COMPOUNDS AS TRKA KINASE INHIBITORS**

BACKGROUND OF THE INVENTION

[0001] The present invention relates to novel compounds, to pharmaceutical compositions comprising the compounds, to processes for making the compounds and to the use of the compounds in therapy. More particularly, it relates to pyrrolidinyl urea, thiourea, guanidine and cyanoguanidine compounds which exhibit TrkA kinase inhibition, and which are useful in the treatment of pain, cancer, inflammation/inflammatory diseases, neurodegenerative diseases, certain infectious diseases, Sjogren's syndrome, endometriosis, diabetic peripheral neuropathy, prostatitis and pelvic pain syndrome.

[0002] The current treatment regimens for pain conditions utilize several classes of compounds. The opioids (such as morphine) have several drawbacks including emetic, constipatory and negative respiratory effects, as well as the potential for addictions. Non-steroidal anti-inflammatory analgesics (NSAIDs, such as COX-1 or COX-2 types) also have drawbacks including insufficient efficacy in treating severe pain. In addition, COX-1 inhibitors can cause ulcers of the mucosa. Accordingly, there is a continuing need for new and more effective treatments for the relief of pain, especially chronic pain.

[0003] Trk's are the high affinity receptor tyrosine kinases activated by a group of soluble growth factors called neurotrophins (NT). The Trk receptor family has three members: TrkA, TrkB and TrkC. Among the neurotrophins are (i) nerve growth factor (NGF) which activates TrkA, (ii) brain-derived neurotrophic factor (BDNF) and NT-4/5 which activate TrkB and (iii) NT3 which activates TrkC. Trk's are widely expressed in neuronal tissue and are implicated in the maintenance, signaling and survival of neuronal cells (Patapoutian, A. et al., *Current Opinion in Neurobiology*, 2001, 11, 272-280).

[0004] Inhibitors of the Trk/neurotrophin pathway have been demonstrated to be effective in numerous pre-clinical animal models of pain. For example, antagonistic NGF and TrkA antibodies such as RN-624 have been shown to be efficacious in inflammatory and neuropathic pain animal models (Woolf, C.J. et al. (1994) *Neuroscience* 62, 327-331; Zahn, P.K. et al. (2004) *J. Pain* 5, 157-163; McMahon, S.B. et al., (1995) *Nat. Med.* 1, 774-780; Ma, Q. P. and Woolf, C. J. (1997) *NeuroReport* 8, 807-810; Shelton, D. L. et al. (2005) *Pain* 116, 8-16; Delafoy, L. et al. (2003) *Pain* 105, 489-497; Lamb, K. et al. (2003) *Neurogastroenterol. Motil.* 15, 355-361; Jaggar, S. I. et al. (1999) *Br. J. Anaesth.* 83, 442-448) and neuropathic pain animal models (Ramer, M. S. and Bisby, M. A. (1999) *Eur. J. Neurosci.* 11, 837-846; Ro, L. S. et al. (1999); Herzberg, U. et al., *Pain* 79, 265-274 (1997) *Neuroreport*

8, 1613–1618; Theodosiou, M. et al. (1999) *Pain* 81, 245–255; Li, L. et al. (2003) *Mol. Cell. Neurosci.* 23, 232–250; Gwak, Y. S. et al. (2003) *Neurosci. Lett.* 336, 117–120).

[0005] It has also been shown that NGF secreted by tumor cells and tumor invading macrophages directly stimulates TrkA located on peripheral pain fibers. Using various tumor models in both mice and rats, it was demonstrated that neutralizing NGF with a monoclonal antibody inhibits cancer related pain to a degree similar or superior to the highest tolerated dose of morphine. Because TrkA kinase may serve as a mediator of NGF driven biological responses, inhibitors of TrkA and/or other Trk kinases may provide an effective treatment for chronic pain states.

[0006] Recent literature has also shown that overexpression, activation, amplification and/or mutation of Trk kinases are associated with many cancers including neuroblastoma (Brodeur, G. M., *Nat. Rev. Cancer* 2003, 3, 203-216), ovarian (Davidson. B., et al., *Clin. Cancer Res.* 2003, 9, 2248-2259), colorectal cancer (Bardelli, A., *Science* 2003, 300, 949), melanoma (Truzzi, F., et al., *Dermato-Endocrinology* 2008, 3 (1), pp. 32-36), head and neck cancer (Yilmaz, T., et al., *Cancer Biology and Therapy* 2010, 10 (6), pp. 644-653), gastric carcinoma (Du, J. et al., *World Journal of Gastroenterology* 2003, 9 (7), pp. 1431-1434), lung carcinoma (Ricci A., et al., *American Journal of Respiratory Cell and Molecular Biology* 25 (4), pp. 439-446), breast cancer (Jin, W., et al., *Carcinogenesis* 2010, 31 (11), pp. 1939-1947), Glioblastoma (Wadhwa, S., et al., *Journal of Biosciences* 2003, 28 (2), pp. 181-188), medulloblastoma (Gruber-Olipitz, M., et al., *Journal of Proteome Research* 2008, 7 (5), pp. 1932-1944), secretory breast cancer (Euthus, D.M., et al., *Cancer Cell* 2002, 2 (5), pp. 347-348), salivary gland cancer (Li, Y.-G., et al., *Chinese Journal of Cancer Prevention and Treatment* 2009, 16 (6), pp. 428-430), papillary thyroid carcinoma (Greco, A., et al., *Molecular and Cellular Endocrinology* 2010, 321 (1), pp. 44-49) and adult myeloid leukemia (Eguchi, M., et al., *Blood* 1999, 93 (4), pp. 1355-1363). In preclinical models of cancer, non-selective small molecule inhibitors of TrkA, B and C were efficacious in both inhibiting tumor growth and stopping tumor metastasis (Nakagawara, A. (2001) *Cancer Letters* 169:107-114; Meyer, J. et al. (2007) *Leukemia*, 1–10; Pierottia, M.A. and Greco A., (2006) *Cancer Letters* 232:90–98; Eric Adriaenssens, E., et al. *Cancer Res* (2008) 68:(2) 346-351).

[0007] In addition, inhibition of the neurotrophin/Trk pathway has been shown to be effective in treatment of pre-clinical models of inflammatory diseases with NGF antibodies or non-selective small molecule inhibitors of TrkA. For example, inhibition of the neurotrophin/Trk pathway has been implicated in preclinical models of inflammatory lung diseases including asthma (Freund-Michel, V; Frossard, N., *Pharmacology & Therapeutics* (2008) 117(1), 52-

76), interstitial cystitis (Hu Vivian Y; et. al. *The Journal of Urology* (2005), 173(3), 1016-21), bladder pain syndrome (Liu, H.-T., et al., (2010) *BJU International*, 106 (11), pp. 1681-1685), inflammatory bowel diseases including ulcerative colitis and Crohn's disease (Di Mola, F. F, et. al., *Gut* (2000) 46(5), 670-678) and inflammatory skin diseases such as atopic dermatitis (Dou, Y.-C., et. al. *Archives of Dermatological Research* (2006) 298(1), 31-37), eczema and psoriasis (Raychaudhuri, S. P., et al., *J. Investigative Dermatology* (2004) 122(3), 812-819).

[0008] The TrkA receptor is also thought to be critical to the disease process of the parasitic infection of *Trypanosoma cruzi* (Chagas disease) in human hosts (de Melo-Jorge, M. et al., *Cell Host & Microbe* (2007) 1(4), 251-261).

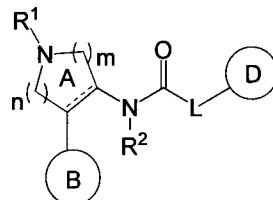

[0009] Trk inhibitors may also find use in treating disease related to an imbalance of the regulation of bone remodeling, such as osteoporosis, rheumatoid arthritis, and bone metastases. Bone metastases are a frequent complication of cancer, occurring in up to 70 percent of patients with advanced breast or prostate cancer and in approximately 15 to 30 percent of patients with carcinoma of the lung, colon, stomach, bladder, uterus, rectum, thyroid, or kidney. Osteolytic metastases can cause severe pain, pathologic fractures, life-threatening hypercalcemia, spinal cord compression, and other nerve-compression syndromes. For these reasons, bone metastasis is a serious and costly complication of cancer. Therefore, agents that can induce apoptosis of proliferating osteoblasts would be highly advantageous. Expression of TrkA receptors has been observed in the bone-forming area in mouse models of bone fracture (K. Asaumi, et al., *Bone* (2000) 26(6) 625-633). In addition, localization of NGF was observed in almost all bone-forming cells (K. Asaumi, et al.). Recently, it was demonstrated that a Trk inhibitor inhibits the signaling activated by neurotrophins binding to all three of the Trk receptors in human hFOB osteoblasts (J. Pinski, et al., (2002) 62, 986-989). These data support the rationale for the use of Trk inhibitors for the treatment of bone remodeling diseases, such as bone metastases in cancer patients.

[0010] Trk inhibitors may also find use in treating diseases and disorders such as Sjogren's syndrome (Fauchais, A.L., et al., (2009) *Scandinavian Journal of Rheumatology*, 38(1), pp. 50-57), endometriosis (Barcena De Arellano, M.L., et al., (2011) *Reproductive Sciences*, 18(12), pp. 1202-1210; Barcena De Arellano, et al., (2011) *Fertility and Sterility*, 95(3), pp. 1123-1126; Cattaneo, A., (2010) *Current Opinion in Molecular Therapeutics*, 12(1), pp. 94-106), diabetic peripheral neuropathy (Kim, H.C., et al., (2009) *Diabetic Medicine*, 26 (12), pp. 1228-1234; Siniscalco, D., et al., (2011) *Current Neuropharmacology*, 9(4), pp. 523-529; Ossipov, M.H., (2011) *Current Pain and Headache Reports*, 15(3), pp. 185-192), and

prostatitis and pelvic pain syndrome (Watanabe, T., et al., (2011) *BJU International*, 108(2), pp. 248-251; and Miller, L.J., et al., (2002) *Urology*, 59(4), pp. 603-608).

[0011] Several classes of small molecule inhibitors of Trk kinases said to be useful for treating pain or cancer are known (*Expert Opin. Ther. Patents* (2009) 19(3), 305-319).

[0012] International application publication WO 2010/032856 describes compounds represented by the formula

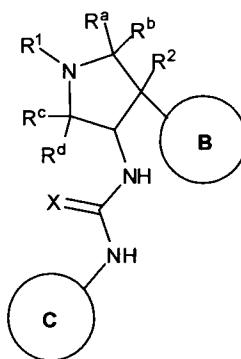

[0013] wherein ring B is an aromatic ring, ring D is an aromatic ring, and L is NR³, NR³C(R^{4a}R^{4b}), O or OC(R^{4a}R^{4b}), which are asserted to be tachykinin receptor antagonists.

Biological assays

Example A-1

TrkA Kinase Binding Assay

[00529] TrkA binding activity was determined in a TrkA LanthaScreen™ Eu Kinase Binding Assay. 5 nM His-tagged recombinant human TrkA (6HIS tagged cytoplasmic domain from Invitrogen, Cat. No. PV3144) was incubated with 4 nM Alexa-Fluor® Tracer 236 (Invitrogen Cat. No. PV5592), 2 nM biotinylated anti-His (Invitrogen Cat. No. PV6090), and 2 nM europium-labeled Streptavidin (Invitrogen Cat. No. PV5899), in buffer (25 mM MOPS, pH 7.5, 5 mM MgCl₂, 0.005% Triton X-100). Three fold serial dilutions of compounds of the invention in DMSO were added to a final percentage of 2% DMSO. After 60-minute incubation at 22 °C, the reaction was measured using the EnVision multimode plate reader (PerkinElmer) via TR-FRET dual wavelength detection at 615 nM and 665 nM. The percent of control was calculated using a ratiometric emission factor. The IC₅₀ values were determined by fitting a four parameter model to the percent of control data.

[00530] Table A provides averaged IC₅₀ values for compounds of the invention when tested in the assay of Example A, where **A** represents an averaged IC₅₀ value <100 nM; and **B** represents an averaged IC₅₀ value from 100 to 1,000 nM.

Example A-2p38 Kinase Binding Assay

[00531] p38 α binding activity was determined in a p38 α LanthaScreenTM Eu Kinase Binding Assay. 5 nM of inactive, GST-tagged recombinant human p38 α (GST-tagged cytoplasmic domain from Invitrogen, Catalog No. PV3305) was incubated with 5 nM Alexa-Fluor[®] Tracer 199 (Invitrogen Cat. No. PV5830), and 2 nM europium labeled anti-GST antibody (Invitrogen Cat. No. PV5594), in buffer (25 mM [Na⁺] HEPES pH 7.3, 10 mM

MgCl₂, 100 µM NaVO₄). Three fold serial dilutions of compounds of the invention in DMSO were added to a final percentage of 2% DMSO. After 60-minute incubation at 22 °C, the reaction was measured using the EnVision multimode plate reader (PerkinElmer) via TR-FRET dual wavelength detection at 615 nM and 665 nM. The percent of control was calculated using a ratiometric emission factor. The IC₅₀ values were determined by fitting a four parameter model to the percent of control data. The compounds of Examples 1-56 were tested in this assay, and all compounds were found to be 1000 fold more potent against TrkA than p38α.

Example B

Off-Target Kinase Profiling

[00532] A representative compound of the invention (Example 48) was tested for off-target kinase activity at a concentration of 10 µM by Millipore, Inc. in their KinaseProfiler™ service against all the kinases available in their full kinase panel. The compound was run in duplicate at a concentration of ATP near the Km for each individual kinase according to Millipore's specifications. The results are shown in Table B. Data are reported as percent of control (POC) and are the average of the two replicates.

[00533] In the KinaseProfiler™ the representative compound showed remarkable and unexpected selectivity for inhibiting TrkA and TrkB versus other kinases in the panel. In fact, the compound was largely inactive against off-target kinases at a concentration of 10 µM, and thus would not be expected to inhibit off-target kinases at therapeutic doses in mammals. The ability of compounds of the invention to selectively inhibit the Trk pathway without inhibiting other off-target kinases could translate into drug profiles that are essentially free of side-effects related to inhibition of off-target kinases. Such a drug profile would represent a safer approach to treating pain, inflammation, cancer and certain skin diseases than has been previously reported.

Preparation of Synthetic Intermediates

Preparation A

tert-butyl trans-4-phenylpyrrolidin-3-ylcarbamate

[00534] Step A: Preparation of trans-1-benzyl-3-nitro-4-phenylpyrrolidine: To a DCM (2 L) solution of (E)-(2-nitrovinyl)benzene (149 g, 1.00 mol) was added TFA (19.5 mL, 0.250 mol), followed by cooling to -15°C and then slow addition of a DCM (500 mL) solution of *N*-

methoxymethyl-*N*-(trimethylsilylmethyl)benzylamine (274 g, 1.00 mol) over 3 hours, maintaining the reaction temperature between -15 and -10 °C. The reaction was warmed up to ambient temperature and stirred for 18 hours, then washed with 2 N NaOH (500 mL) and treated with 2 N HCl (1 L). The resulting white suspension

[00535] was stirred for 1 hour before being filtered and washed with DCM. DCM (1 L) and 2 N NaOH (750 mL) were then added to the collected white solid and stirred until all the solids dissolved. After phase-separation, the aqueous layer was extracted with DCM (2 × 1 L). The combined organic layers were dried with MgSO₄, filtered and concentrated to afford the title product as an off-white solid (205 g, 73% yield). MS (apci) m/z = 283.1 (M+H).

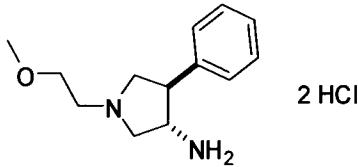

[00536] Step B: Preparation of *trans*-1-benzyl-4-phenylpyrrolidin-3-amine: To a suspension of *trans*-1-benzyl-3-nitro-4-phenyl-pyrrolidine (93.9 g, 333 mmol) in EtOH (1.20 L) was added concentrated HCl (450 mL), followed by addition of zinc dust (173 g, 2.66 mol) in small portions over 1.5 hours while maintaining the temperature between 55-60 °C. The reaction mixture was stirred at ambient temperature for 18 hours, then cooled in an ice/water bath followed by addition of concentrated NH₄OH (900 mL). The mixture (pH = 10-11) was filtered and the collected zinc was washed with CHCl₃. The filtrate was then phase-separated, and the aqueous layer was extracted with CHCl₃ (2 × 400 mL). The combined organics was washed with H₂O, brine, dried with MgSO₄, filtered and concentrated to afford the title compound as an amber oil (85.0 g, 100% yield). MS (apci) m/z = 253.2 (M+H).

[00537] Step C: Preparation of *trans*-(1-benzyl-4-phenyl-pyrrolidin-3-yl)-carbamic acid *tert*-butyl ester: To a mixture of *trans*-1-benzyl-4-phenylpyrrolidin-3-amine (85.0 g, 333 mmol), THF (750 mL) and triethylamine (69.6 mL, 500 mmol), was slowly added (Boc)₂O (72.7 g, 333 mmol) in portions over 30 minutes. The reaction mixture was stirred at ambient temperature for 16 hours and was concentrated under vacuum. The residue was dissolved in CHCl₃ and was washed with aqueous Na₂CO₃ and brine. The organic layer was dried with MgSO₄, filtered and concentrated to afford the title compound as a pale-yellow solid (116 g, 99% yield). MS (apci) m/z = 353.0 (M+H).

[00538] Step D: Preparation of *tert*-butyl *trans*-4-phenylpyrrolidin-3-ylcarbamate: A 2 gallon Parr reactor was charged with *trans*-(1-benzyl-4-phenyl-pyrrolidin-3-yl)-carbamic acid *tert*-butyl ester (114 g, 323 mmol), EtOH (2 L) and 10% Pd/C (50% wet, 11.0 g). The reactor was purged with N₂ several times, filled with H₂ to 56-57 psi and agitated at 80 °C. When the reaction was complete according to HPLC analysis, the reaction mixture was filtered and the filtrate concentrated to provide the crude product as a yellow solid. The crude material was

triturated from toluene to afford the title product as a white solid (68.4 g, 78% yield). MS (apci) m/z = 262.9 (M+H).

Preparation B

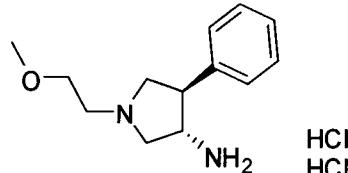

trans-1-(2-methoxyethyl)-4-phenylpyrrolidin-3-amine dihydrochloride

[00539] Step A: Preparation of *tert*-butyl *trans*-1-(2-methoxyethyl)-4-phenylpyrrolidin-3-ylcarbamate. To a solution of *tert*-butyl *trans*-4-phenylpyrrolidin-3-ylcarbamate (Preparation A, 4.82 g, 17.5 mmol) in dry DMF (50 mL) was added sequentially DIEA (9.12 mL, 52.4 mmol) and 1-bromo-2-methoxyethane (1.97 mL, 20.9 mmol). The mixture was stirred at ambient temperature for 46 hours and then poured into H₂O (300 mL). The mixture was extracted with EtOAc (3 x 150 mL) and the combined extracts were washed with brine, dried over MgSO₄/activated carbon, filtered through a SiO₂ plug capped with packed MgSO₄, and eluted with EtOAc. The solution was concentrated and dried under vacuum yielding the product as a white solid (5.15 g, 92% yield). MS (apci) m/z = 321.1 (M+H).

[00540] Step B: Preparation of *trans*-1-(2-methoxyethyl)-4-phenylpyrrolidin-3-amine dihydrochloride: To a solution of *tert*-butyl *trans*-1-(2-methoxyethyl)-4-phenylpyrrolidin-3-ylcarbamate (5.10 g, 15.9 mmol) in 2:1 EtOAc-MeOH (150 mL) was added 4 N HCl in dioxane (59.7 mL, 239 mmol). The mixture was stirred at ambient temperature for 90 minutes and then concentrated under vacuum. The resulting foam was treated with EtOAc (200 mL), sonicated for 5 minutes and stirred vigorously until a fine white suspension formed. The suspension was filtered, washed with EtOAc and dried under vacuum to afford the title compound as a white powder (5.10 g, 100% yield). MS (apci) m/z = 221.1 (M+H).

The reaction mixture was concentrated under vacuum, using toluene to azeotrope, then treated with 2 N HCl in Et₂O and concentrated again to give the title compound (0.21 g, 100% yield) as an off-white solid. MS (apci) m/z = 221.2 (M+H).

[00546] The following pyrrolidine intermediates were made according to the method of Preparation C1, using the appropriately substituted cinnamoyl chloride in Step A.
