## FUSED TETRA OR PENTA-CYCLIC DIHYDRODIAZEPINOCARBAZOLONES AS PARP INHIBITORS

Disclosed herein are fused tetra or penta-cyclic compounds which can inhibit the activity of poly (ADP-ribose)polymerases (PARPs), pharmaceutical compositions comprising at least one of the compounds, and the use thereof in treating certain diseases.

Poly(ADP-ribose) polymerases (PARPs), previously known as poly(ADP-ribose) synthases or poly(ADP-ribose) transferases, are a family of proteins that contain PARP catalytic domain (BMC Genomics, 2005 Oct. 4; 6: 139.). Approximately 17 members of PARPs have been discovered so far, includingPARP-1, PARP-2, PARP-3, PARP-4(Vault-PARP), PARP-5a (Tankyrase-1), PARP5b (Tankyrase-2), PARP-6, PARP-7 (tiPARP),PARP-8, PARP-9 (BALI), PARP-10, PARP-1 1, PARP-12, PARP-13 (ZAP), PARP-14 (CoaSt6), PARP-15, and PARP-16. The catalytic activity of PARPs can be to transfer the ADP-ribose moiety from nicotinamide adenine dinucleotide $\left(\mathrm{NAD}^{+}\right)$to glutamic acid residues of a number of target proteins, and to form long branches of ADP-ribose polymers. However, some of the PARP families have been reported to catalyze only mono-ADP-ribosylation of targets while activities of others have yet to be reported (Mol. Cell. 2008 Oct. 10; 32(1): 57-69.). A number of the PARP enzymes have been reported to show important functional roles in, for example, DNA repair, transcriptional regulation, mitotic progression, genomic integrity, telomere stability, cell death, and Wnt signaling pathway.

PARP-1 may be the most abundant and most well studied member of the family, and PARP-2 may be its closest relative. PARP can be activated by damaged DNA fragments and, once activated, catalyzes the attachment of poly-ADP-ribose units to a variety of nuclear proteins, including histones and PARP itself. The resultant foci of poly(ADP-ribose) has been reported to halt transcription and recruit repair enzymes to the site of DNA damage. The pivotal role of PARP in the repair of DNA strand breaks has been reported as well established. PARP-1 knockout cells can show increased sensitivity to, for example, alkylating agents, topoisomerase (topo) I inhibitors and $\gamma$-irradiation. PARP inhibitors have been reported to sensitize tumor cells to radiation treatment (including ionizing radiation and other DNA damaging treatments) and anticancer drugs (including platinum drugs, temozolomide, and topoisomerase I inhibitors). PARP inhibitors have also been reported to be effective in radiosensitizing (hypoxic) tumor cells and in preventing tumor cells from recovering from potentially lethal and sublethal damages of DNA after radiation therapy, presumably by their ability to prevent broken DNA strand from rejoining and by affecting several DNA damage signaling pathways.

PARP inhibitors have been suggested to effectively destroy tumors defective in the BRCA1 or BRCA2 genes through the concept of synthetic lethality. While tumors with wild type BRCA
genes can be insensitive to PARP inhibitors, the presence of BRCA1 or BRCA2 deficiency leads to significantly increased sensitivity of those genes to PARP inhibitors. It can be suggested that PARP inhibitors may cause an increase in DNA single-strand breaks (SSBs), which are converted during replication to toxic DNA double-strand breaks (DSBs) that cannot be repaired by homology recombination repair in $\mathrm{BRCAI} / 2$ defective cells. The synthetic lethality may have also been reported for PARP inhibitors, and ATM, ATR, RAD5 1 deficiency, and other homology recombination repair defects. PARP inhibitors can be useful for treatment of cancers with DNA repair deficiencies.

Activation of PARP may also have a role in mediating cell death. Excessive activation of PARP may have been indicated in ischemia-reperfusion injuries, and in neurological injuries that can occur during stroke, trauma and Parkinson's disease. The overactivation of PARP may lead to rapid consumption of $\mathrm{NAD}^{+}$to form ADP-ribose polymers. Because the biosynthesis of $\mathrm{NAD}^{+}$can be an ATP consuming process, the cellular level of ATP could be subsequently depleted and the ischemic cells could die from necrosis. Inhibition of PARP can be expected to reduce cell death by preserving cellular $\mathrm{NAD}^{+}$and ATP level and by preventing the activation of certain inflammation pathways that could have contributed to further cellular damage via an immune response.

It has been reported that PARP activation can play a key role in both NMDA- and NOinduced neurotoxicity. The reports were based on cortical cultures and hippocampal slices wherein prevention of toxicity can be directly correlated with PARP inhibition potency. The potential role of PARP inhibitors in treating neurodegenerative diseases and head trauma has been hypothesized.

Studies have reported that PARP inhibitors can be used for treatment and prevention of autoimmune disease such as Type I diabetes and diabetic complications \{Pharmaceutical Research (2005)52: 60-71).

PARP-3 appears to be a newly characterized member of the PARP family. A recent study has reported the role of PARP-3 in genome integrity and mitotic progression (PNAS |February 15, 2011 Ivol. 108 |no. 7 |2783-2788). PARP-3 deficiency can lead to reduced cellular response to DNA double-strand breaks. PARP-3 deficiency when combined with PARP-1/2 inhibitors can result in lowered cell survival in response to $x$-irradiation. PARP-3 can be required for mitotic spindle integrity during mitosis and telomere stability. Therefore inhibition of PARP-3 can also potentially lead to antitumor activity.

Tankyrase - 1 (TRF1-interacting ankyrin-related ADP-ribosepolymerase 1) is initially identified as a component of the human telomeric complex. Tankyrase -2 may share overall sequence identity of $83 \%$ and sequence similarity of $90 \%$ with Tankyrase -1 . Mouse genetic
studies reportedly suggest substantial functional overlaps between tankyrase -1 and tankyrase -2 . Tankyrase - 1 has reportedly been shown to be a positive regulator of telomere length, allowing elongation of the telomeres by telomerase. Inhibition of tankyrases can sensitize cells to telomerase inhibitors. Tankyrase -1 can be also required for sister telomere dissociation during mitosis. Inhibition of Tankyrase -1 by RNAi can induce mitotic arrest. Inhibition of tankyrases potentially may lead to antitumor activity.

Tankyrases have reportedly been implicated in the regulation of Wnt pathway. Wnt pathway can be negatively regulated by proteolysis of the downstream effector $\beta$-catenin by the $\beta$-catenin destruction complex, comprising adenomatous polyposis coli (APC), axin and glycogen synthase kinase $3 \alpha / \beta$ (GSIQa/ $\beta$ ). Inappropriate activation of the Wnt pathway has been reported in many cancers. Notably, truncating mutations of the tumor suppressor APC can be the most prevalent genetic alterations in colorectal carcinomas. APC mutation may lead to defective $\beta$-catenin destruction complex, accumulation of nuclear $\beta$-catenin, and/or active transcription of Wnt pathway-responsive genes. Tankyrase inhibitors have been reported to stabilize the $\beta$-catenin destruction complex by increasing axin levels. Axin, a key component of $\beta$-catenin destruction complex, can be degraded through PARylation and ubiquitination.
Inhibition of tankyrases can lead to reduced degradation of axin and/or increased level of axin. Tankyrase inhibitors have been reported to inhibit colony formation by APC-deficient colon cancer cells. Therefore, tankyrase inhibitors can be potentially useful for treatment of cancers with activated Wnt pathways.

The term "alkyl" herein refers to a hydrocarbon group selected from linear and branched saturated hydrocarbon groups comprising from 1 to 18 , such as from 1 to 12 , further such as from 1 to 6 , carbon atoms. Examples of the alkyl group can be selected from methyl, ethyl, 1propyl or n-propyl ("n-Pr"), 2-propyl or isopropyl ("i-Pr"), 1-butyl or n-butyl ("n-Bu"), 2-methyl-1-propyl or isobutyl ("i-Bu"), 1-methylpropyl or s-butyl ("s-Bu"), and 1,1-dimethylethyl or tbutyl ("t-Bu"). For example, the aryl group is selected from 5 and 6-membered carbocyclic aromatic rings fused to a 5- to 7-membered cycloalkyl or heterocyclic ring optionally comprising at least one heteroatom selected from N, O, and S, provided that the point of attachment is at the carbocyclic aromatic ring when the carbocyclic aromatic ring is fused with a heterocyclic ring, and the point of attachment can be at the carbocyclic aromatic ring or at the cycloalkyl group when the carbocyclic aromatic ring is fused with a cycloalkyl group. Bivalent radicals formed from substituted benzene derivatives and having the free valences at ring atoms are named as substituted phenylene radicals. Bivalent radicals derived from univalent polycyclic hydrocarbon radicals whose names end in "-yl" by removal of one hydrogen atom from the carbon atom with the free valence are named by adding "-idene" to the name of the corresponding univalent radical, e.g., a naphthyl group with two points of attachment is termed naphthylidene. Aryl, however, does not encompass or overlap in any way with heteroaryl, separately defined below. Hence, if one or more carbocyclic aromatic rings are fused with a heterocyclic aromatic ring, the resulting ring system is heteroaryl, not aryl, as defined herein.

The term "arylalkyl" herein refers to an alkyl group as defined above substituted by an aryl group as defined above.

The term "halogen" or "halo" herein refers to $\mathrm{F}, \mathrm{CI}, \mathrm{Br}$ or I.
The term "heteroaryl" herein refers to a group selected from:
5- to 7-membered aromatic, monocyclic rings comprising at least one heteroatom, for example, from 1 to 4 , or, in some embodiments, from 1 to 3 , heteroatoms, selected fromN, O , and S , with the remaining ring atoms being carbon;

8 - to 12 -membered bicyclic rings comprising at least one heteroatom, for example, from 1 to 4 , or, in some embodiments, from 1 to 3 , or, in other embodiments, 1 or 2 , heteroatoms, selected from $\mathrm{N}, \mathrm{O}$, and S , with the remaining ring atoms being carbon and wherein at least one ring is aromatic and at least one heteroatom is present in the aromatic ring; and

11- to 14 -membered tricyclic rings comprising at least one heteroatom, for example, from 1 to 4 , or in some embodiments, from 1 to 3 , or, in other embodiments, 1 or 2 , heteroatoms, selected from $\mathrm{N}, \mathrm{O}$, and S , with the remaining ring atoms being carbon and wherein at least one ring is aromatic and at least one heteroatom is present in an aromatic ring.

For example, the heteroaryl group includes a 5- to 7-membered heterocyclic aromatic ring fused to a 5- to 7 -membered cycloalkyl ring. For such fused, bicyclic heteroaryl ring systems wherein only one of the rings comprises at least one heteroatom, the point of attachment may be at the heteroaromatic ring or at the cycloalkyl ring.

When the total number of S and O atoms in the heteroaryl group exceeds 1, those heteroatoms are not adjacent to one another. In some embodiments, the total number of S and O atoms in the heteroaryl group is not more than 2 . In some embodiments, the total number of S and O atoms in the aromatic heterocycle is not more than 1 .

Examples of the heteroaryl group include, but are not limited to, (as numbered from the linkage position assigned priority 1) pyridyl (such as 2-pyridyl, 3-pyridyl, or 4-pyridyl), cinnolinyl, pyrazinyl, 2,4-pyrimidinyl, 3,5-pyrimidinyl, 2,4-imidazolyl, imidazopyridinyl, isoxazolyl, oxazolyl, thiazolyl, isothiazolyl, thiadiazolyl, tetrazolyl, thienyl, triazinyl, benzothienyl, furyl, benzofuryl, benzoimidazolyl, indolyl, isoindolyl, indolinyl, phthalazinyl, pyrazinyl, pyridazinyl, pyrrolyl, triazolyl, quinolinyl, isoquinolinyl, pyrazolyl, pyrrolopyridinyl (such as 1 H -pyrrolo[2,3-b]pyridin-5-yl), pyrazolopyridinyl (such as 1 H -pyrazolo[3,4-b]pyridin5 -yl), benzoxazolyl (such as benzo[d]oxazol-6-yl), pteridinyl, purinyl, 1-oxa-2,3-diazolyl, 1-oxa-2,4-diazolyl, 1-oxa-2,5-diazolyl, 1-oxa-3,4-diazolyl, 1-thia-2,3-diazolyl, 1-thia-2,4-diazolyl, 1-thia-2,5-diazolyl, l-thia-3,4-diazolyl, furazanyl, benzofurazanyl, benzothiophenyl, benzothiazolyl, benzoxazolyl, quinazolinyl, quinoxalinyl, naphthyridinyl, furopyridinyl,

The rings may be saturated or have at least one double bond (i.e. partially unsaturated). The heterocycle may be substituted with oxo. The point of the attachment may be carbon or heteroatom in the heterocyclic ring. A heterocycle is not a heteroaryl as defined herein.

Examples of the heterocycle include, but not limited to, (as numbered from the linkage position assigned priority 1) 1-pyrrolidinyl, 2-pyrrolidinyl, 2,4-imidazolidinyl, 2,3-pyrazolidinyl, 1-piperidinyl, 2-piperidinyl, 3-piperidinyl, 4-piperidinyl, 2,5-piperazinyl, pyranyl, 2-morpholinyl, 3-morpholinyl, oxiranyl, aziridinyl, thiiranyl, azetidinyl, oxetanyl, thietanyl, 1,2-dithietanyl, 1,3dithietanyl, dihydropyridinyl, tetrahydropyridinyl, thiomorpholinyl, thioxanyl, piperazinyl, homopiperazinyl, homopiperidinyl, azepanyl, oxepanyl, thiepanyl, 1,4-oxathianyl, 1,4dioxepanyl, 1,4-oxathiepanyl, 1,4-oxaazepanyl, 1,4-dithiepanyl, 1,4-thiazepanyl and 1,4diazepane 1,4-dithianyl, 1,4-azathianyl, oxazepinyl, diazepinyl, thiazepinyl, dihydrothienyl, dihydropyranyl, dihydrofuranyl, tetrahydrofuranyl, tetrahydrothienyl, tetrahydropyranyl, tetrahydrothiopyranyl,l-pyrrolinyl, 2-pyrrolinyl, 3-pyrrolinyl, indolinyl, 2H-pyranyl, 4H-pyranyl, 1,4-dioxanyl, 1,3-dioxolanyl, pyrazolinyl, pyrazolidinyl, dithianyl, dithiolanyl, pyrazolidinyl, imidazolinyl, pyrimidinonyl, 1,1-dioxo-thiomorpholinyl, 3-azabicyco[3.1.0]hexanyl, 3azabicyclo[4.1.0]heptanyl and azabicyclo[2.2.2]hexanyl. Compounds described herein may contain an asymmetric center and may thus exist as enantiomers. Where the compounds described herein possess two or more asymmetric centers, they may additionally exist as diastereomers. Enantiomers and diastereomers fall within the
broader class of stereoisomers. All such possible stereoisomers as substantially pure resolved enantiomers, racemic mixtures thereof, as well as mixtures of diastereomers are intended to be included. All stereoisomers of the compounds disclosed herein and /or pharmaceutically acceptable salts thereof are intended to be included. Unless specifically mentioned otherwise, reference to one isomer applies to any of the possible isomers. Whenever the isomeric composition is unspecified, all possible isomers are included.

The term "substantially pure" as used herein means that the target stereoisomer contains no more than $35 \%$, such as no more than $30 \%$, further such as no more than $25 \%$, even further such as no more than $20 \%$, by weight of any other stereoisomer(s). In some embodiments, the term "substantially pure" means that the target stereoisomer contains no more than $10 \%$, for example, no more than $5 \%$, such as no more than $1 \%$, by weight of any other stereoiosomer(s).

When compounds described herein contain olefmic double bonds, unless specified otherwise, such double bonds are meant to include both E and Z geometric isomers.

Some of the compounds described herein may exist with different points of attachment of hydrogen, referred to as tautomers. For example, compounds including carbonyl - $\mathrm{CH}_{2} \mathrm{C}(0)-$ groups (keto forms) may undergo tautomerism to form hydroxyl - $\mathrm{CH}=\mathrm{C}(\mathrm{OH})$ - groups (enol forms). Both keto and enol forms, individually as well as mixtures thereof, are also intended to be included where applicable.

It may be advantageous to separate reaction products from one another and /or from starting materials. The desired products of each step or series of steps is separated and /or purified (hereinafter separated) to the desired degree of homogeneity by the techniques common in the art. Typically such separations involve multiphase extraction, crystallization from a solvent or solvent mixture, distillation, sublimation, or chromatography. Chromatography can involve any number of methods including, for example: reverse-phase and normal phase; size exclusion; ion exchange; high, medium and low pressure liquid chromatography methods and apparatus; small scale analytical; simulated moving bed ("SMB") and preparative thin or thick layer chromatography, as well as techniques of small scale thin layer and flash chromatography. One skilled in the art will apply techniques most likely to achieve the desired separation.

Diastereomeric mixtures can be separated into their individual diastereomers on the basis of their physical chemical differences by methods well known to those skilled in the art, such as by chromatography and /or fractional crystallization. Enantiomers can be separated by converting the enantiomeric mixture into a diastereomeric mixture by reaction with an appropriate optically active compound (e.g., chiral auxiliary such as a chiral alcohol or Mosher's acid chloride), separating the diastereomers and converting (e.g., hydrolyzing) the individual diastereoisomers
to the corresponding pure enantiomers. Enantiomers can also be separated by use of a chiral HPLC column.

A single stereoisomer, e.g., a substantially pure enantiomer, may be obtained by resolution of the racemic mixture using a method such as formation of diastereomers using optically active resolving agents (Eliel, E. and Wilen, S. Stereochemistry of Organic Compounds. New York: John Wiley \& Sons, Inc., 1994; Lochmuller, C. H., et al. "Chromatographic resolution of enantiomers: Selective review." J. Chromatogr., 113(3) (1975): pp. 283-302). Racemic mixtures of chiral compounds of the invention can be separated and isolated by any suitable method, including: (1) formation of ionic, diastereomeric salts with chiral compounds and separation by fractional crystallization or other methods, (2) formation of diastereomeric compounds with chiral derivatizing reagents, separation of the diastereomers, and conversion to the pure stereoisomers, and (3) separation of the substantially pure or enriched stereoisomers directly under chiral conditions. Similarly, examples of pharmaceutically acceptable cations include, but are not limited to, sodium, potassium, calcium, aluminum, lithium, and ammonium.

In addition, if a compound disclosed herein is obtained as an acid addition salt, the free base can be obtained by basifying a solution of the acid salt. Conversely, if the product is a free base, an addition salt, such as a pharmaceutically acceptable addition salt, may be produced by dissolving the free base in a suitable organic solvent and treating the solution with an acid, in accordance with conventional procedures for preparing acid addition salts from base compounds. Those skilled in the art will recognize various synthetic methodologies that may be used without undue experimentation to prepare non-toxic pharmaceutically acceptable addition salts.

As defined herein, "pharmaceutically acceptable salts thereof include salts of at least one compound of Formulas I, II (including II- 1, II-2 or II-3) or III, and salts of the stereoisomers of at least one compound of Formulas I, II (including II-1, II-2 or II-3) or III, such as salts of enantiomers, and /or salts of diastereomers.
"Treating", "treat", or "treatment" or "alleviation" refers to administering at least one compound and/or at least one pharmaceutically acceptable salt thereof disclosed herein to a
subject in recognized need thereof that has, for example, cancer and/or inflammatory disease, or has a symptom of, for example, cancer and/or inflammatory disease, or has a predisposition toward, for example, cancer and/or inflammatory disease, with the purpose to cure, heal, alleviate, relieve, alter, remedy, ameliorate, improve, or affect, for example, cancer and/or inflammatory disease, the symptoms of, for example, cancer and/or inflammatory disease, or the predisposition toward, for example, cancer and/or inflammatory disease.

The term "effective amount" refers to an amount of at least one compound, stereoisomers thereof, and pharmaceutically acceptable salts thereof disclosed herein effective to "treat," as defined above, a disease or disorder in a subject. In the case of cancer, the effective amount may cause any of the changes observable or measurable in a subject as described in the definition of "treating," "treat,""treatment" and "alleviation" above. For example, the effective amount can reduce the number of cancer or tumor cells; reduce the tumor size; inhibit or stop tumor cell infiltration into peripheral organs including, for example, the spread of tumor into soft tissue and bone; inhibit and stop tumor metastasis; inhibit and stop tumor growth; relieve to some extent one or more of the symptoms associated with the cancer, reduce morbidity and mortality; improve quality of life; or a combination of such effects. An effective amount may be an amount sufficient to decrease the symptoms of a disease responsive to inhibition of PARP. For cancer therapy, efficacy in vivo can, for example, be measured by assessing the duration of survival, time to disease progression (TTP), the response rates (RR), duration of response, and/or quality of life. Effective amounts may vary, as recognized by those skilled in the art, depending on route of administration, excipient usage, and co-usage with other agents.

The term "inhibition" indicates a decrease in the baseline activity of a biological activity or process. "Inhibition of PARP" refers to a decrease in the activity of PARP as a direct or indirect response to the presence of at least one compound and/or at least one pharmaceutically acceptable salt disclosed herein, relative to the activity of PARP in the absence of the at least one compound and/or the at least one pharmaceutically acceptable salt thereof. The decrease in activity is not bound by theory and may be due to the direct interaction of the at least one compound, stereoisomers thereof, and pharmaceutically acceptable salts thereof disclosed herein with PARP, or due to the interaction of the at least one compound and/or at least one pharmaceutically acceptable salt disclosed herein, with one or more other factors that in turn affect PARP activity. For example, the presence of at least one compound, stereoisomers thereof, and pharmaceutically acceptable salts thereof disclosed herein, may decrease PARP activity by directly binding to the PARP, by causing (directly or indirectly) another factor to decrease PARP activity, or by (directly or indirectly) decreasing the amount of PARP present in the cell or organism.

GENERAL SYNTHETIC SHEMES
The compounds disclosed herein, and/or the pharmaceutically acceptable salts thereof, can be synthesized from commercially available starting materials taken together with the disclosure herein. The following schemes illustrate methods for preparation of some of the compounds disclosed herein.

Scheme 1

$L v=B r, I, O T f$

4
I, II or III

In this scheme, an alkyl 3-amino-2-Lv-benzoate ( $\mathrm{Lv}=$ leaving group, such as $\mathrm{Br}, \mathrm{I}, \mathrm{OTf}$ ) of formula 1 is reacted with a cyclic 1,3-carbonyls of formula 2 to provide an enaminone of formula 3. The subsequent cyclization under a catalyst, such as palladium, gives an alkyl oxocarbazole carboxylate of formula 4 which is subsequently cyclized with hydrazine to provide the diazepinocarbazolone derivative of Formula (I), (II) or (III).

The first step of this scheme can be conducted in Dean-Stark apparatus in a solvent such as tolueneunder reflux. The resulting enaminone of formula 3 is purified on a flash column.

The second step of this sequence can beconductedusing a palladium/phosphine catalyst at elevated temperature in acetonitrile or DMF and this intramolecular Heck reaction (Bozell, J. J., Hegedus, L. S. J. Org. Chem.1981, 46, 2561; Maruyama, J., Yamashida, H., Watanabe, T., Arai, S., Nishida, A. Tetrahedron 2009, 65, 1327, incorporated herein by reference) can beusually completed in about 5-24 hours. The alkyl oxocarbazole carboxylate of formula 4 can be then isolated using standard conditions for the workup and it may be purified by either chromatographic methods or by recrystallization.

The third step of the synthesis of the novel compounds of Formula (I) is an intermolecular cyclization reaction of a compound of formula 4 to provide the diazepinocarbazolone derivativeof Formula (I), (II) or (III) as shown Scheme 1. This cyclization reaction can be typically conducted using 1-2 equivalents of hydrous hydrazine and the appropriate alcohol as solvent. The cyclization reaction can be typically conducted at a temperature ranging from $50^{\circ} \mathrm{C}$ to the refluxing temperature of the alcohol and it can be completed, for instance, in 0.25 to 4 hours.

The synthesis of some of the compounds of Formula (III) can be described in Scheme 2. The compound of formula a which is also a compound of Formula (III), can be prepared according to Scheme 1.

Scheme 2

The compound of formula $a$ is de-protected to give a compound of formula $b$ (which is also a compound of Formula (III)). Further reaction of the compound of formula $b$ with electrophile such as alkyl halide, aryl halides, acids, acyl chlorides, sulfonyl chlorides, aldehyde, ketone, etc, gives some of the compounds of Formula (III) under the corresponding alkylation, coupling, or reductive alkylation conditions.

## EXAMPLES

The examples below are intended to be purely exemplary and should not be considered to be limiting in any way. Efforts have been made to ensure accuracy with respect to numbers used (for example, amounts, temperature, etc.), but some experimental errors and deviations should be accounted for. Unless indicated otherwise, temperature is in degrees Centigrade. Reagents were purchased from commercial suppliers such as Sigma-Aldrich, Alfa Aesar, or TCI, and were used without further purification unless indicated otherwise.

Unless indicated otherwise, the reactions set forth below were performed under a positive pressure of nitrogen or argon or with a drying tube in anhydrous solvents; the reaction flasks were fitted with rubber septa for the introduction of substrates and reagents via syringe; and glassware was oven dried and/or heat dried.

Unless otherwise indicated, column chromatography purification was conducted on a Biotage system (Manufacturer: Dyax Corporation) having a silica gel column or on a silica SepPak cartridge (Waters), or was conducted on a Teledyne Isco Combiflash purification system using prepacked silica gel cartridges.

H NMR spectra were recorded on a Varian instrument operating at 400 MHz . ${ }^{1} \mathrm{HNMR}$ spectra were obtained using $\mathrm{CDC1}_{3}, \mathrm{CD}_{2} \mathrm{C} 1_{2}, \mathrm{CD}_{3} \mathrm{OD}, \mathrm{D}_{2} 0, \mathrm{~d}_{6}$ - DMSO , $\mathrm{d}_{6}$-acetone or $\left(\mathrm{CD}_{3}\right)_{2} \mathrm{CO}$ as solvent and tetramethylsilane ( 0.00 ppm ) or residual solvent $\left(\mathrm{CDC1}_{3}: 7.25 \mathrm{ppm} ; \mathrm{CD}_{3} \mathrm{OD}: 3.31\right.$ ppm; $\mathrm{D}_{2} 0: 4.79 \mathrm{ppm} ; \mathrm{d}_{6}$-DMSO: $2.50 \mathrm{ppm} ; \mathrm{d}_{6}$-acetone: 2.05; (CD3)2CO: 2.05) as the reference standard. When peak multiplicities are reported, the following abbreviations are used: s (singlet), d (doublet), t (triplet), q (quartet), $q \mathrm{n}$ (quintuplet), sx (sextuplet), m (multiplet), br (broadened), dd (doublet of doublets), dt (doublet of triplets). Coupling constants, when given, are reported in Hertz (Hz). All compound names except the reagents were generated by Chemdraw version 12.0.

Example 1: Synthesis of Compounds 1-19

Compound $\quad$ : 2,3,5, 10 -tetrahy dro-[1,2]diazepino[3,4,5,6-i $e f]$ carbazol-6( $1 \boldsymbol{H}$ )-one

Step 1: Methyl 2-bromo-3-((3-oxocyclohex-l-en-l-yl)amino)benzoate

Methyl 3-amino-2-bromobenzoate ( $2.39 \mathrm{~g}, 10.0 \mathrm{mmol}$ ) and cyclohexane-1,3-dione ( 1.12 g , 10.0 mmol ) were dissolved in 10 mL of acetic acid at $25^{\circ} \mathrm{C}$, under nitrogen. The mixture was stirred at $80^{\circ} \mathrm{C}$ for 8 hours. The resultant solid was purified by chromatography column on silica gel (elution with hexane/ethyl acetate) to afford $2.46 \mathrm{~g}(76 \%)$ of methyl 2-bromo-3-((3-oxocyclohex-l-en-l-yl)amino)benzoate as a tan foam. H NMR ( $\mathrm{CDCl}_{3}$-dl) $\delta 7.53-7.55(\mathrm{~m}, 2 \mathrm{H})$, $7.37(\mathrm{dd}, 1 \mathrm{H}, \mathrm{J}=7.2,8.4 \mathrm{~Hz}$ ), $6.34(\mathrm{br} \mathrm{s}, 1 \mathrm{H}), 5.57$ (s, 1H), 3.95 (s, 3H), 2.56-2.59 (m, 2H), 2.40$2.42(\mathrm{~m}, 2 \mathrm{H})$, and 2.08-2.1 $1(\mathrm{~m}, 2 \mathrm{H}) . \mathrm{MS}$ (ESI) m/e $[\mathrm{M}+1]+324.0$.

## Sten 2: Methvl 4-oxo-2.3.4.9-tetrahvdro-1H-carbazole-5-carboxvlate

A mixture of methyl 2-bromo-3-(3-oxocyclohex-l-enylamino)benzoate $\quad(0.97 \mathrm{~g}, 3.0 \mathrm{mmol})$, palladium acetate $(0.14 \mathrm{~g}, 0.6 \mathrm{mmol})$, tri-o-tolylphosphine $(0.73 \mathrm{~g}, 2.4 \mathrm{mmol})$, and triethylamine $(0.38 \mathrm{~g}, 3.6 \mathrm{mmol})$ in acetonitrile $(10 \mathrm{~mL})$ was heated in a sealed tubule flushed with nitrogen at $100^{\circ} \mathrm{C}$ for 20 h . The cooled reaction mixture was diluted with DCM ( $3 \times 50 \mathrm{~mL}$ ) and water ( 10 $\mathrm{mL})$. The organic layer was separated, washed with water, dried $\left(\mathrm{Na}_{2} \mathrm{SO}{ }_{4}\right)$, and concentrated. The remaining residue was chromatographed on silica gel, eluted with gradient 0-100\% EtOAc in hexane to afford the title compound $(0.61 \mathrm{~g}, 84 \%)$. H NMR ( $\mathrm{CDCl}_{3}$-dl) $\delta 9.47$ (s, 1H), 7.36$7.40(\mathrm{~m}, 2 \mathrm{H}), 7.22(\mathrm{t}, 1 \mathrm{H}, \mathrm{J}=7.8 \mathrm{~Hz}), 2.90-2.92(\mathrm{~m}, 2 \mathrm{H}), 2.51-2.54(\mathrm{~m}, 2 \mathrm{H})$, and 2.14-2.16 (m, 2H).MS (ESI) m/e $[\mathrm{M}+\mathrm{l}]+244.0$.

## Biological Activity

PARP-1 enzymatic assay
PARP-1 enzymatic assay was conducted using a method modified from HT F Homogeneous PARP Inhibition Assay Kit (Trevigen). 8.8 nM PARP-1 was pre-incubated with different concentrations of compounds in a buffer containing 100 mM Tris-HCl pH 8.0, 100 mM $\mathrm{NaCl}, 20 \mathrm{mM} \mathrm{MgCl} 2$, and $1 \%$ DMSO for 30 min at RT. The auto-PARylation reaction was initiated by addition of 500 nM NAD and $20 \mathrm{ng} / \mathrm{ul}$ activated DNA (Sigma) and incubated at RT for 40 min . The remaining NAD was detected by incubation with cycling assay solution containing $1 \%$ ethanol, $0.30 \mathrm{U} / \mathrm{ml}$ alcohol dehydrogenase, 25 uM resazurin, and $0.25 \mathrm{U} / \mathrm{ml}$ diaphorase for 50 min at RT. The concentration of NAD is proportional to the fluorescence signal at Ex540nm/Em 590nm. The IC50S were calculated based on residual enzyme activity (the rate of NAD decrease) in presence of increasing concentrations of compounds.

PARP-2 and PARP-3 enzymatic assay
PARP-2 and PARP-3 enzymatic assays were conducted using commercial PARP-2/PARP-3 Chemiluminescent Assay Kit (BPS Biosciences) and the protocols with the kits. Briefly,
histones were coated in a high binding plate first, and incubated with PARP-2 or PARP-3, and increasing concentrations of compounds for 0.5 h . Then, biotinylated NAD and activated DNA were added to the wells. The biotinylated PARylation product was measured by adding streptavidin-HRP and HRP substrates which produce chemiluminescence. The IC50S were calculated based on residual enzyme activity in presence of increasing concentrations of compounds.

Tankyrase-2 enzymatic assay
Tankyrase-2 enzymatic assay was conducted using commercial Tankyrase-2
Chemiluminescent Assay Kit (BPS Biosciences) and the protocol with the kit. GST-fused tankyrase-2 (recombinant protein expressed and purified from Bacluovirus) were coated on a GSH-precoated plate first, and incubated with increasing concentrations of compounds for 0.5 h . Then, biotinylated NAD was added to the wells. The biotinylated auto-PARylation product was measured by adding streptavidin-HRP and HRP substrates which produce chemiluminescence. The IC50S were calculated based on residual enzyme activity in presence of increasing concentrations of compounds.

## PARylation Assay.

HeLa cells were seeded into a 96 -wellplate with clear bottom and black wall at an initial concentration of 5000 cells/well in culture medium ( $100 \mu \mathrm{~L}$ of DMEM containing $10 \%$ FBS, 0.1 $\mathrm{mg} / \mathrm{rnL}$ penicillin-streptomycin, and 2 mML -glutamine). The plates were incubated for 4 h at 37 ${ }^{\circ} \mathrm{C}$ under5\% $\mathrm{C}_{2}$ atmosphere, and then compounds were added with serial dilutions over eight points over a $0.01 \mathrm{nM}-10 \mu \mathrm{M}$ final concentration range in $0.1 \% \mathrm{DMSO} /$ culture medium. The plate was then incubated for 18 h at $37{ }^{\circ} \mathrm{C}$ in $5 \% \mathrm{C}_{2}$. Then DNA damage was provoked by addition of $60 \mu \mathrm{Lof} \mathrm{H}_{2} \mathrm{O}_{2}$ solution in PBS (final concentration $200 \mu \mathrm{M}$ ). As a negative control, cells untreated with $\mathrm{H}_{2} \mathrm{O}_{2}$ were used. The plate was kept at $37{ }^{\circ} \mathrm{C}$ for 5 min . Then the medium was gently removed by plate inversion, and the cells were fixed by addition of ice-cold MeOH ( $100 \mu \mathrm{~L} /$ weeII) and kept at $-20^{\circ} \mathrm{C}$ for 20 min . After removal of the fixative by plate inversion and washinglO times with PBS ( $120 \mu \mathrm{~L}$ ), the detection buffer ( $50 \mu \mathrm{~L} /$ weII, containing PBS, Tween $(0.1 \%)$, and BSA ( $1 \mathrm{mg} / \mathrm{mL}$ )) together with the primary PAR mAb (Alexis ALX-804-220, 1:2000), the secondary anti-mouse Alexa Fluor 488 antibody (MolecularProbes A1 1029, 1:2000), and nuclear dye DAPI (Molecular Probes D3571, 150nM) were added. Following overnight incubation at $4{ }^{\circ} \mathrm{C}$ in the dark, removal of the solution, and washing 6 times with PBS $(120 \mu \mathrm{~L})$, the plate was read on an Array Scan VTI (ThermoFisher). Monitoring for PAR polymer was by detection ofAlexa488 at XF100_485_20, exposure time of 0.05 s , and identification of the nuclei
was by tracking DAPI with XF100_386_23, exposure time of 0.01 s . The mean of total intensity of cells was calculated by measuring the average of total intensity of nuclei over the total number of DAPI-labeled nuclei. The EC50 was determined on the basis of the residual enzyme activity in the presence of increasing PARPi concentration.

Compounds 1-69 as disclosed herein were tested and found to inhibit PARP, such as PARP1, PARP -2, PARP-3, and Tankyrase-2, with $\mathrm{IC}_{50}$ values ranging from subnanomolar to 10 micromolar.
