Title: ARTICULATED RAZOR HAVING TWO SHAVING HEADS

Abstract: Razor (1) comprising a handle (2) having an axis (X), a first shaving head (3) having one or more blades, mounted at a front end (4) of the handle (2), and a second shaving head (5) mounted on a support (6) which is mounted at a back end (7) of the handle (2) and is pivotable with respect of the same, between: - an open position in which said support (6) projects outward from the back end (7) of the handle (2) to allow shaving with said second shaving head (5), and - a closed position in which said support (6) is retracted within said handle (2).
Articulated Razor having two shaving heads

Field of the invention
The invention relates to safety razors and, more specifically, to razors provided with two shaving heads.

Background of the invention
Several attempts have been made to propose a razor including at least two shaving heads having different sizes to allow shaving of different hair areas of the body.

US patent No. 4,461,078 granted to Carreker discloses a razor assembly including first and second handle portions, with first and second razor heads mounted at the ends of the handle portions. The handle portions are pivotally mounted together so that the heads may be moved from a position wherein the handle portions are substantially in a straight line with the heads widely spaced, to a position wherein the handle portions make a small acute angle with the heads close to each other.

One disadvantage of such a razor is that its handle is near twice as long as a standard razor handle, which makes it difficult to grip comfortably the razor.

US patent No. 4,285,124 granted to Diakonov discloses a safety razor comprising a normal sized razor head and a retractable miniature razor head which is movable from a first position where it is retracted behind the normal sized head to a second position where it is deployed above the normal sized head for use in trimming the area beneath the center of the user’s nose.

One disadvantage of such a razor is that its structure is quite complicated. That makes the razor difficult to manufacture and, hence, quite expensive.

Summary of the invention
It is an object of the invention to provide a razor having two shaving heads, with improved ergonomics.
The razor according to the invention comprises a handle having an axis, a first shaving head having one or more blades, mounted at a front end of the handle, and a second shaving head mounted on a support which is mounted at a back end of the handle and is pivotable with respect of the same, between:
- an open position in which said support projects outward from the back end of the handle to allow shaving with said second shaving head, and
- a closed position in which said support is retracted within said handle.

In the closed position, only the first shaving head is available for shaving, while the second one is out of reach, whereas in the open position, the second shaving head is available for shaving.

The shaving heads may have different sizes. For instance, the first shaving head is of standard width, which makes it usable for common purposes (e.g. for shaving cheek hair), while the second one has a small width which makes it usable for particular purposes (e.g. for beard or mustache trimming).

Each razor head may consist in a removable cartridge which is to be replaced as soon as the blades are dulled.

Latching means may be provided for holding said support in its closed position.

The handle comprises, for example, two parallel arms defining together a housing for receiving the support in its closed position.

The support may be pivotally mounted between respective ends of said arms, while the latching means may comprise an indent protruding from an internal face of each arm, and biasing a lateral face of said support.

In addition, the razor may comprise a stop wall extending between said arms, and against which the support abuts in its closed position.
The support has a rotation axis which is preferably substantially perpendicular to the handle axis.

The above and other objects and advantages of the invention will become apparent from the detailed description of preferred embodiments of the invention, considered in conjunction with the accompanying drawings.

Brief description of the drawings

Figure 1 is a perspective view of a razor having a broad shaving head and a narrow shaving head, shown in a closed position wherein the narrow head is retracted in the handle.

Figure 2 is a perspective view of the razor of figure 1, shown in an open position wherein the narrow shaving head is deployed.

Figure 3-5 are, respectively, a top plan view, a side view and a bottom view of the razor of figure 1, shown in its closed position.

A razor according to the invention is indicated generally by reference number 1 in the drawings.

Razor 1 comprises a handle 2 which has a substantially planar and parallelepipedic shape and extends along a longitudinal axis X.

Razor 1 comprises a first shaving head 3 comprising one or more blades, which is mounted at a front end 4 of the handle 2 so that the edges of the blades are substantially perpendicular to the handle axis X.

Razor 1 also comprises a second shaving head 5 comprising one or more blades substantially perpendicular to the handle axis X. In other words, first head 3 and second head 5 are parallel.

The heads 3, 5 have different sizes, the first one 3 having a standard width W3 while the second one 5 has a width W5 which is less than W3.

First head 3, thereafter called standard head 3, is used in normal shaving (beard, legs), while second head 5,
thereafter called narrow head 5, is dimensioned for easy maneuverability to facilitate accurate trimming of particular hair areas, e.g. moustaches or pubic hairs.

As illustrated on figure 2, narrow head 5 is mounted on a support 6 which is mounted on the handle at the back end 7 thereof and is capable of rotating with respect to the handle 2 about an axis Y perpendicular to the handle axis X, between:

- an open position in which the support 6 projects outward from the back end 7 of the handle 2 (figure 2), and
- a closed position in which the support is retracted and lodged within the handle 2 (figures 1).

In the open position, the narrow head 5 is available for shaving, whereas in the closed position, it is out of reach and, hence, not available for shaving.

In the vicinity of the back end 7, the handle 2 has two parallel arms 8, 9 extending in the direction of the axis X and defining together a housing 10 capable of receiving the support 6 which has such a shape that, in closed position, it is lodged within the housing 10 in a complementary manner (figure 1, 5).

As illustrated on figures 2 and 5, the rotating support 6 has a broad end 11, by which it is pivotally mounted on the handle 2 (e.g. by means of spindles), and a narrow end 12 onto which the narrow head 5 is attached.

Razor 1 also comprises latching means 13 to hold the support 11 in his retracted position. Latching means 13 comprise an indent 14 which protrudes from an internal face 15 of each arm 8, 9, and which biases a corresponding lateral face 16, 17 of the support 6, so that the support 6 can be clipped closed by the user from the open position.

Handle 2 is provided, on a top side thereof, with a stop wall 18, extending between the arms 8, 9, which
partly closes the housing 10 and against which the support 6 abuts in the closed position.

Accordingly, the stop wall 18 and the indents 14 hold together the support 6 in its closed position.

The user is thereby allowed to selectively utilize the standard head 3 or the narrow one 8, whichever is the most convenient to him/her.

During use of the standard head 3, the narrow head 5 is hidden within the handle 2, so that the razor is compact and ergonomic. Moreover, there is no risk for the user to cut his/her fingers with the narrow head 5 or to damage the blades.

In order to utilize the narrow head 5, the user simply pushes the support 6 open (in the direction of arrow A on figure 2).

During use of the narrow head 5, standard head 3 may be covered with a protective cap (not shown), in order to prevent any finger cutting or blade damaging, or retracted within the handle 2. Accordingly, while narrow head 5 is in use position, standard head 3 is protected within the razor handle 2.

The support 6 may be maintained by the user, while shaving with the narrow head 5, in any position intermediate between the closed position illustrated on figure 1 and the wide open position shown on figure 2 in dark lines, depending on the way the user wishes to hold the razor 1 while shaving with the narrow head 5.

For instance, the support 6 may be held by the user in a position, shown in dashed lines on figure 2, wherein it forms a right angle with the handle 2, allowing the user to grasp the handle 2 and/or the support 6 in such a manner that shaving with the narrow head 5 is achieved by movements along a direction parallel to the handle axis X, as shown by arrow B on figure 2.

In addition, razor 1 may be either entirely disposable
or have a reusable handle 2.

In the first case, the heads 3, 5 are permanently attached to the handle 2, so that as soon as the edges are dulled the entire razor 1 is disposed of.

In the second case, each head 3, 5 consists of a replaceable cartridge which is removably attached to the support 6 so that after the edges are dulled only the cartridges are disposed of and replaced by new ones. One skilled in the art may be inspired by existing disposing mechanism (see e.g. US patent No. US-4,492,024).
CLAIMS

1. Razor (1) comprising a handle (2) having an axis (X), a first shaving head (3) having one or more blades, mounted at a front end (4) of the handle (2), and a second shaving head (5) mounted on a support (6) which is mounted at a back end (7) of the handle (2) and is pivotable with respect of the same, between:
   - an open position in which said support (6) projects outward from the back end (7) of the handle (2) to allow shaving with said second shaving head (5), and
   - a closed position in which said support (6) is retracted within said handle (2).

2. Razor (1) according to claim 1, wherein the shaving heads (3, 5) have different sizes.

3. Razor (1) according to claim 2, wherein the first head (3) has a standard width (W3), while the second head (5) has a smaller width (W5).

4. Razor (1) according to any of claims 1-3, further comprising latching means (13) for holding said support (6) in its closed position.

5. Razor (1) according to any of claims 1-4, wherein the handle (2) comprises two parallel arms (8, 9) defining together a housing (10) for receiving the support (6) in its closed position.

6. Razor (1) according to claim 5, wherein the support (6) is pivotally mounted between respective ends of said arms (8, 9).

7. Razor (1) according to claim 5 or 6, comprising latching means (13) for holding said support (6) in its closed position, said latching means (13) comprising an indent (14) protruding from an internal face (15) of each arm (8, 9), and biasing a lateral face (16, 17) of said
support (6).

8. Razor (1) according to claim 7, further comprising a stop wall (18) extending between said arms (8, 9), and against which said support (6) abuts in its closed position.

9. Razor (1) according to any of claim 1-8, wherein said support (6) has a rotation axis (Y) substantially perpendicular to the handle axis (X).

10. Razor (1) according to any of claims 1-9, wherein each razor head (3, 5) consists in a removable cartridge.
