 mg/day, alternatively about 3360 mg/day to about 3710 mg/day, alternatively about 3400 mg/day to about 3700 mg/day, alternatively about 3450 mg/day to about 3650 mg/day, alternatively about 3500 mg/day to about 3600 mg/day, alternatively about 3530 mg/day to about 3580 mg/day, alternatively about 3540 mg/day to about 3560 mg/day, alternatively about 3550 mg/day of EPA.

[0161] In some embodiments, the compositions of the present invention are provided in a dose of between about 1650 mg/day to about 2050 mg/day, alternatively about 1700 mg/day to about 2000 mg/day, alternatively about 1750 mg/day to about 1950 mg/day, alternatively about 1775 mg/day to about 1925 mg/day, alternatively about 1800 mg/day to about 1900 mg/day, alternatively about 1800 mg/day to about 2000 mg/day, alternatively about 1820 mg/day to about 1890 mg/day, alternatively about 1830 mg/day to about 1870 mg/day, alternatively about 1850 mg/day to about 1860 mg/day, alternatively about 1850 mg/day of EPA. In some embodiments, the compositions of the present invention are provided in a dose of between about 2500 mg/day to about 3100 mg/day, alternatively about 2600 mg/day to about 2900 mg/day, alternatively about 2650 mg/day to about 2950 mg/day, alternatively about 2700 mg/day to about 2900 mg/day, alternatively about 2725 mg/day to about 2875 mg/day, alternatively about 2750 mg/day to about 2850 mg/day, alternatively about 2780 mg/day to about 2820 mg/day, alternatively about 2790 mg/day to about 2810 mg/day, alternatively about 2800 mg/day of EPA. In some embodiments, the compositions of the present invention are provided in a dose of between about 3300 mg/day to about 4000 mg/day, alternatively about 3400 mg/day to about 3900 mg/day, alternatively about 3500 mg/day to about 3900 mg/day, alternatively about 3550 mg/day.
mg/day to about 3850 mg/day, alternatively about 3600 mg/day to about 3800 mg/day, alternatively about 3650 mg/day to about 3750 mg/day, alternatively about 3680 mg/day to about 3725 mg/day, alternatively about 3690 mg/day to about 3710 mg/day, alternatively about 3700 mg/day of EPA.

[0162] In some embodiments, the compositions of the present invention are provided in a dose of between about 1500 mg/day to about 2500 mg/day, alternatively about 1750 mg/day to about 2300 mg/day, alternatively about 1800 mg/day to about 2200 mg/day, alternatively about 1950 mg/day to about 2100 mg/day, alternatively about 1975 mg/day to about 2050 mg/day, alternatively about 1950 mg/day to about 2025 mg/day, alternatively about 2000 mg/day of EPA. In some embodiments, the compositions of the present invention are provided in a dose of between about 2500 mg/day to about 3500 mg/day, alternatively about 2700 mg/day to about 3300 mg/day, alternatively about 2800 mg/day to about 3200 mg/day, alternatively about 2900 mg/day to about 3100 mg/day, alternatively about 2950 mg/day to about 3050 mg/day, alternatively about 2975 mg/day to about 3025 mg/day, alternatively about 3000 mg/day of EPA. In some embodiments, the compositions of the present invention are provided in a dose of between about 3500 mg/day to about 4500 mg/day, alternatively about 3700 mg/day to about 4300 mg/day, alternatively about 3750 mg/day to about 4300 mg/day, alternatively about 3800 mg/day to about 4200 mg/day, alternatively about 3900 mg/day to about 4100 mg/day, alternatively about 3950 mg/day to about 4050 mg/day, alternatively about 3975 mg/day to about 4025 mg/day, alternatively about 4000 mg/day of EPA.

[0163] On a EPA+DPA daily dose basis, the compositions of the present invention are preferably provided in a dose of between 100 mg and 10,100 mg/day, alternatively between 200 mg and 8,100 mg/day, alternatively between 500 mg and 6,100 mg/day, alternatively between 400 mg and 5,100 mg/day, alternatively between 500 mg and 4,100 mg/day.

[0164] On a EPA+HPA+DPA daily dose basis, the compositions of the present invention are preferably provided in a dose of between 100 mg and 10,100 mg/day, alternatively between 200 mg and 8,100 mg/day, alternatively between 500 mg and 6,100 mg/day, alternatively between 400 mg and 5,100 mg/day, alternatively between 500 mg and 4,100 mg/day.

[0165] On an omega-3-pentaenic acid daily dose basis, the compositions of the present invention are preferably provided in a dose of between 100 mg and 10,100 mg/day, alternatively between 200 mg and 8,100 mg/day, alternatively between 300 mg and 6,100 mg/day, alternatively between 400 mg and 5,100 mg/day, alternatively between 500 mg and 4,100 mg/day.

[0166] The formulation may be a single daily dose preparation to give in one dose the above intakes, or may be in convenient divided doses, for example, a daily dose formed of two to four soft gelatin or other dosage forms, each containing 300-1500 mg of EPA, EPA+DPA, EPA+DPA+HPA, or omega-3-pentaenic acids in any form embodied in the present invention.

[0167] Flavourants or emulsifiers may be included, for instance, to make the preparation palatable. Other conventional additives, diluents and excipients may be present. The preparation for ingestion may be in the form of a capsule, a dry powder, a tablet, a solution, an oil, an emulsion or any other appropriate form. The capsules may be hard or soft gelatin capsules, agar capsules, or any other appropriate capsule.

[0168] Use of the formulations of the invention in the manufacture of a medicament for the treatment or prevention of any disease or disorder, including those mentioned above, is included in the present invention.

[0169] The omega-3 fatty acid composition optionally includes chemical antioxidants, such as alpha tocopherol, which are administered in pure form or suspended in a vegetable oil, such as soybean oil or corn oil.

[0170] The blended fatty acid compositions may then be incorporated into any appropriate dosage form for oral, enteral, parenteral, rectal, vaginal, dermal or other route of administration. Soft or hard gelatin capsules, flavoured oil blends, emulsifiers or other liquid forms, and microencapsulate powders or other dry form vehicles are all appropriate ways of administering the products.

[0171] The formulated final drug product containing the omega-3 fatty acid composition may be administered to a mammal or patient in need thereof in a capsule, a tablet, a powder that can be dispersed in a beverage, or another solid oral dosage form, a liquid, a soft gel capsule or other convenient dosage form such as oral liquid in a capsule, as known in the art. In some embodiments, the capsule comprises a hard gelatin. The combination product may also be contained in a liquid suitable for injection or infusion.

[0172] Example pharmaceutical grade finished dosage forms: (a) Soft or hard gelatin capsules each containing 500 mg or 1000 mg of a mix 20 parts of EPA as a free fatty acid to 1 parts of DPA as a free fatty acid; (b) As in (a) but where the EPA and DPA free fatty acids are replaced with the fatty acids in any other appropriate bioassimilable form such as the ethyl esters; (c) As in (a)-(b) but where the material is in the form of a microencapsulated powder which can be used as a powder or compressed into tablets. Such powders may be prepared by a variety of technologies known to those skilled in the art; (d) As in (a)-(b) but where the formulation is a liquid or emulsion, appropriately flavoured for palatable oral administration; (e) As in (a)-(b) but where the material is formulated into a pharmaceutically acceptable vehicle appropriate for topical application such as a cream or ointment.

[0173] The omega-3 compositions of the present invention may also be administered with a combination of one or more non-active pharmaceutical ingredients (also known generally herein as “excipients”). Non-active ingredients, for example, serve to solubilize, suspend, thicken, dilute, emulsify, stabilize, preserve, protect, color, flavor, and fashion the active ingredients into an applicable and efficacious preparation that is safe, convenient, and otherwise acceptable for use. Thus, the non-active ingredients may include colloidal silicon dioxide, crosovidone, lactose monohydrate, lecithin, microcrystalline cellulose, polyvinyl alcohol, povidone, sodium lauryl sulfate, sodium stearyl fumarate, talc, titanium dioxide and xanthum gum.

[0174] The term “pharmaceutically acceptable vehicle,” as used herein, includes any of the following: a solution where the first API and optional other ingredients are wholly dissolved in a solubilizer (e.g., a pharmaceutically acceptable solvent or mixture of solvents), wherein the solution remains in clear liquid form at about room temperature; a suspension; an oil; or a semi-solid, wherein the first API and optionally
other ingredients are dissolved wholly or partially in a solubilizer (an emulsion, cream, etc.).

A “pharmaceutical grade finished dosage form” as used herein may be construed as a unit dose form suitable for administration to, for example, human or animal subjects, and having content uniformity acceptable to regulatory authorities. For example, under the USP requirements for content uniformity, a pharmaceutical-grade finished dosage form should have an amount of API within the range of 85% to 115% of the desired dosage and an RSD less than or equal to 6.0%. In addition, a pharmaceutical-grade finished dosage form must be stable (i.e., have a “shelf life”) for a pharmaceutically acceptable duration of time, preferably at least six months, alternatively at least one year, or at least two years, when stored at room temperature (about 23 degree Celsius to 27 degree Celsius, preferably about 25 degree Celsius) and 60% relative humidity. Typically, stability is determined by physical appearance and/or chemical modification of the ingredients, in accordance with standards well-known in the pharmaceutical arts, including those documented in ICH guidelines.

The omega-3 fatty acid dosage form optionally includes chemical antioxidants, such as alpha tocopherol, oils, such as soybean oil and partially hydrogenated vegetable oil, and lubricants such as fractionated coconut oil, lecithin and a mixture of the same.

EXAMPLES

Example 1

A composition according to the present invention is prepared by mixing and homogenizing in a ratio of 98:2 the intermediates MEGAPEX E90002EE (90% EPA ethyl ester) and MAXOMEGA DPA95 FFA (95% DPA synthetic fatty acid produced from EPA ethyl ester concentrate) converted to ethyl ester, respectively. These intermediates were prepared and commercially offered for sale by Chemport Korea (MEGAPEX) and Equateq Ltd. from Scotland, UK (MAXOMEGA). The relative amounts of fatty acids present in the starting intermediates and in the resulting novel composition are listed in Table 1 below. The resulting novel composition comprises 89.10% EPA, 1.95% DPA, 0.19% HPA, 91.24% omega-3-pentaenoic acids, less than 0.01% DHA, 91.24% omega-3-pentaenoic acids, 93.09% total-omega-3 fatty acids, 3.15% ARA and 3.57% omega-6 fatty acids (all Area%).

Example 2

A composition according to the present invention is prepared by mixing and homogenizing in a ratio of 96:4 the intermediates MEGAPEX E90002EE (90% EPA ethyl ester), and MAXOMEGA DPA95 FFA (95% DPA synthetic fatty acid produced from EPA ethyl ester concentrate), converted to ethyl ester, respectively. These intermediates were prepared and commercially offered for sale by Chemport Korea (MEGAPEX) and Equateq Ltd. from Scotland, UK (MAXOMEGA). The relative amounts of fatty acids present in the starting intermediates and in the resulting novel composition are listed in Table 2 below. The resulting novel composition comprises 87.28% EPA, 3.89% DPA, 0.18% HPA, 91.35% omega-3-pentaenoic acids, less than 0.01% DHA, 93.17% total omega-3 fatty acids and 3.49% omega-6 fatty acids (all Area%).

Example 8

The ethyl ester composition of Example 4 may be converted into a free fatty acid composition with essentially the same fatty acid composition according to “Conversion Method EE to FFA” below. This method is indiscriminate with respect to the type, degree of saturation or length of fatty acid if performed for an adequate amount of time under the described conditions.

Example 9

The ethyl ester composition of Example 3 is converted into a free fatty acid composition with essentially the same fatty acid composition according to “Conversion Method EE to FFA” above. This method is indiscriminate with respect to the type, degree of saturation or length of fatty acid if performed for an adequate amount of time under the described conditions.

Example 10

The ethyl ester composition of Example 6 is converted into a free fatty acid composition with essentially the same fatty acid composition according to “Conversion Method EE to FFA” above. This method is indiscriminate with respect to the type, degree of saturation or length of fatty acid if performed for an adequate amount of time under the described conditions.

Example 11

The composition of Example 4 is formulated into a soft gelatin capsule. Prior to encapsulation, an anti-oxidant preparation (composed of 4000 mg alpha-D-tocopherol in one liter of corn oil; corn oil is a triglyceride low in omega-3) is added to the composition of Example 4, by mixing and homogenizing 100 mL of this anti-oxidant preparation into 100 liters of the oil composition of Example 4 followed by thorough homogenization. The resulting pre-encapsulation formulated oil contains approximately 4 mg/gram alpha-D-tocopherol. Subsequently, the formulated oil is encapsulated into soft gelatin capsules with printed logo according to general methods typically used by Accucaps in Canada for fish oils or by any other documented and operational encapsulation method. The fill mass of the oil is approximately 1.08 gram/capsule, providing a dose of approximately 1000 mg omega-3-pentaenoic-acids ethyl esters per capsule. Finally, the capsules are bottled in HDPE bottles with induction seal and child resistant cap.
Example 12

The composition of Example 9 is formulated into a soft gelatin capsule. Prior to encapsulation, an anti-oxidant preparation (composed of 4000 mg alpha-D-tocopherol in one liter of corn oil; corn oil is a triglyceride low in omega-3) is added to the composition of Example 4, by mixing and homogenizing 100 mL of this anti-oxidant preparation into 100 liters of the oil composition of Example 4 followed by thorough homogenization. The resulting pre-encapsulation formulated oil contains approximately 4 mg/gram alpha-D-tocopherol. Subsequently, the formulated oil is encapsulated into soft gelatin capsules with printed logo according to general methods typically used by Banner in High Point, N.C., for fish oils or by any other documented and operational encapsulation method. The fill mass of the oil is approximately 1.90 gram/capsule, providing a dose of approximately 1000 mg omega-3-pentenoic-acids per capsule. Finally, the capsules are bottled in HDPE bottles with induction seal and child resistant cap.

Example 13

The composition of Example 5 is formulated into a soft gelatin capsule. Prior to encapsulation, an anti-oxidant preparation (composed of 4000 mg alpha-D-tocopherol in one liter of corn oil; corn oil is a triglyceride low in omega-3) is added to the composition of Example 4, by mixing and homogenizing 100 mL of this anti-oxidant preparation into 100 liters of the oil composition of Example 4 followed by thorough homogenization. The resulting pre-encapsulation formulated oil contains approximately 4 mg/gram alpha-D-tocopherol. Subsequently, the formulated oil is encapsulated into soft gelatin capsules with printed logo according to general methods typically used by Catalent in St. Petersburg, Fla., for fish oils or by any other documented and operational encapsulation method. The fill mass of the oil is approximately 1.05 gram/capsule, providing a dose of approximately 1000 mg omega-3-pentenoic-acids ethyl esters per capsule. Finally, the capsules are bottled in HDPE bottles with induction seal and child resistant cap.

Example 14

The composition of Example 10 is formulated into a soft gelatin capsule. Prior to encapsulation, an anti-oxidant preparation (composed of 4000 mg alpha-D-tocopherol in one liter of corn oil; corn oil is a triglyceride low in omega-3) is added to the composition of Example 4, by mixing and homogenizing 100 mL of this anti-oxidant preparation into 100 liters of the oil composition of Example 4 followed by thorough homogenization. The resulting pre-encapsulation formulated oil contains approximately 4 mg/gram alpha-D-tocopherol. Subsequently, the formulated oil is encapsulated into soft gelatin capsules with printed logo according to general methods typically used by Banner in High Point, N.C., for fish oils or by any other documented and operational encapsulation method. The fill mass of the oil is 1.06 gram/capsule, providing a dose of approximately 1000 mg omega-3-pentenoic-acids per capsule. Finally, the capsules are bottled in HDPE bottles with induction seal and child resistant cap.

Example 15

A patient is diagnosed with severe hypertriglyceridemia (TG>500 mg/dL). Thereupon, the patient may be initiated on daily treatment with one of the encapsulated compositions according to Examples 10, 11, 12 or 13. Four capsules per day are administered to this patient (4 g/d).

Example 16

A patient is treated as per Example 15. The treatment results in significant reduction of TG as well as non-HDL- and VLDL-cholesterol levels while the LDL-cholesterol level changes insignificantly.

Example 17

A patient is treated as per Example 15. The treatment results in significant reduction of TG as well as non-HDL-, LDL- and VLDL-cholesterol levels.

Example 18

A patient already undergoing treatment with a statin is diagnosed with high triglycerides (TG between 200 and 500 mg/dL). Thereupon, the patient is initiated on daily treatment with one of the encapsulated compositions according to Examples 10, 11, 12 or 13. Four capsules per day are administered to this patient (4 g/d).

Example 19

A patient is treated as per Example 18. The treatment results in significant reduction of TG as well as non-HDL-, VLDL- and LDL-cholesterol levels.

Example 20

A patient is diagnosed with mixed dyslipidemia (TG between 200 and 700 mg/dL and LDL-cholesterol above 190 mg/dL). Thereupon, the patient is initiated on concomitant daily treatment with a statin and one of the encapsulated compositions according to Examples 11, 12, 13, or 14. Four capsules per day are administered to this patient (4 g/d).

Example 21

A patient is treated as per Example 20. The treatment results in significant reduction of TG as well as non-HDL-, VLDL- and LDL-cholesterol levels.

Example 22

A patient is diagnosed with mixed dyslipidemia (TG between 200 and 700 mg/dL and non-HDL-cholesterol above 200 mg/dL). Thereupon, the patient is initiated on concomitant daily treatment with a statin and one of the encapsulated compositions according to Examples 11, 12, 13, or 14. Four capsules per day are administered to this patient (4 g/d).

Example 23

A patient is treated as per Example 22. The treatment results in significant reduction of TG as well as non-HDL-, VLDL- and LDL-cholesterol levels.

Example 24

A patient is diagnosed to be at significant risk for a cardiovascular event according to the NCEP guidelines and has TG levels above 150 mg/dL. Thereupon, the patient is initiated on daily treatment with one of the encapsulated compositions according to Examples 11, 12, 13, or 14. Four capsules per day are administered to this patient (4 g/d).
Example 25

[0210] A patient is treated as per Example 24. The treatment results in significant reduction of TG as well as non-HDL-, VLDL- and LDL-cholesterol levels.

Example 26

[0211] A patient diagnosed as per Example 15, 18, 20, 22 or 24 is treated with 3 capsules per day (instead of 4) of one of the encapsulated compositions according to Examples 11, 12, 13, or 14. The treatment results in significant reduction of TG as well as non-HDL- and VLDL-cholesterol levels.

Example 27

[0212] A patient diagnosed as per Example 15, 18, 20, 22 or 24 is treated with 3 capsules per day (instead of 4) of one of the encapsulated compositions according to Examples 11, 12, 13, or 14. The treatment results in significant reduction of TG as well as non-HDL- and VLDL-cholesterol levels.

Example 28

[0213] A patient diagnosed as per Example 15, 18, 20, 22 or 24 is treated with 2 capsules per day (instead of 3 or 4) of one of the encapsulated compositions according to Examples 11, 12, 13, or 14. The treatment results in significant reduction of TG as well as non-HDL- and VLDL-cholesterol levels.

Example 29

[0214] A patient diagnosed as per Example 15, 18, 20, 22 or 24 is treated with 2 capsules per day (instead of 3 or 4) of one of the encapsulated compositions according to Examples 11, 12, 13, or 14. The treatment results in significant reduction of TG as well as non-HDL- and VLDL-cholesterol levels.

Example 30

[0215] The following are examples of preferred embodiments of the present invention.

### COMPOSITION 1a

<table>
<thead>
<tr>
<th>Composition</th>

Example 34

[0219] A mixture of DPA and EPA was prepared by combining 1 g DPA Ethyl Ester (SE-133-III) with 10 g EPA Ethyl Ester, 914 mg/g (KD Pharma FM13001) in 150 ml of 95% ethanol/water containing 35 ml of 2M sodium hydroxide. This reaction mixture was stirred overnight at ambient temperature. TLC analysis showed complete conversion of the ethyl esters to the corresponding acids. The reaction mixture was cooled in an ice bath, acidified with 6N hydrochloric acid and concentrated on a rotavap under reduced pressure. Water and ethyl acetate were added, the phases separated and the aqueous residue extracted with ethyl acetate. The ethyl acetate extracts were combined, dried over sodium sulfate and concentrated to dryness on a rotavap under reduced pressure. Yield: 9.83 g. The ethyl ester mixture was then converted to the free fatty acids as described in example 7.

[0220] A representative sample of this ethyl ester composition was analysed using split inject by capillary gas chromatography by a 30 meterx0.25 mm Restek Stabil wax column using temperature programming.

Example 35

[0221] The following describes a study conducted to determine the effect of compositions of the present invention.

[0222] An n-3 Pentaenoic testing batch containing roughly 85% EPA, 8% DPA, and 1% HPA was used to study pharmacodynamic effects in the Charles River Zucker fa/fa non-diabetic rat (strain code 185), which is known to display characteristics of insulin resistance, glucose intolerance, hyperinsulinemia, obesity and dyslipidemia. VASCEPA® is also used as a comparator. Male, eight to nine week old animals were used, with eight rats (n=8) per group. At the initiation of daily dosing, all animals were placed on chow+0.5% cholesterol diet (D13022002: Research Diets, New Brunswick, N.J.). Corn oil was used as a diluent for the omega-3 compounds, and methylcellulose to prepare the statin (atorvastatin) for dosing. A separate group of animals receiving corn oil alone was used as the untreated control group. Animals received daily doses of respective solutions by oral gavage. The study was conducted in 2 phases. In the first phase, the n-3 Pentaenoic composition and VASCEPA® solution is administered at 200 mg/kg, 400 mg/kg, and 1000 mg/kg. Animals were dosed daily for 14 days. For reference, a rat dose of 400 mg/kg would be equivalent to a human daily dose of approximately 4 grams (as shown in Rengan-Shaw et al. “Dose translation from animal to human studies revisited,” FASEB J. 22, 659-661 (2007), which is incorporated by reference in its entirety).

[0223] The second phase was initiated on day 15, with the groups receiving the n-3 Pentaenoic composition and VASCEPA® 400 mg/kg solution being co-administered statin at 10 mg/kg. Another group, previously dosed with corn oil vehicle, received atorvastatin to serve as an appropriate control. This second phase consisted of 14 days of daily, oral administration.

[0224] Plasma total cholesterol, LDL, HDL, triglycerides and VLDL were measured in the fasting state on day 0, 7 and 14; and for those groups included in the second phase on days 21 and 28. Levels of lipid parameters were determined in a 96-well multiplexed system using standard clinical chemistry techniques. Non-HDL cholesterol was calculated by subtracting the HDL value from the total cholesterol value. In addition, for the groups included in the second phase, insulin levels were determined at day 28. FIG. 1 shows the fasting plasma lipid values after seven days of dosing. FIG. 2 shows the fasting plasma insulin levels after 28 days of administration.

[0225] Expression of genes for HMGCoA (3-hydroxy-3-methylglutaryl-coenzyme A; key regulatory enzyme for new cholesterol biosynthesis), PCSK9 (pro-protein convertase subtilisin kexin 9; associated with LDL receptor functioning and increased levels of LDL), and SREBP-2 (sterol regulatory enhancing binding protein 2; regulates transcription of a wide variety of genes involved with new cholesterol synthesis) are evaluated in liver from groups included in the second phase. The mRNA (messenger RNA) was isolated from samples previously frozen at ~70° C, and cDNA (complementary DNA) is derived for further study using standard molecular biology technique. Samples and corresponding probes for genes of interest are loaded onto a Life Science TLDA card. The level of gene expression was quantified using real time RT-PCR (reverse transcriptase polymerase chain reaction) and calculated using the ΔΔCT technique relative to the vehicle group in accordance to methodology recommended and as described by Applied Biosystems (Guide to Performing Relative Quantitation of Gene Expression Using Real-Time Quantitative PCR). FIG. 3 shows the relative liver gene expression following 28 days of administration.

Example 36

[0226] The following describes a study to determine the effect of compositions of the present invention.

[0227] Study #2—Humans

[0228] The overall pharmacokinetics of one of COMPOSITION 1a, 1b, 2, 3, or 4 are evaluated versus a reference compound after administration under fasting or fed conditions in normal, mostly healthy volunteers in a standard, 4-way cross-over trial design format. VASCEPA®, EPANOVA™, LOVAZAR™, or EPADEL® are used as a reference compound. A total of 48 subjects are separated into 2 groups of 24. Each subject serves as his or her own internal control for comparison purposes under this 4-way crossover design. Inclusion criteria for tested subjects include volunteers between ages 18-65, with a BMI of 30-35 (alternatively a BMI of 27-35) and triglyceride levels less than 350 mg/dL, who consume no more than 1 fish meal per week and who are not currently prescribed pharmacotherapy for lowering triglycerides, including but not limited to fibrates, omega-3 agents, and niacin. Volunteers on stable anti-hypertensive, anti-diabetic and thyroid therapy re allowed for consideration. Any person on stable statin therapy is considered if their triglyceride levels are less than 350 mg/dL. However, the total composition of subjects in the study with this particular profile is limited to no more than 30%. 
Volunteers self-administering omega-3 non-prescription dietary supplements are asked to refrain from their use 2 weeks prior to the initiation of the study until study completion.

The effect of oral administration of the compounds tested in this study is evaluated under fed versus fasting administration conditions, in order to determine drug pharmacokinetics, as well as to understand the effects of food on drug pharmacokinetics. COMPOSITION 1a or 1b or the reference compound are dosed at approximately 4 grams/day in the morning by administration of 4 capsules containing approximately 1 gram of each compound. Several days prior to pharmacokinetic evaluations, volunteers are housed at the testing facility in order to ensure well-controlled experimental conditions.

Compounds are given to volunteers following an overnight fast, with plasma samples obtained prior to dosing and at various time points after day 1 and day 14 dosing. Volunteers are allowed access to water, and well-defined meals at certain times. Afterwards, compound administration is stopped for a 2-4 week washout period, and the groups are switched with respect to which compound they would receive, meaning that the group initially receiving COMPOSITION 1a or 1b is switched to receive the reference compound, and vice versa. Fasting pharmacokinetics are determined using the procedure described above. Following completion of the second 14-day dosing cycle, compound dosing is stopped for a 2-4-week washout period prior to the initiation of the a similar cycle as above, now with COMPOSITION 1a or 1b and the reference compound are administered together with a meal.

Plasma levels of omega-3 fatty acids of interest from the study are determined utilizing an analytical LC/MS technique under GLP laboratory conditions in order to determine Cmax, Tmax and AUC for the omega-3 fatty acids of interest, including EPA, DPA, HPA, DHA, and other omega-3 fatty acids.

Results
The results of the study show that COMPOSITION 1a or 1b has a better bioavailability (as measured by AUC and Cmax) than the reference compound. This effect is seen under fasting and/or fed administration conditions.

In an alternate study design, this Study #2 is conducted with a certain dose level of COMPOSITION 2, COMPOSITION 3, or COMPOSITION 4 instead of COMPOSITION 1.

Example 37

The following describes a study (STUDY #3) to determine the effect of compositions of the present invention.

A Multi-Center, Placebo-Controlled, Randomized, Double-Blind, 12-Week Study to Evaluate the Efficacy and Safety of COMPOSITION 1a, 1b, 2, 3 or 4 in Patients With Fasting Triglyceride Levels ≥500 mg/dL and ≥2000 mg/dL.

This Phase 3, multi-center study consists of a 6- to 8-week screening/washout period (to include a diet and lifestyle stabilization period), which includes a fasting triglyceride (TG) qualifying period of 2-3 weeks, followed by a 12-week double-blind treatment period. Patients on statin therapy (with or without ezetimibe) at screening are evaluated by the investigator as to whether this therapy could be safely discontinued at screening, or if it is to be continued. Patients on any other dyslipidemia therapy need to discontinue these in order to qualify for the study. If statin therapy (with or without ezetimibe) is to be continued, dose(s) must be stable for 4 weeks prior to the fasting TG baseline qualifying measurements for randomization. The screening visit is to occur at either 6 weeks before randomization for patients not on lipid-altering therapy at screening or for patients who do not need to discontinue their current dyslipidemia therapy, or at 8 weeks before randomization for patients who require washout of their current dyslipidemia therapy at screening.

The population for this study is men and women ≥18 years of age with a body mass index (BMI) ≥35 kg/m2. Patients on lipid-lowering therapy and patients not on lipid-lowering therapy are eligible to enroll in the study. Patients had to have an average TG level ≥500 mg/dL and ≥2000 mg/dL during the screening period to be eligible for randomization.

After confirmation of qualifying fasting TG values, eligible patients will enter a 12-week randomized, double-blind treatment period. At Week 0, patients will be randomly assigned to 1 of the following treatment groups: COMPOSITION 1a or 1b (approximately 2 g daily), COMPOSITION 1a or 1b (approximately 3 g daily), COMPOSITION 1a or 1b (approximately 4 g daily), or placebo. The daily dose may be taken as either a single dose or divided over two doses per day.

Approximately 80 patients per treatment group will be randomized in this study. Stratification will be by baseline fasting TG level (≥750 mg/dL or ≥750 mg/dL, gender, and the use of statin therapy at randomization. During the double-blind treatment period, patients return to the site at Week 4, Week 11, and Week 12 for efficacy and safety evaluations.

The primary objective of the study is to determine the efficacy of COMPOSITION 1 at approximately 2 g daily dose, approximately 3 g daily dose and approximately 4 g daily dose, compared to placebo, in lowering fasting TG levels in patients with fasting TG levels ≥500 mg/dL and ≥2000 mg/dL.

The secondary and exploratory objectives of the study are as follows:

1. To determine the safety and tolerability of COMPOSITION 1a or 1b at approximately 2 g daily, approximately 3 g daily and approximately 4 g daily;

2. To determine the effect of COMPOSITION 1a or 1b on lipid profiles, including total cholesterol (TC), high-density lipoprotein cholesterol (non-HDL-C), low-density lipoprotein cholesterol (LDL-C), high-density lipoprotein cholesterol (HDL-C), and very low-density lipoprotein cholesterol (VLDL-C);

3. To determine the effect of COMPOSITION 1a or 1b on apolipoprotein A-I (apo A-I), apolipoprotein B (apo B), apo A-I/apo B ratio, lipoprotein(a) (LP[a]), and lipoprotein-associated phospholipase A2 (Lp-PLA2);

4. To determine the effect of COMPOSITION 1a or 1b on low-density lipoprotein (LDL) particle number and size, on oxidized LDL and on C-reactive protein (CRP);

5. To determine the effect of COMPOSITION 1a or 1b on intracellular adhesion molecule-1 (ICAM-1) vascular cell adhesion molecule 1 (VCAM-1), interleukin-1β (IL-1β), interleukin-2 (IL-2), interleukin-6 (IL-6), interleukin-8 (IL-8), interleukin-10 (IL-10), interleukin-12 (IL-12), interleukin-15 (IL-15), interleukin-18 (IL-18), tumor necrosis factor-alpha (TNF-α), tumor necrosis factor-beta (TNF-β) and plasminogen activator inhibitor-1 (PAI-1);
6. To determine the effects of COMPOSITION 1a or 1b on nuclear factor kappa-light-chain-enhancer of activated B cells (NF-KB), vitronectin receptor (αvβ3), glycoprotein Ibβ/Illa (gpIbβ/Illa) and other platelet and thrombogenic factors.

7. To determine the effects of COMPOSITION 1a or 1b on E-selectin, P-selectin, homeocysteine, thromboxane B2 (TXB2), thromboxane A2 (TXA2), thromboxane B2 or B3 (TXB3), thromboxane A3 (TXA3), 2,3-dinor thromboxane B2, free fatty acids (FFA or NEFA), serum amyloid A1, serum amyloid A2, serum amyloid A3, serum amyloid A4, thioctobarbituric acid (TBA) reacting material, adiponection (GBP-28), hemoglobin A1c (HbA1c), fasting insulin, fasting glucose, fasting plasma glucose, fasting plasma fructosamine, macrophage colony stimulating factor (M-CSF) and granulocyte macrophage colony stimulating factor (GM-CSF).

8. To determine the effects of COMPOSITION 1a or 1b on fibrinogen, fibrin D-dimer, platelet-derived microparticles, mean platelet volume (MPV), platelet subpopulations, adenosine diphosphate induced platelet aggregation, platelet endothelial cell adhesion molecule (PECAM-1), heart rate, and systolic and diastolic blood pressure.

9. To investigate the relationship between changes in fatty acid concentrations (including EPA, DHA and DPA), and in plasma and red blood cell membranes and the reduction in fasting TG levels.

10. To investigate the relationship between changes in fatty acid concentrations (including EPA, DHA and DPA), and in plasma and red blood cell membranes and the reduction in fasting TG levels.

The primary efficacy variable for the double-blind treatment period is percent change in fasting TG from baseline to the Week 12 endpoint.

The secondary efficacy variable for the double-blind treatment period includes the following: Percent changes in fasting Non-HDL-C, LDL-C, VLDL-C, HDL-C, Lp-PLA2, and apo B from baseline to Week 12 endpoint.

Statistical methods for efficacy evaluations will be conducted on the intent-to-treat (ITT) and on the per-protocol population. Descriptive statistics for the baseline and post-baseline measurements, the percent changes, or changes from baseline are to be presented by treatment group and by visit for all efficacy variables.

The primary and secondary efficacy analyses will be performed using an analysis of covariance (ANCOVA) model with treatment, gender, and the use of statin therapy at randomization as factors and baseline fasting TG value as a covariate.

In an alternate study design, this Study #3 is conducted with one or more dose levels of COMPOSITION 2, 3, or 4 instead of COMPOSITION 1a or 1b.

Example 38

The following describes a study (STUDY #4) to determine the effect of compositions of the present invention.

A Multi-Center, Placebo-Controlled, Randomized, Double-Blind, 6- to 12-Week Study to Evaluate the Efficacy and Safety of COMPOSITION 1a, 1b, 2, 3, or 4 in Statin-Treated Patients With High Fasting Triglyceride Levels 200 mg/dL and 499 mg/dL.

This multi-center study consists of a 4- to 6-week screening and washout period (to include a diet and lifestyle stabilization period, and to wash-out any non-statin/ezetimibe dyslipidemia medications), which also includes a 2-3 week fasting triglyceride (TG) level qualifying period, followed by a 6- to 12-week double-blind treatment period. Patients on statin therapy (with or without ezetimibe) at screening are evaluated by the investigator as to whether this therapy does maintain low-density lipoprotein (LDL) levels of ≥40 mg/dL and <100 mg/dL. At screening, statin therapy (with or without ezetimibe) is to be initiated, in those patients who are not on statin therapy in order to achieve LDL levels of ≥40 mg/dL and <100 mg/dL. Dose(s) of statin therapy must be stable for ≥4 weeks prior to the TG baseline qualifying measurements for randomization.

The population for this study is men and women ≥18 years of age with a body mass index (BMI) ≥25 kg/m². Patients on lipid-lowering therapy and patients not on lipid-lowering therapy are eligible to enroll in the study. Patients had to have an average fasting TG level ≥200 mg/dL and ≤499 mg/dL during the qualifying period to be eligible for randomization.

After confirmation of qualifying fasting TG values, eligible patients will enter a 6- to 12-week randomized, double-blind treatment period. At Week 0, patients will be randomly assigned to one of the following treatment groups: COMPOSITION 1a or 1b at an approximately 2 gram daily dose, COMPOSITION 1a or 1b at an approximately 3 gram daily dose, COMPOSITION 1a or 1b at an approximately 4 gram daily dose, or placebo. The daily dose may be taken as either a single dose or distributed over two doses per day.

Approximately 100 to 250 patients per treatment group will be randomized in this study. Stratification will be by gender. During the double-blind treatment period, patients will return to the site at Week 3 or 4, one week prior to the last week of randomized treatment period, and at the end of the randomized treatment period for efficacy and safety evaluations.

The primary objective of the study is to determine the efficacy of COMPOSITION 1 at approximately 2 grams daily, approximately 3 grams daily and approximately 4 grams daily, compared to placebo, in lowering fasting TG levels in statin-treated patients with fasting TG levels ≥200 mg/dL and ≤499 mg/dL.

The secondary and exploratory objectives of the study may include but are not limited to the following objectives:

1. To determine the safety and tolerability of COMPOSITION 1a or 1b at approximately 2 g daily, approximately 3 g daily and approximately 4 g daily;

2. To determine the effect of COMPOSITION 1a or 1b at on lipid profiles, including total cholesterol (TC), non-high-density lipoprotein cholesterol (non-HDL-C) low-density lipoprotein cholesterol (LDL-C), high-density lipoprotein cholesterol (HDL-C), and very low-density lipoprotein cholesterol (VLDL-C);

3. To determine the effect of COMPOSITION 1a or 1b on apolipoprotein A-1 (apo A-1), apolipoprotein B (apo B), apo A-1/apo B ratio, lipoprotein(a) (Lp[a]), and lipoprotein-associated phospholipase A2 (Lp-PLA2);

4. To determine the effect of COMPOSITION 1a or 1b on low-density lipoprotein (LDL) particle number and size, on oxidized LDL, high-sensitivity C-reactive protein (hsCRP), and on C-reactive protein (CRP);

5. To determine the effect of COMPOSITION 1a or 1b on intracellular adhesion molecule-1 (ICAM-1), vascular cell adhesion molecule 1 (VCAM-1), interleukin-1β (IL-1β), interleukin-2 (IL-2), interleukin-6 (IL-6), interleukin-8
(IL-8), interleukin-10 (IL-10), interleukin-12 (IL-12), interleukin-15 (IL-15), interleukin-18 (IL-18), tumor necrosis factor-alpha (TNF-α), tumor necrosis factor-beta (TNF-β) and plasminogen activator inhibitor-1 (PAI-1).

[0273] 6. To determine the effects of COMPOSITION 1a or 1b on nuclear factor kappa-light-chain-enhancer of activated B cells (NF-κB), vimentin receptor (αvβ3), glycoprotein Ib/IIa (GPIb/IIa) and other platelet and thrombogenic factors.

[0274] 7. To determine the effects of COMPOSITION 1a or 1b on P-selectin, P-selectin, homocysteine, thromboxane B2 (TXB2), thromboxane A2 (TXA2), thromboxane B2 (TXB2), thromboxane A3 (TXA3), 2,3-dinor thromboxane B2, free fatty acids (FFA or NEFA), serum amyloid A1, serum amyloid A2, serum amyloid A3, serum amyloid A4, thio- barbituric acid (TBA) reacting material, adiponectin (GBP-28), hemoglobin A1c (HbA1c), fasting insulin, fasting glucagon, fasting plasma glucose, fasting plasma fructosamine, macrophage colony stimulating factor (M-CSF) and granulocyte macrophage colony stimulating factor (GM-CSF).

[0275] 8. To determine the effects of COMPOSITION 1a or 1b on fibrinogen, fibrin D-dimer, platelet derived-microparticles, mean platelet volume (MPV), platelet subpopulations, adenosine diphosphate induced platelet aggregation, platelet endothelial cell adhesion molecule (PECAM-1), heart rate, and systolic and diastolic blood pressure.

[0276] 9. To determine the effects of COMPOSITION 1a or 1b on fatty acid concentrations (including EPA, DHA and DPA) in plasma and red blood cell membranes;

[0277] 10. To investigate the relationship between changes in fatty acid concentrations (including EPA, DHA and DPA) in plasma and red blood cell membranes and the reduction in fasting TG levels.

[0278] The primary efficacy variable for the double-blind treatment period is percent change in fasting TG from baseline to the Week 6 to 12 endpoint.

[0279] The secondary efficacy variable for the double-blind treatment period include but are not limited to the following: Percent changes in fasting non-HDL-C, LDL-C, HDL-C, Lp-PLA2, and apo B from baseline to Week 6 to 12 endpoint.

[0280] Statistical methods for efficacy evaluations will be conducted on the intent-to-treat (ITT) and on the per-protocol population. Descriptive statistics for the baseline and postbaseline measurements, the percent changes, or changes from baseline are to be presented by treatment group and by visit for all efficacy variables.

[0281] The primary and secondary efficacy analyses will be performed using an analysis of covariance (ANCOVA) model with treatment, gender, the type of statin therapy and diagnosis of diabetes at randomization as factors and baseline fasting TG value as a covariate.

[0282] In an alternate study design, this Study #4 is conducted with one or more dose levels of COMPOSITION 2, 3, or 4 instead of COMPOSITION 1a or 1b. In an alternative study design, Study #4 is conducted, enrolling patients with a baseline triglyceride level of about 300 to 499 mg/dL, or about 350 to 400 mg/dL, instead of 200 to 499 mg/dL.

Example 39

[0283] The following describes a study (STUDY #5) to determine the effect of compositions of the present invention.

[0284] The impact on fasting triglyceride levels and other pharmacodynamic endpoints of one of COMPOSITION 1a, 1b, 2, 3, or 4 are evaluated versus a reference compound after administration under fasting or fed conditions in normal, mostly healthy volunteers in a standard, 4-way cross-over trial design format. VASCEPA®, EPA NOX™ LovaZa™, or EPAPEL® are used as a reference compound. A total of 48 subjects are separated into 2 groups of 24. Each subject serves as his or her own internal control for comparison purposes under this 4-way crossover design. Inclusion criteria for tested subjects include volunteers between ages 18-65, with a BMI of 30-35 (alternatively a BMI of 27-35) and triglyceride levels less than 350 mg/dL, who consume no more than 1 fish meal per week and who are not currently prescribed pharmacotherapy for lowering triglycerides, including but not limited to fibrates, omega-3 agents, and nicotinic. Volunteers on stable anti-hypertensive, anti-diabetic and thyroid therapy are allowed for consideration. Any person on stable statin therapy is considered if his or her triglyceride levels are less than 350 mg/dL. However, the total composition of subjects in the study with this particular profile is limited to no more than 30%.

[0285] Volunteers self-administering omega-3 non-prescription dietary supplements are asked to refrain from their use 2 weeks prior to the initiation of the study until study completion. Subjects using any other non-steroidal anti-inflammatory agents other than acetaminophen are asked to abstain and switch to acetaminophen for relief of pain, or are excluded from study consideration. Subjects are excluded if they receive any type of hormone therapy, weight loss agents, HIV therapy, beta-blockers, or are diagnosed with known cardiovascular disease, including heart failure, arrhythmia, any incidence of acute coronary syndrome, myocardial infarct, coronary artery bypass graft surgery, and angioplasty.

[0286] STUDY #5 Design

[0287] The effect of oral administration of the compounds tested in this study is evaluated under fed versus fasting administration conditions, in order to determine drug pharmacodynamics and effects on lipids. COMPOSITION 1a or 1b or the reference compound are dosed at approximately 4 grams/day in the morning by administration of 4 capsules containing approximately 1 gram each of each compound.

[0288] Compounds are given to volunteers following an overnight fast, with plasma samples obtained prior to dosing on day 1 and day 14 dosing. Volunteers are allowed access to water, and well-defined meals at certain times. Afterwards, compound administration is stopped for a 2-4 week washout period, and the groups are switched with respect to which compound they would receive, meaning that the group initially receiving COMPOSITION 1a or 1b is switched to receive the reference compound, and vice versa. Following completion of the second 14-day dosing cycle, compound dosing is stopped for a 2-4-week washout period prior to the initiation of the a similar cycle as above, now with COMPOSITION 1a or 1b and the reference compound are administered together with a meal.

[0289] Baseline plasma levels of fasting serum triglycerides are determined on day 1 and just prior to initiation and completion of either the fasting or fed multi-dosing period. Additional lipid and other parameters (see below under “Results”) that are analyzed include total cholesterol, LDL, HDL, VLDL, non-HDL, and NEFA as previously described.

[0290] Effects on platelet function, such as clotting time and PAF-induced aggregation are also determined. Standard physiological, plasma and urinary safety markers, including but not limited to electrolytes, ALT, AST, BUN, glucose,
blood pressure, weight etc. are monitored in accordance with standard good clinical trial guidelines.

[0291] Results
[0292] The results of the study show that COMPOSITION 1a or 1b has a better fasting triglyceride lowering effect than the reference compound. This effect is seen under fasting and/or fed administration conditions. Administration of COMPOSITION 1a or 1b have a beneficial effect, versus baseline and versus the reference compound, on other lipid parameters (such as LDL cholesterol, total cholesterol, non-HDL cholesterol, VLDL cholesterol), on platelet function, and one or more of the following: apolipoprotein A-1 (apo A-1), apolipoprotein B (apo B), apo A-I/apo B ratio, lipoprotein(a) (Lp(a)), lipoprotein-associated phospholipase A2 (Lp-PLA2), low density lipoprotein (LDL) particle number and size, oxidized LDL, C-reactive protein (CRP), high sensitivity C-reactive protein (hsCRP), intracellular adhesion molecule-1 (ICAM-1), E-selectin, P-selectin, vascular cell adhesion molecule 1 (VCAM-1) or cluster of differentiation 106 (CD106), intercellular-1p (IL-1p), interleukin-2 (IL-2), interleukin-6 (IL-6), interleukin-8 (IL-8), interleukin-10 (IL-10), interleukin-12 (IL-12), interleukin-15 (IL-15), interleukin-18 (IL-18), tumor necrosis factor-alpha (TNF-a), tumor necrosis factor-beta (TNF-b), plasminogen activator inhibitor-1 (PAI-1), homocysteine, thromboxane B2 (TXB2), thromboxane A2 (TXA2), 2,3-dinor thromboxane B2, free fatty acids (FFA), serum amyloid A1, serum amyloid A2, serum amyloid A3, serum amyloid A4, thioriburic acid (TBA) reacting material, adiponectin (GBP-28), hemoglobin Alc (HbAlc), macrophage colony stimulating factor (M-CSF), granulocyte macrophage colony stimulating factor (GM-CSF), fibrinogen, fibrin D-dimer, platelet derived-micro particles, mean platelet volume (MPV), platelet subpopulations, heart rate, systolic and diastolic blood pressure, nuclear factor kappa-light-chain enhancer of activated B cells (NF-kB), adenosine diphosphate induced platelet aggregation, platelet endothelial cell adhesion molecule (PECAM-1), vitronectin receptor (αvβ3), and glycophorin Ib/IIa (gplIb/IIa). This effect is more beneficial than that observed with VASCEPA®. Administration of COMPOSITION 1 has a beneficial impact, or a minimal impact, or no impact, on other non-HDL lipid parameters, such as LDL cholesterol versus baseline and the reference compound. In an alternate study design, this Study #5 is conducted with a certain dose level of COMPOSITION 2, 3, 4, 5 instead of COMPOSITION 1a or 1b.

DESCRIPTION OF THE PREFERRED EMBODIMENTS

[0293] 1. A fatty acid composition comprising at least 50% omega-3-fatty acids, salts or derivatives thereof, while comprising eicosapentaenoic acid (EPA; C20:5-n3) and docosapentaenoic acid (DPA; C22:5-n3) and wherein the EPA:DHA ratio is higher than 20:1.

[0294] 2. A fatty acid composition comprising at least 60% omega-3-fatty acids, salts or derivatives thereof, while comprising eicosapentaenoic acid (EPA; C20:5-n3) and docosapentaenoic acid (DPA; C22:5-n3) and wherein the EPA:DHA ratio is higher than 20:1.

[0295] 3. A fatty acid composition comprising at least 70% omega-3-fatty acids, salts or derivatives thereof, while comprising eicosapentaenoic acid (EPA; C20:5-n3) and docosapentaenoic acid (DPA; C22:5-n3) and wherein the EPA:DHA ratio is higher than 20:1.

[0296] 4. A fatty acid composition comprising at least 75% omega-3-fatty acids, salts or derivatives thereof, while comprising eicosapentaenoic acid (EPA; C20:5-n3) and docosapentaenoic acid (DPA; C22:5-n3) and wherein the EPA:DHA ratio is higher than 20:1.

[0297] 5. A fatty acid composition comprising at least 80% omega-3-fatty acids, salts or derivatives thereof, while comprising eicosapentaenoic acid (EPA; C20:5-n3) and docosapentaenoic acid (DPA; C22:5-n3) and wherein the EPA:DHA ratio is higher than 20:1.

[0298] 6. A fatty acid composition comprising at least 85% omega-3-fatty acids, salts or derivatives thereof, while comprising eicosapentaenoic acid (EPA; C20:5-n3) and docosapentaenoic acid (DPA; C22:5-n3) and wherein the EPA:DHA ratio is higher than 20:1.

[0299] 7. A fatty acid composition comprising at least 90% omega-3-fatty acids, salts or derivatives thereof, while comprising eicosapentaenoic acid (EPA; C20:5-n3) and docosapentaenoic acid (DPA; C22:5-n3) and wherein the EPA:DHA ratio is higher than 20:1.

[0300] 8. A fatty acid composition comprising at least 95% omega-3-fatty acids, salts or derivatives thereof, while comprising eicosapentaenoic acid (EPA; C20:5-n3) and docosapentaenoic acid (DPA; C22:5-n3) and wherein the EPA:DHA ratio is higher than 20:1.

[0301] 9. A composition according to one of the preferred embodiments 1 through 8, comprising at least 2% docosapentaenoic acid (DPA; C22:5-n3).

[0302] 10. A composition according to one of the preferred embodiments 1 through 8, comprising at least 4% docosapentaenoic acid (DPA; C22:5-n3).

[0303] 11. A composition according to one of the preferred embodiments 1 through 8, comprising at least 5% docosapentaenoic acid (DPA; C22:5-n3).

[0304] 12. A composition according to one of the preferred embodiments 1 through 8, comprising at least 6% docosapentaenoic acid (DPA; C22:5-n3).

[0305] 13. A composition according to one of the preferred embodiments 1 through 8, comprising at least 7% docosapentaenoic acid (DPA; C22:5-n3).

[0306] 14. A composition according to one of the preferred embodiments 1 through 8, comprising at least 8% docosapentaenoic acid (DPA; C22:5-n3).

[0307] 15. A composition according to one of the preferred embodiments 1 through 8, comprising at least 10% docosapentaenoic acid (DPA; C22:5-n3).

[0308] 16. A composition according to one of the preferred embodiments 1 through 8, comprising at least 12% docosapentaenoic acid (DPA; C22:5-n3).

[0309] 17. A composition according to one of the preferred embodiments 1 through 8, comprising at least 15% docosapentaenoic acid (DPA; C22:5-n3).

[0310] 18. A composition according to one of the preferred embodiments 1 through 17, comprising no more than 95% EPA.

[0311] 19. A composition according to one of the preferred embodiments 1 through 17, comprising no more than 10% omega-6 fatty acids.

[0312] 20. A composition according to one of the preferred embodiments 1 through 17, comprising no more than 10% omega-6 fatty acids.

[0313] 21. A composition according to one of the preferred embodiments 1 through 17, comprising no more than 5% omega-6 fatty acids.
[0314] 22. A composition according to one of the preferred embodiments 1 through 17, comprising no more than 3% omega-6 fatty acids.

[0315] 23. A composition according to one of the preferred embodiments 1 through 22, comprising no more than 5% arachidonic acid (C22:4-n6).

[0316] 24. A composition according to one of the preferred embodiments 1 through 22, comprising no more than 4% arachidonic acid (C22:4-n6).

[0317] 25. A composition according to one of the preferred embodiments 1 through 22, comprising no more than 3% arachidonic acid (C22:4-n6).

[0318] 26. A composition according to one of the preferred embodiments 1 through 22, comprising no more than 2% arachidonic acid (C22:4-n6). A composition according to one of the preferred embodiments 1 through 22, comprising no more than 1% arachidonic acid (C22:4-n6).

[0319] 28. A composition according to one of the preferred embodiments 1 through 27, also comprising heneicosapentaenoic acid (C21:5-n3).

[0320] 29. A composition according to one of the preferred embodiments 1 through 27, comprising at least 0.01% heneicosapentaenoic acid (C21:5-n3).

[0321] 30. A composition according to one of the preferred embodiments 1 through 27, comprising at least 0.1% heneicosapentaenoic acid (C21:5-n3).

[0322] 31. A composition according to one of the preferred embodiments 1 through 27, comprising at least 0.3% heneicosapentaenoic acid (C21:5-n3).

[0323] 32. A composition according to one of the preferred embodiments 1 through 27, comprising at least 0.5% heneicosapentaenoic acid (C21:5-n3).

[0324] 33. A composition according to one of the preferred embodiments 1 through 27, comprising at least 1% heneicosapentaenoic acid (C21:5-n3).

[0325] 34. A composition according to one of the preferred embodiments 1 through 27, comprising at least 2% heneicosapentaenoic acid (C21:5-n3).

[0326] 35. A composition according to one of the preferred embodiments 1 through 27, comprising at least 3% heneicosapentaenoic acid (C21:5-n3).

[0327] 36. A composition according to one of the preferred embodiments 1 through 27, comprising at least 4% heneicosapentaenoic acid (C21:5-n3).

[0328] 37. A composition according to one of the preferred embodiments 1 through 27, comprising at least 5% heneicosapentaenoic acid (C21:5-n3).

[0329] 38. A composition according to one of the preferred embodiments 1 through 37, comprising no more than 5% omega-3 fatty acids that are not omega-3-pentaenoic acids.

[0330] 39. A composition according to one of the preferred embodiments 1 through 37, comprising no more than 4% omega-3 fatty acids that are not omega-3-pentaenoic acids.

[0331] 40. A composition according to one of the preferred embodiments 1 through 37, comprising no more than 3% omega-3 fatty acids that are not omega-3-pentaenoic acids.

[0332] 41. A composition according to one of the preferred embodiments 1 through 37, comprising no more than 2% omega-3 fatty acids that are not omega-3-pentaenoic acids.

[0333] 42. A composition according to one of the preferred embodiments 1 through 37, comprising no more than 1.5% omega-3 fatty acids that are not omega-3-pentaenoic acids.

[0334] 43. A composition according to one of the preferred embodiments 1 through 37, comprising no more than 1.25% omega-3 fatty acids that are not omega-3-pentaenoic acids.

[0335] 44. A composition according to one of the preferred embodiments 1 through 37, comprising no more than 1% omega-3 fatty acids that are not omega-3-pentaenoic acids.

[0336] 45. A composition according to one of the preferred embodiments 1 through 44, wherein the EPA:DPA ratio is between 99:1 and 1:99.

[0337] 46. A composition according to one of the preferred embodiments 1 through 44, wherein the EPA:DPA ratio is between 60:1 and 1:60.

[0338] 47. A composition according to one of the preferred embodiments 1 through 44, wherein the EPA:DPA ratio is between 50:1 and 1:10.

[0339] 48. A composition according to one of the preferred embodiments 1 through 44, wherein the EPA:DPA ratio is between 40:1 and 1:3.

[0340] 49. A composition according to one of the preferred embodiments 1 through 44, wherein the EPA:DPA ratio is between 40:1 and 1:2.

[0341] 50. A composition according to one of the preferred embodiments 1 through 44, wherein the EPA:DPA ratio is between 40:1 and 1:1.

[0342] 51. A composition according to one of the preferred embodiments 1 through 44, wherein the EPA:DPA ratio is between 30:1 and 1:1.

[0343] 52. A composition according to one of the preferred embodiments 1 through 44, wherein the EPA:DPA ratio is between 20:1 and 1:1.

[0344] 53. A composition according to one of the preferred embodiments 1 through 44, wherein the EPA:DPA ratio is between 10:1 and 1:1.

[0345] 54. A composition according to one of the preferred embodiments 1 through 44, wherein the EPA:DPA ratio is between 5:1 and 1:1.

[0346] 55. A composition according to one of the preferred embodiments 1 through 44, wherein the EPA:DPA ratio is between 10:1 and 2:1.

[0347] 56. A composition according to one of the preferred embodiments 1 through 44, wherein the EPA:DPA ratio is between 20:1 and 2:1.

[0348] 57. A composition according to one of the preferred embodiments 1 through 44, wherein the EPA:DPA ratio is between 30:1 and 2:1.

[0349] 58. A composition according to one of the preferred embodiments 1 through 44, wherein the EPA:DPA ratio is between 40:1 and 2:1.

[0350] 59. A composition according to one of the preferred embodiments 1 through 44, wherein the EPA:DPA ratio is between 50:1 and 2:1.

[0351] 60. A composition according to one of the preferred embodiments 1 through 44, wherein the EPA:DPA ratio is between 10:1 and 3:1.

[0352] 61. A composition according to one of the preferred embodiments 1 through 44, wherein the EPA:DPA ratio is between 20:1 and 3:1.

[0353] 62. A composition according to one of the preferred embodiments 1 through 44, wherein the EPA:DPA ratio is between 30:1 and 3:1.

[0354] 63. A composition according to one of the preferred embodiments 1 through 44, wherein the EPA:DPA ratio is between 40:1 and 3:1.
[0355] 64. A composition according to one of the preferred embodiments 1 through 44, wherein the EPA:DPA ratio is between 50:1 and 3:1.

[0356] 65. A composition according to one of the preferred embodiments 1 through 44, wherein the EPA:DPA ratio is between 60:1 and 3:1.

[0357] 66. A composition according to one of the preferred embodiments 1 through 44, wherein the EPA:DPA ratio is between 10:1 and 5:1.

[0358] 67. A composition according to one of the preferred embodiments 1 through 44, wherein the EPA:DPA ratio is between 20:1 and 5:1.

[0359] 68. A composition according to one of the preferred embodiments 1 through 44, wherein the EPA:DPA ratio is between 30:1 and 5:1.

[0360] 69. A composition according to one of the preferred embodiments 1 through 44, wherein the EPA:DPA ratio is between 40:1 and 5:1.

[0361] 70. A composition according to one of the preferred embodiments 1 through 44, wherein the EPA:DPA ratio is between 50:1 and 5:1.

[0362] 71. A composition according to one of the preferred embodiments 1 through 44, wherein the EPA:DPA ratio is between 60:1 and 5:1.

[0363] 72. A composition according to one of the preferred embodiments 1 through 44, wherein the EPA:DPA ratio is between 20:1 and 10:1.

[0364] 73. A composition according to one of the preferred embodiments 1 through 44, wherein the EPA:DPA ratio is between 30:1 and 10:1.

[0365] 74. A composition according to one of the preferred embodiments 1 through 44, wherein the EPA:DPA ratio is between 40:1 and 10:1.

[0366] 75. A composition according to one of the preferred embodiments 1 through 44, wherein the EPA:DPA ratio is between 50:1 and 10:1.

[0367] 76. A composition according to one of the preferred embodiments 1 through 44, wherein the EPA:DPA ratio is between 60:1 and 10:1.

[0368] 77. A composition according to one of the preferred embodiments 1 through 44, wherein the EPA:DPA ratio is between 100:1 and 10:1.

[0369] 78. A composition according to one of the preferred embodiments 1 through 44, comprising between 55% and 95% EPA.

[0370] 79. A composition according to one of the preferred embodiments 1 through 44, comprising between 60% and 95% EPA.

[0371] 80. A composition according to one of the preferred embodiments 1 through 44, comprising between 65% and 95% EPA.

[0372] 81. A composition according to one of the preferred embodiments 1 through 44, comprising between 70% and 95% EPA.

[0373] 82. A composition according to one of the preferred embodiments 1 through 44, comprising between 75% and 95% EPA.

[0374] 83. A composition according to one of the preferred embodiments 1 through 44, comprising between 80% and 95% EPA.

[0375] 84. A composition according to one of the preferred embodiments 1 through 44, comprising between 85% and 95% EPA.

[0376] 85. A composition according to one of the preferred embodiments 1 through 44, comprising between 90% and 95% EPA.

[0377] 86. A composition according to one of the preferred embodiments 1 through 44, comprising between 1% and 3% DPA.

[0378] 87. A composition according to one of the preferred embodiments 1 through 44, comprising between 1% and 5% DPA.

[0379] 88. A composition according to one of the preferred embodiments 1 through 44, comprising between 2% and 10% DPA.

[0380] 89. A composition according to one of the preferred embodiments 1 through 44, comprising between 3% and 20% DPA.

[0381] 90. A composition according to one of the preferred embodiments 1 through 44, comprising between 3% and 30% DPA.

[0382] 91. A composition according to one of the preferred embodiments 1 through 44, comprising between 3% and 50% DPA.

[0383] 92. A composition according to one of the preferred embodiments 1 through 44, comprising between 3% and 75% DPA.

[0384] 93. A composition according to one of the preferred embodiments 1 through 44, comprising between 3% and 85% DPA.

[0385] 94. A fatty acid composition according to one of the preferred embodiments 1 through 93, in which the fatty acids are present as ethyl esters.

[0386] 95. A fatty acid composition according to one of the preferred embodiments 1 through 93, in which the fatty acids are present as free fatty acids.

[0387] 96. A fatty acid composition according to one of the preferred embodiments 1 through 93, in which the fatty acids are present as esters in di-glyceride form.

[0388] 97. A fatty acid composition according to one of the preferred embodiments 1 through 93, in which the fatty acids are present as esters in triglyceride form.

[0389] 98. A fatty acid composition according to one of the preferred embodiments 1 through 97, also comprising a suitable anti-oxidant in a concentration sufficient to protect the fatty acids of the composition from oxidation.

[0390] 99. A pharmaceutically suitable formulation comprising one of the compositions according to preferred embodiments 94 through 98, in which the amount of eicosapentaenoic acid plus docosapentaenoic acid is present in an amount between 100 and 10,000 mg.

[0391] 100. A pharmaceutically suitable formulation or dosage form comprising one of the compositions according to preferred embodiments 94 through 98, in which the amount of eicosapentaenoic acid plus docosapentaenoic acid is present in an amount between 250 and 1,250 mg.

[0392] 101. A pharmaceutically suitable formulation or dosage form comprising one of the compositions according to preferred embodiments 94 through 98, in which the amount of eicosapentaenoic acid plus docosapentaenoic acid is present in an amount between 500 and 1,100 mg.

[0393] 102. A pharmaceutically suitable formulation or dosage form comprising one of the compositions according to preferred embodiments 94 through 98, in which the amount of eicosapentaenoic acid plus docosapentaenoic acid is present in an amount between 100 and 10,000 mg.
[0394] 103. A method of administration or treatment to a subject of a formulation or dosage form according to one of the preferred embodiments 94 through 102 at a daily dose between 100 and 10,000 mg.

[0395] 104. A method of administration or treatment to a subject of a formulation or dosage form according to one of the preferred embodiments 94 through 102 at a daily dose between 500 and 5,000 mg.

[0396] 105. A method of administration or treatment to a subject of a formulation or dosage form according to one of the preferred embodiments 94 through 102 at a daily dose between 1,500 and 4,100 mg.

[0397] 106. A method of treatment according to preferred embodiments 103 through 105, in which the subject is a patient diagnosed with very high triglycerides (equal to or more than 500 mg/dL).

[0398] 107. A method of treatment according to preferred embodiments 103 through 105, in which the subject is a patient diagnosed with high triglycerides (equal to or more than 200 mg/dL, but less than 500 mg/dL).

[0399] 108. A method of treatment according to preferred embodiments 103 through 105, in which the subject is a patient already undergoing treatment with a statin and then diagnosed with high triglycerides (equal to or more than 200 mg/dL, but less than 500 mg/dL).

[0400] 109. A method of treatment according to preferred embodiments 103 through 105, in which the subject is a patient diagnosed with mixed dyslipidemia with TG 300-499 mg/dL and LDL-cholesterol equal to or more than 190 mg/dL.

[0401] 110. A method of treatment according to preferred embodiments 103 through 105, in which the subject is a patient diagnosed with mixed dyslipidemia with TG 300-700 mg/dL and non-HDL-cholesterol equal to or more than 190 mg/dL.

[0402] 111. A method of treatment according to preferred embodiments 103 through 105, in which the subject is a patient diagnosed with mixed dyslipidemia with TG 200-499 mg/dL and non-HDL-cholesterol equal to or more than 200 mg/dL.

[0403] 112. A method of treatment according to preferred embodiments 103 through 105, in which the subject is a patient diagnosed with mixed dyslipidemia with TG 300-700 mg/dL and non-HDL-cholesterol equal to or more than 200 mg/dL.

[0404] 113. A method of treatment according to preferred embodiments 103 through 105, in which the subject is a patient diagnosed with mixed dyslipidemia with TG 200-499 mg/dL and LDL-cholesterol equal to or more than 160 mg/dL.

[0405] 114. A method of treatment according to preferred embodiments 103 through 105, in which the subject is a patient diagnosed with mixed dyslipidemia with TG 300-700 mg/dL and LDL-cholesterol equal to or more than 160 mg/dL.

[0406] 115. A method of treatment according to preferred embodiments 103 through 105, in which the subject is a patient diagnosed with mixed dyslipidemia with TG 200-499 mg/dL and non-HDL-cholesterol equal to or more than 160 mg/dL.

[0407] 116. A method of treatment according to preferred embodiments 103 through 105, in which the subject is a patient diagnosed with mixed dyslipidemia with TG 300-700 mg/dL and non-HDL-cholesterol equal to or more than 160 mg/dL.
[0422] 131. A method of treatment according to one of the preferred embodiments 103 through 123, in which the treatment results in significant reduction of blood, serum or plasma apo-B levels.

[0423] 132. A method of treatment according to one of the preferred embodiments 103 through 123, in which the treatment results in significant reduction of blood, serum or plasma apo-C-III levels.

[0424] 133. A method of treatment according to one of the preferred embodiments 103 through 123, in which the treatment results in significant reduction of blood, serum or plasma LPLA2 levels.

[0425] 134. A method of treatment according to one of the preferred embodiments 103 through 123, in which the treatment results in significant reduction of blood, serum or plasma hs-CRP levels.

[0426] 135. A method of treatment according to one of the preferred embodiments 103 through 123, in which the treatment results in significant increase of blood, serum or plasma HDL-cholesterol levels.

[0427] 136. A method of treatment according to one of the preferred embodiments 103 through 123, in which the treatment results in significant increase of blood, serum or plasma apo-A levels.

[0428] 137. A method of treatment according to one of the preferred embodiments 103 through 123, in which the treatment results in significant reduction of the risk of suffering certain cardiovascular events.

[0429] 138. A method of administration or treatment under low fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in a T_{max} of 8 hours or less

[0430] 139. A method of administration or treatment under low fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in a T_{max} of 6 hours or less.

[0431] 140. A method of administration or treatment under low fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in a T_{max} of 5 hours or less.

[0432] 141. A method of administration or treatment under low fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in a T_{max} of 4 hours or less.

[0433] 142. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in a T_{max} of 8 hours or less.

[0434] 143. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in a T_{max} of 6 hours or less.

[0435] 144. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in a T_{max} of 5 hours or less.

[0436] 145. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in a T_{max} of 4 hours or less.

[0437] 146. A method of administration or treatment under low fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA T_{max} less than the EPA+DPA+DHA T_{max} for LOVZA® under the same administration conditions.

[0438] 147. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA T_{max} less than the EPA+DPA+DHA T_{max} for LOVZA® under the same administration conditions.

[0439] 148. A method of administration or treatment under low fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA T_{max} less than the EPA+DPA+DHA T_{max} for AMR101 under the same administration conditions.

[0440] 149. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA T_{max} less than the EPA+DPA+DHA T_{max} for AMR101 under the same administration conditions.

[0441] 150. A method of administration or treatment under low fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an Total Omega-3 FA T_{max} less than the Total Omega-3 FA T_{max} for LOVZA® under the same administration conditions.

[0442] 151. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an Total Omega-3 FA T_{max} less than the Total Omega-3 FA T_{max} for AMR101 under the same administration conditions.

[0443] 152. A method of administration or treatment under low fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an Total Omega-3 FA T_{max} less than the Total Omega-3 FA T_{max} for LOVZA® under the same administration conditions.

[0444] 153. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an Total Omega-3 FA T_{max} less than the Total Omega-3 FA T_{max} for AMR101 under the same administration conditions.

[0445] 154. A method of administration or treatment under high fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA C_{max} or Total Omega-3 FA C_{max} of at least 110% of the EPA+DPA+DHA C_{max} or Total Omega-3 FA C_{max} for LOVZA® under the same administration conditions.

[0446] 155. A method of administration or treatment under high fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA C_{max} or Total Omega-3 FA C_{max} of at least 120% of the EPA+DPA+DHA C_{max} or Total Omega-3 FA C_{max} for LOVZA® under the same administration conditions.

[0447] 156. A method of administration or treatment under high fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA C_{max} or Total Omega-3 FA C_{max} of at least 130% of the EPA+DPA+DHA C_{max} or Total Omega-3 FA C_{max} for LOVZA® under the same administration conditions.

[0448] 157. A method of administration or treatment under high fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA C_{max} or Total Omega-3 FA C_{max} of at least 140% of the EPA+DPA+DHA C_{max} or Total Omega-3 FA C_{max} for LOVZA® under the same administration conditions.

[0449] 158. A method of administration or treatment under high fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA C_{max} or Total Omega-3 FA C_{max} of at least 150% of the EPA+DPA+DHA C_{max} or Total Omega-3 FA C_{max} for LOVZA® under the same administration conditions.
DHA Cmax or Total Omega-3 FA Cmax of at least 150% of the EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax for LOVAZAR® under the same administration conditions.

159. A method of administration or treatment under low fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax of at least 150% of the EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax for LOVAZAR® under the same administration conditions.

160. A method of administration or treatment under low fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax of at least 200% of the EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax for LOVAZAR® under the same administration conditions.

161. A method of administration or treatment under low fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax of at least 300% of the EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax for LOVAZAR® under the same administration conditions.

162. A method of administration or treatment under low fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax of at least 400% of the EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax for LOVAZAR® under the same administration conditions.

163. A method of administration or treatment under low fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax of at least 600% of the EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax for LOVAZAR® under the same administration conditions.

164. A method of administration or treatment under low fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax of at least 500% of the EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax for LOVAZAR® under the same administration conditions.

165. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax of at least 150% of the EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax for LOVAZAR® under the same administration conditions.

166. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax of at least 200% of the EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax for LOVAZAR® under the same administration conditions.

167. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax of at least 300% of the EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax for LOVAZAR® under the same administration conditions.

168. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax of at least 400% of the EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax for LOVAZAR® under the same administration conditions.

169. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax of at least 500% of the EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax for LOVAZAR® under the same administration conditions.

170. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax of at least 600% of the EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax for LOVAZAR® under the same administration conditions.

171. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax of at least 700% of the EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax for LOVAZAR® under the same administration conditions.

172. A method of administration or treatment under high fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA AUC or Total Omega-3 FA AUC of at least 110% of the EPA+DPA+DHA AUC or Total Omega-3 FA AUC for LOVAZAR® under the same administration conditions.

173. A method of administration or treatment under high fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA AUC or Total Omega-3 FA AUC of at least 120% of the EPA+DPA+DHA AUC or Total Omega-3 FA AUC for LOVAZAR® under the same administration conditions.

174. A method of administration or treatment under high fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA AUC or Total Omega-3 FA AUC of at least 130% of the EPA+DPA+DHA AUC or Total Omega-3 FA AUC for LOVAZAR® under the same administration conditions.

175. A method of administration or treatment under high fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA AUC or Total Omega-3 FA AUC of at least 140% of the EPA+DPA+DHA AUC or Total Omega-3 FA AUC for LOVAZAR® under the same administration conditions.

176. A method of administration or treatment under high fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA AUC or Total Omega-3 FA AUC of at least 150% of the EPA+DPA+DHA AUC or Total Omega-3 FA AUC for LOVAZAR® under the same administration conditions.

177. A method of administration or treatment under low fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA AUC or Total Omega-3 FA AUC of at least 150% of the EPA+DPA+DHA AUC or Total Omega-3 FA AUC for LOVAZAR® under the same administration conditions.

178. A method of administration or treatment under low fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA AUC or Total Omega-3 FA AUC of at least 200% of the EPA+DPA+DHA AUC or Total Omega-3 FA AUC for LOVAZAR® under the same administration conditions.

179. A method of administration or treatment under low fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA AUC or Total Omega-3 FA AUC of at least 300% of
the EPA+DPA+DHA AUC or Total Omega-3 FA AUC for LOVAZA® under the same administration conditions

[0471] 180. A method of administration or treatment under low fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA AUC or Total Omega-3 FA AUC of at least 400% of the EPA+DPA+DHA AUC or Total Omega-3 FA AUC for LOVAZA® under the same administration conditions

[0472] 181. A method of administration or treatment under low fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA AUC or Total Omega-3 FA AUC of at least 500% of the EPA+DPA+DHA AUC or Total Omega-3 FA AUC for LOVAZA® under the same administration conditions

[0473] 182. A method of administration or treatment under low fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA AUC or Total Omega-3 FA AUC of at least 600% of the EPA+DPA+DHA AUC or Total Omega-3 FA AUC for LOVAZA® under the same administration conditions

[0474] 183. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA AUC or Total Omega-3 FA AUC of at least 150% of the EPA+DPA+DHA AUC or Total Omega-3 FA AUC for LOVAZA® under the same administration conditions

[0475] 184. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA AUC or Total Omega-3 FA AUC of at least 200% of the EPA+DPA+DHA AUC or Total Omega-3 FA AUC for LOVAZA® under the same administration conditions

[0476] 185. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA AUC or Total Omega-3 FA AUC of at least 300% of the EPA+DPA+DHA AUC or Total Omega-3 FA AUC for LOVAZA® under the same administration conditions

[0477] 186. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA AUC or Total Omega-3 FA AUC of at least 400% of the EPA+DPA+DHA AUC or Total Omega-3 FA AUC for LOVAZA® under the same administration conditions

[0478] 187. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA AUC or Total Omega-3 FA AUC of at least 500% of the EPA+DPA+DHA AUC or Total Omega-3 FA AUC for LOVAZA® under the same administration conditions

[0479] 188. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA AUC or Total Omega-3 FA AUC of at least 600% of the EPA+DPA+DHA AUC or Total Omega-3 FA AUC for LOVAZA® under the same administration conditions

[0480] 189. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA AUC or Total Omega-3 FA AUC of at least 700% of the EPA+DPA+DHA AUC or Total Omega-3 FA AUC for LOVAZA® under the same administration conditions

[0481] 190. A method of administration or treatment under high fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA Cmax or Total Omega-3 FA Cmax of at least 110% of the EPA+DPA Cmax or Total Omega-3 FA Cmax for AMR101 under the same administration conditions

[0482] 191. A method of administration or treatment under high fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA Cmax or Total Omega-3 FA Cmax of at least 120% of the EPA+DPA Cmax or Total Omega-3 FA Cmax for AMR101 under the same administration conditions

[0483] 192. A method of administration or treatment under high fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA Cmax or Total Omega-3 FA Cmax of at least 130% of the EPA+DPA Cmax or Total Omega-3 FA Cmax for AMR101 under the same administration conditions

[0484] 193. A method of administration or treatment under high fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA Cmax or Total Omega-3 FA Cmax of at least 140% of the EPA+DPA Cmax or Total Omega-3 FA Cmax for AMR101 under the same administration conditions

[0485] 194. A method of administration or treatment under high fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA Cmax or Total Omega-3 FA Cmax of at least 150% of the EPA+DPA Cmax or Total Omega-3 FA Cmax for AMR101 under the same administration conditions

[0486] 195. A method of administration or treatment under low fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA Cmax or Total Omega-3 FA Cmax of at least 150% of the EPA+DPA Cmax or Total Omega-3 FA Cmax for AMR101 under the same administration conditions

[0487] 196. A method of administration or treatment under low fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA Cmax or Total Omega-3 FA Cmax of at least 200% of the EPA+DPA Cmax or Total Omega-3 FA Cmax for AMR101 under the same administration conditions

[0488] 197. A method of administration or treatment under low fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA Cmax or Total Omega-3 FA Cmax of at least 300% of the EPA+DPA Cmax or Total Omega-3 FA Cmax for AMR101 under the same administration conditions

[0489] 198. A method of administration or treatment under low fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA Cmax or Total Omega-3 FA Cmax of at least 400% of the EPA+DPA Cmax or Total Omega-3 FA Cmax for AMR101 under the same administration conditions

[0490] 199. A method of administration or treatment under low fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA Cmax or Total Omega-3 FA Cmax of at least 500% of the EPA+DPA Cmax or Total Omega-3 FA Cmax for AMR101 under the same administration conditions

[0491] 200. A method of administration or treatment under low fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA Cmax or Total Omega-3 FA Cmax of at least 600% of the EPA+DPA Cmax or Total Omega-3 FA Cmax for AMR101 under the same administration conditions
201. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA Cmax or Total Omega-3 FA Cmax of at least 150% of the EPA+DPA Cmax or Total Omega-3 FA Cmax for AMR101 under the same administration conditions

202. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA Cmax or Total Omega-3 FA Cmax of at least 200% of the EPA+DPA Cmax or Total Omega-3 FA Cmax for AMR101 under the same administration conditions

203. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA Cmax or Total Omega-3 FA Cmax of at least 300% of the EPA+DPA Cmax or Total Omega-3 FA Cmax for AMR101 under the same administration conditions

204. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA Cmax or Total Omega-3 FA Cmax of at least 400% of the EPA+DPA Cmax or Total Omega-3 FA Cmax for AMR101 under the same administration conditions

205. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA Cmax or Total Omega-3 FA Cmax of at least 500% of the EPA+DPA Cmax or Total Omega-3 FA Cmax for AMR101 under the same administration conditions

206. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA Cmax or Total Omega-3 FA Cmax of at least 600% of the EPA+DPA Cmax or Total Omega-3 FA Cmax for AMR101 under the same administration conditions

207. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA Cmax or Total Omega-3 FA Cmax of at least 700% of the EPA+DPA Cmax or Total Omega-3 FA Cmax for AMR101 under the same administration conditions

208. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA Cmax or Total Omega-3 FA Cmax of at least 800% of the EPA+DPA Cmax or Total Omega-3 FA Cmax for AMR101 under the same administration conditions

209. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA Cmax or Total Omega-3 FA Cmax of at least 900% of the EPA+DPA Cmax or Total Omega-3 FA Cmax for AMR101 under the same administration conditions

210. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA Cmax or Total Omega-3 FA Cmax of at least 100% of the EPA+DPA Cmax or Total Omega-3 FA Cmax for AMR101 under the same administration conditions

211. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA Cmax or Total Omega-3 FA Cmax of at least 110% of the EPA+DPA Cmax or Total Omega-3 FA Cmax for AMR101 under the same administration conditions

212. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA Cmax or Total Omega-3 FA Cmax of at least 120% of the EPA+DPA Cmax or Total Omega-3 FA Cmax for AMR101 under the same administration conditions

213. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA Cmax or Total Omega-3 FA Cmax of at least 130% of the EPA+DPA Cmax or Total Omega-3 FA Cmax for AMR101 under the same administration conditions

214. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA Cmax or Total Omega-3 FA Cmax of at least 140% of the EPA+DPA Cmax or Total Omega-3 FA Cmax for AMR101 under the same administration conditions

215. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA Cmax or Total Omega-3 FA Cmax of at least 150% of the EPA+DPA Cmax or Total Omega-3 FA Cmax for AMR101 under the same administration conditions

216. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA Cmax or Total Omega-3 FA Cmax of at least 160% of the EPA+DPA Cmax or Total Omega-3 FA Cmax for AMR101 under the same administration conditions

217. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA Cmax or Total Omega-3 FA Cmax of at least 170% of the EPA+DPA Cmax or Total Omega-3 FA Cmax for AMR101 under the same administration conditions

218. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA Cmax or Total Omega-3 FA Cmax of at least 180% of the EPA+DPA Cmax or Total Omega-3 FA Cmax for AMR101 under the same administration conditions

219. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA Cmax or Total Omega-3 FA Cmax of at least 190% of the EPA+DPA Cmax or Total Omega-3 FA Cmax for AMR101 under the same administration conditions

220. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA Cmax or Total Omega-3 FA Cmax of at least 200% of the EPA+DPA Cmax or Total Omega-3 FA Cmax for AMR101 under the same administration conditions

221. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA Cmax or Total Omega-3 FA Cmax of at least 210% of the EPA+DPA Cmax or Total Omega-3 FA Cmax for AMR101 under the same administration conditions

222. A method of administration or treatment under fasting conditions according to one of the preferred
embodiments 103 through 105 resulting in an EPA+DPA AUC or Total Omega-3 FA AUC of at least 400% of the EPA+DPA AUC or Total Omega-3 FA AUC for AMR101 under the same administration conditions

[0514] 223. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA AUC or Total Omega-3 FA AUC of at least 500% of the EPA+DPA AUC or Total Omega-3 FA AUC for AMR101 under the same administration conditions

[0515] 224. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA AUC or Total Omega-3 FA AUC of at least 600% of the EPA+DPA AUC or Total Omega-3 FA AUC for AMR101 under the same administration conditions

[0516] 225. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA AUC or Total Omega-3 FA AUC of at least 700% of the EPA+DPA AUC or Total Omega-3 FA AUC for AMR101 under the same administration conditions

[0517] 226. A method of administration or treatment under high fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax of at least 100% of the EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax for EPANOVA™ under the same administration conditions

[0518] 227. A method of administration or treatment under high fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax of at least 105% of the EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax for EPANOVA™ under the same administration conditions

[0519] 228. A method of administration or treatment under high fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax of at least 110% of the EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax for EPANOVA™ under the same administration conditions

[0520] 229. A method of administration or treatment under high fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax of at least 120% of the EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax for EPANOVA™ under the same administration conditions

[0521] 230. A method of administration or treatment under high fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax of at least 130% of the EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax for EPANOVA™ under the same administration conditions

[0522] 231. A method of administration or treatment under high fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax of at least 140% of the EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax for EPANOVA™ under the same administration conditions

[0523] 232. A method of administration or treatment under low fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax of at least 100% of the EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax for EPANOVA™ under the same administration conditions

[0524] 233. A method of administration or treatment under low fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax of at least 105% of the EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax for EPANOVA™ under the same administration conditions

[0525] 234. A method of administration or treatment under low fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax of at least 110% of the EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax for EPANOVA™ under the same administration conditions

[0526] 235. A method of administration or treatment under low fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax of at least 120% of the EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax for EPANOVA™ under the same administration conditions

[0527] 236. A method of administration or treatment under low fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax of at least 130% of the EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax for EPANOVA™ under the same administration conditions

[0528] 237. A method of administration or treatment under low fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax of at least 140% of the EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax for EPANOVA™ under the same administration conditions

[0529] 238. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax of at least 100% of the EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax for EPANOVA™ under the same administration conditions

[0530] 239. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax of at least 105% of the EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax for EPANOVA™ under the same administration conditions

[0531] 240. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax of at least 110% of the EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax for EPANOVA™ under the same administration conditions
241. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax of at least 120% of the EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax for EPANOVA™ under the same administration conditions.

242. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax of at least 130% of the EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax for EPANOVA™ under the same administration conditions.

243. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax of at least 140% of the EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax for EPANOVA™ under the same administration conditions.

244. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax of at least 150% of the EPA+DPA+DHA Cmax or Total Omega-3 FA Cmax for EPANOVA™ under the same administration conditions.

245. A method of administration or treatment under high fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA AUC or Total Omega-3 FA AUC of at least 100% of the EPA+DPA+DHA AUC or Total Omega-3 FA AUC for EPANOVA™ under the same administration conditions.

246. A method of administration or treatment under high fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA AUC or Total Omega-3 FA AUC of at least 105% of the EPA+DPA+DHA AUC or Total Omega-3 FA AUC for EPANOVA™ under the same administration conditions.

247. A method of administration or treatment under high fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA AUC or Total Omega-3 FA AUC of at least 110% of the EPA+DPA+DHA AUC or Total Omega-3 FA AUC for EPANOVA™ under the same administration conditions.

248. A method of administration or treatment under high fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA AUC or Total Omega-3 FA AUC of at least 120% of the EPA+DPA+DHA AUC or Total Omega-3 FA AUC for EPANOVA™ under the same administration conditions.

249. A method of administration or treatment under high fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA AUC or Total Omega-3 FA AUC of at least 130% of the EPA+DPA+DHA AUC or Total Omega-3 FA AUC for EPANOVA™ under the same administration conditions.

250. A method of administration or treatment under high fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA AUC or Total Omega-3 FA AUC of at least 140% of the EPA+DPA+DHA AUC or Total Omega-3 FA AUC for EPANOVA™ under the same administration conditions.

251. A method of administration or treatment under low fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA AUC or Total Omega-3 FA AUC of at least 100% of the EPA+DPA+DHA AUC or Total Omega-3 FA AUC for EPANOVA™ under the same administration conditions.

252. A method of administration or treatment under low fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA AUC or Total Omega-3 FA AUC of at least 105% of the EPA+DPA+DHA AUC or Total Omega-3 FA AUC for EPANOVA™ under the same administration conditions.

253. A method of administration or treatment under low fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA AUC or Total Omega-3 FA AUC of at least 110% of the EPA+DPA+DHA AUC or Total Omega-3 FA AUC for EPANOVA™ under the same administration conditions.

254. A method of administration or treatment under low fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA AUC or Total Omega-3 FA AUC of at least 120% of the EPA+DPA+DHA AUC or Total Omega-3 FA AUC for EPANOVA™ under the same administration conditions.

255. A method of administration or treatment under low fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA AUC or Total Omega-3 FA AUC of at least 130% of the EPA+DPA+DHA AUC or Total Omega-3 FA AUC for EPANOVA™ under the same administration conditions.

256. A method of administration or treatment under low fat meal conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA AUC or Total Omega-3 FA AUC of at least 140% of the EPA+DPA+DHA AUC or Total Omega-3 FA AUC for EPANOVA™ under the same administration conditions.

257. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA AUC or Total Omega-3 FA AUC of at least 100% of the EPA+DPA+DHA AUC or Total Omega-3 FA AUC for EPANOVA™ under the same administration conditions.

258. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA AUC or Total Omega-3 FA AUC of at least 105% of the EPA+DPA+DHA AUC or Total Omega-3 FA AUC for EPANOVA™ under the same administration conditions.

259. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA AUC or Total Omega-3 FA AUC of at least 110% of the EPA+DPA+DHA AUC or Total Omega-3 FA AUC for EPANOVA™ under the same administration conditions.

260. A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA AUC or Total Omega-3 FA AUC of at least 120% of the EPA+DPA+DHA AUC or Total Omega-3 FA AUC for EPANOVA™ under the same administration conditions.
the EPA+DPA+DHA AUC or Total Omega-3 FA AUC for EPANOVA™ under the same administration conditions

Section 553: A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA AUC or Total Omega-3 FA AUC of at least 140% of the EPA+DPA+DHA AUC or Total Omega-3 FA AUC for EPANOVA™ under the same administration conditions

Section 554: A method of administration or treatment under fasting conditions according to one of the preferred embodiments 103 through 105 resulting in an EPA+DPA+DHA AUC or Total Omega-3 FA AUC of at least 150% of the EPA+DPA+DHA AUC or Total Omega-3 FA AUC for EPANOVA™ under the same administration conditions

Section 555: The composition of claim 1, wherein the ratio of EPA to DPA (EPA:DPA) is between 15:1 to 8:1.

Section 556: An orally administrable composition comprising fatty acids, wherein at least 50% by weight of the fatty acids comprise omega-3-pentaenoic acids, salts, esters, or derivatives thereof, wherein the composition comprises eicosapentaenoic acid (EPA), docosapentaenoic acid (DPA), and docosahexaenoic acid (DHA), and wherein the ratio of DHA to EPA (DHA:EPA) is less than 1:20, and wherein the ratio of DHA to DPA (DHA:DPA) is less than 2:1.

What is claimed:

1. A method of increasing a lipid parameter level in a subject from a baseline lipid parameter level, wherein the lipid parameter is selected from the group consisting of HDL cholesterol and apolipoprotein A-I (apo A-I), comprising administering to the subject a composition comprising fatty acids, wherein at least 50% by weight of the fatty acids comprise omega-3 fatty acids, salts, esters, or derivatives thereof, wherein the composition comprises eicosapentaenoic acid (EPA) and docosapentaenoic acid (DPA), and wherein the ratio of docosahexaenoic acid to DHA to EPA (DHA:EPA) is less than 1:10, and wherein the ratio of DHA to DPA (DHA:DPA) is less than 2:1.

2. The method of claim 1, wherein the ratio of DHA:EPA is less than 1:20.

3. The method of claim 1, wherein the ratio of DHA:DPA is less than 1:1.

4. The method of claim 1, wherein the ratio of EPA to DPA (EPA:DPA) is between 30:1 and 1:1.

5. The method of claim 1, wherein the composition comprises DHA in an amount less than 5% of the total amount of fatty acids.

6. The method of claim 1, wherein the composition comprises EPA in an amount between about 80% and about 90% of the total amount of fatty acids.

7. The method of claim 1, wherein the composition comprises DPA in an amount between about 5% and about 15% of the total amount of fatty acids.

8. The method of claim 1, wherein the composition comprises DPA free fatty acid or a salt, ester or derivative of DPA.

9. The method of claim 1, wherein the composition comprises EPA free fatty acid or a salt, ester or derivative of EPA.

10. A method of increasing a lipid parameter level in a subject from a baseline lipid parameter level, wherein the lipid parameter is selected from the group consisting of HDL cholesterol and apolipoprotein A-I (apo A-I), comprising administering to the subject a composition comprising eicosapentaenoic acid (EPA) in an amount between about 70% to about 95% of the total amount of fatty acids and docosapentaenoic acid (DPA), wherein the composition comprises no more than 5% docosahexaenoic acid (DHA) of the total amount of fatty acids, and wherein the ratio of DHA:DPA is 1:1 or lower.

11. The method of claim 10, wherein the composition further comprises eicosapentaenoic acid (EPA) in an amount of at least 1% of the total amount of fatty acids.

12. The method of claim 10, wherein the composition comprises eicosapentaenoic acid (EPA) in an amount between about 80% to about 90% of the total amount of fatty acids.

13. The method of claim 10, wherein the composition comprises eicosapentaenoic acid (EPA) in an amount between about 82% to about 88% of the total amount of fatty acids.

14. The method of claim 10, wherein the composition comprises docosapentaenoic acid (DPA) in amount between about 5% and about 15% of the total amount of fatty acids.

15. The method of claim 10, wherein the composition comprises docosapentaenoic acid (DPA) in amount between about 6% to about 12% of the total amount of fatty acids.

16. The method of claim 10, wherein the composition comprises EPA free fatty acid or a salt, ester or derivative of EPA.

17. The method of claim 10, wherein the composition comprises DPA free fatty acid or a salt, ester or derivative of EPA.

18. A method of increasing a lipid parameter level in a subject from a baseline lipid parameter level, wherein the lipid parameter is selected from the group consisting of HDL cholesterol and apolipoprotein A-I (apo A-I), comprising administering to the subject a composition comprising eicosapentaenoic acid (EPA) in an amount between about 750 mg/g to about 950 mg/g.

19. The method of claim 18, wherein the composition comprises eicosapentaenoic acid (EPA) in an amount between about 800 mg/g to about 900 mg/g.

20. The method of claim 18, wherein the composition comprises eicosapentaenoic acid (EPA) in an amount between about 830 mg/g to about 870 mg/g.

21. The method of claim 18, wherein the composition comprises docosapentaenoic acid (DPA) in an amount between about 60 mg/g to about 120 mg/g.

22. The method of claim 18, wherein the composition comprises docosapentaenoic acid (DPA) in an amount between about 70 mg/g to about 100 mg/g.

23. The method of claim 18, wherein the composition comprises EPA free fatty acid or a salt, ester or derivative of EPA.

24. The method of claim 18, wherein the composition comprises DPA free fatty acid or a salt, ester or derivative of DPA.

25. A method of increasing a lipid parameter level in a subject from a baseline lipid parameter level, wherein the lipid parameter is selected from the group consisting of HDL cholesterol and apolipoprotein A-I (apo A-I), comprising administering to the subject a composition comprising eicosapentaenoic acid (EPA) in a daily dosage amount of between about 1000 mg to about 5000 mg.
and further comprising docosapentaenoic acid (DPA) and
docosahexaenoic acid (DHA),
wherein the composition comprises no more than 5% DHA
of the total amount of fatty acids, and wherein the ratio
of DHA:DPA is 1:1 or lower.

26. The method of claim 25, wherein the composition
comprises eicosapentaenoic acid (EPA) in a daily dosage
amount selected from the group consisting of: about 1735 mg
to about 1855 mg, about 2520 mg to about 2780 mg, and
about 3360 mg to about 3710 mg.

27. The method of claim 25, wherein the composition
comprises eicosapentaenoic acid (EPA) in a daily dosage
amount selected from the group consisting of: about 1750 mg
to about 1950 mg, about 1800 mg to about 2000 mg, about
2650 mg to about 2950 mg, and about 3500 mg to about 3900
mg.

28. The method of claim 25, wherein the composition
comprises eicosapentaenoic acid (EPA) in daily dosage
amount selected from the group consisting of: about 1900 mg
to about 2100 mg, about 2700 mg to about 3300 mg, and
about 3700 mg to about 4300 mg.

29. The method of claim 25, wherein the composition
comprises EPA free fatty acid or a salt, ester or derivative of
EPA.

30. The method of claim 25, wherein the composition
comprises DPA free fatty acid or a salt, ester or derivative of
DPA.
