(54) Title: SYSTEM, PROGRAM PRODUCT AND METHOD FOR PERFORMING AN INCREMENTAL AUTOMATIC CREDIT LINE DRAW USING A PREPAID CARD

(57) Abstract: A consumer is prequalified for a line of credit attached to a prepaid card by a lending institution. The lending institution computer makes available draws to the line of credit line in an authorization stream for a proposed purchase using the prepaid card as payment. When the line of credit is accessed, the prepaid card is loaded with an additional value equal to one or more preselected loan increments so that the prepaid card then has a new amount totaling a previous amount plus the amount of value of the one or more preselected loan increments and so that the new amount exceeds or equals the value of a proposed purchase. Next, a new value for the line of credit balance available is determined, accounting for value loaded onto the prepaid card and a preselected loan advance fee for each loan increment loaded onto the prepaid card.

BACKGROUND

1. Field of Invention

[0002] The present invention relates generally to the financial service and card product industries, and, more particularly, to systems, computer program products, and associated methods of providing an automatic credit line draw in preselected increments for a prepaid card.

2. Background

[0003] Millions of prepaid cards are issued each year in the United States. It is known that many consumers rely primarily on cash and a prepaid card account for their personal finances; these consumers often do not have a traditional checking, savings, or other bank deposit account, and they usually do not write checks. These consumers typically do not have a credit card.

[0004] It is also known to use a prepaid card as payment for a proposed purchase at a merchant. The consumer proposes a purchase and submits the prepaid card to the merchant so that the merchant can request authorization from a prepaid card processor associated with the prepaid card. That is, the merchant checks that funds are available in the account associated with the prepaid card to cover the amount of the proposed purchase. This authorization process also provides an opportunity for security services, such as, for example, determining if the prepaid card has been reported as stolen. If there are insufficient funds available in the account associated with the prepaid card to cover the amount of the proposed purchase, the authorization request is denied by the prepaid card processor, and the proposed purchase is rejected by the merchant. Embarrassed and disappointed, many rejected consumers quickly give up and leave the merchant's premises so that even if a loan or credit were readily available with minimal effort, such as, for example, by placing a short phone call to the prepaid card processor or to a lender, the proposed purchase is abandoned.

[0005] It is known that consumers can receive a loan without having a bank account and that proceeds from a loan can be credited to or posted to a prepaid card. Loans, including, e.g., payday loans, payday advances, and other short-term cash advances, however, involve hassles of applying for and obtaining the loan prior to the consumer having access to the funds. In addition, inherent in requesting a loan is determining the amount of the loan. If the loan amount is too small, the consumer may need to obtain an additional loan, with additional fees; if the loan amount is too large, the consumer will needlessly pay extra interest.

SUMMARY OF INVENTION

[0006] In view of the foregoing, Applicant has recognized one or more sources of many of these problems and provides enhanced embodiments of methods, e.g., computerized methods, of advancing one or more preselected loan increments to a prepaid card, and associated systems and computer program products. According to embodiments of the present invention, a lending institution prequalifies a consumer for a line of credit for a prepaid card responsive to consumer underwriting data and predetermined qualification parameters, makes available draws to the line of credit line in an authorization stream for a proposed purchase using the prepaid card as payment, and loads a prepaid card in preselected loan increments so that the prepaid card then has a new amount that exceeds or equals the value of a proposed purchase. Next, for example, a new value for the line of credit balance available is determined, accounting for value loaded onto the prepaid card and a preselected loan advance fee for each loan increment loaded onto the prepaid card.

[0007] Embodiments of the present invention provide, for example, a computer-implemented method of advancing one or more preselected loan increments to a prepaid card. The computer-implemented method includes initiating consumer engagement of predetermined prepaid card approval and authorizing advancing of one or more preselected loan increments by the consumer upon approval by a lending institution up to a preauthorized total loan value. The preauthorized total loan value represents a maximum amount of value available to the consumer from the lending institution via a line of credit associated with the prepaid card as understood by those skilled in the art. The computer-implemented method also includes using the predetermined prepaid card to propose a purchase of one or more items, determining an amount of value of proposed purchase (including, for example, coupons, discounts, instant rebates, sales tax, or a combination thereof as understood by those skilled in the art), determining an amount of value on the predetermined prepaid card, and determining difference in amount of value of proposed purchase and the amount of value on the predetermined prepaid card. The computer-implemented method includes loading the predetermined prepaid card with an additional value equal to one or more preselected loan increments so that the prepaid card then has a new amount totaling the amount previously on the prepaid card plus the one or more preselected loan increments and so that the new amount exceeds or, alternatively, equals the value of the proposed purchase. The computer-implemented method also includes determining a predetermined loan advance fee for each increment of the one or more increments from the preauthorized total loan value.

[0008] According to other embodiments of the present invention, the consumer initiating engagement of approval can include, for example, the consumer opting in to a program with the lending institution using a written correspondence from the consumer, a consumer selection on a website, a telephone conversation with an interactive voice response unit, a telephone conversation with a customer service representative, a mobile phone, or a combination thereof as understood by those skilled in the art. That is, embodiments of the present invention provide numerous flexible and convenient ways to initiate consumer engagement of predetermined prepaid card approval. A line of credit amount, for example, can be established based on direct deposit and preselected underwriting formula, as understood by those skilled in the art, that use the amount of direct deposits, among other factors, to determine the size of the credit line available.

[0009] In addition, embodiments of the present invention provide, for example, a computer-implemented method of accessing a line of credit with a prepaid card. The computer-implemented method includes a lending institution prequalifying a consumer for a line of credit for a prepaid card responsive to consumer underwriting data and predetermined qualification parameters to thereby convert consumer underwriting data into line of credit data. The computer-implemented method further includes making available draws to the line of credit line in an authorization stream for a proposed purchase using the prepaid card as payment. The line of credit has a total loan value, a preselected loan increment, a preselected loan advance fee associated with each preselected loan increment, and a line of credit balance available. The computer-implemented method also includes loading the prepaid card with an additional value equal to one or more preselected loan increments so that the prepaid card then has a new amount totaling a previous amount of value on the prepaid card plus the amount of value of the one or more preselected loan increments and so that the new amount exceeds or, alternatively, equals the value of a proposed purchase. The computer-implemented method further includes determining a new value for the line of credit balance available. The new value is a previous value for the line of credit balance available minus the value loaded onto the prepaid card and minus fees, as each of the one or more preselected loan increments loaded onto the prepaid card generates a preselected loan advance fee.

[0010] By prequalifying the consumer for the line of credit responsive to consumer underwriting data and predetermined qualification parameters and making draws to the line of credit available in the authorization stream for a purchase using the prepaid card as payment, embodiments of the present invention advantageously allow a consumer to avoid

the planning and hassle associated with determining the amount of a loan prior to proposing a purchase. Previously, a consumer would have to determine the amount of the loan necessary to fund the proposed purchase, then secure the loan, and only then propose the purchase at a merchant using the prepaid card. If the information necessary to determine the amount of the loan exists only at the merchant, multiple trips to the merchant may be required. Under the embodiments of the present invention, however, multiple trips are not required as the amount of the loan is determined, up to the total loan value, in the authorization stream for a proposed purchase using the prepaid card as payment, resulting in fewer rejections of proposed purchases, less embarrassment for consumers, and reduced cost due to fewer abandoned sales as understood by those skilled in the art. Advantageously, under the embodiments of the present invention, the consumer only pays for what is actually drawn.

[0011] By loading the prepaid card in preselected loan increments, embodiments of the present invention advantageously can guarantee a fee structure that is proportional to the amount of credit accessed. By comparison, an overdraft fee charge by a bank for "bounced" check is often larger than the overdraft amount. Instead, the fee structure according to embodiments of the present invention more closely resembles an automated teller machine (ATM) fee from a consumer's point of view as understood by those skilled in the art. In addition, the use of preselected loan increments can often result in value remaining on the prepaid card, allowing for small transactions without generating additional loan fees. For example, after of a load of a preselected loan increment of \$50 and subsequent purchase transaction, the balance on the prepaid card ranges from \$0.00 to \$49.99.

[0012] Embodiments of the present invention provide, for example, a system of advancing one or more preselected loan increments to a prepaid card. The system includes a lending institution computer positioned to manage a line of credit associated with a prepaid card, i.e., to control access to funds from a line of credit associated with a prepaid card; a plurality of merchant computers positioned to determine an amount of value of a proposed purchase of one or more items; a plurality of point-of-sale terminals, each in communication with a merchant computer; and a third computer associated with a customer prepaid card account defining a prepaid card processor. The prepaid card processor is in communication with the lending institution computer and the plurality of acquiring processors of the point-of-sale terminal through an electronic communications network. The prepaid card processor is positioned to process an authorization request for a proposed purchase of one or more items from an acquiring processor of the point-of-sale terminal. The system further includes a

computer program product associated with the lending institution computer as discussed herein.

[0013] Embodiments of the present invention provide, for example, a computer program product associated with the lending institution computer, stored on a tangible computer memory media, and operable on a computer, the computer program product comprising a set of instructions that, when executed by the computer, cause the computer to perform various operations. The operations include prequalifying a consumer for a line of credit for a prepaid card by the lending institution responsive to consumer underwriting data and predetermined qualification parameters to thereby convert consumer underwriting data into line of credit data. The operations further include making available draws to the line of credit line in an authorization stream for a proposed purchase of one or more items using the prepaid card as payment. The proposed purchase data can be, for example, received by the lending institution computer through the electronic communications network from a card reader device associated with a point of sale terminal. The operations further include loading the prepaid card with an additional value equal to one or more preselected loan increments so that the prepaid card then has a new amount totaling a previous amount of value on the prepaid card plus the amount of value of the one or more preselected loan increments and so that the new amount exceeds or, alternatively, equals the value of a proposed purchase to thereby convert line of credit data into a value associated with the prepaid card to thereby fund the proposed purchase. The operations also include determining a new value for the line of credit balance available, in which the new value is a previous value for the line of credit balance available minus a value equal to the one or more preselected loan increments loaded onto the prepaid card and minus a value equal to one or more preselected loan advance fees associated with each of the one or more preselected loan increments loaded onto the prepaid card.

[0014] Additional embodiments of the present invention include a computer program product stored on a tangible computer memory media, operable on a computer, and associated with a prepaid card processor.

[0015] According to another embodiment of the present invention, the financial institution can be a federally-chartered bank subject to federal banking laws and regulations and not subject to state banking laws and regulations. Also, the line of credit program can be bank product so that the line of credit program complies with federal Regulation Z.

[0016] In addition, embodiments of the present invention include systems, program products, and associated methods of advancing one or more preselected loan increments to a prepaid card and accessing a line of credit with a prepaid card as will be understood by those skilled in the art.

BRIEF DESCRIPTION OF DRAWINGS

[0017] So that the manner in which the features and benefits of the invention, as well as others which will become apparent, may be understood in more detail, a more particular description of the invention briefly summarized above may be had by reference to the embodiments thereof which are illustrated in the appended drawings, which form a part of this specification. It is also to be noted, however, that the drawings illustrate only various embodiments of the invention and are therefore not to be considered limiting of the invention's scope as it may include other effective embodiments as well.

DETAILED DESCRIPTION

[0030] The present invention will now be described more fully hereinafter with reference to the accompanying drawings, which illustrate embodiments of the invention. This invention may, however, be embodied in many different forms and should not be construed as limited to the illustrated embodiments set forth herein; rather, these embodiments are provided so that this disclosure will be thorough and complete, and will fully convey the scope of the invention to those skilled in the art. Like numbers refer to like elements throughout.

[0031] As illustrated in Figure 1, embodiments of the present invention include a method, e.g., a computerized method, of advancing one or more preselected loan increments to a prepaid card. The method includes initiating consumer engagement of predetermined prepaid card approval 103. The method further includes authorizing advancing of one or more preselected loan increments by the consumer upon approval by a lending institution up to a preauthorized total loan value 105. The preauthorized total loan value represents a maximum amount of value available to the consumer from the lending institution via a line of credit associated with the prepaid card as understood by those skilled in the art. The method also includes using the predetermined prepaid card to propose a purchase of one or more items 107. The method further includes determining amount of value of proposed purchase of the one or more items 109. According to other embodiments of the present invention, determining amount of value of proposed purchase of the one or more items can include, for example, coupons, discounts, instant rebates, sales tax, or a combination thereof as understood by those skilled in the art. The method also includes determining amount of value on the predetermined prepaid card 111 and determining difference in amount of value of proposed purchase of the one or more items and the amount of value on the predetermined prepaid card upon proposed purchase 113. The method includes loading the predetermined prepaid card with an additional value equal to one or more preselected loan increments so

that the prepaid card then has a new amount totaling the amount previously on the prepaid card plus the one or more preselected loan increments and so that the new amount exceeds or, alternatively, equals the value of the proposed purchase 115. The method also includes determining a predetermined loan advance fee for each increment of the one or more increments from the preauthorized total loan value 117.

[0032] According to other embodiments of the present invention, the consumer initiating engagement of approval can include, for example, the consumer opting in to a program with the lending institution using a written correspondence from the consumer, a consumer selection on a website, a telephone conversation with an interactive voice response unit (IVRU), a telephone conversation with a customer service representative, a mobile phone, or a combination thereof as understood by those skilled in the art. That is, embodiments of the present invention provide numerous flexible and convenient ways to initiate consumer engagement of predetermined prepaid card approval. When launched as an accessible website, for example, the website can provide various software based program product segments, as will be understood by those skilled in the art, from which bank products are accessible or downloadable. The website preferably includes secure site pages or portions, as understood by those skilled in the art, as financial and personal data on or for customers may be provided by a customer. As described herein, the website in an exemplary embodiment includes prepaid card management capabilities as understood by those skilled in the art to enhance qualification of customers and tracking of customer usage data or history. By including this feature, embodiments of other program products, methods, and systems can be enhanced and provided.

[0033] In an embodiment of the present invention involving prequalifying a consumer for a line of credit from a bank or other lending institution, the lending institution can require or define, for example, the following initial qualification parameters for a customer: (1) customer should be a prepaid card customer; (2) customer should provide employment and wage verification through a direct deposit history; (3) customer should authorize bank initiated withdrawals from their prepaid card; and (4) customer should have a history of at least one electronic deposit. In addition, the following on-going criteria, for example, should be met: (1) customer's card account should be in good standing, not overdrawn, cancelled, or in default of the customer agreement; and (2) customer should continue to initiate electronic deposits to the card. The bank or lending institution, for example, can elect to make the account ineligible for a line of credit if an electronic deposit ceases. The bank can have a

dedicated program manager qualify, approve, or authorize a customer or can use program product stored in memory to make sure the criteria or parameters are satisfied or meet certain thresholds as selected by the bank or lending institution.

[0034] For example, as illustrated in Figure 6, a customer C can go on-line through a computer or IVRU 22 in a system 20 to register at a website using a program product according to embodiments of the present invention and launched from a server, e.g., at a loan processor, underwriting organization, bank, lending institution, other financial institution, payroll processing company, or other entity which can provide the line of credit product, among others, as will be understood by those skilled in the art. The form or qualification parameters can be consistent with one or more underwriting organizations or institutions or set/defined by the bank or lending institution.

[0035] As understood by those skilled in the art, a loan, micro-loan, repayment, line of credit, or other type of payment processor, such as provided by First Data Corporation, Total Systems Services, Inc., Fidelity National Information, Inc., or as custom developed by a bank, a financial institution, or other organization, operates to provide a customer interface on a line of credit or micro-loan request (see, e.g., access interface 700 of Figure 7 in the form of a computer display having a graphical user interface) and determines and decides whether a potential or existing customer qualifies for a line of credit product. First Data Corporation, formerly First Data Resources, is a transaction processing company, including prepaid cards, and is headquartered in Greenwood Village, Colorado, as understood by those skilled in the art. With headquarters located in Columbus, Georgia, Total System Services, Inc. provides electronic payment services to financial institutions and companies, including consumer-finance, credit, debit, healthcare, loyalty, prepaid, chip and mobile payments, as understood by those skilled in the art. Headquartered in Jacksonville, Florida, Fidelity National Information, Inc. provides core processing for financial institutions, including card issuer, transaction processing, and outsourcing services to financial institutions and retailers, as understood by those skilled in the art. The line of credit or loan processor 319, for example, can be outsourced by a bank if desired, and numerous different loan processors or entities that handle this function can be used as well (see, e.g., Figure 3 with computer server 319 handling the payment processor and interface access roles for customer lines of credit 321, for example). If the customer qualifies, the credentials can be passed to a bank computer 307 or other financial institution computer, and then a flag, code, notation, or other identifier can be associated with a customer's profile in a database 308 so that when the customer desires to

access the line of credit, e.g., through a customer purchase transaction using the prepaid card, the process acknowledges the identifier to then allow incremental micro-loans on the line of credit to be granted as described herein. Notably, often a loan or other type of payment processor is card processor specific, and in this instance, a dedicated card processor (see, e.g., prepaid card processor 315 in Figure 3, and this processor likewise can be associated with computers and have a customer prepaid card account 317 associated with or processed thereby as understood by those skilled in the art) can be used, but also as shown in Figure 6 and described further in U.S. Provisional Patent Application Serial No. 61/029,975 titled "Methods To Advance Loan Proceeds on Prepaid Cards, Associated Systems and Computer Program Products" filed on February 20, 2008 and incorporated herein by reference methods can be used as well to handle card interface to a variety of card processors, including, e.g., Metavante Corporation ("Metavante") of Milwaukee, Wisconsin, as understood by those skilled in the art.

[0036] The customer transaction using a prepaid card, for example, can then cause the request for the loan advance through the line of credit processor 30 or other payment processor. The credit processor 30 then posts notification of the micro-loan request through an application program interface (API) to post the loan advance in real time through an API Router 32 as understood by those skilled in the art. The API Router 32 passes the request through a security firewall 35 which passes the request through the API to a card processor 42 and particular processor API 44, such as, Metavante. The request data can be compared to flat files 46, 60, 70, e.g., data files that have no structural relationship as understood by those skilled in the art, or flat files database so that the bank or institution reconciles the loan transaction with the customer's line of credit or other account 62. Some card processors, for example, provide additional processor interfaces or allow development of additional processor interfaces, as understood by those skilled in the art, (see, e.g., API to Program Manager 52). Program manager operations, for example, can be provided by various financial solution/program management companies, such as AccountNow of San Ramon, California, as understood by those skilled in the art. A program manager 54, a card processor API 56, and a card processor 58 can be used by the credit processor or other payment processor for a customer transaction as understood by those skilled in the art.

[0037] The following example illustrates an embodiment of the present invention. See also Figure 11. A consumer initiates engagement through a phone call with a customer service representative and receives approval by the lending institution for a line of credit for a

prepaid card with preselected loan increments of \$20 with a \$2.50 fee per increment. The consumer proposes to purchase items with a value of \$42, but only has a prepaid card balance of \$21. The consumer, however, also has \$60 available on the line of credit, with an outstanding balance of \$0. When the consumer proposes the purchase, the amount of value of the proposed purchase is determined to be \$42 (as this example assumes no coupons, discounts, instant rebates, or sales tax for illustrative purposes). The amount of value on the prepaid card is determined to be \$21. Then the difference is determined to be \$21. Next, two (2) preselected increments of \$20 each, for a total value of \$40, are loaded onto the prepaid card so that the prepaid card then has a new amount, in this example \$61, totaling the amount previously on the prepaid card (\$21) plus the one or more preselected loan increments ($2 \times \$20 = \40) and so that the new amount exceeds or, alternatively, equals the value of the proposed purchase ($\$61 \geq \42). The purchase is transacted, and the prepaid card balance after the purchase is \$19 ($\$61 - \$42 = \19). The loan fee is determined to be \$5 ($2 \times \$2.50 = \5). The line of credit balance outstanding is now \$45, which is calculated as a previous balance (\$0) plus the value of the preselected increments loaded onto the prepaid card (\$40) and the value of the loan fee (\$5). Therefore, there remains \$15 available on the line of credit ($\$60 - 2 \times \$20 - 2 \times \$2.50 = \15).

[0038] In other embodiments of the present invention, the lending institution can make available only a part of the preauthorized total loan value available for loading onto the prepaid card, responsive to a consumer determination, so that the consumer retains maximum control. For example, the consumer determines to make available only \$75 of the preauthorized total loan value, of say \$200. The amount of value of the proposed purchase is determined to be \$98; the amount of value on the prepaid card is determined to be \$20; and the difference is determined to be \$78. Because the difference is greater than the amount available for loading onto the prepaid card, authorization for the proposed purchase is denied, and the proposed purchase is rejected.

[0039] As understood by those skilled in the art, by loading the prepaid card only in preselected loan increments, embodiments of the present invention advantageously can guarantee a fee structure that is proportional to the amount of credit accessed. By comparison, an overdraft fee charge by a bank for "bounced" check is often by larger than the overdraft amount. Instead, the fee structure according to embodiments of the present invention more closely resembles an automated teller machine (ATM) fee. In addition, the use of preselected loan increments can often result in value remaining on the prepaid card,

allowing for small transactions without generating additional loan fees. For example, after of a load of a preselected loan increment of \$50 and subsequent purchase transaction, the balance on the prepaid card ranges from \$0.00 to \$49.99.

[0040] According to another embodiment of the present invention, the financial institution can be a federally-chartered bank subject to federal banking laws and regulations and not subject to state banking laws and regulations. Therefore, the federally-chartered financial institution enjoys rate preemption; that is, state licensing requirements, as well as regulations in many states that limit lending interest rates, are preempted and do not apply to the federally-chartered financial institution. As understood by those skilled in the art, a federally-chartered financial institution can operate in every state with a consistent implementation nationally rather than a state-by-state approach, can provide consumers with Regulation Z protection, and can charge any loan or interest rate for the gap filling loans or immediate financing loans without regard to state law.

[0041] According to another embodiment of the present invention, the lending institution can adjust the preauthorized total loan value and repayment terms based on the performance of the consumer. That is, a consumer with good repayment history can typically earn access to a larger line of credit.

[0042] As illustrated in Figure 2, embodiments of the present invention include a computer-implemented method of accessing a line of credit with a prepaid card. The computer-implemented method includes prequalifying a consumer for a line of credit for a prepaid card by a lending institution 203 responsive to consumer underwriting data and predetermined qualification parameters to thereby convert consumer underwriting data into line of credit data. The line of credit has a total loan value, a preselected loan increment, a preselected loan advance fee associated with each preselected loan increment, and a line of credit balance available. The computer-implemented method also includes making available draws to the line of credit line in an authorization stream for a proposed purchase of one or more items using the prepaid card as payment when an amount of value of the proposed purchase of the one or more items is greater than an amount of value on the prepaid card 205. The proposed purchase data can be, for example, received by the lending institution computer through the electronic communications network from a card reader device associated with a point of sale terminal. The computer-implemented method further includes loading the prepaid card with an additional value equal to one or more preselected loan increments so that the prepaid card then has a new amount totaling a previous amount of value on the prepaid card plus the

amount of value of the one or more preselected loan increments and so that the new amount exceeds or, alternatively, equals the value of a proposed purchase 207 to thereby convert line of credit data into a value associated with the prepaid card to thereby fund the proposed purchase. The computer-implemented method also includes determining a new value for the line of credit balance available, the new value being a previous value for the line of credit balance available minus a value equal to the one or more preselected loan increments loaded onto the prepaid card and minus a value equal to one or more preselected loan advance fees associated with each of the one or more preselected loan increments loaded onto the prepaid card 209.

[0043] As understood by those skilled in the art, by prequalifying the consumer for the line of credit and making draws to the line of credit available in the authorization stream for a purchase using the prepaid card as payment, embodiments of the present invention advantageously allow a consumer to avoid the planning and hassle associated with determining the amount of a loan prior to proposing a purchase. Previously, a consumer would have to determine the amount of the loan necessary to fund the proposed purchase, then secure the loan, and only then propose the purchase at a merchant using the prepaid card. If the information necessary to determine the amount of the loan exists only at the merchant, multiple trips to the merchant may be required. Under the embodiments of the present invention, however, multiple trips are not required as the amount of the loan is determined, up to the total loan value, in the authorization stream for a proposed purchase using the prepaid card as payment, resulting in fewer rejections of proposed purchases, less embarrassment for consumers, and reduced cost due to fewer abandoned sales as understood by those skilled in the art. Advantageously, under the embodiments of the present invention, the consumer only pays for what is actually drawn.

[0044] As illustrated in Figure 3, embodiments of the present invention include a system of advancing one or more preselected loan increments to a prepaid card. The system 300 includes a first computer associated with a lending institution defining a lending institution computer 307. The lending institution computer 307 can include, for example, input-output I/O devices 306A; one or more processors 306B; memory 306C, such as, computer readable media; and a display 306D. The memory 306C of the lending institution computer 307 can include a computer program product 400 as described herein and can include, for example, one or more databases containing account data files 308. The lending institution computer 307 is positioned to manage a line of credit associated with a prepaid card, i.e., to control

access to funds from a line of credit associated with a prepaid card. The system 300 also includes a plurality of second computers associated with a plurality of merchants 311 defining a merchant computer 313. Each merchant computer 311 can include, for example, input-output I/O devices 314A; one or more processors 314B; and memory 314C, such as, computer readable media. Each merchant computer 313 is positioned to determine an amount of value of a proposed purchase of one or more items. The system 300 further includes a plurality of point-of-sale terminals 312 associated with the plurality of merchants 311. Each point-of-sale terminal 312 has a processor defining an acquiring processor and is in communication with a merchant computer 313. Prepaid card data can be read by swiping the card through a slot 310C past a reading head of a point-of-sale terminal 312. The point-of-sale terminal 312 can also include a display 310A and input/output (I/O) devices 310B, e.g., a keypad. The system 300 can also include a third computer associated with a customer prepaid card account 317 defining a prepaid card processor 315. The prepaid card processor 315 is in communication with the lending institution computer 307 and the plurality of acquiring processors of the point-of-sale terminal 312 through an electronic communications network 309. The prepaid card processor 315 is positioned to process an authorization request for a proposed purchase of one or more items from an acquiring processor of the point-of-sale terminal 312. The system 300 can also include a plurality of customer computers 303. Each customer computer 303 can include, for example, input-output I/O devices 304A; one or more processors 304B; memory 304C, such as, computer readable media; and a display 304D. The memory 304C of the customer computer 303 can include an Internet browser 304E, a computer application used for accessing sites or information on a network, as understood by those skilled in the art. The system 300 further includes a computer program product associated with the lending institution computer 307, stored on a tangible computer memory media, and operable on a computer, the computer program product comprising a set of instructions that, when executed by the computer, cause the computer to perform various operations as discussed herein.

[0045] As illustrated in Figure 4, embodiments of the present invention include a computer program product 400 associated with the lending institution computer 402, stored on a tangible computer memory media 401, and operable on a computer, the computer program product 400 comprising a set of instructions 403 that, when executed by the computer, cause the computer to perform various operations. The operations include prequalifying a consumer for a line of credit for a prepaid card by the lending institution 405 responsive to

consumer underwriting data and predetermined qualification parameters to thereby convert consumer underwriting data into line of credit data. The line of credit has a total loan value, a preselected loan increment, a preselected loan advance fee associated with each preselected loan increment, and a line of credit balance available. The operations also include making available draws to the line of credit line in an authorization stream for a proposed purchase of one or more items using the prepaid card as payment when an amount of value of the proposed purchase of the one or more items is greater than an amount of value on the prepaid card 407. The proposed purchase data can be, for example, received by the lending institution computer through the electronic communications network from a card reader device associated with a point of sale terminal. The operations further include loading the prepaid card with an additional value equal to one or more preselected loan increments so that the prepaid card then has a new amount totaling a previous amount of value on the prepaid card plus the amount of value of the one or more preselected loan increments and so that the new amount exceeds or, alternatively, equals the value of a proposed purchase 409 to thereby convert line of credit data into a value associated with the prepaid card to thereby fund the proposed purchase. The operations also include determining a new value for the line of credit balance available, in which the new value is a previous value for the line of credit balance available minus a value equal to the one or more preselected loan increments loaded onto the prepaid card and minus a value equal to one or more preselected loan advance fees associated with each of the one or more preselected loan increments loaded onto the prepaid card 411.

[0046] As illustrated in Figure 5, embodiments of the present invention include a computer program product 500 stored on a tangible computer memory media 501, operable on a computer, and associated with a prepaid card processor 502, the computer program product 500 comprising a set of instructions 503 that, when executed by the computer, cause the computer to perform various operations. The operations include receiving information, e.g., data, for a line of credit for a prepaid card from a lending institution computer by a prepaid card processor 505. The information, e.g., data, can include a prequalification status responsive to consumer underwriting data and predetermined qualification parameters, a total loan value, a preselected loan increment, a preselected loan advance fee associated with each preselected loan increment, a line of credit balance available, and a combination thereof. The operations also include making available draws to the line of credit line on behalf of the lending institution computer in an authorization stream for a proposed purchase of one or

more items using the prepaid card as payment when an amount of value of the proposed purchase of the one or more items is greater than an amount of value on the prepaid card 507. The proposed purchase data can be, for example, received by prepaid card processor through the electronic communications network from a card reader device associated with a point of sale terminal. The operations further include loading the prepaid card with an additional value equal to one or more preselected loan increments so that the prepaid card then has a new amount totaling a previous amount of value on the prepaid card plus the amount of value of the one or more preselected loan increments and so that the new amount exceeds or, alternatively, equals the value of a proposed purchase 509 to thereby convert line of credit data into a value associated with the prepaid card to thereby fund the proposed purchase. The operations also include notifying the lending institution of the loading of the prepaid card so that the line of credit balances on the lending institution computer and the prepaid card processor are kept in sync 511.

[0047] According to embodiments of the present invention, the prepaid card processor can communicate with the lending institution computer in real-time, near real-time, in a batch process, daily, or periodically, as understood by those skilled in the art, to assess if a line of credit is available and if a draw is available, or to update line of credit balances.

[0048] Other embodiments of the present invention, for example, can include a stand-in account at the prepaid card processor associated with the line-of-credit or the lending institution to facilitate loading the prepaid card as will be understood by those skilled in the art. A stand-in account allows a consumer to have transactions approved even when the primary authorization system is technically unavailable. This is achieved by one processor using data and instructions provided to it by the authorizing processor to "stand in" and approve or decline transactions on the authorizing processor's behalf if the authorizing processor system is unavailable for real-time processing.

[0049] In other embodiments of the present invention, rather than loading the prepaid card in preselected loan increments with each increment associated with a preselected loan advance fee, the prepaid card can be loaded through a draw for an exact amount of purchase at a defined rate. In such embodiment, a standard consumer draw on the line of credit could be in \$20 increments, but when an auto-draw is initiated by a purchase at a point of sale or an automated teller machine (ATM) withdrawal, the exact amount of funds needed to be borrowed will be advanced. As a result, for example, the fee amount assessed for a \$20 draw

might be \$2.50, while if the amount borrowed on an auto-draw is only \$10 the fee would be assessed ratably and would be \$1.25 for the borrowing.

[0050] Embodiments of the present invention can, for example, include repayment of at least portions of the line of credit responsive to a subsequent direct deposit received for customer's benefit by the bank so that the repayment of the at least portions of the line of credit is deducted from the subsequent direct deposit. That is, loans made under a line of credit can be repaid out of the proceeds of a direct deposit. Recurring direct deposits include, for example, employer payroll funds, federal or state government electronic benefits payments, annuities, dividends, interest payments, lottery winnings, royalty payments, and other streams of payments as understood by one skilled in the art.

[0051] Embodiments of systems, program products, and methods of the present invention can include, for example, for substantially all programs if desired, features such as any repayment of draws on the line of credit can be automatically collected from the next electronic deposit regardless of payment source. As payments are received, fees also can be paid first then the payment applied to the oldest outstanding draw amount. When payments are received, total available line limit is restored by the payment amount. If funds from the electronic deposit are not sufficient to cover the outstanding balance, a partial repayment can be made in the full amount of the electronic deposit resulting in an unpaid balance on the line. Repayment of the remaining unpaid balance can be taken from subsequent electronic deposits until the line has been paid in full. Other cash equivalent repayment options also can be accepted and processed by a line of credit processor as understood by those skilled in the art.

[0052] It will also be understood by those skilled in the art that embodiments of the line of credit product or program product, for example, can be associated with a payroll processing company that processes direct deposits (see, e.g., Figure 8). Embodiments of the program product and methods can be added to product or service offerings by the payroll processing company 810 so that it can be offered to their customers independent of bank by taking money or funds out at the source 810, e.g., as the payroll file is prepared 820 and before the direct deposit is even originated, or loaded onto a prepaid card, for example. These embodiments can also allow the processing company 810 to have more direct information on employment history. A payroll processing company 810 can also use a loan processing system 840, loan processor, or other payment processor either within their facilities or as an outsourcing entity to allow the provision of enrolling and providing customer payroll information 824 and for tracking and reconciling repayment or updated customer payroll

information with repayments pulled 844. The payroll can be sent, loaded or processed by a payroll processor 830 for ACH transmittal, check generation, or card loading/providing, for example (see, e.g., Figure 8). These embodiments of associated methods, for example, can include providing a prepaid card to an employee who gets direct deposit to a demand deposit accounts (DDA) whereby the consumer borrow funds from the service/product and has those funds direct deposited onto the card instantly and repaid by pulling funds from the direct deposit file prior to sending to the other bank account to repay the amount withdrawn. An example of and more details on how repayment can be accomplished is illustrated in U.S. Provisional Patent Application Serial No. 61/016,213 titled "Transfer Account Systems, Computer Program Products, and Associated Methods" filed on December 21, 2007 which is incorporated herein by reference in its entirety.

[0053] Additionally, along these lines, any repayment of a line supersedes repayment of a negative balance on a card due to force posts or settlement transactions that cause the card to go negative. Any monies remaining after a payment is received can be credited to the prepaid card account. If payment takes the card balance to \$0, any transactions attempted with the card can be declined. Those transactions can be subject to any related decline fees. Repayment of a draw, for example, should not be taken from the principal balance on a card. That is, if a card balance is positive prior to a draw, only when the next electronic deposit is initiated to the card will repayment be triggered. If a draw is not paid within the preselected time period, preferably days, e.g., 35 day timeframe, any amount owed can be taken from the principal balance on a card.

[0054] Embodiments of the present invention provide, for example, a program product 900 associated with a bank or other financial or lending institution implemented in modules or components, as illustrated in Figure 9. An underwriting analyzer and interface component 901 of a bank program product 900 can receive underwriting information, e.g., data, and make the determination whether to offer a line of credit or other product to the customer as understood by those skilled in the art. That is, an underwriting analyzer and interface component 901 can respond to a consumer initiated engagement and can determine whether to prequalify the consumer for a line of credit. Underwriting data can include whether a customer is an existing prepaid card customer 911; a direct deposit history 912; a withdrawal authorization or approval, from an enrollment in a line of credit program; a history of at least one electronic deposit 914; an account being in good standing, not overdrawn, cancelled, or in default 915; continued direct deposit 916; and other data as understood by those skilled in

the art. In addition, a loan advance and fee manager module 903 deals with determining whether to advance funds 921, providing loans in predetermined increments 922, calculating available credit 923, managing repayments 924, and other associated tasks as understood by those skilled in the art. Other architectures and organizations will be understood by those skilled in the art to be included within the embodiments of the present invention. Program products can be implemented in a variety of software and programming languages, including without limitation hypertext markup language ("HTML"), Java, C, C++, XML, and others as understood by those skilled in the art.

[0055] As illustrated in Figures 10A, 10B, and 3, embodiments of the present invention can include, for example, a prepaid card 950 and a point-of-sale terminal device 312, e.g., a card reader. As understood by those skilled in the art, a prepaid card can have indicia 952, e.g., logos, slogans, source identifiers, of a sponsoring bank and of a prepaid card processor; a serial number 954; and expiration date 956. The structures of various types of specific cards, e.g., magnetic stripe 958, type of material, are well known to those skilled in the art and can be used with embodiments of the present invention. Typically, a card 950 is formed from plastic and has a magnetic stripe 958 affixed to the plastic through an application of heat. Those skilled in the art will understand that other embodiments besides a magnetic stripe can include radio frequency identification devices (RFID), smart chips, bar codes, and other similar devices. Embodiments of the present invention can include forming cards or receiving cards already formed. The magnetic stripe card 950 can store information, or data, e.g., account information, by modifying the magnetism of particles on the magnetic stripe 958 on the card. The information can be read by swiping the card through a slot 310C past a reading head of a card reader device 312, e.g., point-of-sale hardware. The point-of-sale terminal 312 can include a display 310A and input/output (I/O) devices 310B, e.g., a keypad. Typically, there are two tracks of information on a magnetic card 950 used for financial transactions, known as tracks 1 and 2. In addition, a third track, known as track 3, can be available for magnetic stripe cards. Tracks 1 and 3, if available, are typically recorded at 210 bits per inch, while track 2 typically has a recording density of 75 bits per inch. Track 2, as typically encoded, was developed by the American Bankers Association (ABA) provides for 37 numeric data characters, including up to 19 digits for a primary account number (including a Bank Identification Number as understood by those skilled in the art), an expiration date, a service code, and discretionary verification data, such as, a Personal Identification Number, or PIN. The information, e.g., data, on the card can be used, for example, to facilitate a

transaction. For example, when the prepaid card 950 is swiped through a slot 310C, the data on the magnetic stripe 958 is read and processed by the point-of-sale terminal 312, converting data stored in the magnetic particles on the card into data associated with readers 312 and a lending institution computer 307. The point-of-sale terminal 312 can then communicate through an electronic communications network 309 to, for example, a prepaid card processor 315 or a lending institution computer 307. The point-of-sale terminal 312, e.g., card reader, communicates the account information, e.g., data, as read from the card, as well as other data, such as, an amount of a proposed transaction for approval from the merchant computer 313. The other data, for example, can be entered by merchant personnel (e.g., an amount of the transaction), the consumer (e.g., a PIN, or security code), or bank personnel (e.g., a security approval). The prepaid card processor 315 or a lending institution computer 307 can then utilize the account information and other data to authorize or reject a purchase by, for example, determining whether a proposed purchase by the consumer is less than an amount of funds remaining on the card. Moreover, optional security measures, including, for example, a mismatch between a PIN supplied by the consumer and a PIN stored on the card or in a database, can result in the rejection of a proposed transaction. The prepaid card processor 315 or lending institution computer 307 then perform certain functions, including responding to the authorization request so that a point-of-sale displays an indication of approval or rejection, resulting in a visual depiction to a merchant of the approval or rejection of the proposed transaction. Also, prepaid card processor 315 can, for example, write data to a database to record a purchase or other transaction (including advancing a loan from the line of credit), to debit available funds from an account associated with the prepaid card 950, and to credit directly or indirectly a merchant for a purchase. In addition to purchase authorization, embodiments of the present invention also can include customer inquiries into recent transactions or a balance inquiry, i.e., an amount of remaining value associated with the prepaid card.

[0056] As illustrated in Figure 11, embodiments of the present invention include, for example, providing data associated with a prepaid card account as a visual representation of account activity. For example, a customer computer 303, through an Internet Browser 304E, (see Figure 3) can display on a display 304D an account activity statement 712 for a customer-specific account 713, or set of accounts, with each transaction including, for example, a date 714A, a description 714B, a amount credited to the account 714C, an amount debited from the account 714D, a resulting card balance 714E, a line of credit amount

available 714F, and a line of credit outstanding balance 714G, or other such data as understood by those skilled in the art. For example, the visual representation can include a card balance inquiry 715A. For example, the visual representation can include loading the prepaid card with an additional value equal to one or more preselected loan increments so that the prepaid card then has a new amount totaling a previous amount of value on the prepaid card plus the amount of value of the one or more preselected loan increments and so that the new amount exceeds or, alternatively, equals the value of a proposed purchase 715B. For example, the visual representation can include a purchase of goods 715C, wherein data associated with a prepaid card representing an amount of value on the prepaid card is modified in an exchange for products, including goods or services. In addition, the visual representation can include a direct deposit 715D and also a loan repayment from direct deposit funds relatively instantaneously (or prior to) with the direct deposit funds being made available in the consumer's account 715E. In other embodiments, loading the prepaid card 715B and an associated purchase of goods 715C can be represented as a single transaction; likewise, the direct deposit 715D and an associated loan repayment 715E can be represented as a single transaction. In addition, the visual representation can include an increase in a total loan value 715F, i.e., an amount available from the line of credit, responsive to consumer performance data.

[0057] As illustrated in Figure 12, embodiments of the present invention include a computer-implemented method of accessing a line of credit with a prepaid card. The computer-implemented method includes receiving data for a line of credit for a prepaid card from a lending institution computer by a prepaid card processor 253. The data can include, for example, a prequalification status responsive to consumer underwriting data and predetermined qualification parameters, a total loan value, a preselected loan increment, a preselected loan advance fee associated with each preselected loan increment, and a line of credit balance available. The computer-implemented method also includes making available draws to the line of credit line on behalf of the lending institution computer in an authorization stream for a proposed purchase of one or more items using the prepaid card as payment when an amount of value of the proposed purchase of the one or more items is greater than an amount of value on the prepaid card 255. The proposed purchase data can, for example, be received by the lending institution computer or the payroll processor through the electronic communications network and can originate from a card reader device associated with a point of sale terminal. The computer-implemented method further includes

loading the prepaid card with an additional value equal to one or more preselected loan increments so that the prepaid card then has a new amount totaling a previous amount of value on the prepaid card plus the amount of value of the one or more preselected loan increments and so that the new amount exceeds or, alternatively, equals the value of a proposed purchase 257 to thereby convert line of credit data into a value associated with the prepaid card to thereby fund the proposed purchase. The computer-implemented method also includes notifying the lending institution of the loading of the prepaid card so that the line of credit balances on the lending institution computer and the prepaid card processor are kept in sync 259.

[0058] A person having ordinary skill in the art will recognize that various types of memory are readable by a computer such as described herein, e.g., lending institution, prepaid processor, or other computers with embodiments of the present invention. Examples of computer readable media include but are not limited to: nonvolatile, hard-coded type media such as read only memories (ROMs), CD-ROMs, and DVD-ROMs, or erasable, electrically programmable read only memories (EEPROMs), recordable type media such as floppy disks, hard disk drives, CD-R/RWs, DVD-RAMs, DVD-R/RWs, DVD+R/RWs, flash drives, memory sticks, and other newer types of memories, and transmission type media such as digital and analog communication links. For example, such media can include operating instructions, as well as instructions related to the system and the method steps described above and can operate on a computer. It will be understood by those skilled in the art that such media can be at other locations instead of or in addition to the lending institution computer to store program products, e.g., including software, thereon.

[0059] This application claims priority to and the benefit of: U.S. Provisional Patent Application Serial No. 61/042,612, by Ahlers et al., titled "System, Program Product, and Associated Methods to Authorize Draw for Micro-Credit Attached to a Prepaid Card" filed on April 4, 2008, incorporated herein by reference in its entirety. [0060] Many modifications and other embodiments of the invention will come to the mind of one skilled in the art having the benefit of the teachings presented in the foregoing descriptions and the associated drawings. Therefore, it is to be understood that the invention is not to be limited to the illustrated embodiments disclosed, and that modifications and other embodiments are intended to be included within the scope of the appended claims.

CLAIMS

THAT CLAIMED IS:

1. A system for accessing a line of credit with a prepaid card, the system comprising:

a computer associated with a lending institution defining a lending institution computer, the lending institution computer having memory, being associated with the electronic communications network, and being positioned to control access to funds from a line of credit associated with a prepaid card; and

a computer program product associated with the lending institution computer, stored on a tangible computer memory media, and operable on a computer, the computer program product comprising a set of instructions that, when executed by the computer, cause the computer to perform the operations of:

prequalifying a consumer for a line of credit for a prepaid card by the lending institution computer responsive to consumer underwriting data and predetermined qualification parameters to thereby convert consumer underwriting data into line of credit data, the line of credit having a total loan value, a preselected loan increment, a preselected loan advance fee associated with each preselected loan increment, and a line of credit balance available,

making available draws to the line of credit line in an authorization stream for a proposed purchase of one or more items using the prepaid card as payment when an amount of value of the proposed purchase of the one or more items is greater than an amount of value on the prepaid card, proposed purchase data being received by the lending institution computer through the electronic communications network from a card reader device associated with a point of sale terminal,

loading the prepaid card with an additional value equal to one or more preselected loan increments so that the prepaid card then has a new amount totaling a previous amount of value on the prepaid card plus the amount of value of the one or more preselected loan increments and so that the new amount exceeds or, alternatively, equals the value of a proposed purchase to thereby convert line of credit data into a value associated with the prepaid card to thereby fund the proposed purchase, and

determining a new value for the line of credit balance available, the new value being a previous value for the line of credit balance available minus a value equal to the one or more preselected loan increments loaded onto the prepaid card and minus a

value equal to one or more preselected loan advance fees associated with each of the one or more preselected loan increments loaded onto the prepaid card.

2. A system of Claim 1, wherein the operations further include:
receiving data by the lending institution computer from a card reader device associated with a point of sale terminal responsive to the card reader device reading data from the prepaid card and modifying the data to include point-of-sale data to communicate with the lending institution computer.
3. A system of Claim 1, wherein the operations further include:
displaying an account activity statement, including a purchase, on a display device to thereby provide a visual representation of a value associated with the prepaid card being exchanged for goods.
4. A system of Claim 1, wherein the operation of making available draws to the line of credit line in an authorization stream for a proposed purchase of one or more items using the prepaid card as payment includes making available only a part of the preauthorized total loan value available, responsive to a consumer determination, so that the consumer retains maximum control.
5. A system of Claim 1, wherein loan repayment occurs from direct deposit funds prior to or relatively instantaneously with the direct deposit funds being made available in the consumer's account.
6. A system of Claim 1, wherein the amount of value of the proposed purchase of the one or more items includes adjustments for one or more of the following: coupons, discounts, instant rebates, and sales tax; wherein the lending institution is a federally-chartered bank subject to federal banking laws and regulations and not subject to state banking laws and regulations; and wherein the line of credit is bank product so that the line of credit complies with federal Regulation Z.
7. A system of Claim 1, wherein the lending institution computer is further positioned to adjust the prequalified total loan value and repayment terms responsive to consumer performance data.

8. A computer program product, stored on a tangible computer memory media, operable on a computer, the computer program product comprising a set of instructions that, when executed by the computer, cause the computer to perform the operations of:

prequalifying a consumer for a line of credit for a prepaid card by the lending institution computer responsive to consumer underwriting data and predetermined qualification parameters to thereby convert consumer underwriting data into line of credit data, the line of credit having a total loan value, a preselected loan increment, a preselected loan advance fee associated with each preselected loan increment, and a line of credit balance available;

making available draws to the line of credit line in an authorization stream for a proposed purchase of one or more items using the prepaid card as payment when an amount of value of the proposed purchase of the one or more items is greater than an amount of value on the prepaid card, proposed purchase data being received by the lending institution computer through the electronic communications network from a card reader device associated with a point of sale terminal,

loading the prepaid card with an additional value equal to one or more preselected loan increments so that the prepaid card then has a new amount totaling a previous amount of value on the prepaid card plus the amount of value of the one or more preselected loan increments and so that the new amount exceeds or, alternatively, equals the value of a proposed purchase to thereby convert line of credit data into a value associated with the prepaid card to thereby fund the proposed purchase; and

determining a new value for the line of credit balance available, the new value being a previous value for the line of credit balance available minus a value equal to the one or more preselected loan increments loaded onto the prepaid card and minus a value equal to one or more preselected loan advance fees associated with each of the one or more preselected loan increments loaded onto the prepaid card.

9. A computer program product of Claim 8, wherein the operations further include:

receiving data by the lending institution computer from a card reader device associated with a point of sale terminal responsive to the card reader device reading data from the prepaid card and modifying the data to include point-of-sale data to communicate with the lending institution computer.

10. A computer program product of Claim 8, wherein the operations further include:
displaying an account activity statement, including a purchase, on a display device to thereby provide a visual representation of a value associated with the prepaid card being exchanged for goods.
11. A computer program product of Claim 8, wherein the operation of making available draws to the line of credit line in an authorization stream for a proposed purchase of one or more items using the prepaid card as payment includes making available only a part of the preauthorized total loan value available, responsive to a consumer determination, so that the consumer retains maximum control.
12. A computer program product of Claim 8, wherein loan repayment occurs from direct deposit funds prior to or relatively instantaneously with the direct deposit funds being made available in the consumer's account.
13. A computer program product of Claim 8, wherein the amount of value of the proposed purchase of the one or more items includes adjustments for one or more of the following: coupons, discounts, instant rebates, and sales tax; wherein the lending institution is a federally-chartered bank subject to federal banking laws and regulations and not subject to state banking laws and regulations; and wherein the line of credit is bank product so that the line of credit complies with federal Regulation Z.
14. A computer program product of Claim 8, wherein the lending institution computer can adjust the prequalified total loan value and repayment terms responsive to the consumer performance data.
15. A computer-implemented method for accessing a line of credit with a prepaid card, the computer-implemented method comprising:
prequalifying a consumer for a line of credit for a prepaid card by a lending institution computer responsive to consumer underwriting data and predetermined qualification parameters to thereby convert consumer underwriting data into line of credit data, the line of credit having a total loan value, a preselected loan increment, a preselected loan advance fee associated with each preselected loan increment, and a line of credit balance available;

making available by a lending institution computer draws to the line of credit line in an authorization stream for a proposed purchase of one or more items using the prepaid card as payment when an amount of value of the proposed purchase of the one or more items is greater than an amount of value on the prepaid card, proposed purchase data being received by the lending institution computer through the electronic communications network from a card reader device associated with a point of sale terminal;

loading the prepaid card with an additional value equal to one or more preselected loan increments so that the prepaid card then has a new amount totaling a previous amount of value on the prepaid card plus the amount of value of the one or more preselected loan increments and so that the new amount exceeds or, alternatively, equals the value of a proposed purchase to thereby convert line of credit data into a value associated with the prepaid card to thereby fund the proposed purchase; and

determining a new value for the line of credit balance available by a lending institution computer, the new value being a previous value for the line of credit balance available minus a value equal to the one or more preselected loan increments loaded onto the prepaid card and minus a value equal to one or more preselected loan advance fees associated with each of the one or more preselected loan increments loaded onto the prepaid card.

16. A computer-implemented method of Claim 15, further comprising:

receiving data by the lending institution computer from a card reader device associated with a point of sale terminal responsive to the card reader device reading data from the prepaid card and modifying the data to include point-of-sale data to communicate with the lending institution computer.

17. A computer-implemented method of Claim 15, further comprising:

displaying an account activity statement, including a purchase, on a display device to thereby provide a visual representation of a value associated with the prepaid card being exchanged for goods.

18. A computer-implemented method of Claim 15, wherein the step of making available by a lending institution computer draws to the line of credit line in an authorization stream for a proposed purchase of one or more items using the prepaid card as payment includes making available only a part of the preauthorized total loan value available, responsive to a consumer determination, so that the consumer retains maximum control.

19. A computer-implemented method of Claim 15, wherein loan repayment occurs from direct deposit funds prior to or relatively instantaneously with the direct deposit funds being made available in the consumer's account.

20. A computer program product of Claim 8, wherein the lending institution computer can adjust the prequalified total loan value and repayment terms responsive to consumer performance data.

AMENDED CLAIMS
received at the International Bureau on 15 July 2009 (15.07.2009)

1. A system for accessing a line of credit with a prepaid card, the system comprising:
 - a computer associated with a lending institution defining a lending institution computer, the lending institution computer having memory, being associated with the electronic communications network, and being positioned to control access to funds from a line of credit associated with a prepaid card; and
 - a computer program product associated with the lending institution computer, stored on a tangible computer memory media, and operable on a computer, the computer program product comprising a set of instructions that, when executed by the computer, cause the computer to perform the operations of:
 - prequalifying a consumer for a line of credit for a prepaid card by the lending institution computer responsive to consumer underwriting data and predetermined qualification parameters to thereby convert consumer underwriting data into line of credit data, the line of credit having a total loan value, a preselected loan increment, a preselected loan advance fee associated with each preselected loan increment, and a line of credit balance available;
 - making available draws to the line of credit line in an authorization stream for a proposed purchase of one or more items using the prepaid card as payment when an amount of value of the proposed purchase of the one or more items is greater than an amount of value on the prepaid card, proposed purchase data being received by the lending institution computer through the electronic communications network from a card reader device associated with a point of sale terminal;
 - loading the prepaid card with an additional value equal to one or more preselected loan increments so that the prepaid card then has a new amount totaling a previous amount of value on the prepaid card plus the amount of value of the one or more preselected loan increments and so that the new amount exceeds or, alternatively, equals the value of a proposed purchase to thereby convert line of credit data into a value associated with the prepaid card to thereby fund the proposed purchase;

determining a new value for the line of credit balance available, the new value being a previous value for the line of credit balance available minus a value equal to the one or more preselected loan increments loaded onto the prepaid card and minus a value equal to one or more preselected loan advance fees associated with each of the one or more preselected loan increments loaded onto the prepaid card; and

determining a new loan balance, the loan balance being a previous value for the loan balance plus the one or more preselected loan increments loaded onto the prepaid card plus the value equal to one or more preselected loan advance fees associated with each of the one or more preselected loan increments loaded onto the prepaid card.

2. A system of Claim 1, wherein the operations further include:

receiving data by the lending institution computer from a card reader device associated with a point of sale terminal responsive to the card reader device reading data from the prepaid card and modifying the data to include point-of-sale data to communicate with the lending institution computer.

3. A system of Claim 1, wherein the operations further include:

displaying an account activity statement, including a purchase, on a display device to thereby provide a visual representation of a value associated with the prepaid card being exchanged for goods.

4. A system of Claim 1, wherein the operation of making available draws to the line of credit line in an authorization stream for a proposed purchase of one or more items using the prepaid card as payment includes making available only a part of the preauthorized total loan value available, responsive to a consumer determination, so that the consumer retains maximum control.

5. A system of Claim 1, wherein loan repayment occurs from direct deposit funds prior to or relatively instantaneously with the direct deposit funds being made available in the consumer's account.

6. A system of Claim 1, wherein the amount of value of the proposed purchase of the one or more items includes adjustments for one or more of the following: coupons, discounts, instant rebates, and sales tax; wherein the lending institution is a federally-chartered bank subject to federal banking laws and regulations and not subject to state banking laws and regulations; and wherein the line of credit is bank product so that the line of credit complies with federal Regulation Z.

7. A system of Claim 1, wherein the lending institution computer is further positioned to adjust the prequalified total loan value and repayment terms responsive to consumer performance data.

8. A computer program product, stored on a tangible computer memory media, operable on a computer, the computer program product comprising a set of instructions that, when executed by the computer, cause the computer to perform the operations of:

prequalifying a consumer for a line of credit for a prepaid card by the lending institution computer responsive to consumer underwriting data and predetermined qualification parameters to thereby convert consumer underwriting data into line of credit data, the line of credit having a total loan value, a preselected loan increment, a preselected loan advance fee associated with each preselected loan increment, and a line of credit balance available;

making available draws to the line of credit line in an authorization stream for a proposed purchase of one or more items using the prepaid card as payment when an amount of value of the proposed purchase of the one or more items is greater than an amount of value on the prepaid card, proposed purchase data being received by the lending institution computer through the electronic communications network from a card reader device associated with a point of sale terminal;

loading the prepaid card with an additional value equal to one or more preselected loan increments so that the prepaid card then has a new amount totaling a previous amount of value on the prepaid card plus the amount of value of the one or more preselected loan increments and so that the new amount exceeds or, alternatively, equals the value of a proposed purchase to thereby convert line of credit data into a value associated with the prepaid card to thereby fund the proposed purchase;

determining a new value for the line of credit balance available, the new value being a previous value for the line of credit balance available minus a value equal to the one or more preselected loan increments loaded onto the prepaid card and minus a value equal to one or more preselected loan advance fees associated with each of the one or more preselected loan increments loaded onto the prepaid card; and

determining a new loan balance, the loan balance being a previous value for the loan balance plus the one or more preselected loan increments loaded onto the prepaid card plus the value equal to one or more preselected loan advance fees associated with each of the one or more preselected loan increments loaded onto the prepaid card.

9. A computer program product of Claim 8, wherein the operations further include:
receiving data by the lending institution computer from a card reader device associated with a point of sale terminal responsive to the card reader device reading data from the prepaid card and modifying the data to include point-of-sale data to communicate with the lending institution computer.
10. A computer program product of Claim 8, wherein the operations further include:
displaying an account activity statement, including a purchase, on a display device to thereby provide a visual representation of a value associated with the prepaid card being exchanged for goods.
11. A computer program product of Claim 8, wherein the operation of making available draws to the line of credit line in an authorization stream for a proposed purchase of one or more items using the prepaid card as payment includes making available only a part of the preauthorized total loan value available, responsive to a consumer determination, so that the consumer retains maximum control.
12. A computer program product of Claim 8, wherein loan repayment occurs from direct deposit funds prior to or relatively instantaneously with the direct deposit funds being made available in the consumer's account.

13. A computer program product of Claim 8, wherein the amount of value of the proposed purchase of the one or more items includes adjustments for one or more of the following: coupons, discounts, instant rebates, and sales tax; wherein the lending institution is a federally-chartered bank subject to federal banking laws and regulations and not subject to state banking laws and regulations; and wherein the line of credit is bank product so that the line of credit complies with federal Regulation Z.

14. A computer program product of Claim 8, wherein the lending institution computer can adjust the prequalified total loan value and repayment terms responsive to the consumer performance data.

15. A computer-implemented method for accessing a line of credit with a prepaid card, the computer-implemented method comprising:

prequalifying a consumer for a line of credit for a prepaid card by a lending institution computer responsive to consumer underwriting data and predetermined qualification parameters to thereby convert consumer underwriting data into line of credit data, the line of credit having a total loan value, a preselected loan increment, a preselected loan advance fee associated with each preselected loan increment, and a line of credit balance available;

making available by a lending institution computer draws to the line of credit line in an authorization stream for a proposed purchase of one or more items using the prepaid card as payment when an amount of value of the proposed purchase of the one or more items is greater than an amount of value on the prepaid card, proposed purchase data being received by the lending institution computer through the electronic communications network from a card reader device associated with a point of sale terminal;

loading the prepaid card with an additional value equal to one or more preselected loan increments so that the prepaid card then has a new amount totaling a previous amount of value on the prepaid card plus the amount of value of the one or more preselected loan increments so that the new amount exceeds or, alternatively, equals the value of a proposed purchase to thereby convert line of credit data into a value associated with the prepaid card to thereby fund the proposed purchase;

determining a new value for the line of credit balance available by a lending institution computer, the new value being a previous value for the line of credit balance available minus a value equal to the one or more preselected loan increments loaded onto the prepaid card and minus a value equal to one or more preselected loan advance fees associated with each of the one or more preselected loan increments loaded onto the prepaid card; and

determining a new loan balance, the loan balance being a previous value for the loan balance plus the one or more preselected loan increments loaded onto the prepaid card plus the value equal to one or more preselected loan advance fees associated with each of the one or more preselected loan increments loaded onto the prepaid card.

16. A computer-implemented method of Claim 15, further comprising:

receiving data by the lending institution computer from a card reader device associated with a point of sale terminal responsive to the card reader device reading data from the prepaid card and modifying the data to include point-of-sale data to communicate with the lending institution computer.

17. A computer-implemented method of Claim 15, further comprising:

displaying an account activity statement, including a purchase, on a display device to thereby provide a visual representation of a value associated with the prepaid card being exchanged for goods.

18. A computer-implemented method of Claim 15, wherein the step of making available by a lending institution computer draws to the line of credit line in an authorization stream for a proposed purchase of one or more items using the prepaid card as payment includes making available only a part of the preauthorized total loan value available, responsive to a consumer determination, so that the consumer retains maximum control.

19. A computer-implemented method of Claim 15, wherein loan repayment occurs from direct deposit funds prior to or relatively instantaneously with the direct deposit funds being made available in the consumer's account.

20. A computer program product of Claim 8, wherein the lending institution computer can adjust the prequalified total loan value and repayment terms responsive to consumer performance data.

STATEMENT UNDER ARTICLE 19 (1)

RESPONSE TO ISSUES RELATED TO ITEM V

Applicant thanks the Examiner for thorough examination of the Application. The Examiner has indicated that Claims 1, 2, 4, 5, 7-9, 11, 12, 14-16, and 18-20 lack novelty under PCT Article 33(2) over Knox, U.S. Patent Pub. 2002-0194122; Claims 1, 2, 4, 5, 7-9, 11, 12, 14-16, and 18-20 lack an inventive step under PCT Article 33(3) over Knox; Claims 3, 10, and 17 lack an inventive step under PCT Article 33(3) over Knox in view of Wendt, U.S. Patent Pub. 2007/0282740; and Claims 6 and 13 lack an inventive step under PCT Article 33(3) over Knox in view of Nix, et al., U.S. Patent Pub. 2008/0040261. Claims 1, 8, and 15 have been amended without prejudice to clarify that "...the loan balance [is] a previous value for the loan balance plus the one or more preselected loan increments loaded onto the prepaid card..." Applicant respectfully requests reconsideration in light of this amendment.

Applicant's claims require overdrawn balances be covered by the line of credit in "predetermined increments." As explained in Applicant's specification, these increments are preset and associated with a particular fee. Thus, if a user has a \$100 balance on the prepaid card, a \$1000 line of credit, and the line of credit is extended in \$100 increments, a purchase costing \$102 would require the account to draw on the line of credit \$100. Once the purchase is made, Applicant's system would leave a balance of \$98 [$\$100 + \$100 - \$102 = \98] on the prepaid card, and the user would owe the bank \$100 plus any fees for extending the line of credit. Knox on the other hand teaches a card loaded with a user's money that extends exactly the amount of credit needed when the card is overdrawn. In Knox, a user loads their own money onto a card and if the card is overdrawn, the user can still pay for the purchase up to a predetermined credit limit. In other words, if the user has a \$100 balance on the prepaid card and

wants to purchase an item costing \$102, \$2 of credit will be advanced to the user, and the user will owe the bank \$2. Nowhere does Knox teach a system that allocates money to a user in a predetermined loan increment, and accordingly Claim 1, 8, 15, and all claims dependent thereon are novel and have an inventive step over this reference.

Moreover, Knox cannot be used alone or in combination with Wendt or Nix to suggest the Claims lack an inventive step under PCT Article 33(3). Wendt teaches a system that allows a person to control the credit account of another and Nix teaches merchant specific accounts that may be prepaid. Neither reference teaches extending credit in "predetermined increments." Therefore, in light of the aforementioned amendments to the Claims and the deficiencies of the references with respect to same. Applicant respectfully requests reconsideration.
