PROCESSES FOR PREPARING PYRAZOLO[3,4-d]PYRIMIDINE ETHERS

FIELD OF THE INVENTION

5 The present invention relates to processes for preparing pyrazolo[3,4-d]pyrimidine ether compounds that are modulators of glucose metabolism and therefore useful in the treatment of metabolic disorders such as diabetes and obesity.

BACKGROUND OF THE INVENTION

10 Modulation of G-protein coupled receptors has been well-studied for controlling various metabolic disorders. Small molecule modulators of the receptor RUP3, a G-protein coupled-receptor described in, for example, GenBank (see, e.g., accession numbers XM_066873 and AY288416), have been shown to be useful for treating or preventing certain metabolic disorders. In particular, pyrazolo[3,4-d]pyrimidine ethers and similar compounds, which are described in U.S. Ser. No.
 15 10/890,549 are shown to be effective modulators of the RUP3 receptor and are useful in the treatment of various metabolic-related disorders such as type I diabetes, type II diabetes, inadequate glucose tolerance, insulin resistance, hyperglycemia, hyperlipidemia, hypertriglyceridemia, hypercholesterolemia, dyslipidemia or syndrome X. The aromatic ethers are also useful in controlling weight gain, controlling food intake, and inducing satiety in mammals. The promising nature of these
 20 RUP3 modulators in treating or preventing a number of common diseases evidences a need for more efficient processes of making these compounds. The processes described herein are directed toward this and other current needs.

10 *Embodiments of Scheme I*

The present invention provides, *inter alia*, processes for preparing compounds of Formula I:

I

by reacting a compound of Formula II:

II

with a compound of Formula III:

III

in the presence of a trisubstituted phosphine and a compound having the Formula A':

wherein R' and R'' are each, independently, C₁₋₁₀ alkyl or C₃₋₇ cycloalkyl; to form the compound of Formula I.

The trisubstituted phosphine can be any suitable tertiary phosphine such as a phosphine having the formula P(R)₃, where each R is, independently, C₁₋₈ alkyl, aryl, cycloalkyl, heteroaryl, heterocyclic, arylalkyl, cycloalkylalkyl, heteroarylalkyl, or heterocyclicalkyl, each of which can be substituted by one or more halo, C₁₋₄ alkyl, C₁₋₄ haloalkyl, C₁₋₄ alkoxy, or C₁₋₄ haloalkoxy. In some embodiments, the trisubstituted phosphine is a triarylphosphine. In some embodiments, the trisubstituted phosphine is triphenylphosphine.

A suitable compound of Formula A' can be readily selected by the skilled artisan. In some embodiments, R' and R'' are each, independently, C₁₋₁₀ alkyl. In further embodiments, R' and R'' are each, independently, C₁₋₄ alkyl. In yet further embodiments, R' and R'' are both prop-2-yl.

In some embodiments, the compound of Formula III is added to a mixture containing the compound of Formula II, the compound of Formula A', and the trisubstituted phosphine. Additional portions of phosphine and/or additional portions of the compound of Formula A' can be added after the initial reacting. In some embodiments, the total amount of phosphine is added in two or more portions. In some embodiments, the total amount of compound of Formula A' is added in two or more portions.

The reacting of II with III can be carried out at any suitable temperature. In some embodiments, the reacting is carried out at a temperature of about 35 to about 65, about 40 to about 60, or about 45 to about 55 °C.

The reacting of II with III can also be optionally carried out in a solvent. Suitable solvents can be readily selected by the skilled artisan. Example solvents include polar to moderately polar solvents or high boiling solvents such as dimethylformamide (DMF), dimethylacetamide (DMA), toluene, acetonitrile, propionitrile, tetrahydrofuran (THF), N-methylpyrrolidine (NMP), or tertiary amines including cyclic amines. In some embodiments, the solvent includes a cyclic amine. In some embodiments, the cyclic amine is an N-alkylated morpholine such as 4-methylmorpholine.

The reacting of II with III can be carried out where the molar ratio of compound of Formula A' to compound of Formula II is about 2:1 to about 1:1, about 1.8:1 to about 1.2:1; or about 1.8:1 to about 1.5:1. In some embodiments, the molar ratio of trisubstituted phosphine to compound of Formula II is about 2:1 to about 1:1, 1.8:1 to about 1.2:1, or about 1.8:1 to about 1.5:1. In further embodiments, the molar ratio of compound of Formula A' to trisubstituted phosphine is about

1:1. In yet further embodiments, the molar ratio of compound of Formula II to compound of Formula III is about 1:1.

In some embodiments, the reacting of II with III can result in the formation of a byproduct which is a structural isomer (e.g., has the same molecular weight) of the compound of Formula I.

5 Accordingly, bulk samples of Formula I made by the processes described herein can contain a compound which is a structural isomer of the compound of Formula I. The amount of structural isomer byproduct in preparations of Formula I can be, for example, less than about 5%, less than about 3%, less than about 2%, less than about 1%, less than about 0.5%, less than about 0.2%, less than about 0.1%, less than about 0.05%, less than about 0.02%, or less than about 0.01% by weight in
10 the bulk sample.

The present invention further provides processes for preparing a compound of Formula II by reacting a compound of Formula IV:

15 with R^5CO_2H to form the compound of Formula II.

The reacting of IV with acid R^5CO_2H can be optionally carried out in the presence of any suitable solvent readily selected by the skilled artisan. In some embodiments, the solvent is a polar solvent and/or a high boiling solvent (e.g., boils above 100 °C). Example suitable solvents include an aqueous solvent (water or water mixture containing greater than about 5 wt% water),
20 dimethylsulfoxide (DMSO), dimethylformamide (DMF), dimethylacetamide (DMA), N-methylpyrrolidine (NMP), propionitrile, and the like. In some embodiments, the solvent is an aqueous solvent such as water.

The reacting of IV with acid R^5CO_2H can be optionally carried out in the presence of a strong acid, for example, sulfuric acid. In some embodiments, the strong acid is present from about 0.5
25 equivalents to about 3 equivalents compared to a compound of Formula IV. In further embodiments, the strong acid is present from about 1 equivalent to about 2.5 equivalents compared to a compound of Formula IV. In yet further embodiments, the strong acid is present in about 2 equivalents compared to a compound of Formula IV. In certain embodiments, the presence of the strong acid reduces the reaction time by a factor of about 7 to about 4 compared to the reaction time in the
30 absence of strong acid.

The reacting of IV with acid R^5CO_2H can be carried out at any suitable temperature. For example, the reaction can be carried out at elevated temperature for at least a portion of the reacting. In some embodiments, the temperature is reflux temperature. In further embodiments, the reaction is carried out at a temperature of about 80 to about 120 °C. In yet further embodiments, the reaction is carried out at a temperature of about 80 to about 120 °C and then the resulting mixture is cooled to about -20 to about 20 °C. The cooling process can be relatively rapid, cooling the mixture in less than about 2, less than about 1, or less than about 0.5 hours.

While not wishing to be bound by theory, it is believed that the relatively rapid cooling substantially prevents or inhibits the hydrolysis of the bicyclic product II, which is a competing reaction that appears to be favored at intermediate temperatures (e.g., 70-80 °C). An example byproduct of hydrolysis of II is shown in Formula IIb:

IIb.

In some embodiments, bulk samples of the compound of Formula II made by the processes described herein can contain a detectable amount of compound of Formula IIb. For example, product formation can be monitored by spectroscopic means, such as nuclear magnetic resonance spectroscopy (e.g., ¹H or ¹³C) infrared spectroscopy, spectrophotometry (e.g., UV-visible), or mass spectrometry, or by chromatography such as high performance liquid chromatography (HPLC) or thin layer chromatography.

25 In some embodiments, preparation of compounds can involve the protection and deprotection of various chemical groups. The need for protection and deprotection, and the selection of appropriate protecting groups can be readily determined by one skilled in the art. The chemistry of protecting groups can be found, for example, in Greene and Wuts, et al., *Protective Groups in Organic Synthesis*, 3rd. Ed., Wiley & Sons, 1999, which is incorporated herein by reference in its entirety.

30 The reactions of the processes described herein can be carried out in suitable solvents which can be readily selected by one of skill in the art of organic synthesis. Suitable solvents can be

substantially nonreactive with the starting materials (reactants), the intermediates, or products at the temperatures at which the reactions are carried out, e.g., temperatures which can range from the solvent's freezing temperature to the solvent's boiling temperature. A given reaction can be carried out in one solvent or a mixture of more than one solvent. Depending on the particular reaction step, suitable solvents for a particular reaction step can be selected. The reactions of the processes described herein can be carried out at appropriate temperatures which can be readily determined by the skilled artisan. Reaction temperatures will depend on, for example, the melting and boiling points of the reagents and solvent, if present; the thermodynamics of

the reaction (e.g., vigorously exothermic reactions may need to be carried out at reduced temperatures); and the kinetics of the reaction (e.g., a high activation energy barrier may need elevated temperatures). "Elevated temperature" refers to temperatures above room temperature (about 25 °C) and "reduced temperature" refers to temperatures below room temperature.

5 The reactions of the processes described herein can be carried out in air or under an inert atmosphere. Typically, reactions containing reagents or products that are substantially reactive with air can be carried out using air-sensitive synthetic techniques that are well known to the skilled artisan.

10 In some embodiments, preparation of compounds can involve the addition of acids or bases to effect, for example, catalysis of a desired reaction or formation of salt forms such as acid addition salts.

15 Example acids can be inorganic or organic acids. Inorganic acids include hydrochloric acid, hydrobromic acid, sulfuric acid, phosphoric acid, and nitric acid. Organic acids include formic acid, acetic acid, propionic acid, butanoic acid, methanesulfonic acid, p-toluene sulfonic acid, benzenesulfonic acid, trifluoroacetic acid, propiolic acid, butyric acid, 2-butyric acid, vinyl acetic acid, pentanoic acid, hexanoic acid, heptanoic acid, octanoic acid, nonanoic acid and decanoic acid.

25 The compounds described herein can be asymmetric (e.g., having one or more stereocenters). All stereoisomers, such as enantiomers and diastereomers, are intended unless otherwise indicated. Compounds of the present invention that contain asymmetrically substituted carbon atoms can be isolated in optically active or racemic forms. Methods on how to prepare optically active forms from optically active starting materials are known in the art, such as by resolution of racemic mixtures or
30 by stereoselective synthesis.

35 The processes described herein can be stereoselective such that any given reaction starting with one or more chiral reagents enriched in one stereoisomer forms a product that is also enriched in one stereoisomer. The reaction can be conducted such that the product of the reaction substantially retains one or more chiral centers present in the starting materials. The reaction can also be conducted such that the product of the reaction contains a chiral center that is substantially inverted relative to a corresponding chiral center present in the starting materials.

Resolution of racemic mixtures of compounds can be carried out by any of numerous methods known in the art. An example method includes fractional recrystallizaion using a "chiral resolving acid" which is an optically active, salt-forming organic acid. Suitable resolving agents for fractional recrystallization methods are, for example, optically active acids, such as the D and L forms of tartaric acid, diacetyltartaric acid, dibenzoyltartaric acid, mandelic acid, malic acid, lactic acid or the various optically active camphorsulfonic acids such as α -camphorsulfonic acid. Other resolving agents suitable for fractional crystallization methods include stereoisomerically pure forms of α -methylbenzylamine (e.g., *S* and *R* forms, or diastereomerically pure forms), 2-phenylglycinol, norephedrine, ephedrine, N-methylephedrine, cyclohexylethylamine, 1,2-diaminocyclohexane, and the like.

Resolution of racemic mixtures can also be carried out by elution on a column packed with an optically active resolving agent (e.g., dinitrobenzoylphenylglycine). Suitable elution solvent composition can be determined by one skilled in the art.

Compounds according to the invention can also include all isotopes of atoms occurring in the intermediates or final compounds. Isotopes include those atoms having the same atomic number but different mass numbers. For example, isotopes of hydrogen include tritium and deuterium.

Compounds according to the invention can also include tautomeric forms, such as keto-enol tautomers. Tautomeric forms can be in equilibrium or sterically locked into one form by appropriate substitution.

The present invention also includes salt forms of the compounds described herein. Examples of salts (or salt forms) include, but are not limited to, mineral or organic acid salts of basic residues such as amines, alkali or organic salts of acidic residues such as carboxylic acids, and the like. Generally, the salt forms can be prepared by reacting the free base or acid with stoichiometric amounts or with an excess of the desired salt-forming inorganic or organic acid or base in a suitable solvent or various combinations of solvents. Lists of suitable salts are found in *Remington's Pharmaceutical Sciences*, 17th ed., Mack Publishing Company, Easton, Pa., 1985, p. 1418 and *Journal of Pharmaceutical Science*, 66, 2 (1977), each of which is incorporated herein by reference in its entirety.

Upon carrying out preparation of compounds according to the processes described herein, the usual isolation and purification operations such as concentration, filtration, extraction, solid-phase extraction, recrystallization, chromatography, and the like may be used, to isolate the desired products.

The invention will be described in greater detail by way of specific examples. The following examples are offered for illustrative purposes, and are not intended to limit the invention in any manner. Those of skill in the art will readily recognize a variety of noncritical parameters which can be changed or modified to yield essentially the same results.

EXAMPLES

Example 1

Preparation of 5-Amino-1-(2-fluoro-4-methanesulfonyl-phenyl)-1H-pyrazole-4-carbonitrile (3)

5 To a stirred suspension of 2-fluoro-4-methylsulfonylphenyl hydrazine (1) (4.0336 Kg; 1 eq) (commercially available from, e.g., Peakdale Molecular, Ltd.) in methanol (12.7723 Kg) was added a suspension of ethoxymethylene malononitrile (2.6564 Kg, 1.101 equivalents) in methanol (11.212 Kg) at a rate sufficiently slow to maintain the reaction mixture at -10° to 0° C with reactor jacket cooling. After the addition had been completed, the reaction mixture was stirred for 1 hour at -6° C

10 and then heated to reflux for 5 hours, at which time the reaction mixture gave a pyrazole (3) : hydrazine (1) HPLC peak area ratio of 105:1. Solvent (20.5153 Kg) was then distilled off the reaction mixture at atmospheric pressure, leaving a residue having less than 20% of the original volume. The resulting mixture was used directly in the next step.

15 Example 2

Example 2A: Preparation of 1-(2-fluoro-4-methanesulfonyl-phenyl)-1,5-dihydro-pyrazolo[3,4-d]pyrimidin-4-one (4)

20 To the concentrated reaction mixture from Example 1 containing pyrazole (3) was added formic acid (36.3924 Kg, 40.0 equivalents) and then water (2.832 Kg) at a rate sufficiently slow to maintain the reaction mixture at 25° to 35° C with reactor jacket cooling. After an additional 6.345 Kg of solvent had been distilled off the stirred reaction mixture at atmospheric pressure, more formic acid (1.8245 Kg) and then more water (0.564 Kg) were added at a rate sufficiently slow to maintain

the reaction mixture at 25° to 35° C with reactor jacket cooling. A small amount of remaining volatiles were then distilled off the stirred reaction mixture at atmospheric pressure until a reflux temperature of 100° C was achieved. After six hours of reflux, the reaction mixture gave a product (4):pyrazole (3) HPLC peak area ratio of 670 :1. The only other detectable component had an HPLC peak area 0.41% of that for product (4). After the reaction mixture is cooled from reflux to 0° C in 70 minutes, water (10.0 Kg) is added, and the precipitated product is filtered, washed with 20° C water (about 40 Kg) until the pH of the wash filtrate is at least 5, and then dried to constant weight at 45° C, ≤ 40 torr to provide product (4).

Example 2B: Preparation of 1-(2-fluoro-4-methanesulfonyl-phenyl)-1,5-dihydro-pyrazolo[3,4-d]pyrimidin-4-one (4)

A similar preparation of (4) was carried out where the refluxed reaction mixture was held at a holding temperature of about 70-80 °C overnight after achieving complete conversion to (4) (>99%). In this preparation, an impurity identified as 5-amino-1-(2-fluoro-4-methanesulfonyl-phenyl)-1H-pyrazole-4-carboxylic acid amide was detected at about 30% (HPLC % peak area). This impure preparation of 4 containing 4a (5.01 g) was purified by additional refluxing in formic acid (25 mL) for about 7 h. After each hour of refluxing, a sample was collected. Each sample revealed the presence of 4a as well as about an equal amount of 1-(2-fluoro-4-methanesulfonyl-phenyl)-5-formylamino-1H-pyrazole-4-carboxylic acid amide; however the total amount of impurity decreased during the course of the refluxing until essentially complete conversion was achieved after 7 hours.

Example 2C: Preparation of 1-(2-Fluoro-4-methanesulfonyl-phenyl)-1,7-dihydro-pyrazolo[3,4-d]pyrimidin-4-one (4)

To a one liter, bottom discharge jacketed glass reactor equipped with overhead agitation, reflux condenser and nitrogen blanket bubbler was added (2-fluoro-4-methanesulfonyl-phenyl)-hydrazine (50.0 g, 0.244 mol) with the aid of methanol (200 mL, 4 vol Eq.). The resulting reaction mixture was a light slurry and subsequently cooled to -5°C. In a separate vessel was made a suspension of ethoxymethylene malononitrile (EMM) (32.9 g, 0.270 mol) in methanol (205 mL, 4.1 Vol. Eq.). The resulting EMM/MeOH suspension was added dropwise to the reaction containing (2-

fluoro-4-methanesulfonyl-phenyl)-hydrazine at a rate that maintains the reaction temperature at about -5°C. The reaction mixture was then held at about -5°C until all of the starting material ((2-fluoro-4-methanesulfonyl-phenyl)-hydrazine) was consumed, typically about 2-4 hrs. The resulting reaction mixture was heated to reflux for about 2-4 hours until complete conversion to intermediate 5-amino-1-(2-fluoro-4-methanesulfonyl-phenyl)-1H-pyrazole-4-carbonitrile (shown in bracket above) is greater than 99%. The reaction mixture was then stripped to near dryness under full house vacuum (<20 torr) with a maximum jacket temperature of 65°C to afford a soft orange solid. The solid was then dissolved in formic acid (250 mL, 5 Vol. Eq.) and sulfuric acid (24.0 g, 0.245 mol) yielding a dark red transparent solution. The solution was heated to reflux (105-110°C) and held until reaction was complete (about 4-5 hrs). The addition of sulfuric acid showed nearly complete conversion of intermediate 5-amino-1-(2-fluoro-4-methanesulfonyl-phenyl)-1H-pyrazole-4-carbonitrile to another intermediate 5-amino-1-(2-fluoro-4-methanesulfonyl-phenyl)-1H-pyrazole-4-carboxylic acid amide as well as the title compound in one hour with no unknown intermediate (m/z 327 ($m + H$)⁺) present. The disappearance of 5-amino-1-(2-fluoro-4-methanesulfonyl-phenyl)-1H-pyrazole-4-carboxylic acid amide and appearance of the title compound was then followed until the reaction was complete. After the reaction was complete, the reaction mixture was cooled to 65°C and water (100 mL, 2 Vol Eq.) was slowly added to aid in product precipitation. Water was added slowly as it was slightly exothermic, also rapid addition will make reaction mixture very thick. Slower addition maintains reaction stirrability. Higher temperature additions may alleviate any stirring problems. The reaction was allowed to stir for 1-2 hrs at 20-25°C and was filtered. Filtration was quite rapid. Cooling to 0-5°C may aid in additional yield. The cake was washed with water (2 x 100 mL) followed by sodium bicarbonate (aqueous 5%, 1 x 150 mL) to neutralize residual acid. Cake was again washed with water (1 x 150 mL) and dried overnight, 65°C, full house vacuum (<20 torr) to afford 67.4 grams of dried light tan/white of the title compound @ about 100.0% HPLC purity. The overall molar yield was 89.2%.

Example 3

Preparation of 4-Hydroxy-Piperidine-1-Carboxylic Acid Isopropyl Ester (5)

To a stirred mixture of 4-hydroxypiperidine (53.8 g, 1.000 eq), triethylamine (71.8 g, 1.334 equivalents), and ethyl acetate (498.8 g) was added neat isopropyl chloroformate (78.0 g, 1.1966 equivalents) at a rate sufficiently slow to maintain the reaction mixture temperature at 10° – 17 °C

with reactor jacket cooling. After the addition had been completed, the reaction mixture was stirred at 20° C for 18 hours. Then water (100 g) was added, and the resulting mixture was stirred for 15 minutes before the phases were separated. The organic phase was washed with two 100-gram-
 5 portions of 20 wt% aqueous NaCl by stirring for 15 min at 150 rpm before separating the aqueous wash. After a final wash with water (100 g), the organic phase was concentrated by distillation on a rotary evaporator at reduced pressure to provide product (2) (91.1 g, 92.0 % yield) as light amber oil of 96.8 % purity by GC. Distillation of this crude product at 117-120° C, 0.3-1.0 torr gave a 95.7 % recovery of product (2) as a colorless oil collected at 112° -119° C.

Example 4

Preparation of 4-[1-(2-Fluoro-4-methanesulfonyl-phenyl)-1H-pyrazolo[3,4-d]pyrimidin-4-yloxy]-piperidine-1-carboxylic acid isopropyl ester (6)

15

Diisopropyl azodicarboxylate (2.9812 Kg, 1.1713 equivalents) was added to a stirred suspension of (4) (3.8806 Kg, 1.000 equivalent), triphenylphosphine (3.8532 Kg, 1.1671 equivalents), and 4-methylmorpholine (24.7942 Kg) at a rate sufficiently slow to maintain the reaction mixture at 20-30° C with reactor jacket cooling. The resulting suspension was stirred for 30 minutes at about 25
 20 °C and then heated to 50-55° C for about two hours. A solution of 4-hydroxypiperidine-1-carboxylic acid isopropyl ester (5) (2.7164 Kg, 1.15255 equivalents) in 4-methylmorpholine (3.0302 Kg) was then added to the reaction mixture at a rate sufficiently slow to maintain the reaction mixture at 45-55° C. About 1.5 hours after the addition of (5) had been completed and then again after another 1.5 hours, more triphenylphosphine (1.4856 Kg, 0.4500 equivalents and then 0.8897 Kg, 0.2695
 25 equivalents) and more diisopropyl azodicarboxylate (1.1445 Kg, 0.4497 equivalents and then 0.6894

Kg, 0.2709 equivalents) were added to the stirred reaction mixture while it continued to be maintained at 50-55° C. After about six more hours of stirring at that temperature, the (6) : (4) HPLC peak area ratio was greater than 9:1, and the product was crystallized by cooling the reaction mixture to 0-5° C and stirring at that temperature for about four hours. The crystallized product was filtered, washed with 4-methylmorpholine (4.3802 Kg, 2° C) and then with water (10.4754 Kg, ambient temperature), and then recrystallized from 4-methylmorpholine (20.7215 Kg, about 75° C) by cooling to 2° C and stirring at that temperature for about two hours. The recrystallized product was filtered, washed with 4-methylmorpholine (4.5893 Kg, 2° C) and then with water (10.4955 Kg, ambient temperature), and then recrystallized from boiling absolute ethanol (35 Kg) by cooling to 25° C and stirring at that temperature for about 18 hours. The recrystallized product was collected by filtration, washed with a 2° C mixture of absolute ethanol (7.657 Kg) and water (3.8276 Kg), and dried to constant weight at 70° C, \leq 40 torr to provide product (6) (3.4269 Kg, 57.0% yield).

A similar reaction was conducted using a similar manner as described in this example except for the use of THF as the solvent and portionwise addition of triphenylphosphine, DIAD, and 4-hydroxypiperidine-1-carboxylic acid isopropyl ester (5), which enhanced stirreability and molar efficiency. The multiple crystallization operation from previous iteration of the technology was replaced by a single crystallization in alcohol and aqueous solvent mixture which resulted in higher overall yield and consistent purity for product (6).

Example 5

Preparation of 4-Chloro-1-(2-fluoro-4-methanesulfonyl-phenyl)-1H-pyrazolo[3,4-d]pyrimidine (7)

POCl₃ (379.1g, 2.59 mol) was transferred under nitrogen to a 1L round bottom flask fitted with a mechanical stirrer, a condenser and a tube connected above the condenser filled with a drying agent (drierite). 1-(2-Fluoro-4-methanesulfonyl-phenyl)-1,5-dihydro-pyrazolo[3,4-d]pyrimidin-4-one (4) (100g, 0.324 mol) was added to the reaction vessel, the contents were stirred, and a slurry was obtained. Dimethylformamide (DMF; 9.43g, 0.129 mol) was added, and the reaction mixture was heated to reflux (oil bath set at 130 °C). After refluxing for 3 h, an additional amount of DMF (9.43g,

0.129 mol) was added. The resulting mixture was refluxed for another 2 h and then gradually cooled to 55 °C. Subsequently, acetone (270 mL) was added. The mixture was further cooled to 23 °C and a precipitate was obtained, which was isolated by filtration. The filtrate was quenched by slow dropwise addition into ice water (1.5 L) with stirring. During the quench, the internal temperature was kept at 0 °C or below by cooling with an ice-salt bath. Product 4-chloro-1-(2-fluoro-4-methanesulfonyl-phenyl)-1H-pyrazolo[3,4-d]pyrimidine (7) crystallized out of the quenched mixtures was isolated by filtration. The solids from both filtrations were combined and washed with water (2 X 500 mL), 10% aqueous NaHCO₃ (2 X 500 mL), and water (2 X 500 mL) until the filtrate was neutral. The washed solids were vacuum dried overnight at room temperature and dissolved in methylene chloride (600 mL). The resulting mixture was filtered to remove any residual starting material (4). Hexane (200 mL) was added to the filtrate and methylene chloride was removed by rotary evaporation under reduced pressure. Product crystallized from the hexane solution and was filtered to obtain (7) (95g; 90%). HPLC analysis, 99.26% (purity, by peak area); ¹H NMR (Bruker 400 MHz, CDCl₃) δ 8.88 (s, 1H, Ar-H), 8.46 (s, 1H, Ar-H), 7.96 (m, 3H, Ar-H), 3.14 (s, 3H, -SO₂CH₃); mass spec. (electrospray), m/z 327 (M+H).

Example 6

Alternate preparation of 4-[1-(2-Fluoro-4-methanesulfonyl-phenyl)-1H-pyrazolo[3,4-d]pyrimidin-4-yloxy]-piperidine-1-carboxylic acid isopropyl ester (6)

20

Toluene (1.6 L) was transferred to a 4 L jacketed reaction vessel fitted with a mechanical stirrer, nitrogen inlet and a temperature probe. 4-Chloro-1-(2-fluoro-4-methanesulfonyl-phenyl)-1H-pyrazolo[3,4-d]pyrimidine (7) (97.0g, 0.297 mol) was added with stirring into the reaction vessel under nitrogen, and a slurry was obtained. The carbamate, 4-hydroxy-piperidine-1-carboxylic acid isopropyl ester (5) (66.57g, 0.356 mol), was added at room temperature. The reactor was cooled to 12

25

°C and sodium *tert*-butoxide (37.09g, 0.386 mol) was added with stirring. The internal temperature gradually increased to 34 °C due to an exotherm. Then the internal temperature was brought down to 23-25 °C. The reaction mixture became a thick slurry and was stirred at room temperature for 2.5 h. The precipitate from the reaction mixture was filtered, washed with toluene (250 mL) followed by water (3 X 500 mL), and vacuum dried overnight at room temperature. The dried solid product was slurried in EtOH (500 mL) at room temperature, filtered, and washed with water (2.5 L) until the filtrate was neutral. The washed solid product was dissolved in refluxing EtOH (1.3 L), and the resulting clear solution was gradually cooled to room temperature. The product (6) crystallized out and was isolated by filtration and dried overnight in a vacuum oven at 40 °C, 20 torr to provide 105.5 g of product (6) (74%). HPLC analysis, >99% (purity, by peak area). ¹H NMR (Bruker 400 MHz, CDCl₃) δ 8.62 (s, 1H, Ar-H), 8.32 (s, 1H, Ar-H), 7.93 (m, 3H, Ar-H), 5.62 (m, 1H, -O-CH-), 4.95 (m, 1H, CH₃-CH-CH₃), 3.91 (m, 2H, -CH₂-), 3.37 (m, 2H, -CH₂-), 3.12 (s, 3H, -SO₂CH₃), 2.09 (m, 2H, -CH₂-), 1.87 (m, 2H, -CH₂-), 1.27 (d, 6H, J=8 Hz, CH₃-CH-CH₃); mass spec. (electrospray) m/z 478 (M+H).
