ABSTRACT

The invention provides a novel class of compounds, pharmaceutical compositions comprising such compounds and methods of using such compounds to treat or prevent diseases or disorders associated with abnormal or deregulated kinase activity, particularly diseases or disorders that involve abnormal activation of the Abl, BCR-Abl, PDGF-R, lck, SAPK2α, p38, TGFβ, KDR, c-Kit, b-RAF, c-RAF, FLT1 and FLT4 kinases.
COMPOUNDS AND COMPOSITIONS AS PROTEIN KINASE INHIBITORS

CROSS-REFERENCE TO RELATED APPLICATIONS

BACKGROUND OF THE INVENTION

[0002] 1. Field of the Invention
[0003] The invention provides a novel class of compounds, pharmaceutical compositions comprising such compounds and methods of using such compounds to treat or prevent diseases or disorders associated with abnormal or deregulated kinase activity, particularly diseases or disorders that involve abnormal activation of the Abl, BCR-Abl, Ick, SAPK2α, PDGF-R, p38, TGFβ, KDR, c-Kit, b-RAF, c-RAF, FLT1 and FLT4 kinases.
[0004] 2. Background
[0005] The protein kinases represent a large family of proteins, which play a central role in the regulation of a wide variety of cellular processes and maintaining control over cellular function. A partial, non-limiting, list of these kinases include: receptor tyrosine kinases such as platelet-derived growth factor receptor kinase (PDGF-R), TGFβ, VEGF-receptor kinase (e.g. KDR, FLT-1 and FLT-4), the receptor kinase for stem cell factor, c-kit; non-receptor tyrosine kinases such Abl and the fusion kinase BCR-Abl; and serine/threonine kinases such as p38, b-RAF and c-RAF. Aberrant kinase activity has been observed in many disease states including benign and malignant proliferative disorders as well as diseases resulting from inappropriate activation of the immune and nervous systems.
[0006] The novel compounds of this invention inhibit the activity of one or more protein kinases and are, therefore, expected to be useful in the treatment of kinase-associated diseases.

SUMMARY OF THE INVENTION

[0007] In one aspect, the present invention provides compounds of Formula I:

\[
\begin{align*}
\text{R}_1, \text{R}_2 & \text{ are independently selected from hydrogen, } -\text{XR}_3, -\text{X(C(O)}\text{)}\text{R}_3, -\text{XR}_3, -\text{X(S)}\text{O(OR)}\text{R}_3, -\text{XR}_3, -\text{X(S)}\text{O}^\text{2R}_3, -\text{XR}_3, -\text{XNC(O)}\text{NR}_3\text{R}_3, & \\

\end{align*}
\]

[0009] In a second aspect, the present invention provides a pharmaceutical composition which contains a compound of Formula I or a N-oxide derivative, individual isomers and mixture of isomers thereof; or a pharmaceutically acceptable salt thereof, in admixture with one or more suitable excipients.

[0010] In a third aspect, the present invention provides a method of treating a disease in an animal in which inhibition of kinase activity, particularly Abl, BCR-Abl, PDGF-R, Ick, SAPK2α, p38, TGFβ, KDR, c-Kit, b-RAF, c-RAF, FLT1 and FLT4 activity, can prevent, inhibit or ameliorate the pathology and/or symptomology of the diseases, which method comprises administering to the animal a therapeutically effective amount of a compound of Formula I or a N-oxide derivative, individual isomers and mixture of isomers thereof, or a pharmaceutically acceptable salt thereof.

[0011] In a fourth aspect, the present invention provides the use of a compound of Formula I in the manufacture of a medicament for treating a disease in an animal in which kinase activity, particularly Abl, BCR-Abl, PDGF-R, Ick, SAPK2α, p38, TGFβ, KDR, c-Kit, b-RAF, c-RAF, FLT1 and FLT4 activity, contributes to the pathology and/or symptomology of the disease.

[0012] In a fifth aspect, the present invention provides a process for preparing compounds of Formula I and the N-oxide derivatives, prodrug derivatives, protected derivatives, individual isomers and mixture of isomers thereof, and the pharmaceutically acceptable salts thereof.

DETAILED DESCRIPTION OF THE INVENTION

Definitions

[0013] “Alkyl” as a group and as a structural element of other groups, for example halo-substituted-alkyl and alkoxy, can be either straight-chained or branched. C_i-alkoxy includes methoxy, ethoxy, and the like. Halo-substituted alkyl includes trifluoromethyl, pentafluoroethyl, and the like.

[0014] “Aryl” means a monocyclic or fused bicyclic aromatic ring assembly containing six to ten ring carbon atoms. For example, aryl may be phenyl or naphthyl, preferably phenyl. “Arylene” means a divalent radical derived from an aryl group. “Heteroaryl” is as defined for aryl where one or more of the ring members are a heteroatom. For example heteroaryl includes pyridyl, indolyl, indazolyl, quinoxalinyl, quinolinyl, benzo furanyl, benzopyranyl, benzothiopyranyl,
benzo[1,3]dioxole, imidazolyl, benzo-imidazolyl, pyrimidinyl, furanyl, oxazolyl, isoxazolyl, triazolyl, tetrazolyl, pyrazolyl, thiophenyl, etc.

**[0015]** “Cyloalkyl” means a saturated or partially unsaturated, monocyclic, fused bicyclic or bridged polycyclic ring assembly containing the number of ring atoms indicated. For example, C₃₋₅-cycloalkyl includes cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, etc. “Heterocyloalkyl” means cycloalkyl, as defined in this application, provided that one or more of the ring carbons indicated, are replaced by a moiety selected from —O—, —N—, —NR—, —O(O)—, —S—, —SO— or —SO₂—, wherein R is hydrogen, C₁₆-alkyl or a nitrogen protecting group. For example, C₆₋₁₀heterocycloalkyl us used in this application to describe compounds of the invention includes morpholino, pyrrolidinyl, piperazinyl, piperidinyl, piperidinolone, 1,4-dioxo-8-aza-spiro[4.5]deca-8-yl, etc.

**[0016]** “Halogen” (or halo) preferably represents chloro or fluoro, but may also be bromo or iodo.

**[0017]** “Treat”, “treating” and “treatment” refer to a method of alleviating or abating a disease and/or its attendant symptoms.

**DESCRIPTION OF THE PREFERRED EMBODIMENTS**

**[0018]** The present invention provides compositions, compositions and methods for the treatment of kinase related disease, particularly Abl, BCR-Ab1, PDGF-R, lck, SAPK2α, p38, TGFβ, KDR, c-Kit, b-RAF, c-RAF, FLT1 and FLT4 kinase related diseases. For example, leukemia and other proliferation disorders related to BCR-Ab1 can be treated through the inhibition of wild type and mutant forms of Bcr-Abl.

**[0019]** In one embodiment, with reference to compositions of Formula 1, R₁ and R₂ are independently selected from hydrogen, —X—R₃, and —XO(O)NR₃R₄, wherein X is a bond or C₁₋₅-alkylene; R₃ is selected from hydrogen and C₁₋₅-alkyl; R₄ is selected from C₆₋₁₀aryl, C₆₋₁₀heteroaryl and C₆₋₁₀heterocycloalkyl; wherein any aryl, heteroaryl or heterocycloalkyl of R₄ is optionally substituted by 1 to 3 radicals selected from halogen, nitro, C₁₋₅-alkyl, C₁₋₅-alkoxy, halo-substituted-C₁₋₅-alkyl, —XO(O)NR₅R₆, and —NR₃R₅; wherein X is a bond or C₁₋₅-alkylene and R₃ and R₄ are independently selected from hydrogen and C₁₋₅-alkyl.

**[0020]** In another embodiment, R₃ is selected from hydrogen and phenyl; wherein said phenyl is optionally substituted by 1 to 3 radicals selected from trifluoromethyl, dimethylamino, methoxy, halo, ethoxy and nitro.

**[0021]** In a further embodiment, R₄ is selected from hydrogen, —OH and —OC(O)NHR₆, wherein R₆ is selected from phenyl and benzo[1,3]dioxol-5-yl; wherein said phenyl of R₄ is optionally substituted by 1 to 3 radicals selected from —C(O)OCH₃ and dimethylamino.

**[0022]** Preferred compounds of Formula 1 are selected from: Phenyl-carboxic acid 8-(2-phenyl-5-pyridin-4-yl-3H-imidazol-4-yl)-naphthalen-2-yl ester; 4-(5-Naphthalen-1-yl-2 phenyl-3H-imidazol-4-yl)-pyridine; 4-[2-(3,5-Bis-trifluoromethyl)phenyl]-5-naphthalen-1-yl-3H-imidazol-4-yl] pyridine; Dimethyl-1-(4-(naphthalen-1-yl-5-pyridin-4-yl-3H-imidazol-2-yl)-phenyl)-amine; 4-[5-Naphthalen-1-yl-2-(2,4,6-trimethoxy-phenyl)-3H-imidazol-4-yl]-pyridine; 4-[4-(2-fluoro-phenyl)-5-naphthalen-1-yl-3H-imidazol-4-yl]pyridine; 4-[2-(2-Ethoxy-phenoxy)-3-naphthalen-1-yl-3H-imidazol-4-yl]pyridine; 4-[5-Naphthalen-1-yl-2-(3-nitro-phenyl)-3H-imidazol-4-yl]-pyridine; 4-(5-Naphthalen-1-yl-3H-imidazol-4-yl)-pyridine; Phenyl-carboxic acid 6-(2-phenyl-5-pyridin-4-yl-1H-imidazol-4-yl)-naphthalen-2-yl ester; 6-(2-Phenyl-5-pyridin-4-yl-1H-imidazol-4-yl)-naphthalen-2-ol; 4-[6-(2-Phenyl-5-pyridin-4-yl-1H-imidazol-4-yl)-naphthalen-2-yl-2oxycarboxaminol]-benzoic acid methyl ester; Benzol[1,3]dioxol-5-yl-carboxic acid 6-(2-phenyl-5 pyridin-4-yl-1H-imidazol-4-yl)-naphthalen-2-yl ester; 5-[6-(2-Phenyl-5-pyridin-4-yl-1H-imidazol-4-yl)-naphthalen-2 yloxy)carboxaminol]-isophthalic acid dimethyl ester; (4-Dimethylaminophenyl-carboxic acid 6-(2-phenyl-5-pyridin-4-yl-1H-imidazol-4-yl)-naphthalen-2-yl ester; Benzol[1,3]dioxol-5-yl-carboxic acid 4-(8-2-phenyl-5-pyridin-4-yl1H-imidazol-4-yl)-naphthalen-2-yl ester; 5-[8-(2-Phenyl-5pyridin-4-yl-1H-imidazol-4-yl)-naphthalen-2-ylloxy)carboxaminol]-isophthalic acid dimethyl ester; (4-Dimethylaminophenyl-carboxic acid 8-(2-phenyl-5-pyridin 4-yl-1H-imidazol-4-yl)-naphthalen-2-yl ester.

**[0023]** Further preferred compounds of Formula 1 are detailed in the Examples and Table I, infra.

**Pharmacology and Utility**

**[0024]** Compounds of the present invention modulate the activity of protein tyrosine kinases and, as such, are useful for treating diseases or disorders in which protein tyrosine kinases, particularly Abl, BCR-Ab1, PDGF-R, lck, SAPK2α, p38, TGFβ, KDR, c-Kit, b-RAF, c-RAF, FLT1 and FLT4 kinase related diseases. For example, leukemia and other proliferation disorders related to BCR-Ab1 can be treated through the inhibition of wild type and mutant forms of Bcr-Abl.

**[0025]** Abeelson tyrosine kinase (i.e. Abl, c-Abl) is involved in the regulation of the cell cycle, in the cellular response to genotoxic stress, and in the transmission of information about the cellular environment through integrin signaling. Overall, it appears that the Abl protein serves a complex role as a cellular module that integrates signals from various extracellular and intracellular sources and that influences decisions in regard to cell cycle and apoptosis. Abeelson tyrosine kinase includes sub-types derivatives such as the chimeric fusion (oncoprotein) BCR-Abl with deregulated tyrosine kinase activity or the v-Abl. BCR-Ab1 is critical in the pathogenesis of 95% of chronic myelogenous leukemia (CML) and 10% of acute lymphoblastic leukemia. STI-571 (Gleevec) is an inhibitor of the oncogenic BCR-Abl tyrosine kinase and is used for the treatment of chronic myeloid leukemia (CML). However, some patients in the blast crisis stage of CML are resistant to STI-571 due to mutations in the BCR-Abl kinase. Over 22 mutations have been reported to date with the most common being G250E, E255V, T315I, F317L and M351T.

**[0026]** Compounds of the present invention inhibit abl kinase, especially v-abl kinase. The compounds of the present invention also inhibit wild-type BCR-Abl kinase and mutations of BCR-Abl kinase and are thus suitable for the treatment of Bcr-abl-positive cancer and tumor diseases, such as leukemias (especially chronic myeloid leukemia and acute lymphoblastic leukemia, where especially apoptotic mechanisms of action are found), and also shows effects on the subgroup of leukemic stem cells as well as potential for the purification of these cells in vitro after removal of said cells (for example, bone marrow removal) and reimplantation of the cells once they have been cleared of cancer cells (for example, reimplantation of purified bone marrow cells).

**[0027]** PDGF (Platelet-derived Growth Factor) is a very commonly occurring growth factor, which plays an important role both in normal growth and also in pathological cell proliferation, such as is seen in carcinogenesis and in diseases
of the smooth-muscle cells of blood vessels, for example in atherosclerosis and thrombosis. Compounds of the invention can inhibit PDGF receptor (PDGFR) activity and are, therefore, suitable for the treatment of tumor diseases, such as gliomas, sarcomas, prostate tumors, and tumors of the colon, breast, and ovary.

[0028] Compounds of the present invention, can be used not only as a tumor-inhibiting substance, for example in small cell lung cancer, but also as an agent to treat non-malignant proliferative disorders, such as atherosclerosis, thrombosis, psoriasis, scleroderma and fibrosis, as well as for the protection of stem cells, for example to combat the hemotoxic effect of chemotherapeutic agents, such as 5-fluorouracil, and in asthma. Compounds of the invention can especially be used for the treatment of diseases, which respond to an inhibition of the PDGF receptor kinase.

[0029] Compounds of the present invention show useful effects in the treatment of disorders arising as a result of transplantation, for example, allogenic transplantation, especially tissue rejection, such as especially obliterator bronchiolitis (OB), i.e. a chronic rejection of allogenic lung transplants. In contrast to patients without OB, those with OB often show an elevated PDGF concentration in bronchioloveolar lavage fluids.

[0030] Compounds of the present invention are also effective in diseases associated with vascular smooth-muscle cell migration and proliferation (where PDGF and PDGFR-R often also play a role), such as restenosis and atherosclerosis. These effects and the consequences thereof for the proliferation or migration of vascular smooth-muscle cells in vivo and in vitro can be demonstrated by administration of the compounds of the present invention, and also by investigating its effect on the thickening of the vascular intima following mechanical injury in vivo.

[0031] The compounds of the present invention also inhibit cellular processes involving stem-cell factor (SCF), also known as the c-kit ligand or steel factor), such as inhibiting SCF receptor (kit) autophosphorylation and SCF-stimulated activation of MAPK kinase (mitogen-activated protein kinase). M07e cells are a human promegakaryocytic leukemia cell line, which depends on SCF for proliferation. Compounds of the invention can inhibit the autophosphorylation of SCF receptors.

[0032] The Ras-Raf-MEK-ERK signaling pathway mediates cellular response to growth signals. Ras is mutated in ~15% of human cancer. The Raf family belongs to the serine/threonine protein kinase and it includes three members, A-Raf, B-Raf and c-Raf (or Raf-1). The focus on Raf being a drug target has centered on the relationship of Raf as a downstream effector of Ras. However, recent data suggests that B-Raf may have a prominent role in the formation of certain tumors with no requirement for an activated Ras allele (Nature 417, 949-954 (1 Jul. 2002). In particular, B-Raf mutations have been detected in a large percentage of malignant melanomas.

[0033] Existing medical treatments for melanoma are limited in their effectiveness, especially for late stage melanomas. The compounds of the present invention also inhibit cellular processes involving b-Raf kinase, providing a new therapeutic opportunity for treatment of human cancers, especially for melanoma.

[0034] The compounds of the present invention also inhibit cellular processes involving c-Raf kinase. c-Raf is activated by the ras oncogene, which is mutated in a wide number of human cancers. Therefore inhibition of the kinase activity of c-Raf may provide a way to prevent ras mediated tumor growth [Campbell, S. L., Oncogene, 17, 1395 (1998)].

[0035] The compounds of the present invention also inhibit cellular processes involving KDR, Flt-1 and Flt-4. A number of diseases are known which are associated with deregulated angiogenesis, for example diseases caused by ocular neovascularisation, especially retinopathies (diabetic retinopathy, age-related macular degeneration); psoriasis; haemangio-blastomas, such as "strawberry-marks" (=haemangioma); various inflammatory diseases, such as arthritis, especially rheumatoid arthritis, arterial atherosclerosis and atherosclerosis occurring after transplants, endometriosis or chronic asthma; and, especially, tumor diseases (solid tumors, but also leukemias and other liquid tumors, since many primitive blood cells and leukemia cells express c-kit, KDR, Flt-1 and Flt-4). Flt-4 is expressed in developing lymphatic vessels. Only the lymphatic endothelia and some high endothelial venules express Flt4 mRNA in adult human tissues and increased expression occurs in lymphatic sinuses in metastatic lymph nodes and in lymphangioma. Inhibition of KDR-mediated functional effects by inhibiting KDR’s catalytic activity is considered to be an important therapeutic strategy in the treatment of angiogenized disease states including cancer.

[0036] Multiple forms of p38 MAPK (α, β, γ, δ), each encoded by a separate gene, form part of a kinase cascade involved in the response of cells to a variety of stimuli, including osmotic stress, UV light and cytokine mediated events. These four isoforms of p38 are thought to regulate different aspects of intracellular signaling. Its activation is part of a cascade of signaling events that lead to the synthesis and production of pro-inflammatory cytokines like TNFα. P38 functions by phosphorylating downstream substrates that include other kinases and transcription factors. Agents that inhibit p38 kinase have been shown to block the production of cytokines including but not limited to TNFα, IL-6, IL-8 and IL-1β. Peripheral blood monocytes (PBMCs) have been shown to express and secrete pro-inflammatory cytokines when stimulated with lipopolysaccharide (LPS) in vitro. P38 inhibitors efficiently block this effect when PBMCs are pre-treated with such compounds prior to stimulation with LPS. P38 inhibitors are efficacious in animal models of inflammatory disease. The destructive effects of many disease states are caused by the over production of pro-inflammatory cytokines. The ability of p38 inhibitors to regulate this overproduction makes them useful as disease modifying agents.

[0037] Molecules that block p38’s function have been shown to be effective in inhibiting bone resorption, inflammation, and other immune and inflammation-based pathologies. Thus, a safe and effective p38 inhibitor would provide a means to treat debilitating diseases that can be regulated by modulation of p38 signaling like, for example, RA. Therefore, compounds of the invention that inhibit p38 activity are useful for the treatment of inflammation, osteoarthritis, rheumatoid arthritis, cancer, autoimmune diseases, and for the treatment of other cytokine mediated diseases.

[0038] Transforming growth factor-beta (TGFβ) denotes a superfamily of proteins that includes, for example, TGFβ1, TGFβ2, and TGFβ3, which are pleotropic modulators of cell growth and differentiation, embryonic and bone development, extracellular matrix formation, hematopoiesis, immune and inflammatory responses. The members of the TGFβ family initiate intracellular signaling pathways leading
ultimately to the expression of genes that regulate the cell cycle, control proliferative responses, or relate to extracellular matrix proteins that mediate outside-in cell signaling, cell adhesion, migration and intercellular communication. Consequently, compounds of the invention that are inhibitors of the TGFβ intracellular signaling pathway are useful treatments for fibroproliferative diseases, including kidney disorders associated with unregulated TGFβ activity and excessive fibrosis including glomerulonephritis (GN), such as mesangial proliferative GN, immune GN, and crescentic GN. Other renal conditions include diabetic nephropathy, renal interstitial fibrosis, renal fibrosis in transplant patients receiving cyclosporin, and HIV-associated nephropathy. Collagen vascular disorders include progressive systemic sclerosis, polymyositis, scleroderma, dermatomyositis, eosinophilic fasciitis, morphea, or those associated with the occurrence of Raynaud’s syndrome. Lung fibrosis resulting from excessive TGFβ activity include adult respiratory distress syndrome, COPD, idiopathic pulmonary fibrosis, and interstitial pulmonary fibrosis often associated with autoimmune disorders, such as systemic lupus erythematosus and scleroderma, chemical contact, or allergies. Another autoimmune disorder associated with fibroproliferative characteristics is rheumatoid arthritis. Fibroproliferative conditions can be associated with surgical eye procedures. Such procedures include retinal reattachment surgery accompanying proliferative vitreoretinopathy, extracorporeal extraction with intracocular lens implantation, and post glaucoma drainage surgery.  

[0039] In accordance with the foregoing, the present invention further provides a method for preventing or treating any of the diseases or disorders described above in a subject in need of such treatment, which method comprises administering to said subject a therapeutically effective amount (See, “Administration and Pharmaceutical Compositions”, infra) of a compound of Formula I or a pharmaceutically acceptable salt thereof. For any of the above uses, the required dosage will vary depending on the mode of administration, the particular condition to be treated and the effect desired.

Administration and Pharmaceutical Compositions  

[0040] In general, compounds of the invention will be administered in therapeutically effective amounts via any of the usual and acceptable modes known in the art, either singly or in combination with one or more therapeutic agents. A therapeutically effective amount may vary widely depending on the severity of the disease, the age and relative health of the subject, the potency of the compound used and other factors. In general, satisfactory results are indicated to be obtained systemically at daily dosages of from about 0.03 to 2.5 mg/kg per body weight. An indicated daily dosage in the larger mammal, e.g. humans, is in the range from about 0.5 mg to about 100 mg, conveniently administered, e.g. in divided doses up to four times a day or in retard form. Suitable unit dosage forms for oral administration comprise from ca. 1 to 50 mg active ingredient.

[0041] Compounds of the invention can be administered as pharmaceutical compositions by any conventional route, in particular enterally, e.g., orally, e.g., in the form of tablets or capsules, or parenterally, e.g., in the form of injectable solutions or suspensions, topically, e.g., in the form of lotions, gels, ointments or creams, or in a nasal or suppository form. Pharmaceutical compositions comprising a compound of the present invention in free form or in a pharmaceutically acceptable salt form in association with at least one pharmaceutically acceptable carrier or diluent can be manufactured in a conventional manner by mixing, granulating or coating methods. For example, oral compositions can be tablets or gelatin capsules comprising the active ingredient together with a) diluents, e.g., lactose, dextrose, sucrose, mannitol, sorbitol, cellulose and/or glycine; b) lubricants, e.g., silica, talc, stearic acid, its magnesium or calcium salt and/or polyethylene glycol; for tablets also c) binders, e.g., magnesium aluminium silicate, starch paste, gelatin, tragacanth, methylcellulose, sodium carboxymethylcellulose and or polymethyl vinylpyrolidone; if desired d) disintegrants, e.g., starches, agar, alginic acid or its sodium salt, or effervescent mixtures; and/or e) absorbents, colorants, flavors and sweeteners. Injectable compositions can be aqueous isotonic solutions or suspensions, and suppositories can be prepared from fatty emulsions or suspensions. The compositions may be sterilized and/or contain adjuvants, such as preserving, stabilizing, wetting or emulsifying agents, solution promoters, salts for regulating the osmotic pressure and/or buffers. In addition, they may also contain other therapeutically valuable substances. Suitable formulations for transdermal applications include an effective amount of a compound of the present invention with a carrier. A carrier can include absorbable pharmacologically acceptable solvents to assist passage through the skin of the host. For example, transdermal devices are in the form of a bandage comprising a backing member, a reservoir containing the compound optionally with carriers, optionally a rate controlling barrier to deliver the compound to the skin of the host at a controlled and predetermined rate over a prolonged period of time, and means to secure the device to the skin. Matrix transdermal formulations may also be used. Suitable formulations for topical application, e.g., to the skin and eyes, are preferably aqueous solutions, ointments, creams or gels well-known in the art. Such may contain solubilizers, stabilizers, tonicity enhancing agents, buffers and preservatives.

[0042] Compounds of the invention can be administered in therapeutically effective amounts in combination with one or more therapeutic agents (pharmaceutical combinations). For example, synergistic effects can occur with other immunomodulatory or anti-inflammatory substances, for example when used in combination with cyclosporin, rapamycin, or ascomycin, or immunosuppressant analogues thereof, for example cyclosporin A (CSA), cyclosporin G, FK-506, rapamycin, or comparable compounds, corticosteroids, cyclophosphamide, azathioprine, methotrexate, broquinul, lefunomide, mizoribine, mycophenolic acid, mycophenolate mofetil, 15-deoxyspergualin, immunosuppressant antibiotics, especially monoclonal antibodies for leukocyte receptors, for example MHC, CD2, CD3, CD4, CD7, CD25, CD28, B7, CD45, CD58 or their ligands, or other immunomodulatory compounds, such as CTLA-4lg. Where the compounds of the invention are administered in conjunction with other therapies, dosages of the co-administered compounds will of course vary depending on the type of co-drug employed, on the specific drug employed, on the condition being treated and so forth.

[0043] The invention also provides for a pharmaceutical combinations, e.g. a kit, comprising a) a first agent which is a compound of the invention as disclosed herein, in free form or in pharmaceutically acceptable salt form, and b) at least one co-agent. The kit can comprise instructions for its administration.

[0044] The terms “co-administration” or “combined administration” or the like as utilized herein are meant to encompass administration of the selected therapeutic agents to a single patient, and are intended to include treatment
regimens in which the agents are not necessarily administered by the same route of administration or at the same time.

The term “pharmaceutical combination” as used herein means a product that results from the mixing or combining of more than one active ingredient and includes both fixed and non-fixed combinations of the active ingredients. The term “fixed combination” means that the active ingredients, e.g., a compound of Formula I and a co-agent, are both administered to a patient simultaneously in the form of a single entity or dosage. The term “non-fixed combination” means that the active ingredients, e.g., a compound of Formula I and a co-agent, are both administered to a patient as separate entities either simultaneously, concurrently or sequentially with no specific time limits, wherein such administration provides therapeutically effective levels of the 2 compounds in the body of the patient. The latter also applies to cocktail therapy, e.g., the administration of 3 or more active ingredients.

Processes for Making Compounds of the Invention

The present invention also includes processes for the preparation of compounds of the invention. In the reactions described, it can be necessary to protect reactive functional groups, for example hydroxy, amino, imino, thio or carboxy groups, where these are desired in the final product, to avoid their unwanted participation in the reactions. Conventional protecting groups can be used in accordance with standard practice, for example, see T. W. Greene and P. G. M. Wuts in “Protective Groups in Organic Chemistry”, John Wiley and Sons, 1991.

Compounds of Formula I can be prepared by proceeding as in the following Reaction Scheme I:

![Reaction Scheme I](image)

in which A, B, R₁, and R₂ are as defined for Formula I in the Summary of the Invention.

A compound of the invention (Formula I) can be prepared by reacting a compound of formula 2 with a compound of formula 3 in the presence of a suitable reagent (e.g., ammonium acetate, and the like) and a suitable solvent (e.g., acetic acid, or the like). The reaction is carried out in the temperature range of 100 to 140 °C. and can take up to 24 hours to complete. A detailed description of the synthesis of a compound of Formula I is set forth in the examples, infra.

Additional Processes for Making Compounds of the Invention

A compound of the invention can be prepared as a pharmaceutically acceptable acid addition salt by reacting the free base form of the compound with a pharmaceutically acceptable inorganic or organic acid. Alternatively, a pharmaceutically acceptable base addition salt of a compound of the invention can be prepared by reacting the free acid form of the compound with a pharmaceutically acceptable inorganic or organic base. Alternatively, the salt forms of the compounds of the invention can be prepared using salts of the starting materials or intermediates.

The free acid or free base forms of the compounds of the invention can be prepared from the corresponding base addition salt or acid addition salt, respectively. For example a compound of the invention in an acid addition salt form can be converted to the corresponding free base by treating with a suitable base (e.g., ammonium hydroxide solution, sodium hydroxide, and the like). A compound of the invention in a base addition salt form can be converted to the corresponding free acid by treating with a suitable acid (e.g., hydrochloric acid, etc.).

Compounds of the invention in unoxidized form can be prepared from N-oxides of compounds of the invention by treating with a reducing agent (e.g., sulfur, sulfur dioxide, triphenyl phosphine, lithium borohydride, sodium borohydride, phosphorus trichloride, tribromide, or the like) in a suitable inert organic solvent (e.g., acetonitrile, ethanol, aqueous dioxane, or the like) at 0 to 80 °C.

Prodrug derivatives of the compounds of the invention can be prepared by methods known to those of ordinary skill in the art (e.g., for further details see Saulnier et al., (1994), Bioorganic and Medicinal Chemistry Letters, Vol. 4, p. 1985). For example, appropriate prodrugs can be prepared by reacting a non-derivatized compound of the invention with a suitable carbamoylating agent (e.g., 1,1-dicycloalkylcarbamic chloride, para-nitrophenyl carbonate, or the like).

Protected derivatives of the compounds of the invention can be made by methods known to those of ordinary skill in the art. A detailed description of techniques applicable to the creation of protecting groups and their removal can be found in T. W. Greene, “Protecting Groups in Organic Chemistry”, 3rd edition, John Wiley and Sons, Inc., 1999.

Compounds of the present invention can be conveniently prepared, or formed during the process of the invention, as solvates (e.g., hydrates). Hydrates of compounds of the present invention can be conveniently prepared by recrystallization from an aqueous/organic solvent mixture, using organic solvents such as dioxin, tetrahdrofurin or methanol.

Compounds of the present invention can be prepared as their individual stereoisomers by reacting a racemic mixture of the compound with an optically active resolving agent to form a pair of diastereomeric compounds, separating the diastereomers and recovering the optically pure enantiomers. While resolution of enantiomers can be carried out using covalent diastereomeric derivatives of the compounds of the invention, dissociable complexes are preferred (e.g., crystalline diastereomeric salts). Diastereomers have distinct physi-
cal properties (e.g., melting points, boiling points, solubilities, reactivity, etc.) and can be readily separated by taking advantage of these dissimilarities. The diastereomers can be separated by chromatography, or preferably, by separation/resolution techniques based upon differences in solubility. The optically pure enantiomer is then recovered, along with the resolving agent, by any practical means that would not result in racemization. A more detailed description of the techniques applicable to the resolution of stereoisomers of compounds from their racemic mixture can be found in Jean Jacques, Andre Collet, Samuel H. Wilen, “Enantiomers, Racemates and Resolutions”, John Wiley And Sons, Inc., 1981.

In summary, the compounds of Formula I can be made by a process, which involves:

(a) that of reaction schemes 1; and
(b) optionally converting a compound of the invention into a pharmaceutically acceptable salt;
(c) optionally converting a salt form of a compound of the invention to a non-salt form;
(d) optionally converting an unoxidized form of a compound of the invention into a pharmaceutically acceptable N-oxide;
(e) optionally converting an N-oxide form of a compound of the invention to its unoxidized form;
(f) optionally resolving an individual isomer of a compound of the invention from a mixture of isomers;
(g) optionally converting a non-derivatized compound of the invention into a pharmaceutically acceptable prodrug derivative; and
(h) optionally converting a prodrug derivative of a compound of the invention to its non-derivatized form.

Insofar as the production of the starting materials is not particularly described, the compounds are known or can be prepared analogously to methods known in the art or as disclosed in the Examples hereinafter.

One of skill in the art will appreciate that the above transformations are only representative of methods for preparation of the compounds of the present invention, and that other well known methods can similarly be used.

EXAMPLES

The present invention is further exemplified, but not limited, by the following examples that illustrate the preparation of compounds of Formula I according to the invention.

Example 1

Phenyl-carbamic acid 8-(2-phenyl-4-pyridyl-3H-imidazol-4-yl)-naphthalen-2-yl ester

A mixture of 8-amino-2-naphthol (14.63 g, 91.9 mmol) and di-tert-butyl dicarbonate (21.0 g, 96.2 mmol) in methylene chloride (200 mL) and tetrahydrofuran (200 mL) is stirred under reflux condition for 24 hours. The mixture is then cooled to ambient temperature, filtered, and the filtrate is concentrated to dryness. Silica gel chromatography (CH$_3$CO$_2$H / EtOAc = 5:95 to 10:90) afforded (7-hydroxy-naphthalen-1-yl)-carbamic acid tert-butyl ester (21.5 g, 90% yield); MS m/z (M+Na$^+$) 282.05.

To a mixture of (7-hydroxy-naphthalen-1-yl)-carbamic acid tert-butyl ester (5.11 g, 19.7 mmol) and potassium carbonate (3.26 g, 23.6 mmol) in N,N-dimethylformamide is added benzyl bromide (3 mL, 43.1 g, 25.2 mmol) slowly. The mixture is then stirred at room temperature over night and poured into ice-water (150 mL). The resulting mixture is extracted with ethyl acetate (4x100 mL) and the organic portions are combined, washed with water and brine, dried over sodium sulfate, concentrated and purified by silica gel chromatography (Hexanes/EtOAc = 15:1) to give (7-benzoxyl-naphthalen-1-yl)carbamic acid tert-butyl ester (5.93 g, 86.3%); $^1$H NMR 400 Hz (CDCl$_3$) $^6$ 1.00 (s, 9H), 2.22 (s, 2H), 6.63 (br, 1H), 7.27 (m, 2H), 7.38 (m, 2H), 7.45 (m, 2H), 7.44 (d, J=7.44 Hz, 2H), 7.61 (d, J=8.11 Hz, 1H), 7.80 (m, 2H); MS m/z (M+Na$^+$) 372.10.

To a solution of (7-benzoxyl-naphthalen-1-yl)-carbamic acid tert-butyl ester (9.89 g, 28.3 mmol) in methylene chloride (200 mL) is added trifluoroacetic acid (50 mL, 73 g, 649 mmol) and the mixture is stirred at room temperature for 30 minutes. The solvent and excess trifluoroacetic acid is evaporated under reduced pressure and the crude product is dried on high vacuum over night and the resulting 7-benzoxyl-naphthalen-1-ylamine (6.98 g, 99%) was used for next step without further purification.

A solution of 7-benzoxyl-naphthalen-1-ylamine (5.98 g, 28.02 mmol) in concentrated hydrochloric acid (30 mL), water (30 mL) and tetrahydrofuran (30 mL) is cooled with an ice-salt (sodium chloride) bath. A solution of sodium nitrite (2.32 g, 33.6 mmol) in water (20 mL) is then added in a dropwise manner over a 15-minute period of time and the reaction temperature is kept under 5°C. The mixture is stirred for another 30 minutes before potassium iodide (9.3 g, 56.04 mmol) in water (30 mL) is added. The resulting mixture is stirred for three hours at room temperature before being extracted with ethyl acetate, dried over sodium sulfate, filtered, concentrated and purified by silica gel chromatography (Hexanes/CH$_3$Cl$_2$ = 25:1-20:1) to give 7-benzoxyl-1-ido-naphthalene (6.26 g, 61%); MS m/z (M+Na$^+$) 361.00.

To a solution of 7-benzoxyl-1-ido-naphthalene (4.60 g, 12.77 mmol) in ether (120 mL) is added 1.7 M tert-butyl-lithium in pentane (8.26 mL, 14.0 mmol) at –78°C under nitrogen atmosphere and the resulting mixture is stirred for one hour while being warmed up to 5°C. The mixture is cooled to –78°C again before tetramethylethylene-diamine (1.95 mL, 1.49 g, 12.79 mmol) is added. The mixture is stirred for 10 minutes before N,N-dimethylformamide (0.99 mL, 0.93 g, 12.78 mmol) is added. The mixture is gradually warmed up to room temperature and stirred over night. Ethyl acetate is added to reaction mixture, washed with saturated ammonium chloride, dried over sodium sulfate, filtered and concentrated. The crude product is purified by silica gel chromatography (Hexanes/EtOAc = 20:1) to give 7-benzoxyl-naphthalen-1-carbaldehyde (1.95 g, 58.3% yield); $^1$H NMR 400 Hz (CDCl$_3$) $^6$ 5.27 (s, 2H), 7.33 (m, 2H), 7.42 (m, 2H), 7.52 (m, 3H), 7.83 (d, J=8.98 Hz, 1H), 7.95 (d, J=7.11 Hz, 1H), 8.03 (d, J=8.10 Hz, 1H), 10.32 (s, 1H); MS m/z (M+Li$^+$) 263.05.
To a solution of 4-(tert-butyl-dimethyl-silyloxy)methyl)pyridine (1.59 g, 7.09 mmol) in tetrahydrofuran (40 mL) is added 2M lithium diisopropylamide in hexanes (3.55 mL, 7.11 mmol) over 5 minutes at -70°C under a nitrogen atmosphere. The mixture is stirred at -40°C for one hour and 7-benzyloxy-naphthalene-1-carboxylic acid (1.69 g, 6.45 mmol) in tetrahydrofuran (20 mL) is added over 10 minutes. The reaction is gradually warmed up to room temperature and stirred at that temperature overnight before being quenched by saturated sodium bicarbonate and extracted with ethyl acetate. The organic layers are combined, washed with brine, dried over sodium sulfate, filtered and concentrated in a vacuum. Silica gel chromatography (Hexanes/EtOAc=2/1-1/1) afforded 1-(7-benzyloxy-naphthalen-1-yl)-2-(tert-butyl-dimethyl-silyloxy)-2-pyridin-4-yl-ethanol (3.85 g, 89% yield); MS m/z (M+H)+ 486.20.

To a solution of 1-(7-benzyloxy-naphthalen-1-yl)-2-(tert-butyl-dimethyl-silyloxy)-2-pyridin-4-yl-ethanol (3.75 g, 7.72 mmol) in tetrahydrofuran (60 mL) is added 1.0 M tetrabutylammonium fluoride in tetrahydrofuran (10 mL, 10 mmol) and the mixture is stirred at room temperature for 1 hour. The mixture is concentrated and ethyl acetate is added to the residue. The solution is washed with water, dried over sodium sulfate, filtered, concentrated and dried on a high vacuum. The resulting diol is used for the following oxidation without further purification.

A mixture of dimethylsulfoxide (1.64 mL, 1.81 g, 23.1 mmol) and anhydrous methylene chloride (100 mL) is cooled to -70°C and oxalyl chloride (2.0 mL, 2.94 g, 23.1 mmol) is added dropwise. The mixture is stirred for 15 minutes at this temperature and a solution of the above diol in methylene chloride (40 mL) and dimethylsulfoxide (10 mL) is added dropwise. The mixture is stirred at -60°C for 2 hours before triethylamine (6.45 mL, 4.68 g, 46.3 mmol) is added. The reaction mixture is gradually warmed up to room temperature and stirred overnight. Water is then added to the mixture and organic phase is separated, washed with water, dried over sodium sulfate, filtered and concentrated. The crude product is purified by silica gel chromatography (Hexanes/EtOAc=3/1-1/1) to give 1-(7-benzyloxy-naphthalen-1-yl)-2-pyridin-4-yl-ethene-1,2-dione (2.26 g, 79.7% yield); \( ^1H \) NMR 400 Hz (CDCl₃) δ 5.31 (s, 2H), 7.40 (m, 5H), 7.55 (d, J=7.30 Hz, 2H), 7.81 (dd, J=1.66, 4.42 Hz, 2H), 7.87 (m, 2H), 8.10 (d, J=8.08 Hz, 1H), 8.89 (dd, J=1.55, 4.48 Hz, 2H), 8.93 (d, J=2.48 Hz, 1H); MS m/z (M+H)+ 368.20.

A mixture of 1-(7-benzyloxy-naphthalen-1-yl)-2-pyridin-4-yl-ethene-1,2-dione (576 mg, 1.57 mmol), benzaldehyde (0.2 mL, 2.11 g, 19.8 mmol) and ammonium acetate (1.21 g, 15.7 mmol) in acetic acid (15 mL) is stirred at 120°C overnight. The reaction mixture is then cooled to room temperature, poured into ice cold ammonium hydroxide solution and extracted with ethyl acetate (3×100 mL). The organic extracts are combined, dried over sodium sulfate, filtered and concentrated in vacuum. Silica gel chromatography (CH₃Cl/EtOAc=2/1) of the crude product afforded 4-[5-(7-benzyloxy-naphthalen-1-yl)-2-phenyl-1H-imidazol-4-yl]-pyridine (700 mg, 98% yield); \( ^1H \) NMR 400 Hz (DMSO) δ 3.30 (s, 2H), 6.99 (s, 1H), 7.21 (m, 5H), 7.24 (m, 3H), 7.43 (t, J=7.31 Hz, 1H), 7.52 (t, J=7.37 Hz, 3H), 7.66 (m, 1H), 8.00 (m, 2H), 8.13 (d, J=7.30 Hz, 2H), 8.32 (d, J=4.43 Hz, 2H); MS m/z (M+H)+ 454.20.

To a solution of 4-[5-(7-benzyloxy-naphthalen-1-yl)-2-phenyl-1H-imidazol-4-yl]-pyridine (830 mg, 1.79 mmol) in methanol (50 mL) and tetrahydrofuran (10 mL) is added 10% Pd/C (100 mg) and the mixture is stirred for 3 hours under hydrogen atmosphere (1 atm). The catalyst is filtered and washed with ethyl acetate. The filtrate is concentrated and silica gel chromatography (CH₃Cl/EtOAc=1/1) afforded 8-(2-phenyl-5-pyridin-4-yl-3H-imidazol-4-yl)-naphthalen-2-ol (520 mg, 80% yield) as a syrup; \( ^1H \) NMR 400 Hz (CDCl₃) δ 6.89 (d, J=2.32 Hz, 1H), 7.17 (dd, J=2.38, 8.89 Hz, 1H), 7.48 (dd, J=7.15, 8.21 Hz, 1H), 7.55 (m, 3H), 7.66 (d, J=1.09, 7.04 Hz, 1H), 7.91 (d, J=8.93 Hz, 1H), 7.95 (d, J=7.03 Hz, 3H), 8.04 (d, J=8.24 Hz, 1H), 8.10 (m, 2H), 8.47 (d, J=7.02 Hz, 2H); MS m/z (M+H)+ 364.20.

A mixture of 8-(2-phenyl-5-pyridin-4-yl-3H-imidazol-4-yl)-naphthalen-2-ol (31 mg, 0.085 mmol), phenyl isocyanate (11 mg, 0.094 mmol) and triethylamine (17.8 μL, 12.9 mg, 0.128 mmol) in N,N-dimethylformamide (1.5 mL) is stirred for 3 hours at room temperature. Preparative LC/MS afforded phenyl-carbanionic acid 8-(2-phenyl-5-pyridin-4-yl-3H-imidazol-4-yl)-naphthalen-2-yl ester (17 mg, 41% yield); \( ^1H \) NMR 400 Hz (CDCl₃) δ 7.01 (m, 2H), 7.25 (m, 4H), 7.39 (m, 5H), 7.45 (dd, J=2.28, 8.86 Hz, 1H), 7.53 (m, 3H), 7.72 (dd, J=7.14, 8.23 Hz, 1H), 7.83 (d, J=6.02 Hz, 1H), 7.90 (d, J=6.99 Hz, 2H), 8.10 (m, 3H), 8.19 (d, J=8.29 Hz, 1H), 8.43 (d, J=7.00 Hz, 2H); MS m/z (M+H)+ 483.20.

By repeating the procedures described in the above example, using appropriate starting materials, the following compounds of Formula I, as identified in Table 1, are obtained.

Assays

Comounds of the present invention are assayed to measure their capacity to selectively inhibit cell proliferation of 32D cells expressing BCR-Abl (32D-p210) compared with parental 32D cells. Compounds selectively inhibiting the proliferation of these BCR-Abl transformed cells are tested for anti-proliferative activity on Ba/F3 cells expressing either wild type or the mutant forms of Ber-abl. In addition, compounds are assayed to measure their capacity to inhibit b-Raf.

Inhibition of Cell Cycle Distribution

The murine cell line used is the 32D hemopoietic progenitor cell line transformed with BCR-Abl cDNA (32D-p210). These cells are maintained in RPMI/10% fetal calf serum (RPMI/FCS) supplemented with penicillin 50 µg/mL, streptomycin 50 µg/mL and L-glutamine 200 mM. Untransformed 32D cells are similarly maintained with the addition of 15% of WEHI conditioned medium as a source of IL3.

Effect on Cell Cycle Distribution

32D and 32D-p210 cells are plated into 6 well TC plates at 2.5x10^5 cells per well in 5 ml of medium and test compound at 1 or 10 µM is added (ST1571 is included as a control). The cells are then incubated for 24 or 48 hours at 37°C, 5% CO$_2$. 2 ml of cell suspension is washed with PBS, fixed in 70% EtOH for 1 hour and treated with PBS/EDTA/RNase A for 30 minutes. Propidium iodide (CF=10 µg/ml) is added and the fluorescence intensity is quantified by flow cytometry on the FACScalibur™ system (BD Biosciences). Test compounds of the present invention demonstrate an apoptotic effect on the 32D-p210 cells but do not induce apoptosis in the 32D parental cells.
Effect on Cellular BCR-Abl Autophosphorylation

[0087] BCR-Abl autophosphorylation is quantified with capture Elisa using a c-abl specific capture antibody and an antiphosphotyrosine antibody. 32D-p210 cells are plated in 96 well TC plates at 2x10^4 cells per well in 50µl of medium. 50µl of two fold serial dilutions of test compounds (C_max is 10 µM) are added to each well (ST1571 is included as a positive control). The cells are incubated for 90 minutes at 37° C, 5% CO2. The cells are then treated for 1 hour on ice with 150 µl of lysis buffer (50 mM Tris-Cl, pH 7.4, 150 mM NaCl, 5 mM EDTA, 1 mM EGTA and 1% NP-40) containing protease and phosphatase inhibitors. 50 µl of cell lysate is added to 96 well optiplates previously coated with anti-abl specific antibody and blocked. The plates are incubated for 4 hours at 4° C. After washing with TBS-Tween 20 buffer, 50 µl of alkaline-phosphatase conjugated anti-phosphotyrosine antibody is added and the plate is further incubated overnight at 4° C. After washing with TBS-Tween 20 buffer, 90 µl of a luminescent substrate are added and the luminescence is quantified using the Acquest™ system (Molecular Devices). Test compounds of the invention that inhibit the proliferation of the BCR-Abl expressing cells, inhibit the cellular BCR-Abl autophosphorylation in a dose-dependent manner.

Effect on Proliferation of Cells Expressing Mutant Forms of Bcr-Abl

[0088] Compounds of the invention are tested for their antiproliferative effect on Ba/F3 cells expressing either wild type or the mutant forms of BCR-Abl (G250E, F255V, T315I, F317L, M351T) that conferes resistance or diminished sensitivility to ST1571. The antiproliferative effect of these compounds on the mutant-BCR-Abl expressing cells and on the non transformed cells were tested at 10, 3.3, 1.1 and 0.37 µM as described above (in media lacking IL3). The IC50 values of the compounds lacking toxicity on the untransformed cells were determined from the dose response curves obtained as describe above.

b-Raf

[0089] Compounds of the invention are tested for their ability to inhibit the activity of b-Raf. The assay is carried out in 384-well Maxisorp plates (NUNC) with black walls and clear bottom. The substrate, Ikbeta is diluted in DPBS (1:750) and 15 µl is added to each well. The plates are incubated at 4° C. overnight and washed 3 times with TBST (25 mM Tris, pH 8.0, 150 mM NaCl and 0.05% Tween-20) using the EMBA plate washer. Plates are blocked by Superblock (15 µl/well) for 3 hours at room temperature, washed 3 times with TBST and air-dried. Assay buffer containing 20 µl ATP (10 µM) is added to each well followed by 100 nl or 500 nM of compound. B-Raf is diluted in the assay buffer (1 µl into 25 µl) and 10 µl of diluted b-Raf is added to each well (0.4 µl/well). The plates are incubated at room temperature for 2.5 hours. The kinase reaction is stopped by washing the plates 6 times with TBST. Phospho-Ikbeta (Ser32/36) antibody is diluted in Superblock (1:10,000) and 15 µl is added to each well. The plates are incubated at 4° C. overnight and washed 6 times with TBST. AP-conjugated goat-anti-mouse IgG is diluted in Superblock (1:1,500) and 1 µl is added to each well. Plates are incubated at room temperature for 1 hour and washed 6 times with TBST. 15 µl of Altrophos AP substrate is added to each well and plates are incubated at room temperature for 15 minutes. Plates are read on Acquest or Analyst GT using a Fluorescence Intensity Nanxin BBT anion (505 dichroic mirror).

Upstate KinaseProfiler™-Radio-Enzymatic Filter Binding Assay

[0090] Compounds of the invention are assessed for their ability to inhibit individual members of a panel of kinases (a partial, non-limiting list of kinases includes: Abl, BCR-Abl, EGFR-R, c-erbB2 kinase (HER-2), PDGF-R, Ick, SAPK2alpha, p38, TGFbeta, KDR, c-Kit, b-Raf, c-Raf, c-Raf, FLT1 and FLT4). The compounds are tested in duplicates at a final concentration of 10 µM following this generic protocol. Note that the kinase buffer composition and the substrates vary for the different kinases included in the “Upstate KinaseProfiler™” panel. The compounds are tested in duplicates at a final concentration of 10 µM following this generic protocol. Note that the kinase buffer composition and the substrates vary for the different kinases included in the “Upstate KinaseProfiler™” panel. Kinase buffer (2.5 µl, 10x-containing MnCl2 when required), active kinase (0.001-0.01 Units; 2.5 µl), specific or Poly (Glut4-Tyr) peptide (5-500 µM or 0.1 ng/ml) in kinase buffer and kinase buffer (50 µM; 5 µl) are mixed in an ependorf on ice. A Mg/ATP mix (10 µl; 67.5 or (33.75) mM MgCl2, 450 (or 225) µl ATP and 1 µCi/ml [γ-32P]-ATP (300 Ci/mmol)) is added and the reaction is incubated at about 30° C. for about 10 minutes. The reaction mixture is spotted (20 µl) onto a 2 cm×2 cm P81 (phosphocellulose, for positively charged peptide substrates) or Whatman No. 1 (for Poly (Glut4-Tyr) peptide substrate) paper square. The assay squares are washed 4 times, for 5 minutes each, with 0.75% phosphoric acid and washed once with acetone for 5 minutes. The assay squares are transferred to a scintillation vial, 5 ml scintillation cocktail are added and 32P incorporation (cpm) to the peptide substrate is quantified with a Beckman scintillation counter. Percentage inhibition is calculated for each reaction.

[0091] Compounds of Formula I, in free form or in pharmaceutically acceptable salt form, exhibit valuable pharmacological properties, for example, as indicated by the in vitro tests described in this application. For example, compounds of Formula I preferably show an IC50 in the range of 1x10^-10 to 1x10^-8 M, preferably less than 500 nM for wild type BCR-Abl and b-Raf. For example, 6-(2-phenyl-5-pyridin-4-yl-1H-imidazol-4-yl)-naphthalen-2-ol (compound 11) and (4-dimethylamino-phenyl)-carboxylic acid 6-(2-phenyl-5-pyridin-4-yl-1H-imidazol-4-yl)-naphthalen-2-yl ester (compound 15) have an IC50 of 300 nM and 879 nM against b-Raf, respectively.

[0092] Compounds of Formula I, at a concentration of 10 µM, preferably show a percentage inhibition of greater than 50%, preferably greater than about 70%, against Abl, BCR-Abl, PDGF-R, Ick, SAPK2alpha, p38, TGFbeta, KDR, c-Kit, b-Raf, c-Raf, FLT1 and/or FLT4 kinases. For example, 6-(2-Phenyl-5-pyridin-4-yl-1H-imidazol-4-yl)-naphthalen-2-ol (compound 11) at a concentration of 10 µM, inhibits the following kinases by the percentage shown in brackets (for example, 100% means complete inhibition, 0% means no inhibition): Abl (98%); c-Raf (98%); Ick (61%); and SAPK2alpha (74%).

[0093] It is understood that the examples and embodiments described herein are for illustrative purposes only and that various modifications or changes in light thereof will be suggested to persons skilled in the art and are to be included within the spirit and purview of this application and scope of
the appended claims. All publications, patents, and patent applications cited herein are hereby incorporated by reference for all purposes.

We claim:

1. A compound of Formula I:

   ![Chemical Structure Diagram]

   in which:

   R₁ is selected from hydrogen, —XR₂, —XC(O)R₂, —XSR₂, —XS(O)R₂, —X(O)S(O)R₂, and —XO(C)NR₃R₄; wherein X is a bond or C₁₋₅ alkylene;

   R₂ is selected from —XR₃, —XC(O)R₃, —XSR₃, —XS(O)R₃, —X(O)S(O)R₃, and —XO(C)NR₃R₄; wherein X is a bond or C₁₋₅ alkylene;

   R₃ is selected from hydrogen and C₁₋₅ alkyl;

   R₄ is selected from C₆₋₁₀ heteroaryl, and C₅₋₁₀ heterocycloalkyl; wherein any heteroaryl or heterocycloalkyl of R₄ is optionally substituted by 1 to 3 radicals selected from hydroxy, halo, nitro, C₁₋₅ alkyl, C₁₋₅ alkoxy, halo-substituted-C₁₋₅ alkyl, halo-substituted-C₁₋₅ alkoxy, —XC(O)OR₅ and —NR₆R₇; wherein X is a bond or C₁₋₅ alkylene and R₅ and R₆ are independently selected from hydrogen and C₁₋₅ alkyl;

   and pharmaceutically acceptable salts thereof.

2. The compound of claim 1, wherein:

   R₁ is selected from hydrogen, —XR₂, and —XO(C)NR₃R₄; wherein X is a bond or C₁₋₅ alkylene;

   R₂ is selected from —XR₃ and —XO(C)NR₃R₄; wherein X is a bond or C₁₋₅ alkylene;

   R₃ is selected from hydrogen and C₁₋₅ alkyl;

   R₄ is C₂₋₁₀ heteroaryl or C₃₋₁₀ heterocycloalkyl optionally substituted by 1 to 3 radicals selected from halo, nitro, C₁₋₅ alkyl, C₅₋₁₀ alkoxy, halo-substituted-C₁₋₅ alkyl, —XC(O)OR₅ and —NR₆R₇; wherein X is a bond or C₁₋₅ alkylene and R₅ and R₆ are independently selected from hydrogen and C₁₋₅ alkyl.

3. The compound of claim 2, wherein R₁ is selected from hydrogen and phenyl; wherein said phenyl is optionally substituted by 1 to 3 radicals selected from trifluoromethyl, dimethylamino, methoxy, halo, ethoxy and nitro.

4. The compound of claim 2, wherein in which R₂ is —OC(O)NHR₃ and R₃ is benzo[1,3]dioxol-5-yl optionally substituted by 1 to 3 radicals selected from —C(O)OCH₃ and dimethylamino.

5. The compound of claim 1 selected from benzo[1,3]dioxol-5-yl-carbamic acid 6-(2-phenyl-5-pyridin-4-yl-1H-imidazol-4-yl)-naphthalen-2-yl ester and benzo[1,3]dioxol-5-yl-carbamic acid 8-(2-phenyl-5-pyridin-4-yl-1H-imidazol-4-yl)-naphthalen-2-yl ester.

6. A pharmaceutical composition comprising a therapeutically effective amount of a compound of claim 1 in combination with a pharmaceutically acceptable excipient.
