(54) Title: BRANCHED CHAIN AMINO ACID-DEPENDENT AMINOTRANSFERASE INHIBITORS AND THEIR USE IN  
THE TREATMENT OF NEURODEGENERATIVE DISEASES

(57) Abstract: The invention relates to BCAT inhibitors and the use thereof for treating or preventing neuronal loss associated with stroke, ischemia, CNS trauma, hypoglycemia and surgery, as well as treating neurodegenerative diseases including Alzheimer's disease, amyotrophic lateral sclerosis, Huntington's disease and Down's syndrome, treating or preventing the adverse consequences of the overstimulation of the excitatory amino acids, treating anxiety, psychosis, convulsions, aminoglycoside antibiotics-induced hearing loss, migraine headache, chronic pain, neuropathic pain, Parkinson's disease, diabetic retinopathy, glaucoma, CMV retinitis, urinary incontinence, opioid tolerance or withdrawal, and inducing anesthesia, as well as for enhancing cognition.

BRANCHED CHAIN AMINO ACID-DEPENDENT AMINOTRANSFERASE  
INHIBITORS AND THEIR USE IN THE TREATMENT OF  
NEURODEGENERATIVE DISEASES

5 This application claims priority to United States provisional application  
Number 60/333,636, filed November 27, 2001.

FIELD OF THE INVENTION

This invention is related to branched chain amino acid-dependent amino transferase (BCAT) inhibitors. The invention is also directed to the use of BCAT inhibitors as neuro-protective agents for treating conditions such as stroke, 10 cerebral ischemia, central nervous system trauma, hypoglycemia, anxiety, convulsions, aminoglycoside antibiotics-induced hearing loss, migraine headaches, chronic pain, neuropathic pain, glaucoma, CMV retinitis, diabetic retinopathy, psychosis, urinary incontinence, opioid tolerance or withdrawal, or neuro-degenerative disorders such as lathyrism, Alzheimer's disease, 15 Parkinsonism, amyotrophic lateral sclerosis (ALS), and Huntington's Disease.

RELATED BACKGROUND ART

Excessive excitation by neurotransmitters can cause the degeneration and death of neurons. It is believed that this degeneration is in part mediated by the excitotoxic actions of the excitatory amino acids (EAA) glutamate and aspartate at 20 the N-methyl-D-aspartate (NMDA) receptor. This excitotoxic action is considered responsible for the loss of neurons in cerebrovascular disorders such as cerebral ischemia or cerebral infarction resulting from a range of conditions, such as thromboembolic or hemorrhagic stroke, cerebral vasospasms, hypoglycemia, cardiac arrest, status epilepticus, perinatal asphyxia, anoxia such as from 25 drowning, pulmonary surgery and cerebral trauma, as well as lathyrism, Alzheimer's disease, Parkinson's disease, and Huntington's disease.

-2-

Excitatory amino acid receptor antagonists that block NMDA receptors are recognized for usefulness in the treatment of disorders. NMDA receptors are intimately involved in the phenomenon of excitotoxicity, which may be a critical determinant of outcome of several neurological disorders. Disorders known to be 5 responsive to blockade of the NMDA receptor include acute cerebral ischemia (stroke or cerebral trauma, for example), muscular spasm, convulsive disorders, neuropathic pain and anxiety, and may be a significant causal factor in chronic neurodegenerative disorders such as Parkinson's disease (Klockgether T., Turski L., *Ann. Neurol.*, 1993;34:585-593), human immunodeficiency virus (HIV) 10 related neuronal injury, amyotrophic lateral sclerosis (ALS), Alzheimer's disease (Francis P.T., Sims N.R., Procter A.W., Bowen D.M., *J. Neurochem.*, 1993;60(5):1589-1604, and Huntington's disease (see Lipton S., *TINS*, 1993;16(12):527-532; Lipton S.A., Rosenberg P.A., *New Eng. J. Med.*, 1994;330(9):613-622; and Bigge C.F., *Biochem. Pharmacol.*, 1993;45:1547-1561, 15 and referenced cited therein). NMDA receptor antagonists may also be used to prevent tolerance to opiate analgesia or to help control withdrawal symptoms from addictive drugs (Eur. Pat. Appl. 488,959A).

United States Patent Number 5,352,683 discloses the treatment of chronic pain with a compound which is an antagonist of the NMDA receptor.

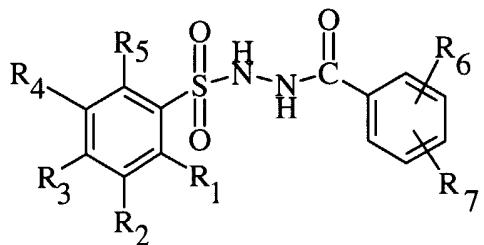

20 United States Patent Number 4,902,695 discloses certain competitive NMDA antagonists that are useful for the treatment of neurological disorders, including epilepsy, stroke, anxiety, cerebral ischemia, muscular spasms, and neurodegenerative diseases such as Alzheimer's disease and Huntington's disease.

25 United States Patent Number 5,192,751 discloses a method of treating urinary incontinence in a mammal which comprises administering an effective amount of a competitive NMDA antagonist.

The invention also relates to a method of treating or preventing neuronal loss associated with stroke, ischemia, CNS trauma, hypoglycemia and surgery, as well as treating neurodegenerative diseases including Alzheimer's disease, amyotrophic lateral sclerosis, Huntington's disease, Parkinson's disease and 5 Down's syndrome, treating or preventing the adverse consequences of the overstimulation of the excitatory amino acids, treating anxiety, psychosis, convulsions, chronic pain, neuropathic pain, diabetic retinopathy, glaucoma, CMV retinitis, urinary incontinence, and inducing anesthesia, as well as enhancing cognition, and preventing opiate tolerance and withdrawal symptoms, comprising 10 administering to an animal in need of such treatment an effective amount of any one of the BCAT inhibitors of the present invention, or a pharmaceutically acceptable salt thereof.

The present invention also includes a pharmaceutical composition comprising a therapeutically effective amount of one or more compounds of 15 Formula I and a pharmaceutically acceptable carrier.

#### DETAILED DESCRIPTION OF THE INVENTION

The present invention is predicated on the discovery that intraocular glutamate injection causes ganglion cell loss which is related to the early stages of diabetic retinopathy (Vorwerk et al., *IOVS*, 1996;37:1618-1624 and that an 20 inhibitor of the branched chain amino acid-dependent aminotransferase pathway, specifically gabapentin, is effective in inhibiting the synthesis of glutamate (see example below), thus preventing diabetic retinopathy. Accordingly, the present invention provides a method for the prophylactic and therapeutic treatment of diabetic retinopathy, including treatment at the pre-diabetic retinopathy stage, the 25 nonproliferative diabetic retinopathy stage, and the proliferative diabetic retinopathy stage. By "prophylactic" is meant the protection, in whole or in part, against diabetic retinopathy, in particular diabetic macular edema. By "therapeutic" is meant the amelioration of diabetic retinopathy, itself, and the protection, in whole or in part, against further diabetic retinopathy, in particular 30 diabetic macular edema.

The method comprises the administration of an inhibitor of the branched chain amino acid-dependent aminotransferase pathway in an amount sufficient to treat the neurodegenerative disease or condition, for example, to treat the retina for retinopathy prophylactically or therapeutically. Any inhibitor of the branched 5 chain amino acid-dependent aminotransferase pathway can be used in the method of the present invention as long as it is safe and efficacious. Herein, “branch chain amino acid-dependent aminotransferase (BCAT) inhibitor” will be used to refer to such compounds and is intended to encompass all compounds that affect the branch chain amino acid-dependent aminotransferase pathway at any and all 10 points in the pathway.

Preferably, the BCAT inhibitor is a compound of Formula I as described above, or a pharmaceutically acceptable, BCAT pathway-inhibiting analogue or prodrug thereof or a pharmaceutically acceptable salt, ester, or amide of any of the foregoing.

15 Unless otherwise expressly stated, the following definitions are adhered to throughout this disclosure.

The term “alkyl” includes saturated aliphatic groups, including straight-chain alkyl groups (e.g., methyl, ethyl, propyl, butyl, pentyl, hexyl, heptyl, octyl, nonyl, decyl, etc.), branched-chain alkyl groups (isopropyl, tert-butyl, isobutyl, 20 etc), cycloalkyl (alicyclic) groups (cyclopropyl, cyclopentyl, cyclohexyl, cycloheptyl, cyclooctyl), alkyl substituted cycloalkyl groups, and cycloalkyl substituted alkyl groups. The term “alkyl” further includes alkyl groups, which can further include oxygen, nitrogen, sulfur, or phosphorous atoms replacing one or more carbons of the hydrocarbon backbone. These heteroatoms can also be 25 substituted. For example, sulfur may be substituted with one or more oxygen atoms (e.g., SO or SO<sub>2</sub>). In certain embodiments, a straight-chain or branched-chain alkyl has 6 or fewer carbon atoms in its backbone (e.g., C<sub>1</sub>-C<sub>6</sub> for straight chain, C<sub>3</sub>-C<sub>6</sub> for branched chain), and more preferably 4 or fewer. Likewise, preferred cycloalkyls have from 3 to 8 carbon atoms in their ring structure, and 30 more preferably have 5 or 6 carbons in the ring structure. The term C<sub>1</sub>-C<sub>6</sub> includes alkyl groups containing 1 to 6 carbon atoms.

Moreover, the term “alkyl” includes both “unsubstituted alkyls” and “substituted alkyls,” the latter of which refers to alkyl moieties having substituents replacing a hydrogen on one or more carbons of the hydrocarbon backbone. Such substituents can include, for example, alkenyl, alkynyl, halogen, hydroxyl, 5 alkylcarbonyloxy, arylcarbonyloxy, alkoxy carbonyloxy, aryloxycarbonyloxy, carboxylate, alkylcarbonyl, arylcarbonyl, alkoxy carbonyl, aminocarbonyl, alkylaminocarbonyl, dialkylaminocarbonyl, alkylthiocarbonyl, alkoxy, phosphate, phosphonato, phosphinato, cyano, amino (including alkyl amino, dialkylamino, arylamino, diarylamino, and alkylarylamino), acylamino (including 10 alkylcarbonylamino, arylcarbonylamino, carbamoyl, and ureido), amidino, imino, sulfhydryl, alkylthio, arylthio, thiocarboxylate, sulfates, alkylsulfinyl, sulfonato, sulfamoyl, sulfonamido, nitro, trifluoromethyl, cyano, azido, heterocyclyl, alkylaryl, or an aromatic or heteroaromatic moiety. Cycloalkyls can be further substituted, e.g., with the substituents described above. An “alkylaryl” or an 15 “arylalkyl” moiety is an alkyl substituted with an aryl [e.g., phenylmethyl (benzyl)].

The term “alkyl” also includes the side chains of natural and unnatural amino acids. In an embodiment, the term “cycloalkyl” includes saturated hydrocarbon rings having 3 to 8 carbon atoms and further includes, for example, 20 cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, cycloheptyl, cyclooctyl, and the like.

Unless the number of carbons is otherwise specified, “lower alkyl” as used herein means an alkyl group, as defined above, but having from 1 to 5 carbon atoms in its backbone structure. In an embodiment, the term “lower alkyl” 25 includes straight or branched hydrocarbon radicals having from 1 to 4 carbon atoms and includes, for example, methyl, ethyl, n-propyl, isopropyl, n-butyl, sec-butyl, isobutyl, or tert-butyl. “Lower alkenyl” and “lower alkynyl” have chain lengths of, for example, 2 to 5 carbon atoms.

The term “aryl” includes groups, including 5- and 6-membered single-ring 30 aromatic groups that may include from 0 to 4 heteroatoms, for example, benzene, phenyl, pyrrole, furan, thiophene, thiazole, isothiazole, imidazole, triazole, tetrazole, pyrazole, oxazole, isooxazole, pyridine, pyrazine, pyridazine, and pyrimidine, and the like. Furthermore, the term “aryl” includes multicyclic aryl

-9-

groups, e.g., tricyclic, bicyclic, e.g., naphthalene, benzoxazole, benzodioxazole, benzothiazole, benzoimidazole, benzothiophene, methylenedioxypyphenyl, quinoline, isoquinoline, napthridine, indole, benzofuran, purine, benzofuran, deazapurine, or indolizine. Those aryl groups having heteroatoms in the ring structure may also be referred to as "aryl heterocycles," "heterocycles," "heteroaryls," or "heteroaromatics". The aromatic ring can be substituted at one or more ring positions with such substituents as described above, as for example, halogen, hydroxyl, alkoxy, alkylcarbonyloxy, arylcarbonyloxy, alkoxy carbonyloxy, aryloxycarbonyloxy, carboxylate, alkylcarbonyl, 10 alkylaminocarbonyl, arylalkyl aminocarbonyl, alkenylaminocarbonyl, alkylcarbonyl, arylcarbonyl, arylalkylcarbonyl, alkenylcarbonyl, alkoxy carbonyl, aminocarbonyl, alkylthiocarbonyl, phosphate, phosphonato, phosphinato, cyano, amino (including alkylamino, dialkylamino, arylamino, diarylamino, and alkylarylamino), acylamino (including alkylcarbonylamino, arylcarbonylamino, carbamoyl, and ureido), amidino, imino, sulfhydryl, alkylthio, arylthio, 15 thiocarboxylate, sulfates, alkylsulfinyl, sulfonato, sulfamoyl, sulfonamido, nitro, trifluoromethyl, cyano, azido, heterocyclyl, alkylaryl, or an aromatic or heteroaromatic moiety. Aryl groups can also be fused or bridged with alicyclic or heterocyclic rings which are not aromatic so as to form a polycycle (e.g., tetralin). 20 In an embodiment, the heteroaromatic group is 2- or 3-thienyl, 2- or 3-furanyl, 2- or 3-pyrrolyl, 2-, 3-, or 4-pyridinyl, 2-pyrazinyl, 2-, 4-, or 5-pyrimidinyl, 3- or 4-pyridazinyl, or 2-, 3-, 4-, 5-, 6-, or 7-indolyl.

Other examples of heterocycles include 5- or 6-membered mono- or bicyclic ring structures which may contain one or more heteroatoms such as N, S, 25 or O; examples of heterocycles are pyridine, pyrimidine, pyridazine, pyrazole, oxazole, indole, N-alkylindole, quinoline, quinazoline, quinazolinone, and the like. Substituents may include substituted or unsubstituted lower alkyl, substituted or unsubstituted alkenyl, substituted or unsubstituted alkynyl, substituted or unsubstituted aralkyl, substituted or unsubstituted aryl, halogen, cyano, nitro, 30 CHO, COR<sub>5</sub>, OR<sub>5</sub>, COOR<sub>5</sub>, CONR<sub>5</sub>R<sub>6</sub>, (CH<sub>2</sub>)<sub>n</sub>NR<sub>5</sub>R<sub>6</sub>, (CH<sub>2</sub>)<sub>n</sub>OR<sub>5</sub>, SR<sub>5</sub>, SOR<sub>5</sub>, SO<sub>2</sub>R<sub>5</sub>, NHSO<sub>2</sub>R<sub>5</sub>, NR<sub>5</sub>R<sub>6</sub>, NHCOR<sub>5</sub>, O(CR<sub>5</sub>R<sub>6</sub>)<sub>0-3</sub>CF<sub>3</sub>, O(R<sub>5</sub>R<sub>6</sub>)<sub>0-3</sub>CC1<sub>3</sub>, or SO<sub>2</sub>NR<sub>5</sub>R<sub>6</sub>, SCF<sub>3</sub>, SCC1<sub>3</sub>, wherein R<sub>5</sub> and R<sub>6</sub> are

-10-

independently hydrogen, substituted or unsubstituted lower alkyl, substituted or unsubstituted lower alkenyl, substituted or unsubstituted alkynyl, substituted or unsubstituted aralkyl.

The term “phenyl” includes aromatic rings of 6 carbons. Phenyl may be 5 unsubstituted (or substituted with hydrogen) or substituted at one or more positions with a substituent such as, but not limited to, halogen, hydroxyl alkoxy, alkylcarbonyloxy, arylcarbonyloxy, alkoxy carbonyloxy, aryloxycarbonyloxy, carboxylate, alkylcarbonyl, alkylaminocarbonyl, arylalkyl aminocarbonyl, alkenylaminocarbonyl, alkylcarbonyl, arylcarbonyl, arylalkylcarbonyl, 10 alkenylcarbonyl, alkoxy carbonyl, aminocarbonyl, alkylthiocarbonyl, phosphate, phosphonato, phosphinato, cyano, amino (including alkyl amino, dialkylamino, arylamino, diarylamino, and alkylarylamino), acylamino (including alkylcarbonylamino, arylcarbonylamino, carbamoyl, and ureido), amidino, imino, sulfhydryl, alkylthio, arylthio, thiocarboxylate, sulfates, alkylsulfinyl, sulfonato, 15 sulfamoyl, sulfonamido, nitro, trifluoromethyl, cyano, azido, heterocyclyl, alkylaryl, or an aromatic or heteroaromatic moiety. The term “aryl” is intended to include both substituted and unsubstituted phenyl groups.

The term “acyl” includes compounds and moieties which contain the acyl radical ( $\text{CH}_3\text{CO}-$ ) or a carbonyl group. The term “substituted acyl” includes acyl 20 groups where one or more of the hydrogen atoms are replaced by for example, alkyl groups, alkynyl groups, halogens, hydroxyl, alkylcarbonyloxy, arylcarbonyloxy, alkoxy carbonyloxy, aryloxycarbonyloxy, carboxylate, alkylcarbonyl, arylcarbonyl, alkoxy carbonyl, aminocarbonyl, alkylaminocarbonyl, dialkylaminocarbonyl, alkylthiocarbonyl, alkoxyl, phosphate, phosphonato, phosphinato, cyano, amino (including alkyl amino, dialkylamino, arylamino, diarylamino, and alkylarylamino), acylamino (including alkylcarbonylamino, arylcarbonylamino, carbamoyl, and ureido), amidino, imino, sulfhydryl, alkylthio, arylthio, thiocarboxylate, sulfates, alkylsulfinyl, sulfonato, sulfamoyl, sulfonamido, nitro, trifluoromethyl, cyano, azido, heterocyclyl, alkylaryl, or an 25 aromatic or heteroaromatic moiety.

-11-

The term “acylamino” includes moieties wherein an acyl moiety is bonded to an amino group. For example, the term includes alkylcarbonylamino, arylcarbonylamino, carbamoyl, and ureido groups.

5 The term “aroyl” includes compounds and moieties with an aryl or heteroaromatic moiety bound to a carbonyl group. Examples of aroyl groups include phenylcarboxy, naphthyl carboxy, etc.

10 The terms “alkoxyalkyl,” “alkylaminoalkyl,” and “thioalkoxyalkyl” include alkyl groups, as described above, which further include oxygen, nitrogen, or sulfur atoms replacing one or more carbons of the hydrocarbon backbone, e.g., oxygen, nitrogen, or sulfur atoms.

15 The term “alkoxy” includes substituted and unsubstituted alkyl, alkenyl, and alkynyl groups covalently linked to an oxygen atom. Examples of alkoxy groups include methoxy, ethoxy, isopropoxy, propoxy, butoxy, and pentoxy groups. Examples of substituted alkoxy groups include halogenated alkoxy groups. The alkoxy groups can be substituted with groups such as alkenyl, alkynyl, halogen, hydroxyl, alkylcarbonyloxy, arylcarbonyloxy, alkoxy carbonyloxy, aryloxycarbonyloxy, carboxylate, alkylcarbonyl, arylcarbonyl, alkoxy carbonyl, aminocarbonyl, alkylaminocarbonyl, dialkylaminocarbonyl, alkylthiocarbonyl, alkoxy, phosphate, phosphonato, phosphinato, cyano, amino (including alkylamino, dialkylamino, arylamino, diarylamino, and alkylaryl amino), acylamino (including alkylcarbonylamino, arylcarbonylamino, carbamoyl, and ureido), amidino, imino, sulphydryl, alkylthio, arylthio, thiocarboxylate, sulfates, alkylsulfinyl, sulfonato, sulfamoyl, sulfonamido, nitro, trifluoromethyl, cyano, azido, heterocyclyl, alkylaryl, or an aromatic or heteroaromatic moieties. Examples of halogen substituted alkoxy groups include, but are not limited to, fluoromethoxy, difluoromethoxy, trifluoromethoxy, chloromethoxy, dichloromethoxy, trichloromethoxy, etc. In an embodiment, the term “lower alkoxy” includes O-alkyl, wherein alkyl is as defined above for lower alkyl.

30 The term “ether” includes compounds or moieties which contain an oxygen bonded to two different carbon atoms or heteroatoms. For example, the term includes “alkoxyalkyl” which refers to an alkyl, alkenyl, or alkynyl group

-12-

covalently bonded to an oxygen atom which is covalently bonded to another alkyl group.

5 The term "ester" includes compounds and moieties which contain a carbon or a heteroatom bound to an oxygen atom which is bonded to the carbon of a carbonyl group. The term "ester" includes alkoxy carboxy groups such as methoxycarbonyl, ethoxycarbonyl, propoxycarbonyl, butoxycarbonyl, pentoxy carbonyl, etc. The alkyl, alkenyl, or alkynyl groups are as defined above.

10 The term "thioether" includes compounds and moieties which contain a sulfur atom bonded to two different carbon or hetero atoms. Examples of thioethers include, but are not limited to, alkthioalkyls, alkthioalkenyls, and alkthioalkynyls. The term "alkthioalkyls" includes compounds with an alkyl, alkenyl, or alkynyl group bonded to a sulfur atom which is bonded to an alkyl group. Similarly, the terms "alkthioalkenyls" and "alkthioalkynyls" refer to compounds or moieties wherein an alkyl, alkenyl, or alkynyl group is bonded to a 15 sulfur atom which is covalently bonded to an alkynyl group.

The term "hydroxy" or "hydroxyl" includes groups with an -OH or -O-. The term "halogen" includes fluorine, bromine, chlorine, iodine, etc. The term "perhalogenated" generally refers to a moiety wherein all hydrogens are replaced by halogen atoms.

20 It will be noted that the structure of some of the compounds of this invention includes asymmetric carbon atoms. It is to be understood accordingly that the isomers arising from such asymmetry (e.g., all enantiomers and diastereomers) are included within the scope of this invention, unless indicated otherwise. Such isomers can be obtained in substantially pure form by classical 25 separation techniques and by stereochemically controlled synthesis. Furthermore, the structures and other compounds and moieties discussed in this application also include all tautomers thereof.

The term "arenes" means a hydrocarbon including an aryl group.

30 The term "subject" includes organisms which are capable of having or have a chemokine mediated disorder. Preferred examples include humans and animals, including cows, sheep, pigs, dogs, cats, rats, ferrets, bears, rabbits, etc.

The term "treatment" includes the diminishment or alleviation of at least one symptom associated or caused by the disorder being treated. For example,

-13-

treatment can be diminishment of several symptoms of a disorder or complete eradication of a disorder.

The symbol “-“ means a bond.

5 The compounds of the present invention can exist in unsolvated forms as well as solvated forms, including hydrated forms. In general, the solvated forms, including hydrated forms, are equivalent to unsolvated forms and are intended to be encompassed within the scope of the present invention.

10 Certain of the compounds of the present invention possess one or more chiral centers and each center may exist in the R(D) or S(L) configuration. The present invention includes all enantiomeric and epimeric forms as well as the appropriate mixtures thereof.

15 The compounds of Formula I are capable of further forming both pharmaceutically acceptable formulations comprising salts, esters, amides, and prodrugs. As used herein, the term “pharmaceutically acceptable salts, esters, amides, and prodrugs” refers to those carboxylate salts, amino acid addition salts, esters, amides, and prodrugs of the compounds of the present invention which are, within the scope of sound medical judgment, suitable for use in contact with the tissues of patients without undue toxicity, irritation, allergic response, and the like, commensurate with a reasonable benefit/risk ratio, and effective for their intended 20 use, as well as the zwitterionic forms, where possible, of the compounds of the invention. The term “salts” refers to the relatively non-toxic, inorganic and organic acid addition salts of compounds of the present invention. These salts can be prepared *in situ* during the final isolation and purification of the compounds or by separately reacting the purified compound in its free base form with a suitable 25 organic or inorganic acid and isolating the salt thus formed and including, but not limited to, acid addition and/or base salts, solvents and N-oxides of a compound of Formula I. This invention also provides pharmaceutical formulations comprising a compound of Formula I together with a pharmaceutically acceptable carrier, diluent, or excipient therefor. All of these forms are within the present 30 invention.

Pharmaceutically acceptable acid addition salts of the compounds of Formula I include salts derived from inorganic acids such as hydrochloric, nitric, phosphoric, sulfuric, hydrobromic, hydriodic, phosphorus, and the like, as well as

-14-

the salts derived from organic acids, such as aliphatic mono- and dicarboxylic acids, phenyl-substituted alkanoic acids, hydroxy alkanoic acids, alkanedioic acids, aromatic acids, aliphatic and aromatic sulfonic acids, etc. Such salts thus include sulfate, pyrosulfate, bisulfate, sulfite, bisulfite, nitrate, phosphate, 5 monohydrogenphosphate, dihydrogenphosphate, metaphosphate, pyrophosphate, chloride, bromide, iodide, acetate, propionate, caprylate, isobutyrate, oxalate, malonate, succinate, suberate, sebacate, fumarate, maleate, mandelate, benzoate, chlorobenzoate, methylbenzoate, dinitrobenzoate, phthalate, benzenesulfonate, toluenesulfonate, phenylacetate, citrate, lactate, maleate, tartrate, 10 methanesulfonate, and the like. Also contemplated are the salts of amino acids such as arginate, gluconate, galacturonate, and the like; see, for example, Berge, et al., "Pharmaceutical Salts," *J. of Pharmaceutical Science*, 1977;66:1-19.

The acid addition salts of the basic compounds are prepared by contacting the free base form with a sufficient amount of the desired acid to produce the salt 15 in the conventional manner. The free base form may be regenerated by contacting the salt form with a base and isolating the free base in the conventional manner. The free base forms differ from their respective salt forms somewhat in certain physical properties such as solubility in polar solvents, but otherwise the salts are equivalent to their respective free base for purposes of the present invention.

20 Pharmaceutically acceptable base addition salts are formed with metals or amines, such as alkali and alkaline earth metal hydroxides, or of organic amines. Examples of metals used as cations are sodium, potassium, magnesium, calcium, and the like. Examples of suitable amines are N,N'-dibenzylethylenediamine, chloroprocaine, choline, diethanolamine, ethylenediamine, N-methylglucamine, 25 and procaine; see, for example, Berge et al., *supra.*, 1977.

The base addition salts of acidic compounds are prepared by contacting the free acid form with a sufficient amount of the desired base to produce the salt in the conventional manner. The free acid form may be regenerated by contacting the salt form with an acid and isolating the free acid in a conventional manner. The 30 free acid forms differ from their respective salt forms somewhat in certain physical properties such as solubility in polar solvents, but otherwise the salts are equivalent to their respective free acid for purposes of the present invention.

-15-

Examples of pharmaceutically acceptable, non-toxic esters of the compounds of this invention include C<sub>1</sub>-C<sub>6</sub> alkyl esters wherein the alkyl group is a straight or branched chain. Acceptable esters also include C<sub>5</sub>-C<sub>7</sub> cycloalkyl esters as well as arylalkyl esters such as, but not limited to benzyl. C<sub>1</sub>-C<sub>4</sub> alkyl esters are preferred. Esters of the compounds of the present invention may be prepared according to conventional methods.

Examples of pharmaceutically acceptable, non-toxic amides of the compounds of this invention include amides derived from ammonia, primary C<sub>1</sub>-C<sub>6</sub> alkyl amines and secondary C<sub>1</sub>-C<sub>6</sub> dialkyl amines wherein the alkyl groups are straight or branched chain. In the case of secondary amines the amine may also be in the form of a 5- or 6-membered heterocycle containing one nitrogen atom. Amides derived from ammonia, C<sub>1</sub>-C<sub>3</sub> alkyl primary amines, and C<sub>1</sub>-C<sub>2</sub> dialkyl secondary amines are preferred. Amides of the compounds of the invention may be prepared according to conventional methods.

The term "prodrug" refers to compounds that are rapidly transformed in vivo to yield the parent compound of the above Formulae, for example, by hydrolysis in blood. A thorough discussion is provided in T. Higuchi and V. Stella, "Pro-drugs as Novel Delivery Systems," Vol. 14 of the A.C.S. Symposium Series, and in *Bioreversible Carriers in Drug Design*, ed. Edward B. Roche, American Pharmaceutical Association and Pergamon Press, 1987, both of which are incorporated herein by reference. In general, a prodrug is a drug which has been chemically modified and may be biologically inactive at its site of action, but which may be degraded or modified by one or more enzymatic or other in vivo processes to the parent bioactive form.

A "therapeutically effective amount" is an amount of a compound of Formula I that when administered to a patient, ameliorates a symptom of the disease.

The BCAT inhibitor, which is preferably a compound of Formula I, a BCAT pathway-inhibiting analogue of Formula I, a BCAT pathway-inhibiting prodrug of Formula I, or a pharmaceutically acceptable salt of any of the foregoing, can be administered in accordance with the present inventive method by any suitable route. Suitable routes of administration include systemic, such as

-16-

orally or by injection, topical, intraocular, periocular (e.g., subTenon's), subconjunctival, subretinal, suprachoroidal and retrobulbar. The manner in which the BCAT inhibitor is administered is dependent, in part, upon whether the treatment of retinopathy is prophylactic or therapeutic. The manner in which the  
5 BCAT inhibitor is administered for therapeutic treatment of retinopathy is dependent, in part, upon the cause of the retinopathy.

For example, given that diabetes is the leading cause of retinopathy, the BCAT inhibitor can be administered prophylactically as soon as the pre-diabetic retinopathy state is detected. For the prophylactic treatment of retinopathy that can result from diabetes, the BCAT inhibitor is preferably administered systemically, e.g., orally or by injection. For the therapeutic treatment of nonproliferative diabetic retinopathy, the BCAT inhibitor can be administered systemically, e.g., orally or by injection, or intraocularly. Proliferative diabetic retinopathy can be therapeutically treated by the administration of the BCAT inhibitor intraocularly, 10 topically, subconjunctivally or periocularly (e.g., subTenon's), for example. The BCAT inhibitor is preferably administered intraocularly, topically, subconjunctivally or periocularly (e.g., subTenon's) for the prophylactic or therapeutic treatment of retinopathy before, during or after surgical removal from 15 an eye of scar tissue generated during neovascularization during the proliferative diabetic stage.  
20

The BCAT inhibitor is preferably administered as soon as possible after it has been determined that an animal, such as a mammal, specifically a human, is at risk for retinopathy (prophylactic treatment) or has begun to develop retinopathy (therapeutic treatment). Treatment will depend, in part, upon the particular BCAT inhibitor used, the amount of the BCAT inhibitor administered, the route of 25 administration, and the cause and extent, if any, of retinopathy realized.

One skilled in the art will appreciate that suitable methods of administering a BCAT inhibitor, which is useful in the present inventive methods, are available. Although more than one route can be used to administer a particular 30 BCAT inhibitor, a particular route can provide a more immediate and more effective reaction than another route. Accordingly, the described routes of administration are merely exemplary and are in no way limiting.

-17-

The dose administered to an animal, particularly a human, in accordance with the present invention should be sufficient to effect the desired response in the animal over a reasonable time frame. One skilled in the art will recognize that dosage will depend upon a variety of factors, including the strength of the 5 particular BCAT inhibitor employed, the age, species, condition or disease state, and body weight of the animal, as well as the amount of the retina about to be affected or actually affected by retinopathy. The size of the dose also will be determined by the route, timing and frequency of administration as well as the existence, nature, and extent of any adverse side effects that might accompany the 10 administration of a particular BCAT inhibitor and the desired physiological effect. It will be appreciated by one of ordinary skill in the art that various conditions or disease states, in particular, chronic conditions or disease states, may require prolonged treatment involving multiple administrations.

Suitable doses and dosage regimens can be determined by conventional 15 range-finding techniques known to those of ordinary skill in the art. Generally, treatment is initiated with smaller dosages, which are less than the optimum dose of the compound. Thereafter, the dosage is increased by small increments until the optimum effect under the circumstances is reached. The present inventive method will typically involve the administration of from about 1 mg/kg/day to about 20 100 mg/kg/day, preferably from about 15 mg/kg/day to about 50 mg/kg/day, if administered systemically. Intraocular administration typically will involve the administration of from about 0.1 mg total to about 5 mg total, preferably from about 0.5 mg total to about 1 mg total. A preferred concentration for topical administration is 100  $\mu$ M.

25 Compositions for use in the present inventive method preferably comprise a pharmaceutically acceptable carrier and an amount of a BCAT inhibitor sufficient to treat retinopathy prophylactically or therapeutically. The carrier can be any of those conventionally used and is limited only by chemico-physical considerations, such as solubility and lack of reactivity with the compound, and by 30 the route of administration. It will be appreciated by one of ordinary skill in the art that, in addition to the following described pharmaceutical compositions, the BCAT inhibitor can be formulated as polymeric compositions, inclusion complexes, such as cyclodextrin inclusion complexes, liposomes, microspheres,

-18-

microcapsules and the like (see, e.g., U.S. Pat. Nos. 4,997,652; 5,185,152; and 5,718,922).

The BCAT inhibitor can be formulated as a pharmaceutically acceptable acid addition salt. Examples of pharmaceutically acceptable acid addition salts for 5 use in the pharmaceutical composition include those derived from mineral acids, such as hydrochloric, hydrobromic, phosphoric, metaphosphoric, nitric and sulfuric acids, and organic acids, such as tartaric, acetic, citric, malic, lactic, fumaric, benzoic, glycolic, gluconic, succinic, and arylsulphonic, for example p-toluenesulphonic acids.

10 The pharmaceutically acceptable excipients described herein, for example, vehicles, adjuvants, carriers or diluents, are well-known to those who are skilled in the art and are readily available to the public. It is preferred that the pharmaceutically acceptable carrier be one which is chemically inert to the BCAT inhibitor and one which has no detrimental side effects or toxicity under the 15 conditions of use.

20 The choice of excipient will be determined in part by the particular BCAT inhibitor, as well as by the particular method used to administer the composition. Accordingly, there is a wide variety of suitable formulations of the pharmaceutical composition of the present invention. The following formulations are merely exemplary and are in no way limiting.

25 Injectable formulations are among those that are preferred in accordance with the present inventive method. The requirements for effective pharmaceutically carriers for injectable compositions are well-known to those of ordinary skill in the art (see *Pharmaceutics and Pharmacy Practice*, J. B. Lippincott Co., Philadelphia, PA, Banker and Chalmers, eds., pages 238-250 (1982), and *ASHP Handbook on Injectable Drugs*, Toissel, 4th ed., pages 622-630 (1986). It is preferred that such injectable compositions be administered intramuscularly, intravenously, or intraperitoneally.

30 Topical formulations are well-known to those of skill in the art. Such formulations are suitable in the context of the present invention for application to the skin. The use of patches, corneal shields (see, e.g., United States Patent Number 5,185,152), and ophthalmic solutions (see, e.g., United States Patent

-19-

Number 5,710,182) and ointments, e.g., eye drops, is also within the skill in the art.

Formulations suitable for oral administration can consist of (a) liquid solutions, such as an effective amount of the compound dissolved in diluents, such 5 as water, saline, or orange juice; (b) capsules, sachets, tablets, lozenges, and troches, each containing a predetermined amount of the active ingredient, as solids or granules; (c) powders; (d) suspensions in an appropriate liquid; and (e) suitable emulsions. Liquid formulations may include diluents, such as water and alcohols, for example, ethanol, benzyl alcohol, and the polyethylene alcohols, either with or 10 without the addition of a pharmaceutically acceptable surfactant, suspending agent, or emulsifying agent. Capsule forms can be of the ordinary hard- or soft-shelled gelatin type containing, for example, surfactants, lubricants, and inert fillers, such as lactose, sucrose, calcium phosphate, and corn starch. Tablet forms can include one or more of lactose, sucrose, mannitol, corn starch, potato starch, 15 alginic acid, microcrystalline cellulose, acacia, gelatin, guar gum, colloidal silicon dioxide, croscarmellose sodium, talc, magnesium stearate, calcium stearate, zinc stearate, stearic acid, and other excipients, colorants, diluents, buffering agents, disintegrating agents, moistening agents, preservatives, flavoring agents, and pharmacologically compatible excipients. Lozenge forms can comprise the active 20 ingredient in a flavor, usually sucrose and acacia or tragacanth, as well as pastilles comprising the active ingredient in an inert base, such as gelatin and glycerin, or sucrose and acacia, emulsions, gels, and the like containing, in addition to the active ingredient, such excipients as are known in the art.

The effectiveness of an orally administered drug is dependent upon the 25 drug's efficient transport across the mucosal epithelium and its stability in entero-hepatic circulation. Drugs that are effective after parenteral administration but less effective orally, or whose plasma half-life is considered too short, may be chemically modified into a prodrug form.

Formulations suitable for parenteral administration include aqueous and 30 non-aqueous, isotonic sterile injection solutions, which can contain anti-oxidants, buffers, bacteriostats, and solutes that render the formulation isotonic with the blood of the intended recipient, and aqueous and non-aqueous sterile suspensions that can include suspending agents, solubilizers, thickening agents, stabilizers, and

-20-

preservatives. The inhibitor can be administered in a physiologically acceptable diluent in a pharmaceutical carrier, such as a sterile liquid or mixture of liquids, including water, saline, aqueous dextrose and related sugar solutions, an alcohol, such as ethanol, isopropanol, or hexadecyl alcohol, glycols, such as propylene 5 glycol or polyethylene glycol, dimethylsulfoxide, glycerol ketals, such as 2,2-dimethyl-1,3-dioxolane-4-methanol, ethers, such as poly(ethyleneglycol) 400, an oil, a fatty acid, a fatty acid ester or glyceride, or an acetylated fatty acid 10 glyceride, with or without the addition of a pharmaceutically acceptable surfactant, such as a soap or a detergent, suspending agent, such as pectin, carbomers, methylcellulose, hydroxypropylmethylcellulose, or carboxymethylcellulose, or emulsifying agents and other pharmaceutical adjuvants. Oils, which can be used in parenteral formulations include petroleum, animal, vegetable, or synthetic oils. Specific examples of oils include peanut, soybean, sesame, cottonseed, corn, olive, petrolatum, and mineral.

15 Suitable fatty acids for use in parenteral formulations include oleic acid, stearic acid, and isostearic acid. Ethyl oleate and isopropyl myristate are examples of suitable fatty acid esters.

20 Suitable soaps for use in parenteral formulations include fatty alkali metals, ammonium, and triethanolamine salts, and suitable detergents include (a) cationic detergents such as, for example, dimethyl dialkyl ammonium halides, and alkyl pyridinium halides, (b) anionic detergents such as, for example, alkyl, aryl, and olefin sulfonates, alkyl, olefin, ether, and monoglyceride sulfates, and sulfosuccinates, (c) nonionic detergents such as, for example, fatty amine oxides, fatty acid alkanolamides, and polyoxyethylenopolypropylene copolymers, 25 (d) amphoteric detergents such as, for example, alkyl-p-aminopropionates, and 2-alkyl-imidazoline quaternary ammonium salts, and (e) mixtures thereof.

30 The parenteral formulations will typically contain from about 0.5 to about 25% by weight of the active ingredient in solution. Preservatives and buffers may be used. In order to minimize or eliminate irritation at the site of injection, such compositions may contain one or more nonionic surfactants having a hydrophile-lipophile balance (HLB) of from about 12 to about 17.

The quantity of surfactant in such formulations will typically range from about 5 to about 15% by weight. Suitable surfactants include polyethylene

-21-

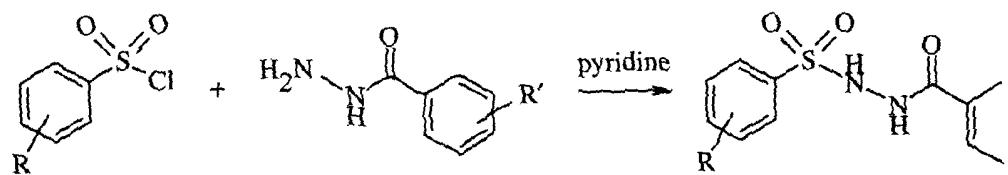

5 sorbitan fatty acid esters, such as sorbitan monooleate and the high molecular weight adducts of ethylene oxide with a hydrophobic base, formed by the condensation of propylene oxide with propylene glycol. The parenteral formulations can be presented in unit-dose or multi-dose sealed containers, such as ampules and vials, and can be stored in a freeze-dried (lyophilized) condition requiring only the addition of the sterile liquid excipient, for example, water, for injections, immediately prior to use. Extemporaneous injection solutions and suspensions can be prepared from sterile powders, granules, and tablets of the kind previously described.

10 Such compositions can be formulated as intraocular formulations, sustained-release formulations or devices (see, e.g., United States Patent Number 5,378,475). For example, gelatin, chondroitin sulfate, a polyphosphoester, such as bis-2-hydroxyethyl-terephthalate (BHET), or a polylactic-glycolic acid (in various proportions) can be used to formulate 15 sustained-release formulations. Implants (see, e.g., U.S. Pat. Nos. 5,443,505; 4,853,224; and 4,997,652), devices (see, e.g., U.S. Pat. Nos. 5,554,187; 4,863,457; 5,098,443; and 5,725,493), such as an implantable device, e.g., a mechanical reservoir, an intraocular device or an extraocular device with an intraocular conduit (e.g., 100  $\mu$ -1 mm in diameter), or an implant or a device comprised of a 20 polymeric composition as described above, can be used.

25 The present inventive method also can involve the co-administration of other pharmaceutically active compounds. By "co-administration" is meant administration before, concurrently with, e.g., in combination with the BCAT inhibitor in the same formulation or in separate formulations, or after administration of a BCAT inhibitor as described above. For example, corticosteroids, e.g., prednisone, methylprednisolone, dexamethasone, or triamcinolone acetonide, or noncorticosteroid anti-inflammatory compounds, such as ibuprofen or flubiprofen, can be co-administered. Similarly, vitamins and minerals, e.g., zinc, antioxidants, e.g., carotenoids (such as a xanthophyll 30 carotenoid like zeaxanthin or lutein), and micronutrients can be co-administered. A general synthetic scheme for preparing compounds of Formula I is set forth below.

### EXAMPLE 1

Benzoic acid, 4-nitro-2-(phenylsulfonyl) hydrazide

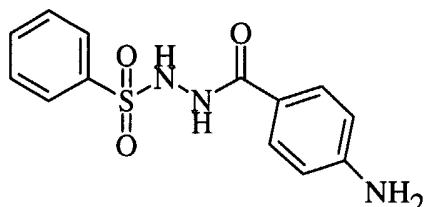

A solution of 4-nitro benzoic acid (0.2 g, 1.2 mmol in 10 mL of dry THF) 5 was cooled to 0°C, treated with N-methyl-morpholine (1.6 mL, 14.6 mmol) as well as isobutyl-chloroformate (1.7 mL, 1.3 mmol), and stirred for 10 minutes prior to the addition of benzenesulfonyl hydrazide (0.21 g, 1.2 mmol). After the addition of hydrazide, the mixture was stirred for 3 hours at 25°C. Then the reaction was diluted with ethyl acetate (100 mL), washed with saturated sodium 10 bicarbonate solution as well as brine, and concentrated in vacuum. The crude material was chromatographed on silica gel eluting with hexanes/ethyl acetate = 2:1 to give the desired product (65% yield).

EXAMPLE 24

4-(1,1-Dimethylethyl)-benzoic acid, 2-(phenylsulfonyl)hydrazide.

Step 1: The preparation of 4-*tert*-butyl-benzoic acid hydrazide.

5 A solution of 4-*tert*-butyl benzoic acid (0.2 g, 1.2 mmol in 10 mL of dry THF) cooled to 0°C and treated with N-methyl-morpholine (1.6 mL, 14.6 mmol) as well as isobutyl chloroformate (1.7 mL, 1.3 mmol). Then the mixture was stirred for 10 minutes at 0°C. After hydrazine (0.6 g, 3.6 mmol) was added to the reaction mixture, it was stirred 3 hours at 25°C. The reaction was then diluted with 10 ethyl acetate (100 mL), washed with saturated sodium bicarbonate solution as well as brine, and concentrated in vacuum. The crude material was chromatographed on silica gel eluting with hexanes/ethyl acetate = 2:1 to give 4-*tert*-butyl-benzoic acid hydrazide.

15 Step 2: The preparation of 4-(1,1-dimethylethyl)-benzoic acid, 2-(phenylsulfonyl)hydrazide (Example 24)

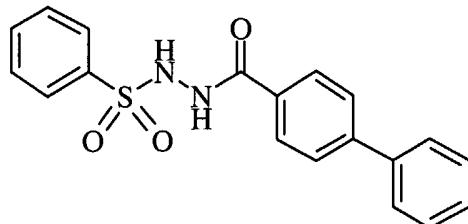

4-*tert*-Butyl-benzoic acid hydrazide (0.5 g, 2.60 mmol) was dissolved in THF (29 mL). N,N-diisopropylethylamine (1.81 mL, 10.4 mmol) was added, and the reaction was cooled to 0°C. Phenylsulfonyl chloride (0.36 mL, 2.86 mmol) was added followed by DMAP (5 mg, 0.04 mmol). The reaction was allowed to 20 warm to room temperature, and the reactants all dissolved. The solution went from a yellow color to a deep red over the course of 4 hours. The reaction was then concentrated down and purified by flash chromatography eluting with 3:1 hexanes/EtOAc. The desired product was isolated (0.32 g, 37.1%).

[1,1'-Biphenyl]-4-carboxylic acid, 2-(phenylsulfonyl) hydrazide

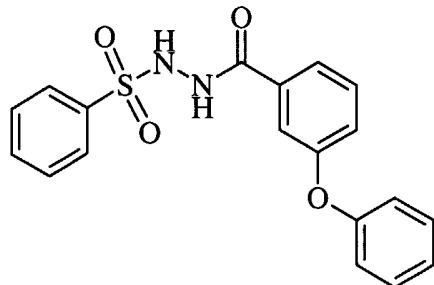

Biphenyl-4-carboxylic acid hydrazide (0.5 g, 2.36 mmol) was suspended  
5 in THF (26 mL). N,N-diisopropylethylamine (1.64 mL, 9.44 mmol) was added,  
and the reaction was cooled to 0°C. Phenylsulfonyl chloride (0.33 mL,  
2.59 mmol) was added followed by DMAP (5 mg, 0.04 mmol). The reaction was  
allowed to warm to room temperature. The solution was orange after it stirred for  
1 hour; DMF (5 mL) was added, and the solution became clear. After 3 hours of  
10 stirring, the solution was diluted with EtOAc (150 mL). It was then washed with  
saturated sodium bicarbonate and brine and dried over Na<sub>2</sub>SO<sub>4</sub>. The reaction was  
then concentrated down and triturated with CH<sub>2</sub>Cl<sub>2</sub>. The desired product was  
isolated (0.19 g, 22.7%).

#### EXAMPLE 39

5 *In vitro enzyme assay: human Branched Chain Amino Acid*  
Aminotransferase cytosolic form (hBCATc) and mitochondrial form (hBCATm) as well as rat BCAT cytosolic form were assayed at 37°C in 25 mM phosphate buffer pH 7.8. In addition, 2 mM DTT and 12.5 mM EDTA were added to the assay mixture. A coupling enzyme assay was used to monitor the production of 10 glutamate. The formation of NADH from NAD<sup>+</sup> at 340 nM was followed on a 96-well plate Molecular Devices plate reader. The following components were used in this coupled assay: 4 mM ADP, 1 mM NAD<sup>+</sup>, 750  $\mu\text{M}$  L-Leucine, 500  $\mu\text{M}$   $\alpha$ -ketoglutarate, 10  $\mu\text{M}$  pyridoxal phosphate, 1 unit glutamate 15 dehydrogenase, and 1.25  $\mu\text{g}$  of the appropriate BCAT enzyme. Inhibitions by compounds were assayed by adding various concentrations to this coupled assay procedure as a DMSO stock up to a 5% v/v DMSO/buffer ratio. Data is shown in Table 1.

20 *Enzyme Preparation: humanBCATc and ratBCATc were expressed in BL21(DE3) cells. A growing culture of cells was induced with 1 mM IPTG at room temperature overnight. These cells were harvested by centrifugation at 10,000 g for 20 minutes. The supernatant was discarded, and the cells were stored at -80°C until needed. The protein was purified by the following method. The cell 25 paste was resuspended in extraction buffer (0.1 M phosphate, pH 8.0, with 0.01 M Tris-HCL and 5 mM TCEP and then lysed on a French Press at 1000 psi. The lysate was centrifuged at 10,000 g for 15 minutes, and the pellet was discarded. The supernatant was loaded onto a Hitrap Chelating column previously charged with 0.1 M NiSO<sub>4</sub> and washed with 3 to 4 column volumes of extraction buffer. The column was then washed with 0.01 Tris, pH 7.5, 10% glycerol, 150 mM 30 NaCl, 5 mM TCEP for two column volumes. The column was then further washed with two column volumes of 0.1 M phosphate, pH 6.0, 0.01 M Tris, 10% glycerol, and 750 mM NaCl. Finally, the column was washed with two column volumes of*

the same buffer plus 50 mM imidazole. The BCAT enzyme was then eluted with the same buffer but with 350 mM imidazole. The eluant was then dialyzed overnight against 10 mM phosphate buffer pH 8.0, 10% glycerol, and 5 mM TCEP. The dialyzed protein was then loaded onto a Q-sepharose column and eluted using a salt gradient. Active fractions were collected and further purified on a Superose-12 column to yield pure BCAT protein.

6. A pharmaceutical composition comprising a compound of Claim 1 and a pharmaceutically acceptable carrier.

7. A method of treating or preventing neuronal loss associated with stroke, ischemia, CNS trauma, hypoglycemia or surgery, or treating a 20 neurodegenerative disease, or treating or preventing the adverse consequences of the overstimulation of the excitatory amino acids, or treating anxiety, psychosis, glaucoma, CMV retinitis, diabetic retinopathy, urinary incontinence, migraine headache, convulsions, aminoglycoside antibiotics-induced hearing loss, Parkinson's disease, chronic pain, 25 neuropathic pain, or inducing anesthesia, opioid tolerance or withdrawal, or enhancing cognition, comprising administering to a patient in need of such treatment an effective amount of a compound of Claim 1.

-52-

8. The method of Claim 7 wherein R<sub>6</sub> or R<sub>7</sub> comprises -NHSO<sub>2</sub>-aryl, -NHSO<sub>2</sub>-substituted aryl, -NHSO<sub>2</sub>-alkyl or -NHSO<sub>2</sub>-substituted alkyl, and R<sub>1</sub>, R<sub>2</sub>, R<sub>3</sub>, R<sub>4</sub>, and R<sub>5</sub> are H.
9. The method of Claim 7 wherein R<sub>1</sub>, R<sub>2</sub>, R<sub>3</sub>, R<sub>4</sub>, and R<sub>5</sub> are hydrogen.
- 5 10. The method of Claim 7 wherein R<sub>5</sub> or R<sub>6</sub> is O-aryl, O-substituted aryl, O-alkylaryl, or O-substituted alkylaryl.
11. The method of Claim 7 wherein the compound is:
  - Benzoic acid, 4-nitro-2-(phenylsulfonyl) hydrazide;
  - Benzoic acid, 4-amino-2-(phenylsulfonyl) hydrazide;
  - 10 Benzoic acid, 4-[[2,4,6-trichlorophenyl]sulfonyl]amino]-, 2-(phenylsulfonyl) hydrazide;

Continuation of Box I.1

Although claims 6-15 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound.

-----

Continuation of Box I.1

Claims Nos.: 6-15

Rule 39.1(iv) PCT - Method for treatment of the human or animal body by therapy

-----

Continuation of Box I.2

Claims Nos.: 1-2

The initial phase of the search revealed a very large number of documents relevant to the issue of novelty. So many documents were retrieved that it is impossible to determine which parts of the claim 1-2 may be said to define subject-matter for which protection might legitimately be sought (Article 6 PCT). For these reasons, a meaningful search over the whole breadth of claims 1-2 is impossible. The present search report can be considered as complete only for the subject-matter of claims 3-5. As regard to the pharmaceutical use, it has been searched on the whole scope of formula (I).

The applicant's attention is drawn to the fact that claims, or parts of claims, relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure.

### Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1.  Claims Nos.: 6-15  
because they relate to subject matter not required to be searched by this Authority, namely:  
see FURTHER INFORMATION sheet PCT/ISA/210
  
2.  Claims Nos.: 1-2  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:  
see FURTHER INFORMATION sheet PCT/ISA/210
  
3.  Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

### Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1.  As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
  
2.  As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
  
3.  As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
  
4.  No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

#### Remark on Protest

The additional search fees were accompanied by the applicant's protest.

No protest accompanied the payment of additional search fees.
