DESCRIPTION

Description

RELATED APPLICATION

[0001] This application claims the benefit of priority to U.S. Provisional Patent Application No. 62/724,397, filed August 29, 2018.

TECHNICAL FIELD

[0002] This disclosure relates to novel chemical compounds and methods useful for inhibiting $\alpha v \beta 6$ integrin.

BACKGROUND

[0003] The heterodimeric integrin family of receptors modulate cellular shape and cell adhesion to the extracellular matrix in response to extrinsic and intrinsic cues.

[0004] Integrin signaling controls cell survival, cell cycle progression, cell differentiation, and cell migration.

[0005] The integrin receptor exclusively can signal a cell bi-directionally, both "inside-out" and "outside-in." Thus, they mediate cell migration by transmitting forces from the extracellular matrix to the cytoskeleton and regulate cytoskeletal organization to achieve shape changes needed during cell migration. RGD-binding integrins can bind to and activate TGF- β , and have recently been implicated in fibrotic disease.

[0006] Integrins are expressed on the surface of most of human cells. Their pathology contributes to a diverse set of human diseases, including platelet disorders, atherosclerosis, cancer, osteoporosis, fibrosis, diabetic neuropathy of the kidney, macular degeneration and various autoimmune and chronic inflammation diseases.

[0007] The role of integrins as drug targets has long been recognized, and a total of six injectable integrin inhibitors have been approved by the Food and Drug Administration for the treatment of various therapeutic indications: inflammatory bowel disease (Entyvio[®], Tysabri[®]), multiple sclerosis (Tysabri[®]), psoriasis (Raptiva[®]), and acute coronary syndrome (Reopro[®],

Aggrastat[®], Integrilin[®]). However, there has been a notable absence of therapeutic success with orally bioavailable integrin inhibitors.

[0008] Of the 24 known integrin heterodimers, at least half have relevance in inflammation, fibrosis, oncology and vascular disease. There exists a need for new classes of integrin inhibitors.

[0009] For example, there remains a need for a small molecule integrin inhibitor of $\alpha\text{v}\beta 6$ suitable for oral administration. The oral administration route is preferred for small-molecule delivery as it allows a wide range of doses to be administered, allows convenient patient self-administration, is adaptable to varying dosage regimens and needs no special equipment. Therefore, it is important to identify $\alpha\text{v}\beta 6$ integrin inhibitor compounds that are not only potent at the intended biological target, but are also demonstrating other characteristics relating to the ability of the compound to be absorbed in the body (e.g., after oral delivery) in a therapeutically effective manner. For example, $\alpha\text{v}\beta 6$ integrin inhibitor compounds can be selected based on both potency and based on performance in an in vitro permeability assay (e.g., evaluating the ability of compounds to cross a layer of Madin-Darby Canine Kidney (MDCK) cells from the apical to basolateral side (A->B)).

[0010] WO 2017/162572 A1 discloses pyrrolidine compounds as $\alpha\text{v}\beta 6$ integrin antagonists for use in therapy, in particular the treatment of idiopathic pulmonary fibrosis.

[0011] WO 2016/046225 A1 and WO 2016/046226 A1 disclose pyrrolidine compounds as $\alpha\text{v}\beta 6$ integrin antagonists for use in therapy, especially in the treatment of conditions for which an $\alpha\text{v}\beta 6$ integrin antagonist is indicated.

[0012] WO 2018/119087 A1 discloses amino acid compounds as $\alpha\text{v}\beta 6$ integrin inhibitors for use in treating tissue specific fibrosis such as idiopathic pulmonary fibrosis and nonspecific interstitial pneumonia.

[0013] WO 2018/160521 A2 discloses small molecule inhibitors of $\alpha\text{v}\beta 6$ integrin for use in treating conditions including idiopathic pulmonary fibrosis and diabetic nephropathy.

SUMMARY

[0014] Applicants have discovered novel $\alpha\text{v}\beta 6$ integrin inhibitor compounds and evaluated the possession, performance and utility of representative examples of such compounds, both for biochemical potency (e.g., using the assay of from Examples below to evaluate fluorescence polarization assays of compounds for $\alpha\text{v}\beta 6$ binding) and in vitro permeability properties (e.g., using a MDCK permeability assay provided in the Examples herein).

DEFINITIONS

[0021] For convenience, before further description of the present invention, certain terms employed in the specification, examples and appended claims are collected here. These definitions should be read in light of the remainder of the disclosure and understood as by a person of skill in the art. Unless defined otherwise, all technical and scientific terms used herein have the same meaning as commonly understood by a person of ordinary skill in the art.

[0022] In order for the present invention to be more readily understood, certain terms and

phrases are defined below and throughout the specification.

[0023] The articles "a" and "an" are used herein to refer to one or to more than one (i.e., to at least one) of the grammatical object of the article. By way of example, "an element" means one element or more than one element.

[0024] The phrase "and/or," as used herein in the specification and in the claims, should be understood to mean "either or both" of the elements so conjoined, i.e., elements that are conjunctively present in some cases and disjunctively present in other cases. Multiple elements listed with "and/or" should be construed in the same fashion, i.e., "one or more" of the elements so conjoined. Other elements may optionally be present other than the elements specifically identified by the "and/or" clause, whether related or unrelated to those elements specifically identified. Thus, as a non-limiting example, a reference to "A and/or B", when used in conjunction with open-ended language such as "comprising" can refer, in one embodiment, to A only (optionally including elements other than B); in another embodiment, to B only (optionally including elements other than A); in yet another embodiment, to both A and B (optionally including other elements); etc.

[0025] As used herein in the specification and in the claims, "or" should be understood to have the same meaning as "and/or" as defined above. For example, when separating items in a list, "or" or "and/or" shall be interpreted as being inclusive, i.e., the inclusion of at least one, but also including more than one, of a number or list of elements, and, optionally, additional unlisted items. Only terms clearly indicated to the contrary, such as "only one of" or "exactly one of," or, when used in the claims, "consisting of," will refer to the inclusion of exactly one element of a number or list of elements. In general, the term "or" as used herein shall only be interpreted as indicating exclusive alternatives (i.e., "one or the other but not both") when preceded by terms of exclusivity, such as "either," "one of," "only one of," or "exactly one of." "Consisting essentially of," when used in the claims, shall have its ordinary meaning as used in the field of patent law.

[0026] As used herein in the specification and in the claims, the phrase "at least one," in reference to a list of one or more elements, should be understood to mean at least one element selected from any one or more of the elements in the list of elements, but not necessarily including at least one of each and every element specifically listed within the list of elements and not excluding any combinations of elements in the list of elements. This definition also allows that elements may optionally be present other than the elements specifically identified within the list of elements to which the phrase "at least one" refers, whether related or unrelated to those elements specifically identified. Thus, as a non-limiting example, "at least one of A and B" (or, equivalently, "at least one of A or B," or, equivalently "at least one of A and/or B") can refer, in one embodiment, to at least one, optionally including more than one, A, with no B present (and optionally including elements other than B); in another embodiment, to at least one, optionally including more than one, B, with no A present (and optionally including elements other than A); in yet another embodiment, to at least one, optionally including more than one, A, and at least one, optionally including more than one, B (and optionally including

other elements); etc.

[0027] It should also be understood that, unless clearly indicated to the contrary, in any methods disclosed herein that include more than one step or act, the order of the steps or acts of the method is not necessarily limited to the order in which the steps or acts of the method are recited.

[0028] In the claims, as well as in the specification above, all transitional phrases such as "comprising," "including," "carrying," "having," "containing," "involving," "holding," "composed of," are to be understood to be open-ended, i.e., to mean including but not limited to. Only the transitional phrases "consisting of" and "consisting essentially of" shall be closed or semi-closed transitional phrases, respectively, as set forth in the United States Patent Office Manual of Patent Examining Procedures, Section 2111.03.

[0029] Certain compounds contained in compositions of the present invention may exist in particular geometric or stereoisomeric forms. In addition, polymers of the present invention may also be optically active. The present invention contemplates all such compounds, including cis- and trans-isomers, R- and S-enantiomers, diastereomers, (D)-isomers, (L)-isomers, the racemic mixtures thereof, and other mixtures thereof, as falling within the scope of the invention. Additional asymmetric carbon atoms may be present in a substituent such as an alkyl group. All such isomers, as well as mixtures thereof, are intended to be included in this invention.

[0030] If, for instance, a particular enantiomer of compound of the present invention is desired, it may be prepared by asymmetric synthesis, or by derivation with a chiral auxiliary, where the resulting diastereomeric mixture is separated and the auxiliary group cleaved to provide the pure desired enantiomers. Alternatively, where the molecule contains a basic functional group, such as amino, or an acidic functional group, such as carboxyl, diastereomeric salts are formed with an appropriate optically-active acid or base, followed by resolution of the diastereomers thus formed by fractional crystallization or chromatographic means well known in the art, and subsequent recovery of the pure enantiomers.

[0031] Structures depicted herein are also meant to include compounds that differ only in the presence of one or more isotopically enriched atoms. For example, compounds produced by the replacement of a hydrogen with deuterium or tritium, or of a carbon with a ^{13}C - or ^{14}C -enriched carbon are within the scope of this invention.

[0032] The term "prodrug" as used herein encompasses compounds that, under physiological conditions, are converted into therapeutically active agents. A common method for making a prodrug is to include selected moieties that are hydrolyzed under physiological conditions to reveal the desired molecule. In other embodiments, the prodrug is converted by an enzymatic activity of the host animal.

[0033] The phrase "pharmaceutically acceptable excipient" or "pharmaceutically acceptable

carrier" as used herein means a pharmaceutically acceptable material, composition or vehicle, such as a liquid or solid filler, diluent, excipient, solvent or encapsulating material, involved in carrying or transporting the subject chemical from one organ or portion of the body, to another organ or portion of the body. Each carrier must be "acceptable" in the sense of being compatible with the other ingredients of the formulation, not injurious to the patient, and substantially non-pyrogenic. Some examples of materials which can serve as pharmaceutically acceptable carriers include: (1) sugars, such as lactose, glucose, and sucrose; (2) starches, such as corn starch and potato starch; (3) cellulose, and its derivatives, such as sodium carboxymethyl cellulose, ethyl cellulose, and cellulose acetate; (4) powdered tragacanth; (5) malt; (6) gelatin; (7) talc; (8) excipients, such as cocoa butter and suppository waxes; (9) oils, such as peanut oil, cottonseed oil, safflower oil, sesame oil, olive oil, corn oil, and soybean oil; (10) glycols, such as propylene glycol; (11) polyols, such as glycerin, sorbitol, mannitol, and polyethylene glycol; (12) esters, such as ethyl oleate and ethyl laurate; (13) agar; (14) buffering agents, such as magnesium hydroxide and aluminum hydroxide; (15) alginic acid; (16) pyrogen-free water; (17) isotonic saline; (18) Ringer's solution; (19) ethyl alcohol; (20) phosphate buffer solutions; and (21) other non-toxic compatible substances employed in pharmaceutical formulations. In certain embodiments, pharmaceutical compositions of the present invention are non-pyrogenic, i.e., do not induce significant temperature elevations when administered to a patient.

[0034] The term "pharmaceutically acceptable salts" refers to the relatively non-toxic, inorganic and organic acid addition salts of the compound(s). These salts can be prepared in situ during the final isolation and purification of the compound(s), or by separately reacting a purified compound(s) in its free base form with a suitable organic or inorganic acid, and isolating the salt thus formed. Representative salts include the hydrobromide, hydrochloride, sulfate, bisulfate, phosphate, nitrate, acetate, valerate, oleate, palmitate, stearate, laurate, benzoate, lactate, phosphate, tosylate, citrate, maleate, fumarate, succinate, tartrate, naphthylate, mesylate, glucoheptonate, lactobionate, and laurylsulphonate salts. (See, for example, Berge et al. (1977) "Pharmaceutical Salts", J. Pharm. Sci. 66: 1-19.)

[0035] In other cases, the compounds useful in the present invention may contain one or more acidic functional groups and, thus, are capable of forming pharmaceutically acceptable salts with pharmaceutically acceptable bases. The term "pharmaceutically acceptable salts" in these instances refers to the relatively non-toxic inorganic and organic base addition salts of a compound(s). These salts can likewise be prepared in situ during the final isolation and purification of the compound(s), or by separately reacting the purified compound(s) in its free acid form with a suitable base, such as the hydroxide, carbonate, or bicarbonate of a pharmaceutically acceptable metal cation, with ammonia, or with a pharmaceutically acceptable organic primary, secondary, or tertiary amine. Representative alkali or alkaline earth salts include the lithium, sodium, potassium, calcium, magnesium, and aluminum salts. Representative organic amines useful for the formation of base addition salts include ethylamine, diethylamine, ethylenediamine, ethanolamine, diethanolamine and piperazine, (see, for example, Berge et al., *supra*).

[0036] A "therapeutically effective amount" (or "effective amount") of a compound with respect to use in treatment, refers to an amount of the compound in a preparation which, when administered as part of a desired dosage regimen (to a mammal, preferably a human) alleviates a symptom, ameliorates a condition, or slows the onset of disease conditions according to clinically acceptable standards for the disorder or condition to be treated or the cosmetic purpose, e.g., at a reasonable benefit/risk ratio applicable to any medical treatment.

[0037] The term "prophylactic or therapeutic" treatment is art-recognized and includes administration to the host of one or more of the subject compositions. If it is administered prior to clinical manifestation of the unwanted condition (e.g., disease or other unwanted state of the host animal) then the treatment is prophylactic, (i.e., it protects the host against developing the unwanted condition), whereas if it is administered after manifestation of the unwanted condition, the treatment is therapeutic, (i.e., it is intended to diminish, ameliorate, or stabilize the existing unwanted condition or side effects thereof).

[0038] The term "patient" refers to a mammal in need of a particular treatment. In certain embodiments, a patient is a primate, canine, feline, or equine. In certain embodiments, a patient is a human.

[0039] An aliphatic chain comprises the classes of alkyl, alkenyl and alkynyl defined below. A straight aliphatic chain is limited to unbranched carbon chain moieties. As used herein, the term "aliphatic group" refers to a straight chain, branched-chain, or cyclic aliphatic hydrocarbon group and includes saturated and unsaturated aliphatic groups, such as an alkyl group, an alkenyl group, or an alkynyl group.

[0040] "Alkyl" refers to a fully saturated cyclic or acyclic, branched or unbranched carbon chain moiety having the number of carbon atoms specified, or up to 30 carbon atoms if no specification is made. For example, alkyl of 1 to 8 carbon atoms refers to moieties such as methyl, ethyl, propyl, butyl, pentyl, hexyl, heptyl, and octyl, and those moieties which are positional isomers of these moieties. Alkyl of 10 to 30 carbon atoms includes decyl, undecyl, dodecyl, tridecyl, tetradecyl, pentadecyl, hexadecyl, heptadecyl, octadecyl, nonadecyl, eicosyl, heneicosyl, docosyl, tricosyl and tetracosyl. In certain embodiments, a straight chain or branched chain alkyl has 30 or fewer carbon atoms in its backbone (e.g., C₁-C₃₀ for straight chains, C₃-C₃₀ for branched chains), and more preferably 20 or fewer. Alkyl groups may be substituted or unsubstituted.

[0041] As used herein, the term "alkylene" refers to an alkyl group having the specified number of carbons, for example from 2 to 12 carbon atoms, that contains two points of attachment to the rest of the compound on its longest carbon chain. Non-limiting examples of alkylene groups include methylene -(CH₂)-, ethylene -(CH₂CH₂)-, n-propylene -(CH₂CH₂CH₂)- and isopropylene -(CH₂CH(CH₃))- . Alkylene groups can be cyclic or acyclic, branched or unbranched carbon chain moiety, and may be optionally substituted with one or more substituents.

[0042] "Cycloalkyl" means mono- or bicyclic or bridged or spirocyclic, or polycyclic saturated carbocyclic rings, each having from 3 to 12 carbon atoms. Likewise, preferred cycloalkyls have from 3-10 carbon atoms in their ring structure, and more preferably have 3-6 carbons in the ring structure. Cycloalkyl groups may be substituted or unsubstituted.

[0043] Unless the number of carbons is otherwise specified, "lower alkyl," as used herein, means an alkyl group, as defined above, but having from one to ten carbons, more preferably from one to six carbon atoms in its backbone structure such as methyl, ethyl, n-propyl, isopropyl, n-butyl, isobutyl, sec-butyl, and tert-butyl. Likewise, "lower alkenyl" and "lower alkynyl" have similar chain lengths. Throughout the application, preferred alkyl groups are lower alkyls. In certain embodiments, a substituent designated herein as alkyl is a lower alkyl.

[0044] "Alkenyl" refers to any cyclic or acyclic, branched or unbranched unsaturated carbon chain moiety having the number of carbon atoms specified, or up to 26 carbon atoms if no limitation on the number of carbon atoms is specified; and having one or more double bonds in the moiety. Alkenyl of 6 to 26 carbon atoms is exemplified by hexenyl, heptenyl, octenyl, nonenyl, decenyl, undecenyl, dodenyl, tridecenyl, tetradecenyl, pentadecenyl, hexadecenyl, heptadecenyl, octadecenyl, nonadecenyl, eicosenyl, heneicosoenyl, docosenyl, tricosenyl, and tetracosenyl, in their various isomeric forms, where the unsaturated bond(s) can be located anywhere in the moiety and can have either the (Z) or the (E) configuration about the double bond(s).

[0045] "Alkynyl" refers to hydrocarbyl moieties of the scope of alkenyl, but having one or more triple bonds in the moiety.

[0046] The term "alkylthio" refers to an alkyl group, as defined above, having a sulfur moiety attached thereto. In certain embodiments, the "alkylthio" moiety is represented by one of -(S)-alkyl, -(S)-alkenyl, -(S)-alkynyl, and -(S)-(CH₂)_m-R¹, wherein m and R¹ are defined below. Representative alkylthio groups include methylthio and ethylthio. The terms "alkoxy" or "alkoxy" as used herein refers to an alkyl group, as defined below, having an oxygen moiety attached thereto. Representative alkoxy groups include methoxy, ethoxy, propoxy and tert-butoxy. An "ether" is two hydrocarbons covalently linked by an oxygen. Accordingly, the substituent of an alkyl that renders that alkyl an ether is or resembles an alkoxy, such as can be represented by one of -O-alkyl, -O-alkenyl, -O-alkynyl, -O-(CH₂)_m-R₁₀, where m and R₁₀ are described below.

[0047] The terms "amine" and "amino" are art-recognized and refer to both unsubstituted and substituted amines, e.g., a moiety that can be represented by the formulae:

wherein R₁₁, R₁₂ and R₁₃ each independently represent a hydrogen, an alkyl, an alkenyl, -(CH₂)_m-R₁₀, or R₁₁ and R₁₂ taken together with the N atom to which they are attached complete a heterocycle having from 4 to 8 atoms in the ring structure; R₁₀ represents an

alkenyl, aryl, cycloalkyl, a cycloalkenyl, a heterocyclyl, or a polycyclyl; and m is zero or an integer in the range of 1 to 8. In certain embodiments, only one of R_{11} or R_{12} can be a carbonyl, e.g., R_{11} , R_{12} , and the nitrogen together do not form an imide. In even more certain embodiments, R_{11} and R_{12} (and optionally R_{13}) each independently represent a hydrogen, an alkyl, an alkenyl, or $-(CH_2)_m-R_{10}$. Thus, the term "alkylamine" as used herein means an amine group, as defined above, having a substituted or unsubstituted alkyl attached thereto, i.e., at least one of R_{11} and R_{12} is an alkyl group. In certain embodiments, an amino group or an alkylamine is basic, meaning it has a conjugate acid with a $pK_a > 7.00$, i.e., the protonated forms of these functional groups have pK_a s relative to water above about 7.00.

[0048] The term "amide", as used herein, refers to a group

wherein each R_{14} independently represent a hydrogen or hydrocarbonyl group, or two R_{14} are taken together with the N atom to which they are attached complete a heterocycle having from 4 to 8 atoms in the ring structure.

[0049] The term "aryl" as used herein includes 3- to 12-membered substituted or unsubstituted single-ring aromatic groups in which each atom of the ring is carbon (i.e., carbocyclic aryl) or where one or more atoms are heteroatoms (i.e., heteroaryl). Preferably, aryl groups include 5- to 12-membered rings, more preferably 6- to 10-membered rings. The term "aryl" also includes polycyclic ring systems having two or more cyclic rings in which two or more carbons are common to two adjoining rings wherein at least one of the rings is aromatic, e.g., the other cyclic rings can be cycloalkyls, cycloalkenyls, cycloalkynyls, aryls, heteroaryls, and/or heterocyclyls. Carbocyclic aryl groups include benzene, naphthalene, phenanthrene, phenol and aniline. EXEMPLARY PHARMACEUTICAL COMPOSITIONS

[0105] In certain embodiments, the invention relates to a pharmaceutical composition comprising any one of the aforementioned compounds and a pharmaceutically acceptable carrier.

[0106] Patients, including but not limited to humans, can be treated by administering to the patient an effective amount of the active compound or a pharmaceutically acceptable prodrug or salt thereof in the presence of a pharmaceutically acceptable carrier or diluent. The active materials can be administered by any appropriate route, for example, orally, parenterally, intravenously, intradermally, subcutaneously, or topically, in liquid or solid form.

[0107] The concentration of active compound in the drug composition will depend on absorption, inactivation and excretion rates of the drug as well as other factors known to those of skill in the art. It is to be noted that dosage values will also vary with the severity of the condition to be alleviated. It is to be further understood that for any particular subject, specific dosage regimens should be adjusted over time according to the individual need and the professional judgment of the person administering or supervising the administration of the compositions, and that the concentration ranges set forth herein are exemplary only and are not intended to limit the scope or practice of the claimed composition. The active ingredient can be administered at once, or can be divided into a number of smaller doses to be administered at varying intervals of time.

[0108] In certain embodiments, the mode of administration of the active compound is oral. Oral compositions will generally include an inert diluent or an edible carrier. They can be enclosed in gelatin capsules or compressed into tablets. For the purpose of oral therapeutic administration, the active compound can be incorporated with excipients and used in the form of tablets, troches or capsules. Pharmaceutically compatible binding agents, and/or adjuvant materials can be included as part of the composition.

[0109] The tablets, pills, capsules and troches can contain any of the following ingredients, or compounds of a similar nature: a binder such as microcrystalline cellulose, gum tragacanth or gelatin; an excipient such as starch or lactose, a disintegrating agent such as alginic acid, Primogel or corn starch; a lubricant such as magnesium stearate or Sterotes; a glidant such as colloidal silicon dioxide; a sweetening agent such as sucrose or saccharin; or a flavoring agent such as peppermint, methyl salicylate, or orange flavoring. When the dosage unit form is a capsule, it can contain, in addition to material of the above type, a liquid carrier such as a fatty oil. In addition, unit dosage forms can contain various other materials that modify the physical form of the dosage unit, for example, coatings of sugar, shellac, or other enteric agents.

[0110] The compound can be administered as a component of an elixir, suspension, syrup, wafer, chewing gum or the like. A syrup can contain, in addition to the active compound(s), sucrose or sweetener as a sweetening agent and certain preservatives, dyes and colorings and flavors.

[0111] The compound or a pharmaceutically acceptable prodrug or salts thereof can also be mixed with other active materials that do not impair the desired action, or with materials that supplement the desired action, such as antibiotics, antifungals, anti-inflammatories or other antivirals, including but not limited to nucleoside compounds. Solutions or suspensions used for parenteral, intradermal, subcutaneous, or topical application can include the following components: a sterile diluent such as water for injection, saline solution, fixed oils, polyethylene glycols, glycerine, propylene glycol or other synthetic solvents; antibacterial agents such as benzyl alcohol or methyl parabens; antioxidants such as ascorbic acid or sodium bisulfite; chelating agents, such as ethylenediaminetetraacetic acid; buffers, such as acetates, citrates or phosphates, and agents for the adjustment of tonicity, such as sodium chloride or dextrose. The parental preparation can be enclosed in ampoules, disposable syringes or multiple dose

vials made of glass or plastic.

[0112] If administered intravenously, carriers include physiological saline and phosphate buffered saline (PBS).

[0113] In certain embodiments, the active compounds are prepared with carriers that will protect the compound against rapid elimination from the body, such as a controlled release formulation, including but not limited to implants and microencapsulated delivery systems. Biodegradable, biocompatible polymers can be used, such as ethylene vinyl acetate, polyanhydrides, polyglycolic acid, collagen, polyorthoesters and polylactic acid. For example, enterically coated compounds can be used to protect cleavage by stomach acid. Methods for preparation of such formulations will be apparent to those skilled in the art. Suitable materials can also be obtained commercially.

[0114] Liposomal suspensions (including but not limited to liposomes targeted to infected cells with monoclonal antibodies to viral antigens) are also preferred as pharmaceutically acceptable carriers. These can be prepared according to methods known to those skilled in the art, for example, as described in U.S. Pat. No. 4,522,811.

[0115] For example, liposome formulations can be prepared by dissolving appropriate lipid(s) (such as stearyl phosphatidyl ethanolamine, stearyl phosphatidyl choline, arachadyl phosphatidyl choline, and cholesterol) in an inorganic solvent that is then evaporated, leaving behind a thin film of dried lipid on the surface of the container. An aqueous solution of the active compound is then introduced into the container. The container is then swirled by hand to free lipid material from the sides of the container and to disperse lipid aggregates, thereby forming the liposomal suspension.

General Schemes for the synthesis of $\alpha\text{v}\beta 6$ inhibitors

[0125]

General Procedures

9-BBN and Suzuki Reactions

[0126]

[0127] Alkene intermediates may be cross-coupled to 2-halo naphthyridines or tetrahydronaphthyridines by the following procedure. To a solution of alkene (1 equiv.) in dry THF (2-10 mL/mmol) under Ar was added 9-BBN (0.5M solution in THF, 1-2 equiv.). The reaction was stirred at 40-80 °C for 1-4 hours, then cooled to room temperature. This solution was added to a mixture of 2-halonaphthyridine or Boc-protected 2-halotetrahydronaphthyridine (1-1.5 equiv.), cesium carbonate (2-5 equiv.) and Pd(PPh₃)₄ or another appropriate Pd/ligand combination (0.05 to 0.1 equiv.) in 1,4-Dioxane (2-10 mL/mmol). The reaction was stirred at 80-100 °C for 12-24 hours. Solvent was removed in vacuo, and the residue was purified by

silica gel column to give the alkyl linked naphthyridine product.

Ring Annulations

[0128]

[0129] Naphthyridines may also be made from methyl ketones by the following procedure. A mixture of methyl ketone (1 equiv.), 2-aminonicotinaldehyde (1-2 equiv.) and secondary amine such as pyrrolidine or L-proline (1-2 equiv.) in DMF or EtOH (1-10 mL/mmol) was stirred at 70-100 °C for 2- 10 hours. Solvent was removed *in vacuo*, and the residue was purified by silica gel column to give the desired naphthyridine product.

Naphthyridine Reduction

[0130]

[0131] Naphthyridines may be reduced to tetrahydronaphthyridines by the following procedure. A mixture of an appropriate naphthyridine (1 equiv.) and Pd/C (5-20 weight percent Pd, 0.05 to 0.2 equiv.) in ethyl acetate or another appropriate solvent (2-10 mL/mmol) was stirred under H_2 balloon at room temperature to 50 °C for 2-20 hours. The reaction was filtered and concentrated in *vacuo* to give the desired tetrahydronaphthyridine product.

Boc Deprotection

[0132]

[0133] Boc-protected amine (1 equiv.) was treated with HCl (4-100 equiv.) in 1,4-dioxane (1-50 mL/mmol amine) at room temperature to 50 °C for 1-4 hours. The reaction was concentrated in vacuo, and the amine product was used crude or after purification by silica gel column. The amine could be used crude as a dihydrochloride salt or converted to the free base by dissolving in an appropriate solvent and washing with aqueous NaHCO₃.

Amine alkylation:

[0134]

[0135] A mixture of amine (1 equiv.), alkylating agent (1-1.5 equiv.) and K₂CO₃ or N,N-diisopropylethylamine (2-10 equiv.) in MeCN or DMF (3-10 mL/mmol amine) was stirred at room temperature to 80 °C for 4-16 hours. The reaction was concentrated in vacuo, and the residue was purified by silica gel column to give the desired amino acetic acid ester. The amine used may be the free base or a salt such hydrochloride or dihydrochloride. If the reaction is done with a salt of the amine, additional equivalents of base may be needed.

Saponification:

[0136]

[0137] For certain esters such as Ri = Me or ethyl, the ester may be saponified under basic conditions. The ester (1 equiv.) was treated with LiOH-H₂O (3-5 equiv.) in MeOH (3-10 mL/mmol ester) and water (3-10 mL/mmol ester) at room temperature to 50 °C for 1-16 hours. The reaction was concentrated in vacuo, and the residue was purified by prep HPLC to give the desired carboxylic acid product.

[0138] For certain esters such as Ri = tert-butyl, the ester may be saponified under acidic conditions. The ester (1 equiv.) was treated with 4 N HCl (4-100 equiv.) in 1,4-dioxane (1-25 mL/mmol ester) at room temperature to 50 °C for 1-16 hours. The reaction was concentrated in vacuo, and the residue was purified by prep HPLC to give the desired carboxylic acid product.

Petasis reaction:

[0139]

[0140] As an alternative to the amine alkylation/saponification sequence, a Petasis reaction can be used to prepare certain aryl analogs: A mixture of amine (1 equiv.) aryl boronic acid or aryl boronate ester (1-1.5 equiv.) and 2-oxoacetic acid (1.5-2 equiv.) in MeCN or DMF (2-10 mL/mmol amine) was stirred at 50-80 °C for 2-16 hours. The reaction was concentrated in vacuo, and the residue was purified by prep HPLC to give the desired amino acid.

Step 1: 3-bromo-2-(3,4-dihydro-2H-pyran-6-yl)-5-fluoropyridine

[0353]

[0354] Under N₂, to a solution of 2,3-dibromo-5-fluoropyridine (3g, 11.77mmol) in MeOH (10 mL) was added 2-(3,4-dihydro-2H-pyran-6-yl)-4,4,5,5-tetramethyl-1,3,2-dioxaborolane (1.98g, 9.42 mmol), palladium(II) acetate (915 mg, 1 mmol), PPh₃ (476 mg, 1 mmol) and potassium carbonate (3.5g, 25 mmol). The mixture was stirred at 50 °C for 5 hours under N₂, then cooled to room temperature, and diluted with ethyl acetate (60 mL) and water (60 mL) were added. The organic layer was separated, and the aqueous layer was extracted with ethyl acetate (20 mL x 2). The combined organic layer was washed with brine and dried over anhydrous Na₂SO₄. After filtration and concentration, the residue was purified by silica gel column (pet ether/EtOAc = 0% → 20%) to give the desired product as a colorless oil (1.0 g, 33% yield). ESI 258.7 (M+H)⁺.

Step 2: tert-butyl 2-(2-(3,4-dihydro-2H-pyran-6-yl)-5-fluoropyridin-3-yl)acetate

[0355]

[0356] A mixture of 3-bromo-2-(3,4-dihydro-2H-pyran-6-yl)-5-fluoropyridine (1 g, 3.87 mmol), (2-(tert-butoxy)-2-oxoethyl)zinc(II) bromide (0.5M in THF, 15 mL, 11.1 mmol), Pd₂(dba)₃ (201 mg, 0.22 mmol) and Q-phos (156 mg, 0.22 mmol) in THF (dry, 10 mL) was stirred at 60°C for 2 hours under N₂. Then the reaction mixture was poured into sat. NaHCO₃ aq. solution (50 mL) and extracted with EtOAc (3 × 40 mL). The combined organic layers were dried over anhydrous Na₂SO₄, filtered and concentrated under vacuum. The residue was purified by silica gel column (pet ether/EtOAc 4:1) to give the desired product tert-butyl 2-(2-(3,4-dihydro-2H-pyran-6-yl)-5-fluoropyridin-3-yl)acetate (710 mg, 63 % yield). ESI 294.7 [M+H]⁺.

Step 3: tert-butyl 2-(5-fluoro-2-(tetrahydro-2H-pyran-2-yl)pyridin-3-yl)acetate

[0357]

The mixture was stirred for 5 hours at 35 °C under H₂ atmosphere (with a H₂ balloon). Then, the catalyst was removed by filtration, and the filtrate was concentrated under reduced pressure. The residue was purified by silica gel column (pet ether/EtOAc = 5% → 20%) to give the desired product as a pale-yellow oil (630 mg, 88% yield). ESI 296.1 (M+H)⁺. The racemic compound was separated by Prep chiral SFC G to give **stereoisomer A** (195 mg) and **stereoisomer B** (180 mg) as pale-yellow oils.

The reaction was stirred continuously for 15 minutes, and a solution of N-bromosuccinimide (325 mg, 1.83 mmol) in THF (5 mL, dry) was added. The reaction was stirred for 0.5 hour at -78 °C, then quenched with H₂O (10 mL) and extracted with ethyl acetate (20 mL × 3). Example 19: Fluorescence polarization assays of compounds for $\alpha\text{v}\beta 6$ binding

[0532] Fluorescence Polarization (FP) assays were used to measure compound activity through binding competition with the fluorescein-labeled peptide GRGDLGRL. In the assay, 10 nM of integrin $\alpha\text{v}\beta 6$ was incubated with the test compound in 2 mM manganese chloride, 0.1 mM calcium chloride, 20 mM HEPES buffer at pH 7.3, 150 mM sodium chloride, 0.01% Triton X-100, 2% DMSO, and 3 nM of the fluorescein-labeled peptide. The assays were run in 384-well plates. For both assay versions, the integrin protein was preincubated with the test compounds for 15 minutes at 22 °C before the fluorescein-labeled peptide was added. After the fluorescein-labeled peptide was added, the assay was incubated at 22 °C for 1 hour and fluorescence polarization was measured. IC_{50} values were determined by nonlinear regression, 4-parameter curve fitting (data in tables in Figure 1 and Figure 2).

Example 20: MDCK in vitro permeability assays of compounds

[0533] Compounds were tested for permeability in an MDCK permeability assay. This assay measures the ability of compounds to cross a layer of Madin-Darby Canine Kidney (MDCK) cells from the apical to basolateral side (A->B). This measurement is predictive of the ability of compounds to be absorbed in the gut following oral dosing, an essential characteristic of an orally administered small molecule integrin inhibitor drug.

[0534] The assay is run in two formats. One uses wild type MDCK cells with no inhibitor. This method works well in determining the passive permeability of compounds with low efflux by P-glycoprotein (Pgp), and was used to assess permeability of a Reference Compound having the chemical formula shown below. The MDCK value of less than 1 (i.e., less than about 0.23) was obtained for the Reference Compound using this method; an IC_{50} value of about 96.5 nM was obtained for the Reference Compound using the fluorescence polarization assay of Example 19.

Reference Compound

[0535]

avb6. (IC50) [nM]	MDCK (A->B)
96.5	<0.23

[0536] However, for compounds with Pgp efflux, it is necessary to include a Pgp inhibitor order to determine passive permeability for A->B transmission. In this case, a MDCK-MDR1 cell line overexpressing Pgp is used, and PGP inhibitor GF120918 is included at sufficient concentration (10 μ M) to block activity of Pgp. This procedure (MDCK-MDR1 with PGP inh (A->B) [10^6 cm/s]) was used to obtain the data presented in Tables shown in Figures 3A and 3B. MDCK permeability values of less than 5 10^6 cm/s predict low absorption in the gut, while permeability values greater than 5 10^6 cm/s predict sufficient absorption in the gut for oral dosing of a small molecule drug.

[0537] The detailed experimental procedure is as follows:

	• Assay and dosing solution buffer: Hanks Balanced

EQUIPMENT	REAGENTS
	Salt Solution (HBSS, Invitrogen, Cat# 14025-092) with 25 mM HEPES, pH 7.4
	• Test article and reference compound stock solutions were prepared in DMSO, Lucifer Yellow (LY) stock solution was prepared in the assay buffer.

Cell culture and maintenance:

[0538]

- Cell stock cultures (MDCK or MDCK MDR1) are maintained in MEM + 10% FBS + 1% NEAA, grown in 75 cm² tissue culture treated flasks and split (passed) 2 times weekly to maintain desired confluence.
- For maintenance passage: trypsinized cells are routinely distributed into new flasks at a standard passage ratio of 1:20.

[0539] Seeding assay plates: MDCK assay plates are seeded with MDCK or MDCK MCR1 cells 3-4 days prior to running the assay. 24-well plates are seeded at a cell density of 0.88×10^5 /well in a 400 μ L apical chamber volume (2.2×10^5 /mL) with a 25 mL volume of growth medium to the 24-well basal chamber. Assay plates are generally provided with a growth medium change 24 hours prior to the assay.

Preparation of the assay plates and Trans-epithelial Electrical Resistance (TEER)

[0540] measurement: MDCK assay plates are rinsed with HBSS+ prior to running the assay. After rinsing, fresh HBSS+ is added to the assay plate in a 400 μ L apical chamber volume and a 0.8 mL HBSS+ basal chamber volume. Measure the electrical resistance across the monolayer using the Millicell ERS system ohm meter. (The cells will be used if TEER is higher than 100 ohm*cm²).

[0541] Preparation of dosing solution. Donor solutions are prepared in HBSS+ with 0.4% DMSO and 5 μ M test compound. The donor solution contains 5 μ M lucifer yellow for apical dosing, but no lucifer yellow for basolateral dosing. The donor solution may also contain 10 μ M GF 120918 for Pgp inhibition. Receiver solutions are prepared with HBSS+ with 0.4% DMSO. Donor and receiver solutions were centrifuged at 4000 rpm, 5 min, and supernatants were used for compound dosing.

Preparation of the cell plates:**[0542]**

- Remove the buffer from the apical side and basolateral side. Add 600 μL of donor solution (for A-to-B) or 500 μL of receiver solution (for B-to-A) to the apical wells based on plate map.
- A fresh basolateral plate is prepared by adding 800 μL of receiver solution (for A-to-B) or 900 μL of donor solution (B-to-A) to the well of a new 24-well plate.
- Put the apical plate and basolateral plate into a 37 $^{\circ}\text{C}$ CO_2 incubator.

Preparation of analytical plate:**[0543]**

- After 5 min, transfer 100 μL of samples from all donors (for both A-to-B and B-to-A) into appropriate wells of a sample plate for D0. And transfer 100 μL of samples from all apical chambers (the donor of A-to-B and receiver of B-to-A) into appropriate wells of a microplate for Lucifer Yellow D0 (D0 LY)
- Lay the apical plate to the basolateral plate to start transport process.
- At 90 min, separate the apical and basolateral plates and transfer 100 μL of samples from all donors (for both A-to-B and B-to-A) into appropriate wells of a new sample plate for D90, and transfer 200 μL of samples from all receivers into appropriate wells of a sample plate for R90. Transfer 100 μL of samples from all basolateral chambers (receiver of A-to-B and donor of B-to-A) into appropriate wells of a new microplate for Lucifer Yellow R90 (R90 LY).
- Determine LY permeability by reading D0 LY and R90 LY at an excitation wavelength of 485 nm and an emission wavelength of 535 nm using a fluorescent plate reader.
- LC/MS/MS Sample preparation:
 - For receiver solution: 60 μL of sample + 60 μL ACN with IS (200 ng/mL Osalmid)
 - For donor solution: 6 μL of sample + 54 μL 0.4% DMSO/HBSS + 60 μL ACN with IS (200 ng/mL Osalmid)
 - The compound standard curve 20X solutions (0.1 - 60 μM range) are prepared in MeOH:H₂O (1:1). 1X concentrated solutions (0.005 - 3 μM range) are prepared by mixing 3 μL of 20X solution with 57 μL 0.4% DMSO HBSS and 60 μL ACN with IS (200 ng/mL Osalmid).

Calculations

[0544]

Transepithelial electrical resistance (TEER) = (Resistance_{sample} - Resistance_{blank}) × Effective Membrane Area

[0545] Lucifer Yellow permeability:

$$P_{app} = (V_A / (\text{Area} \times \text{time})) \times ([\text{RFU}]_{\text{accepter}} - [\text{RFU}]_{\text{blank}}) / (([\text{RFU}]_{\text{initial, donor}} - [\text{RFU}]_{\text{blank}}) \times \text{Dilution Factor}) \times 100$$

[0546] Plate drug transport assays using the following equation:

Transepithelial electrical resistance (TEER) = (Resistance_{sample} - Resistance_{blank}) × Effective Membrane Area

[0547] Drug permeability:

$$P_{app} = (V_R / (\text{Area} \times \text{time})) \times ([\text{drug}]_{\text{receiver}} / (([\text{drug}]_{\text{initial, donor}}) \times \text{Dilution Factor}))$$

[0548] Where V_R is the volume in the receiver well (0.8 mL for A-to-B and 0.4 mL for B-to-A), area is the surface area of the membrane (0.7 cm² for Millipore-24 Cell Culture Plates), and time is the total transport time in seconds.

Percentage Recovery = $100 \times (\text{Total compound in donor at 90 min} \times \text{Dilution Factor} + \text{Total compound in receiver at 90 min}) / (\text{Total compound in donor at 0 min} \times \text{Dilution Factor})$
