Inventor:
Frank R. White,
By his Attorney, Leo. M. Mith

UNITED STATES PATENT OFFICE.

FRANK R. WHITE, OF MONTCLAIR, NEW JERSEY.

BAG HOLDER.

1,426,528.

Specification of Letters Patent. Patented Aug. 22, 1922.

Application filed December 24, 1921. Serial No. 524,596.

To all whom it may concern:

Be it known that I, FRANK R. WHITE, a citizen of the United States, and a resident of Montclair, county of Essex and State of New Jersey, have invented certain new and useful Improvements in Bag Holders, of which the following is a specification.

The object of my invention is to afford a simple, cheap, but convenient and effective, holder for use as a receptacle for waste paper, or other waste material, as a laundry bag, and for any and various other analogous purposes, as may be found expedient,—the invention consisting in the specific construction, combination and arrangement of parts herein described and claimed, and distinctive features being the one piece arcuate wire suspender frame, and the flexible container or pocket detachably supported thereon by means of an edge casing, substantially as hereinafter set forth.

In the accompanying drawings,

Fig. 1, is a perspective view of my new holder as hung up for use;

Fig. 2, is a side elevation of the container, so suspended;

Fig. 3, is a perspective view of the frame detached from the bag;

Fig. 4, is a side edge elevation of the frame;

Fig. 5, is a perspective view of the copulative ends of the frame.

My bag holder consists essentially of a wire loop or frame F, adapted to be threaded into an edge casing *c*, of a receptacle, bag, or container C, of flexible material, preferably of suitable textile fabric, which may be detached from its supporting frame F, for transfer or storage of contents, or for cleansing or renovation, the fabric employed in the making of said container being preferably washable.

The edge casing *c*, of the container C, extends completely around the mouth thereof, except for the side placket *c'*, provided for insertion and threading of the frame F, and that (*c*²) provided for the exposure and protrusion of the hang-hook *h*, as shown more particularly in Fig. 1, of the drawings.

Said hang-hook *h*, is formed medially of the length of the straight back portion *b*, of the frame F, as shown in Fig. 3; and the front member or bow *b'*, is preferably of arcuate shape, as also indicated, although this is not an essential feature of my structure, since the said bow *b'*, may be of any desired shape or configuration provided it is adapted to function as a means of holding extended or open the mouth of the bag or container C, substantially as shown in Figs. 1 and 2.

The ends of the wire frame F, considered in a unitary sense, are formed with copulative means of any suitable character consistent with one piece structure, as for instance a hook on one end and an eye on the other end, or a hook on each end,—or any modification of loop form thereof, provided the detachable interlocking of said ends of the wire is provided for substantially as indicated in the accompanying drawings.

Thus constructed and arranged, my bag holder is adapted not only for household and domestic purposes, but also as a substitute for waste paper baskets, etc., in offices, and other localities where floor space is not conveniently available. Furthermore, the detachable character of the receptacle C, is conducive to sanitation and cleanliness; and the simplicity and cheapness of the device render it generally available in a utilitarian sense.

What I claim as my invention and desire to secure by Letters Patent is,

A bag holder consisting of a single piece of wire bent so as to form a straight back portion with a single central coil, and a curved front portion; said back and front portions each having a curved or hooked end portion adapted to interlock, and said central coil being adapted to aid in supporting said holder.

FRANK R. WHITE.
