DESCRIPTION

CROSS-REFERENCE TO RELATED APPLICATIONS

BACKGROUND

[0001] The present disclosure relates to novel compounds which exhibit Rearranged during Transfection (RET) kinase inhibition, pharmaceutical compositions comprising the compounds, processes for making the compounds, and the use of the compounds in therapy. More particularly, it relates to substituted pyrazolo[1,5-a]pyridine compounds useful in the treatment and prevention of diseases which can be treated with a RET kinase inhibitor, including RET-associated diseases and disorders. US 2012/0277247 describes certain pyrazolopyridine compounds as JAK inhibitors.

[0002] RET is a single-pass transmembrane receptor belonging to the tyrosine kinase superfamily that is required for normal development, maturation and maintenance of several tissues and cell types (Mulligan, L. M., Nature Reviews Cancer, 2014, 14, 173-186). The extracellular portion of the RET kinase contains four calcium-dependent cadherin-like repeats involved in ligand binding and a juxtamembrane cysteine-rich region necessary for the correct folding of the RET extracellular domain, while the cytoplasmic portion of the receptor includes two tyrosine kinase subdomains.

[0003] RET signaling is mediated by the binding of a group of soluble proteins of the glial cell line-derived neurotrophic factor (GDNF) family ligands (GFLs), which also includes neurturin (NTRN), artemin (ARTN) and persephin (PSPN) (Arighi et al., Cytokine Growth Factor Rev., 2005, 16, 441-67). Unlike other receptor tyrosine kinases, RET does not directly bind to GFLs and requires an additional co-receptor: that is, one of four GDNF family receptor-α (GFRα) family members, which are tethered to the cell surface by a glycosylphosphatidylinositol linkage. GFLs and GFRα family members form binary complexes that in turn bind to RET and recruit it into cholesterol-rich membrane subdomains, which are known as lipid rafts, where RET signaling occurs.

[0004] Upon binding of the ligand-co-receptor complex, RET dimerization and autophosphorylation on intracellular tyrosine residues recruits adaptor and signaling proteins to stimulate multiple downstream pathways. Adaptor protein binding to these docking sites leads to activation of Ras-MAPK and PI3K-Akt/mTOR signaling pathways or to recruitment of the CBL family of ubiquitin ligases that functions in RET downregulation of the RET-mediated functions.

[0005] Aberrant RET expression and/or activity have been demonstrated in different cancers, gastrointestinal disorders and irritable bowel syndrome (IBS).

[0150] Compound **2** is obtained by treating 3-bromo-5-methoxypyridine (compound 1), which is commercially available, with O-(mesitylsulfonyl)hydroxylamine. The O-mesitylsulfonylhydroxylamine may be prepared as described in Mendiola, J., et al., Org. Process Res. Dev. 2009, 13(2), 263-267. Compound **2** may be reacted with ethyl propiolate to provide a mixture of compounds **3A** and **3B,** which typically are obtained in a ratio of approximately 2:1 to 9:1, respectively. The mixture of compounds **3A**

After isolation, compound **4A** may be treated with $POCl_3$ to provide compound **5.** The formyl group may be converted to an oxime group using NH_2OH to provide compound **6.** The oxime group may be converted to a nitrile group using acetic anhydride to provide compound 7. The methoxy group of compound 7 may be converted to a hydroxy group by treating compound 7 with aluminum trichloride to provide compound **8.**

[0178] Compounds **28** (when group B is methyl), **29** (when group B is hydrogen) and 30 (when group B is other than hydrogen) may be prepared by coupling compounds **25, 26** and **27,** respectively, with the corresponding boronic ester compound **10** (where Ring D, E, X^1, X^2, X^3 and X^4 are as defined for Formula I; Z is $-B(OR^x)(OR^y)$ and R^z and R^y are H or (1-6C)alkyl, or R^x and R^y together with the atoms to which they are connected form a 5-6 membered ring optionally substituted with 1-4 substituents selected from (C1-C3 alkyl)) using appropriate palladium-catalyzed cross-coupling reaction conditions, e.g., Suzuki coupling reaction conditions (for example, a palladium catalyst and optionally a ligand in the presence of an inorganic base, for example, $Pd(PPh_3)_4$ and Na_2CO_3 in dioxane at elevated temperatures), wherein if Ring D of is substituted with an R^b substituent that is R^cR^dN- wherein one or both of R^c and R^d is hydrogen, the nitrogen atom of R^b may be protected with an appropriate amino protecting group prior to coupling. The amino protecting group if present on a substituent of Ring D of compound **29** or **30** may be removed under standard conditions (for example, a Boc group may be removed by treating compound **1** to acidic conditions, e.g., HCl) to provide compound **31** where E is H.

[0179] Alternatively, the E group may be functionalized (i.e., reacted or treated with an appropriate reagent) under standard conditions described below to provide compound **31** where E is as defined for Formula I except that E is not H.

[0180] The E group of compounds **11, 11a, 16, 19, 20, 29** and **30** described in Schemes 1-6 may be functionalized (i.e., reacted or treated with an appropriate reagent) to introduce an E group, where E is any of the E groups defined for Formula I with the exception of hydrogen, using standard chemistry well known to persons skilled in the art. As used herein, the term "functionalized" refers to a process step in the E group of a compound of general Formula I is reacted or treated with an appropriate reagent to provide a compound of Formula I where E is as defined for Formula I except that E is other than hydrogen.

[0181] For example, an amide derivative (e.g., where E is $Ar^1C(=O)NR^g$-, $hetAr^2C(=O)NR^g(CH_2)_p$- p is 0 or 1, or $R^4R^5NC(=O)NR^g$-, may be obtained by reacting compound **11** wherein E is $-NH_2$ with an acid chloride using conventional amide bond formation conditions, for example in the presence of a base (e.g., DIEA) in an appropriate solvent (DCM) to provide a functionalized compound **12.** Alternative, compound **11** wherein E is $-NH_2$ may be reacted with an carboxylic acid using conventional amide bond formation conditions, for example by treating the carboxylic acid with an activating agent (e.g., HATU) followed by addition of compound **11** in the presence of a base ((e.g., DIEA) in an appropriate solvent (DMA) to provide a functionalized compound **12.** The same chemistry may be utilized with compounds **11a, 16, 19, 20, 29** and **30** to prepare functionalized compounds **12, 17, 21** and **31.**

[0182] As another example, a urea derivative, (e.g., where E is $R^4R^5NHC(=O)NR^g$-) may be prepared reacting a compound **11** where E is $-NH_2$ with a compound having the formula $R^4R^5N=C(=O)$ where R^4 and R^5 are as defined for Formula I in the presence of an appropriate base (e.g., DIEA) to provide a functionalized compound **12.** The same chemistry may be utilized with compounds **11a, 16, 19, 20, 29** and **30** to prepare functionalized compounds **12, 17, 21** and **31.**

[0183] As another example, an alkoxy, aryloxy or heteroaryloxy derivative (e.g., where E is (C1-C6 alkoxy)C1-C6 alkoxy, Ar^1O- or $hetAr^2O$-), may be prepared by reacting a compound **11** where E is hydroxy with a compound having the formula (C1-C6 alkoxy)C1-C6 alkyl-X, Ar^1-X or $hetAr^2$-X, where X is a halogen, in the presence of an inorganic base (e.g., sodium hydride or potassium hydride) in an appropriate solvent (e.g., DMA). The same chemistry may be utilized with compounds **11a, 16, 19, 20, 29** and **30** to prepare functionalized compounds **12, 17, 21** and **31.**

[0184] Accordingly, further provided herein is a process for preparing of a compound of Formula I or a pharmaceutically acceptable salt thereof as defined herein which comprises:

[0186] The term "amino protecting group" as used herein refers to a derivative of the groups commonly employed to block or protect an amino group while reactions are carried out on other functional groups on

the compound. Examples of suitable protecting groups for use in any of the processes described herein include carbamates, amides, alkyl and aryl groups, imines, as well as many N-heteroatom derivatives which can be removed to regenerate the desired amine group. Examples of amino protecting groups are acetyl, trifluoroacetyl, t-butyloxycarbonyl ("Boc"), benzyloxycarbonyl ("CBz") and 9-fluorenylmethyleneoxycarbonyl ("Fmoc"). Further examples of these groups, and other protecting groups, are found in T. W. Greene, et al., Greene's Protective Groups in Organic Synthesis. New York: Wiley Interscience, 2006.

[0187] Hydroxy groups may be protected with any convenient hydroxy protecting group, for example as described in T. W. Greene, et al., Greene's Protective Groups in Organic Synthesis. New York: Wiley Interscience, 2006. Examples include benzyl, trityl and silyl ethers.

[0188] Nitrogen atoms in compounds described in any of the above methods may be protected with any convenient nitrogen protecting group, for example as described in Greene & Wuts, eds., "Protecting Groups in Organic Synthesis", 2nd ed. New York; John Wiley & Sons, Inc., 1991. Examples of nitrogen protecting groups include acyl and t-butoxycarbonyl (BOC), phenoxycarbonyl, and [2-(trimethylsilyl)ethoxy]methyl (SEM).

[0189] The ability of test compounds to act as RET inhibitors may be demonstrated by the assay described in Example A. IC_{50} values are shown in **Table 5.**

[0190] In some embodiments, the compounds provided herein exhibit potent and selective RET inhibition. For example, the compounds provided herein exhibit nanomolar potency against wild type RET and select RET mutants, including the KIF5B-RET fusion and V804M gatekeeper mutation, with minimal activity against related kinases.

[0191] In some embodiments, the compounds of Formula I or a pharmaceutically acceptable salt or solvate thereof, selectively target a RET kinase. For example, a compound of Formula I or a pharmaceutically acceptable salt or solvate thereof, can selectively target a RET kinase over another kinase or non-kinase target.

[0192] In some embodiments, a compound of Formula I or a pharmaceutically acceptable salt or solvate thereof, exhibits at least a 30-fold selectivity for a RET kinase over another kinase. For example, a compound of Formula I or a pharmaceutically acceptable salt or solvate thereof, exhibits at least a 40-fold selectivity; at least a 50-fold selectivity; at least a 60-fold selectivity; at least a 70-fold selectivity; at least a 80-fold selectivity; at least a 90-fold selectivity; at least 100-fold selectivity; at least 200-fold selectivity; at least 300-fold selectivity; at least 400-fold selectivity; at least 500-fold selectivity; at least 600-fold selectivity; at least 700-fold selectivity; at least 800-fold selectivity; at least 900-fold selectivity; or at least 1000-fold selectivity for a RET kinase over another kinase. In some embodiments, selectivity for a RET kinase over another kinase is measured in a cellular assay (e.g., a cellular assay as provided herein).

[0193] In some embodiments, the compounds provided herein can exhibit selectivity for a RET kinase over a KDR kinase (e.g., VEGFR2). In some embodiments, the selectivity for a RET kinase over a KDR kinase is observed without loss of gatekeeper mutant potency. In some embodiments, the selectivity over a KDR kinase is at least 10-fold (e.g., at least a 40-fold selectivity; at least a 50-fold selectivity; at least a 60-fold selectivity; at least a 70-fold selectivity; at least a 80-fold selectivity; at least a 90-fold selectivity; at least 100-fold selectivity; at least 150-fold selectivity; at least 200-fold selectivity; at least 250-fold selectivity; at least 300-fold selectivity; at least 350-fold selectivity; or at least 400-fold selectivity) as compared to the inhibition of KIF5B-RET (i.e. the compounds were more potent against KIF5B-RET than

KDR). In some embodiments, the selectivity for a RET kinase over a KDR kinase is about 30-fold. In some embodiments, the selectivity for a RET kinase over a KDR kinase is at least 100-fold. In some embodiments, the selectivity for a RET kinase over a KDR kinase is at least 150-fold. In some embodiments, the selectivity for a RET kinase over a KDR kinase is at least 400-fold. Without being bound by any theory, potent KDR kinase inhibition is believed to be a common feature among multikinase inhibitors (MKIs) that target RET and may be the source of the dose-limiting toxicities observed with such compounds.

[0194] In some embodiments, inhibition of V804M was similar to that observed for wild-type RET. For example, inhibition of V804M was within about 2-fold (e.g., about 5-fold, about 7-fold, about 10-fold) of inhibition of wild-type RET (i.e. the compounds were similarly potent against wild-type RET and V804M). In some embodiments, selectivity for a wildtype or V804M RET kinase over another kinase is measured in an enzyme assay (e.g., an enzyme assay as provided herein). In some embodiments, the compounds provided herein exhibit selective cytotoxicity to RET-mutant cells.

[0195] In some embodiments, the compounds provided herein exhibit brain and/or central nervous system (CNS) penetrance. Such compounds are capable of crossing the blood brain barrier and inhibiting a RET kinase in the brain and/or other CNS structures. In some embodiments, the compounds provided herein are capable of crossing the blood brain barrier in a therapeutically effective amount. For example, treatment of a patient with cancer (e.g., RET-associated brain or CNS cancer) can include administration (e.g., oral administration) of the compound to the patient. In some such embodiments, the compounds provided herein are useful for treating a primary brain tumor or metastatic brain tumor.

[0196] In some embodiments, the compounds of Formula I or a pharmaceutically acceptable salt or solvate thereof, exhibit one or more of high GI absorption, low clearance, and low potential for drug-drug interactions.

[0197] Compounds of Formula I are useful for treating diseases and disorders which can be treated with a RET kinase inhibitor, RET-associated diseases and disorders, e.g., proliferative disorders, cancers, including hematological cancers and solid tumors, and gastrointestinal disorders and IBS.

[0198] As used herein, terms "treat" or "treatment" refer to therapeutic or palliative measures. Beneficial or desired clinical results include, alleviation, in whole or in part, of symptoms associated with a disease or disorder or condition, diminishment of the extent of disease, stabilized (i.e., not worsening) state of disease, delay or slowing of disease progression, amelioration or palliation of the disease state (e.g., one or more symptoms of the disease), and remission (whether partial or total), whether detectable or undetectable. "Treatment" can also mean prolonging survival as compared to expected survival if not receiving treatment.

Berhman RE, Kliegman R, Arvin AM, Nelson WE. Nelson Textbook of Pediatrics, 15th Ed. Philadelphia: W.B. Saunders Company, 1996; Rudolph AM, et al. Rudolph's Pediatrics, 21st Ed. New York: McGraw-Hill, 2002; and Avery MD, First LR. Pediatric Medicine, 2nd Ed. Baltimore: Williams & Wilkins; 1994. In some embodiments, a pediatric patient is from birth through the first 28 days of life, from 29 days of age to less than two years of age, from two years of age to less than 12 years of age, or 12 years of age through 21 years of age (up to, but not including, the twenty-second birthday). [0201] In certain embodiments, compounds of Formula I are useful for preventing diseases and disorders as defined herein (for example, autoimmune diseases, inflammatory diseases, and cancer). The term "preventing" as used herein means the prevention of the onset, recurrence or spread, in whole or in part, of the disease or condition as described herein, or a symptom thereof.

[0202] The term "RET-associated disease or disorder" as used herein refers to diseases or disorders associated with or having a dysregulation of a RET gene, a RET kinase (also called herein RET kinase protein), or the expression or activity or level of any (e.g., one or more) of the same (e.g., any of the types of dysregulation of a RET gene, a RET kinase, a RET kinase domain, or the expression or activity or level of any of the same described herein). Examples of a RET-associated disease or disorder include, for example, cancer and gastrointestinal disorders and irritable bowel syndrome (IBS).

[0204] The phrase "dysregulation of a RET gene, a RET kinase, or the expression or activity or level of any of the same" refers to a genetic mutation (e.g., a RET gene translocation that results in the expression of a fusion protein, a deletion in a RET gene that results in the expression of a RET protein that includes a deletion of at least one amino acid as compared to the wild-type RET protein, a mutation in a RET gene that results in the expression of a RET protein with one or more point mutations, or an

alternative spliced version of a RET mRNA that results in a RET protein having a deletion of at least one amino acid in the RET protein as compared to the wild-type RET protein) or a RET gene amplification that results in overexpression of a RET protein or an autocrine activity resulting from the overexpression of a RET gene in a cell that results in a pathogenic increase in the activity of a kinase domain of a RET protein (e.g., a constitutively active kinase domain of a RET protein) in a cell. As another example, a dysregulation of a RET gene, a RET protein, or expression or activity, or level of any of the same, can be a mutation in a RET gene that encodes a RET protein that is constitutively active or has increased activity as compared to a protein encoded by a RET gene that does not include the mutation. For example, a dysregulation of a RET gene, a RET protein, or expression or activity, or level of any of the same, can be the result of a gene or chromosome translocation which results in the expression of a fusion protein that contains a first portion of RET that includes a functional kinase domain, and a second portion of a partner protein (i.e., that is not RET). In some examples, dysregulation of a RET gene, a RET protein, or expression or activity or level of any of the same can be a result of a gene translocation of one RET gene with another non-RET gene. Examples of fusion proteins are described in Table 1. Examples of RET kinase protein point mutations/insertions/deletions are described in Table 2. Additional examples of RET kinase protein mutations (e.g., point mutations) are RET inhibitor resistance mutations Examples of RET inhibitor resistance mutations are described in Tables 3 and 4.

[0205] The term "wildtype" or "wild-type" describes a nucleic acid (e.g., a RET gene or a RET mRNA) or protein (e.g., a RET protein) that is found in a subject that does not have a RET-associated disease, e.g., a RET-associated cancer (and optionally also does not have an increased risk of developing a RET-associated disease and/or is not suspected of having a RET-associated disease), or is found in a cell or tissue from a subject that does not have a RET-associated disease, e.g., a RET-associated cancer (and optionally also does not have an increased risk of developing a RET-associated disease and/or is not suspected of having a RET-associated disease).

[0206] The term "regulatory agency" refers to a country's agency for the approval of the medical use of pharmaceutical agents with the country. For example, a non-limiting example of a regulatory agency is the U.S. Food and Drug Administration (FDA).

[0210] In some embodiments, the cancer (e.g., the RET-associated cancer) is a solid tumor. Examples of solid tumors (e.g., solid tumors that are RET-associated cancers) include, for example, thyroid cancer (e.g., papillary thyroid carcinoma, medullary thyroid carcinoma), lung cancer (e.g., lung adenocarcinoma, small-cell lung carcinoma), pancreatic cancer, pancreatic ductal carcinoma, breast cancer, colon cancer, colorectal cancer, prostate cancer, renal cell carcinoma, head and neck tumors, neuroblastoma, and melanoma. [0212] In some embodiments, the patient is a human.

[0213] Compounds of Formula I and pharmaceutically acceptable salts thereof are also useful for treating a RET-associated cancer.

[0214] Dysregulation of a RET kinase, a RET gene, or the expression or activity or level of any (e.g., one or more) of the same can contribute to tumorigenesis. For example, a dysregulation of a RET kinase, a RET gene, or expression or activity or level of any of the same can be a translocation, overexpression, activation, amplification, or mutation of a RET kinase, a RET gene, or a RET kinase domain. Translocation can include translocations involving the RET kinase domain, mutations can include mutations involving the RET ligand-binding site, and amplification can be of a RET gene. Other dysregulations can include RET mRNA splice variants and RET autocrine/paracrine signaling, which can also contribute to tumorigenesis.

[0215] In some embodiments, the dysregulation of a RET gene, a RET kinase, or expression or activity or level of any of the same, includes overexpression of wild-type RET kinase (e.g., leading to autocrine activation). In some embodiments, the dysregulation of a RET gene, a RET kinase protein, or expression or activity or level of any of the same, includes overexpression, activation, amplification, or mutation in a chromosomal segment comprising the RET gene or a portion thereof, including, for example, the kinase domain portion, or a portion capable of exhibiting kinase activity.

[0216] In some embodiments, the dysregulation of a RET gene, a RET kinase protein, or expression or activity or level of any of the same, includes one or more chromosome translocations or inversions resulting in a RET gene fusion. In some embodiments, the dysregulation of a RET gene, a RET kinase protein, or expression or activity or level of any of the same, is a result of genetic translocations in which the expressed protein is a fusion protein containing residues from a non-RET partner protein, and includes a minimum of a functional RET kinase domain.

[0217] Examples of RET fusion proteins are shown in **Table 1.**

[0218] In some embodiments, the dysregulation of a RET gene, a RET kinase, or expression or activity or level of any of the same, includes one or more deletions (e.g., deletion of an amino acid at position 4), insertions, or point mutation(s) in a RET kinase. In some embodiments, the dysregulation of a RET gene, a RET kinase, or expression or activity or level of any of the same, includes a deletion of one or more residues from the RET kinase, resulting in constitutive activity of the RET kinase domain.

[0219] In some embodiments, the dysregulation of a RET gene, a RET kinase, or expression or activity or level of any of the same, includes at least one point mutation in a RET gene that results in the production of a RET kinase that has one or more amino acid substitutions, insertions, or deletions as compared to the wild-type RET kinase (see, for example, the point mutations listed in **Table 2**).

[0222] In some embodiments, the dysregulation of a RET gene, a RET kinase, or expression or activity or level of any of the same, includes a splice variation in a RET mRNA which results in an expressed protein that is an alternatively spliced variant of RET having at least one residue deleted (as compared to the wild-type RET kinase) resulting in a constitutive activity of a RET kinase domain.

[0223] A "RET kinase inhibitor" as defined herein includes any compound exhibiting RET inhibition activity. In some embodiments, a RET kinase inhibitor is selective for a RET kinase. Exemplary RET kinase inhibitors can exhibit inhibition activity (IC_{50}) against a RET kinase of less than about 1000 nM, less than about 500 nM, less than about 200 nM, less than about 100 nM, less than about 50 nM, less than about 25 nM, less than about 10 nM, or less than about 1 nM as measured in an assay as described herein. In some embodiments, a RET kinase inhibitor can exhibit inhibition activity (IC_{50}) against a RET kinase of less than about 25 nM, less than about 10 nM, less than about 5 nM, or less than about 1 nM as measured in an assay as provided herein.

[0224] As used herein, a "first RET kinase inhibitor" or "first RET inhibitor" is a RET kinase inhibitor as defined herein, but which does not include a compound of Formula I or a pharmaceutically acceptable salt or solvate thereof as defined herein. As used herein, a "second RET kinase inhibitor" or a "second RET inhibitor" is a RET kinase inhibitor as defined herein, but which does not include a compound of Formula I or a pharmaceutically acceptable salt or solvate thereof as defined herein. When both a first and a second RET inhibitor are present in a method provided herein, the first and second RET kinase inhibitor are different.

[0225] In some embodiments, the dysregulation of a RET gene, a RET kinase, or expression or activity or level of any of the same, includes at least one point mutation in a RET gene that results in the production of a RET kinase that has one or more amino acid substitutions or insertions or deletions in a RET gene that results in the production of a RET kinase that has one or more amino acids inserted or removed, as compared to the wild-type RET kinase. In some cases, the resulting RET kinase is more resistant to inhibition of its phosphotransferase activity by one or more first RET kinase inhibitor(s), as compared to a wildtype RET kinase or a RET kinase not including the same mutation. Such mutations, optionally, do not decrease the sensitivity of the cancer cell or tumor having the RET kinase to treatment with a compound of Formula I or a pharmaceutically acceptable salt or solvate thereof (e.g., as compared to a cancer cell or a tumor that does not include the particular RET inhibitor resistance mutation). In such embodiments, a RET inhibitor resistance mutation can result in a RET kinase that has one or more of an increased V_{max}, a decreased K_m for ATP, and an increased K_D for a first RET kinase inhibitor, when in the presence of a first RET kinase inhibitor, as compared to a wildtype RET kinase or a RET kinase not having the same

mutation in the presence of the same first RET kinase inhibitor.

[0226] In other embodiments, the dysregulation of a RET gene, a RET kinase, or expression or activity or level of any of the same, includes at least one point mutation in a RET gene that results in the production of a RET kinase that has one or more amino acid substitutions as compared to the wild-type RET kinase, and which has increased resistance to a compound of Formula I or a pharmaceutically acceptable salt or solvate thereof, as compared to a wildtype RET kinase or a RET kinase not including the same mutation. In such embodiments, a RET inhibitor resistance mutation can result in a RET kinase that has one or more of an increased V_{max}, a decreased K_m, and a decreased K_D in the presence of a compound of Formula I or a pharmaceutically acceptable salt or solvate thereof, as compared to a wildtype RET kinase or a RET kinase not having the same mutation in the presence of the same compound of Formula I or a pharmaceutically acceptable salt or solvate thereof.

[0227] Examples of RET inhibitor resistance mutations can, e.g., include point mutations, insertions, or deletions in and near the ATP binding site in the tertiary structure of RET kinase, including the gatekeeper residue, P-loop residues, residues in or near the DFG motif, and ATP cleft solvent front amino acid residues. Additional examples of these types of mutations include changes in residues that may affect enzyme activity and/or drug binding including residues in the activation loop, residues near or interacting with the activation loop, residues contributing to active or inactive enzyme conformations, changes including mutations, deletions, and insertions in the loop proceeding the C-helix and in the C-helix. Specific residues or residue regions that may be changed (and are RET inhibitor resistance mutations) include those listed in Table 3 based on the human wildtype RET protein sequence (e.g., SEQ ID NO: 1). Additional examples of RET inhibitor resistance mutation positions are shown in Table 4. Changes to these residues may include single or multiple amino acid changes, insertions within or flanking the sequences, and deletions within or flanking the sequences.

[0229] In some embodiments, compounds of Formula I and pharmaceutically acceptable salts are useful in treating patients that develop cancers with RET inhibitor resistance mutations (e.g., that result in an increased resistance to a first RET inhibitor, e.g., a substitution at amino acid position 804, e.g., V804M, V804L, or V804E, and/or one or more RET inhibitor resistance mutations listed in Tables 3 and 4) by either dosing in combination or as a follow-up therapy to existing drug treatments (e.g., other RET kinase inhibitors; e.g., first and/or second RET kinase inhibitors). Exemplary first and second RET kinase

inhibitors are described herein. In some embodiments, a first or second RET kinase inhibitor can be selected from the group consisting of cabozantinib, vandetanib, alectinib, sorafenib, lenvatinib, ponatinib, dovitinib, sunitinib, foretinib, BLU667, and BLU6864.

[0230] In some embodiments, compounds of Formula I or pharmaceutically acceptable salts thereof are useful for treating a cancer that has been identified as having one or more RET inhibitor resistance mutations (that result in an increased resistance to a first or second RET inhibitor, e.g., a substitution at amino acid position 804, e.g., V804M, V804L, or V804E). Examples of RET inhibitor resistance mutations are listed in Tables 3 and 4.

[0231] The oncogenic role of RET was firstly described in papillary thyroid carcinoma (PTC) (Grieco et al., Cell, 1990, 60, 557-63), which arises from follicular thyroid cells and is the most common thyroid malignancy. Approximately 20-30% of PTC harbor somatic chromosomal rearrangements (translocations or inversions) linking the promoter and the 5' portions of constitutively expressed, unrelated genes to the RET tyrosine kinase domain (Greco et al., Q. J. Nucl. Med. Mol. Imaging, 2009, 53, 440-54), therefore driving its ectopic expression in thyroid cells. To date, a variety of fusion partners have been identified, all providing a protein/protein interaction domain that induces ligand-independent RET dimerization and constitutive kinase activity (see, e.g., Table 1). The role of RET-PTC rearrangements in the pathogenesis of PTC has been confirmed in transgenic mice (Santoro et al., Oncogene, 1996, 12, 1821-6). Recently, a 10.6 Mb pericentric inversion in chromosome 10, where RET gene maps, has been identified in about 2% of lung adenocarcinoma patients, generating different variants of the chimeric gene KIF5B-RET (Ju et al., Genome Res., 2012, 22, 436-45; Kohno et al., 2012, Nature Med., 18, 375-7; Takeuchi et al., Nature Med., 2012, 18, 378-81; Lipson et al., 2012, Nature Med., 18, 382-4). The fusion transcripts are highly expressed and all the resulting chimeric proteins contain the N-terminal portion of the coiled-coil region of KIF5B, which mediates homodimerization, and the entire RET kinase domain. None of RET positive patients harbor other known oncogenic alterations (such as EGFR or K-Ras mutation, ALK translocation), supporting the possibility that KIF5B-RET fusion could be a driver mutation of lung adenocarcinoma. The oncogenic potential of KIF5B-RET has been confirmed by transfecting the fusion gene into cultured cell lines: similarly to what has been observed with RET-PTC fusion proteins, KIF5B-RET is constitutively phosphorylated and induces NIH-3T3 transformation and IL-3 independent growth of BA-F3 cells. However, other RET fusion proteins have been identified in lung adenocarcinoma patients, the CCDC6-RET fusion protein, which has been found to play a key role in the proliferation of the human lung adenocarcinoma cell line LC-2/ad (Journal of Thoracic Oncology, 2012, 7(12):1872-1876). RET inhibitors have been shown to be useful in treating lung cancers involving RET rearrangements (Drilon, A.E. et al. J Clin Oncol 33, 2015 (suppl; abstr 8007)). RET fusion proteins have also been identified in patients having colorectal cancer (Song Eun-Kee, et al. International Journal of Cancer, 2015, 136: 1967-1975).

[0232] Besides rearrangements of the RET sequence, gain of function point mutations of RET proto-oncogene are also driving oncogenic events, as shown in medullary thyroid carcinoma (MTC), which arises from parafollicular calcitonin-producing cells (de Groot, et al., Endocrine Rev., 2006, 27, 535-60; Wells and Santoro, Clin. Cancer Res., 2009, 15, 7119-7122). Around 25% of MTC are associated with multiple endocrine neoplasia type 2 (MEN2), a group of inherited cancer syndromes affecting neuroendocrine organs caused by germline activating point mutations of RET. In MEN2 subtypes (MEN2A, MEN2B and Familial MTC/FMTC) RET gene mutations have a strong phenotype-genotype correlation defining different MTC aggressiveness and clinical manifestations of the disease. In MEN2A syndrome mutations involve one of the six cysteine residues (mainly C634) located in the cysteine-rich extracellular region, leading to ligand-independent homodimerization and constitutive RET activation. Patients develop MTC at a young age (onset at 5-25 years) and may also develop pheochromocytoma (50%) and hyperparathyroidism. MEN2B is mainly caused by M918T mutation, which is located in the kinase domain. This mutation constitutively activates RET in its monomeric state and alters substrate

recognition by the kinase. MEN2B syndrome is characterized by an early onset (< 1 year) and very aggressive form of MTC, pheochromocytoma (50% of patients) and ganglioneuromas. In FMTC the only disease manifestation is MTC, usually occurring at an adult age. Many different mutations have been detected, spanning the entire RET gene. The remaining 75% of MTC cases are sporadic and about 50% of them harbor RET somatic mutations: the most frequent mutation is M918T that, as in MEN2B, is associated with the most aggressive phenotype. Somatic point mutations of RET have also been described in colorectal cancer (Wood et al., Science, 2007, 318, 1108-13) and small cell lung carcinoma (Jpn. J. Cancer Res., 1995, 86, 1127-30).

[0233] RET signaling components have been found to be expressed in primary breast tumors and to functionally interact with estrogen receptor-cc pathway in breast tumor cell lines (Boulay et al., Cancer Res. 2008, 68, 3743-51; Plaza-Menacho et al., Oncogene, 2010, 29, 4648-57), while RET expression and activation by GDNF family ligands could play an important role in perineural invasion by different types of cancer cells (Ito et al., Surgery, 2005, 138, 788-94; Gil et al., J. Natl. Cancer Inst., 2010, 102, 107-18; Iwahashi et al., Cancer, 2002, 94, 167-74).

[0234] RET is also expressed in 30-70% of invasive breast cancers, with expression being relatively more frequent in estrogen receptor-positive tumors (Plaza-Menacho, I., et al., Oncogene, 2010, 29, 4648-4657; Esseghir, S., et al., Cancer Res., 2007, 67, 11732-11741; Morandi, A., et al., Cancer Res., 2013, 73, 3783-3795; Gattelli, A., EMBO Mol. Med., 2013, 5, 1335-1350).

[0235] The identification of RET rearrangements has been reported in a subset of (patient-derived xenograft) PDX established from colorectal cancer. Although the frequency of such events in colorectal cancer patients remains to be defined, these data suggest a role of RET as a target in this indication (Gozgit et al., AACR Annual Meeting 2014). Studies have shown that the RET promoter is frequently methylated in colorectal cancers, and heterozygous missense mutations, which are predicted to reduce RET expression, are identified in 5-10% of cases, which suggests that RET might have some features of a tumor suppressor in sporadic colon cancers (Luo, Y., et al., Oncogene, 2013, 32, 2037-2047; Sjoblom, T., et al., Science, 2006, 268-274; Cancer Genome Atlas Network, Nature, 2012, 487, 330-337).

[0236] An increasing number of tumor types are now being shown to express substantial levels of wild-type RET kinase that could have implications for tumor progression and spread. RET is expressed in 50-65% of pancreatic ductal carcinomas, and expression is more frequent in metastatic and higher grade tumors (Ito, Y, et al., Surgery, 2005, 138, 788-794; Zeng, Q., et al., J. Int. Med. Res. 2008, 36, 656-664).

[0237] In neoplasms of hematopoietic lineages, RET is expressed in acute myeloid leukemia (AML) with monocytic differentiation, as well as in CMML (Gattei, V. et al., Blood, 1997, 89, 2925-2937; Gattei, V., et al., Ann. Hematol, 1998, 77, 207-210; Camos, M., Cancer Res. 2006, 66, 6947-6954). Recent studies have identified rare chromosomal rearrangements that involve RET in patients with chronic myelomonocytic leukemia (CMML). CMML is frequently associated with rearrangements of several tyrosine kinases, which result in the expression of chimeric cytosolic oncoproteins that lead to activation of RAS pathways (Kohlmann, A., et al., J. Clin. Oncol. 2010, 28, 2858-2865). In the case of RET, gene fusions that link RET with BCR (BCR-RET) or with fibroblast growth factor receptor 1 oncogene partner (FGFR1OP-RET) were transforming in early hematopoietic progenitor cells and could shift maturation of these cells towards monocytic paths, probably through the initiation of RET-mediated RAS signaling (Ballerini, P., et al., Leukemia, 2012, 26, 2384-2389).

[0238] RET expression has also been shown to occur in several other tumor types, including prostate cancer, small-cell lung carcinoma, melanoma, renal cell carcinoma, and head and neck tumors (Narita,

N., et al., Oncogene, 2009, 28, 3058-3068; Mulligan, L. M., et al., Genes Chromosomes Cancer, 1998, 21, 326-332; Flavin, R., et al., Urol. Oncol., 2012, 30, 900-905; Dawson, D. M., J Natl Cancer Inst, 1998, 90, 519-523).

[0239] In neuroblastoma, RET expression and activation by GFLs has roles in tumor cell differentiation, potentially collaborating with other neurotrophic factor receptors to down regulate N-Myc, the expression of which is a marker of poor prognosis (Hofstra, R. M., W., et al., Hum. Genet. 1996, 97, 362-364; Petersen, S. and Bogenmann, E., Oncogene, 2004, 23, 213-225; Brodeur, G. M., Nature Ref. Cancer, 2003, 3, 203-216).

[0240] Multitargeted inhibitors which cross react with RET are known (Borrello, M.G., et al., Expert Opin. Ther. Targets, 2013, 17(4), 403-419; International Patent Application Nos. WO 2014/141187, WO 2014/184069, and WO 2015/079251).

[0285] Also provided herein is (i) a pharmaceutical combination for treating a cancer in a patient in need thereof, which comprises (a) a compound of Formula I or a pharmaceutically acceptable salt or solvate thereof, (b) at least one additional therapeutic agent (e.g., any of the exemplary additional therapeutic agents described herein or known in the art), and (c) optionally at least one pharmaceutically acceptable carrier for simultaneous, separate or sequential use for the treatment of cancer, wherein the amounts of the compound of Formula I or pharmaceutically acceptable salt or solvate thereof and of the additional therapeutic agent are together effective in treating the cancer; (ii) a pharmaceutical composition comprising such a combination; (iii) the use of such a combination for the preparation of a medicament for the treatment of cancer; and (iv) a commercial package or product comprising such a combination as a combined preparation for simultaneous, separate or sequential use; and to a method of treatment of cancer in a patient in need thereof. In one embodiment the patient is a human. In some embodiments, the cancer is a RET-associated cancer. For example, a RET-associated cancer having one or more RET inhibitor resistance mutations.

[0286] The term "pharmaceutical combination", as used herein, refers to a pharmaceutical therapy resulting from the mixing or combining of more than one active ingredient and includes both fixed and non-fixed combinations of the active ingredients. The term "fixed combination" means that a compound of Formula I or a pharmaceutically acceptable salt or solvate thereof and at least one additional therapeutic agent (e.g., a chemotherapeutic agent), are both administered to a patient simultaneously in the form of a single composition or dosage. The term "non-fixed combination" means that a compound of Formula I or a pharmaceutically acceptable salt or solvate thereof and at least one additional therapeutic agent (e.g., chemotherapeutic agent) are formulated as separate compositions or dosages such that they may be administered to a patient in need thereof simultaneously, concurrently or sequentially with variable intervening time limits, wherein such administration provides effective levels of the two or more compounds in the body of the patient. These also apply to cocktail therapies, e.g. the administration of three or more active ingredients

[0287] Although the genetic basis of tumorigenesis may vary between different cancer types, the cellular and molecular mechanisms required for metastasis appear to be similar for all solid tumor types. During a metastatic cascade, the cancer cells lose growth inhibitory responses, undergo alterations in adhesiveness and produce enzymes that can degrade extracellular matrix components. This leads to detachment of tumor cells from the original tumor, infiltration into the circulation through newly formed vasculature, migration and extravasation of the tumor cells at favorable distant sites where they may form colonies. A number of genes have been identified as being promoters or suppressors of metastasis. For example, overexpression of glial cell-derived neurotrophic factor (GDNF) and its RET receptor tyrosine kinase have been correlated with cancer proliferation and metastasis. See, e.g., Zeng, Q. et al. J. Int. Med. Res. (2008) 36(4): 656-64.

[0288] The term "metastasis" is an art known term and means the formation of an additional tumor (e.g., a solid tumor) at a site distant from a primary tumor in a subject or patient, where the additional tumor includes the same or similar cancer cells as the primary tumor.

[0289] The phrase "effective amount" means an amount of compound that, when administered to a patient in need of such treatment, is sufficient to (i) treat a RET kinase-associated disease or disorder, (ii) attenuate, ameliorate, or eliminate one or more symptoms of the particular disease, condition, or disorder, or (iii) delay the onset of one or more symptoms of the particular disease, condition, or disorder described herein. The amount of a compound of Formula I that will correspond to such an amount will vary depending upon the particular compound, disease condition and its severity, the identity (e.g., weight) of the patient in need of treatment, but can nevertheless be routinely determined by one skilled in

the art.

[0290] When employed as pharmaceuticals, the compounds of Formula I can be administered in the form of pharmaceutical compositions. These compositions can be prepared in a manner well known in the pharmaceutical art, and can be administered by a variety of routes, depending upon whether local or systemic treatment is desired and upon the area to be treated. Administration may be topical (including transdermal, epidermal, ophthalmic and to mucous membranes including intranasal, vaginal and rectal delivery), pulmonary (e.g., by inhalation or insufflation of powders or aerosols, including by nebulizer; intratracheal or intranasal), oral or parenteral. Oral administration can include a dosage form formulated for once-daily or twice-daily (BID) administration. Parenteral administration includes intravenous, intraarterial, subcutaneous, intraperitoneal intramuscular or injection or infusion; or intracranial, e.g., intrathecal or intraventricular, administration. Parenteral administration can be in the form of a single bolus dose, or may be, for example, by a continuous perfusion pump. Pharmaceutical compositions and formulations for topical administration may include transdermal patches, ointments, lotions, creams, gels, drops, suppositories, sprays, liquids and powders. Conventional pharmaceutical carriers, aqueous, powder or oily bases and thickeners may be necessary

In some embodiments, the composition is suitable for topical administration. In making the compositions provided herein, the active ingredient is typically mixed with an excipient, diluted by an excipient or enclosed within such a carrier in the form of, for example, a capsule, sachet, paper, or other container. When the excipient serves as a diluent, it can be a solid, semisolid, or liquid material, which acts as a vehicle, carrier or medium for the active ingredient. Thus, the compositions can be in the form of tablets, pills, powders, lozenges, sachets, cachets, elixirs, suspensions, emulsions, solutions, syrups, aerosols (as a solid or in a liquid medium), ointments containing, for example, up to 10% by weight of the active compound, soft and hard gelatin capsules, suppositories, sterile injectable solutions, and sterile packaged powders. Examples

[0301] The following examples illustrate the invention.

Biological Examples

Example A

RET Enzyme Assay

[0302] Compounds of Formula I were screened for their ability to inhibit wildtype and V804M mutant RET kinase using CisBio's HTRF® KinEASE™-TK assay technology. Briefly, N-terminal GST tagged recombinant human RET cytoplasmic domain (aa 658-end) from Eurofins (0.25 nM RET; Catalog No. 14-570M) or N-terminal GST tagged recombinant human V804M mutant RET cytoplasmic domain (aa 658-end) from Millipore (0.25 nM enzyme; Catalog No. 14-760) was incubated with 250 nM TK-substrate biotin (CisBio, part of Catalog No. 62TK0PEC) and 1 mM ATP along with test compound in a buffer consisting of 25 mM HEPES pH 7.4, 10 mM $MgCl_2$, 0.01% Triton X-100, and 2% DMSO in a volume of 8 µL. Compounds were typically prepared in a threefold serial dilution in DMSO and added to the assay to give the appropriate final concentration. After a 30-minute incubation at 22 °C, the reaction was quenched by adding 8 µL of quench solution containing 31.25 nM Sa-XL665 and IX TK-ab-Cryptate in HTRF detection buffer (all from CisBio, part of Cat. No. 62TK0PEC). After a 1 hour incubation at 22°C, the extent of reaction was determined using a PerkinElmer EnVision multimode plate reader via HTRF dual wavelength detection, and the percent of control (POC) was calculated using a ratiometric emission factor. 100 POC was determined using no test compounds and 0 POC was determined using pre-quenched control reactions. The POC values were fit to a 4 parameter logistic curve, and the IC_{50} is defined as the concentration of inhibitor at which the POC equals 50 for the fitted curve. The IC_{50} values for the compounds tested in this assay are provided in Table 5.

Example B

RET cell assay

[0303] The cellular potency of a compound inhibiting RET kinase was determined in HEK-293 cells expressing a Kif5b-RET fusion protein. Briefly, HEK-293 cells expressing a Kif5b-RET fusion protein were plated at 50K cells /well in 96 well poly-D-Lysine coated plates the day prior to the assay. The cells were incubated for 1 hour with test compound in DMEM (Dulbecco's Modified Eagle Medium) at a final DMSO concentration of 0.5%. Compounds were typically prepared in a three fold serial dilution in DMSO and added to the assay to give the appropriate final concentration. After 1 hour the media was removed, the cells were fixed with 3.8% formaldehyde for 20 min, washed with PBS, and permeabilized for 10 min with 100% methanol. The plates were then washed with PBS-0.05% Tween20, and blocked with LI-COR Blocking solution (LI-COR catalog # 927-40000) for 1 hour. Plates were washed with PBS-0.05% Tween20, then incubated with anti-phospho-RET(Tyr1062) (Santa Cruz catalog #sc-20252-R) antibody and anti-GAPDH (Millipore catalog # MAB374) antibody for 2 hours. The plates were washed with PBS-0.05%Tween20, and incubated with anti-rabbit 680 (Molecular Probes catalog No. A21109) and anti-mouse 800 (LI-COR catalog No. 926-32210) secondary antibodies for 1 hour. All antibodies were diluted

in LI-COR Block containing 0.05% Tween. The plates were washed with PBS-0.05% Tween20, 100 µL PBS was added to each well, and the plates were read on a LI-COR Aerius fluorescent plate reader. The phospho-RET signal was normalized to the GAPDH signal. 100 POC (percent of control) was determined using no test compounds and 0 POC was determined using 1 µM of a control inhibitor. The POC values were fit to a 4 parameter logistic curve. The IC_{50} value is the point where the curve crosses 50 POC. The IC_{50} values for the compounds tested in this assay are provided in Table 5.

Example C

RET G810R mutant assay

[0304] The potency of a compound inhibiting G810R mutant RET kinase was determined using CisBio's HTRF Kinease-TK assay technology. The assays contained G810R mutant RET produced at Array Biopharma, Inc. (1 nM enzyme - p1982 Lot. No. 160713. The kinase was incubated with 250 nM TK-substrate biotin (CisBio, part of Catalog # 62TK0PEC) and 1 mM ATP along with test compound in a buffer consisting of 25 mM HEPES, pH 7.4, 10 mM $MgCl_2$, 0.01% Triton X-100, and 2% DMSO in a volume of 8 µL. Compounds were typically prepared as a three-fold serial dilution in DMSO and added to the assay to give the appropriate final concentration. After a 60-min incubation at 22 °C, the reaction was quenched by adding 8 µL of quench solution containing 31.25 nM Sa-XL665 and 1x TK-Ab-Cryptate in HTRF detection buffer (all from CisBio, part of cat # 62TK0PEC). After a 1-h incubation at 22 °C, the extent of reaction was determined using a PerkinElmer EnVision multimode plate reader via HTRF dual wavelength detection, and the percent of control (POC) was calculated using a ratiometric emission factor. One hundred POC was determined using no test compounds, and 0 POC was determined using pre-quenched control reactions. A 4-parameter logistic curve was fit to the POC values as a function of the concentration of compound, and the IC_{50} value was the point where the best-fit curve crossed 50 POC.

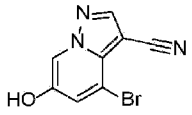
Intermediate P1



4-Bromo-6-hydroxypyrazolo[1.5-a]pyridine-3-carbonitrile

Part A: Preparation of O-(mesitylsulfonyl)hydroxylamine

[0306] Step 1: Preparation of tert-butyl (mesitylsulfonyl)oxycarbamate. To a 0 °C solution of 2,4,6-trimethylbenzene-1-sulfonyl chloride (10.0 g, 45.72 mmol) and tert-butyl hydroxycarbamate (6.088 g, 45.72 mmol) in MTBE (100 mL) was added TEA (14.46 mL, 48.01 mmol) drop-wise while stirring. The resulting suspension was stirred at 0 °C for an additional 30 min and then warmed to ambient temperature. The reaction was then diluted with water (100 mL), adjusted to pH 4 with 1 N $HCl_{(aq)}$. The organic layer was dried (Na_2SO_4), filtered and concentrated to yield the title compound initially as a yellowish oil, which upon drying overnight under high vacuum became a white solid (12.89 g, 89% yield). ^1H NMR ($CDCl_3$) δ 7.66 (br s, 1H), 6.98 (s, 2H), 2.67 (s, 6H), 2.32 (s, 3H), 1.31 (s, 9H).

[0307] Step 2: Preparation of O-(mesitylsulfonyl)hydroxylamine. To TFA (117 mL, 1521 mmol) at 0 °C was slowly added tert-butyl (mesitylsulfonyl)oxycarbamate (39.0 g, 124 mmol) over 25 min. The reaction mixture was stirred at 0 °C for 1.5 h and then quenched with the sequential addition of crushed ice and water. The resulting thick suspension was vigorously stirred at ambient temperature for 5 min. Without allowing the filter cake to run dry, the solids were collected by careful vacuum filtration followed by subsequent rinsing with water (4 L) until the filtrate reached pH 6 (Caution: explosion risk exists with dry compound at ambient temperature). The wet filter cake was taken up in DCM (150 mL) and the resulting biphasic solution was separated. The DCM layer was dried over $MgSO_4$ for 30 min and then filtered and rinsed with DCM (420 mL) to provide the title compound as a 0.22 M solution in DCM

Part B: Preparation of 4-Bromo-6-hydroxypyrazolo[1,5-a]pyridine-3-carbonitrile

[0308] Step 1: Preparation of 1-amino-3-bromo-5-methoxypyridin-1-ium 2,4,6-trimethylbenzenesulfonate. To a solution of O-(mesitylsulfonyl)hydroxylamine (Part A, 26.6 g, 117 mmol) in DCM (570 mL) cooled to 0 °C was added 3-bromo-5-methoxypyridine (22.1 g, 117 mmol) in portions. The reaction mixture was stirred for 1 h at 0 °C then treated with additional 3-bromo-5-methoxypyridine (250 mg, 1.39 mmol) and stirred for an additional 2 h at 0 °C. The reaction mixture was diluted with Et_2O (600 mL), stirred at 0 °C for 10 min and then vacuum filtered, rinsed with Et_2O (3 × 250 mL). Upon reduction in volume by about 1/3, the filtrate yielded additional precipitate which was collected by filtration. Both filter cakes were dried *in vacuo* to provide the title compound (39.3 g, 83% yield). ^1H NMR ($CDCl_3$) δ 9.25 (br s, 1H), 8.99 (m,

1H), 8.74 (m, 1H), 7.46 (m, 1H), 6.83 (s, 2H), 3.92 (s, 3H), 2.65 (s, 6H), 2.22 (s, 3H).

[0309] Step 2: Preparation of Ethyl 6-bromo-4-methoxypyrazolo[1,5-a]pyridine-3-carboxylate and Ethyl 4-bromo-6-methoxypyrazolo[1,5-a]pyridine-3-carboxylate. To a magnetically stirred white suspension of 1-amino-3-bromo-5-methoxypyridin-1-ium 2,4,6-trimethylbenzenesulfonate (33.24 g, 82.42 mmol) in DMF (82 mL) at ambient temperature was added TEA (22.98 mL, 164.8 mmol), followed by drop-wise addition of ethyl propiolate (16.71 mL, 164.8 mmol). After vigorous stirring for 2 d, the reaction was slowly quenched via portion-wise addition to rapidly stirring ice water (820 mL). The mixture was stirred at ambient temperature for 10 min and then vacuum filtered. Solids collected were rinsed with water and air-dried, yielding the title compounds as an orange solid in an isomeric ratio of about 4:1 (by ^{1}H NMR) with the 6-Br isomer as the major isomer (21 g). The wet solid isomeric mixture (about 75% w/w) was directly used in Step 3 without further purification. MS (apci) m/z = 298.9, 300.9 (M+H). Regioisomeric ratio was determined by MeO chemical shift in ^{1}H NMR ($CDCl_3$) δ 3.98 (6-Br isomer) vs. 3.83 (4-Br isomer).

[0310] Step 3: Preparation of 6-bromo-4-methoxypyrazolo[1,5-a]pyridine (P1) and 4-bromo-6-methoxypyrazolo[1,5-a]pyridine. The isomeric mixture of ethyl 6-bromo-4-methoxypyrazolo[1,5-a]pyridine-3-carboxylate and ethyl 4-bromo-4-methoxypyrazolo[1,5-a]pyridine-3-carboxylate from Step 2 (15 g, 50.1 mmol) was added to 48% HBr (114 mL) while stirring, then heated at 80 °C for 90 min followed by stirring at ambient temperature overnight. The resulting suspension was vacuum filtered and rinsed with water. The aqueous filtrate and the filter cake were treated independently. The filter cake was taken up in MTBE and vacuum filtered to remove insoluble impurities. The MTBE filtrate was dried over anhydrous Na_2SO_4, filtered and concentrated *in vacuo* to yield 6-bromo-4-methoxypyrazolo[1,5-a]pyridine as a beige solid (about 98:2 6-/4- Br; 5.08 g). MS (apci) m/z = 226.9, 228.9 (M+H). ^{1}H NMR ($CDCl_3$) δ 8.26 (m, 1H), 7.82 (d, 1H), 6.61 (m, 1H), 6.43 (m, 1H), 3.94 (s, 3H). Independently the original aqueous reaction mixture filtrate was extracted with EtOAc. The combined organic extracts were dried (Na_2SO_4), filtered and concentrated *in vacuo.* The crude residue was taken up in DCM (50 mL) and then filtered to remove insoluble solids. Concentration of the DCM filtrate under vacuum followed by silica chromatography (0 to 50% EtOAc/hexanes) yielded a second batch of 6-bromo-4-methoxypyrazolo[1,5-a]pyridine (Intermediate P1) as white solid (upper R_f spot, 2.06 g), as well as the minor isomer title compound 4-bromo-6-methoxypyrazolo[1,5-a]pyridine (Intermediate P2) also as white solid (lower R_f spot, 1.32 g). MS (apci) m/z = 226.9, 228.9 (M+H). ^{1}H NMR ($CDCl_3$) δ 8.02 (m, 1H), 7.85 (d, 1H), 7.17 (d, 1H), 6.55 (m, 1H), 3.80 (s, 3H).

[0311] Step 4: Preparation of 4-bromo-6-methoxypyrazolo[1,5-a]pyridine-3-carbaldehyde: A solution of 4-bromo-6-methoxypyrazolo[1,5-a]pyridine (5.0 g, 22 mmol) in DMF (220 mL) was cooled to 0 °C and then slowly treated with $POCl_3$ (6.2 mL, 66 mmol). The reaction was warmed to ambient temperature and stirred overnight. The reaction mixture was cooled to 0 °C, quenched with water (220 mL), and basified with 6 M $NaOH_{(aq)}$ to pH 9-10. The reaction mixture was stirred for 1 h and then vacuum filtered. The solids were rinsed sequentially with water and MTBE. The collected solid was suspended in DCM (500 mL) and stirred in a sonicating bath for 30 min and then vacuum filtered. The filtrate was retained, while the filter cake was taken up in water (300 mL) and extracted with DCM. The organic extracts, along with the retained DCM filtrate, were combined and dried over anhydrous Na_2SO_4, then filtered and concentrated *in vacuo* to provide the title compound (4.84 g, 86% yield). MS (apci), m/z = 256.9 (M+H).

[0312] Step 5: Preparation of 4-bromo-6-methoxypyrazolo[1,5-a]pyridine-3-carbaldehyde oxime. To a suspension of 4-bromo-6-methoxypyrazolo[1,5-a]pyridine-3-carbaldehyde (4.84 g, 19.0 mmol) in EtOH (253 mL) at ambient temperature was added water (127 mL) and hydroxylamine hydrochloride (1.98 g,

28.5 mmol). After stirring at 50 °C overnight, the reaction mixture was cooled to ambient temperature and concentrated *in vacuo.* The residue was suspended in water (150 mL) and then quenched slowly with saturated $NaHCO_{3(aq)}$ (30 mL). After stirring for 1 hour at ambient temperature the suspension was vacuum filtered and the filter cake rinsed sequentially with H_2O (500 mL) and MTBE (100 mL) to yield the title compound as a 2:1 E/Z mixture (5.13 g, quantitative yield), which was used in the next step without further purification. MS (apci) m/z = 271.9 (M+H).

[0313] Step 6: Preparation of .4-bromo-6-methoxypyrazolo[1,5-a]pyridine-3-carbonitrile The E/Z mixture of 4-bromo-6-methoxypyrazolo[1,5-a]pyridine-3-carbaldehyde oxime (4.95 g, 18.33 mmol) in acetic anhydride (172.9 mL, 1833 mmol) was stirred at 140 °C for 25 h, and then cooled to ambient temperature. The resulting suspension was further cooled in an ice bath for 15 min and then vacuum filtered and rinsed sequentially with water and MTBE to provide the title compound (3.74 g, 81% yield). ^1H NMR (d^6-DMSO) δ 8.70 (s, 1H), 8.60 (s, 1H), 7.78 (s, 1H), 3.83 (s, 3H).

[0314] Step 7: Preparation of 4-Bromo-6-hydroxypyrazolo[1,5-a]pyridine-3-carbonitrile: A slurry of 4-bromo-6-methoxypyrazolo[1,5-a]pyridine-3-carbonitrile (50.0 g, 198.4 mmol) in DCE (500 mL) was treated with $AlCl_3$ (79.34 g, 595.1 mmol). Under a $N_{2(g)}$ atmosphere, the resulting mixture was stirred 19 h at 76 °C, before cooling to room temperature. Using THF (1750 mL) as a rinse solvent, the reaction mixture was poured into a mechanically stirred suspension of sodium sulfate decahydrate (10 eq, 639 g) in THF (1000 mL). After stirring overnight at ambient temperature, the resulting suspension was filtered, and the solids were rinsed with additional THF (2 × 250 mL). The filtrate was concentrated *in vacuo,* and the resulting solid was dried under high vacuum for 3 days to afford the title compound (46.18 g, 98% yield) in sufficient purity for subsequent use. ^1H NMR (d^6-DMSO) δ 10.48 (s, 1H), 8.58 (s, 1H), 8.38 (d, 1H), 7.64 (3, 1H).

[0499] A mixture of 4-(6-(4-amino-4-methylpiperidin-1-yl)pyridin-3-yl)-6-(2-hydroxy-2-methylpropoxy)pyrazolo[1,5-a]pyridine-3-carbonitrile **(Intermediate P46;** 36 mg, 0.0856 mmol), benzoic acid (20.9 mg, 0.171 mmol) and HATU (35.8 mg, 0.0942 mmol) in DCM (856 µL) was treated with DIEA (74.8 µL, 0.428 mmol) and then stirred for 2 h at ambient temperature. The reaction mixture was concentrated *in vacuo.* The residue was suspended in 60:40 ACN:water containing 2% TFA, then filtered through a syringe filter. The filtrate was purified directly by C18 reverse phase chromatography (5-95% ACN in water with 0.1% TFA as the gradient eluent) to afford the title compound as the TFA salt. The TFA salt was treated with saturated $NaHCO_{3(aq)}$ and extracted with DCM. The combined organic extracts were washed with brine, then dried over anhydrous $Na_2SO_{4(s)}$, filtered and concentrated *in vacuo* to afford the title compound (33.2 mg, 74% yield). MS (apci) m/z = 525.25 (M+H).

Reactions were monitored for completion by LCMS, and reaction durations were adjusted accordingly. Title compounds were cleanly isolated following chromatographic purification using an appropriate gradient eluent (and if necessary converted to the free base).

To (3-cyano-6-(2-morpholinoethoxy)pyrazolo[1,5-a]pyridin-4-yl)boronic acid **(Intermediate P110,** 190 mg, 0.61mmol) and 5-bromo-2-iodopyrimidine (225mg, 0.789mmol) in dioxane (2 mL) was added XPhos (58 mg, 0.121 mmol), $Pd_2(dba)_3$ (3.3 mg, 0.03 mmol) and K_3PO_4 (2 M aq, 0.9 mL, 1.8 mmol). The reaction mixture was sparged with argon and heated at 85 °C overnight. After cooling to RT, the reaction was partitioned in 1:1 DCM:water (30 mL). After phase-separation, the aqueous was extracted with DCM (2 × 15 mL). The combined organic extracts were dried (Na_2SO_4), filtered and concentrated. The crude material was purified by silica chromatography (0-60% EtOAc/hexanes) to afford the title compound (30 mg, 14%).

[1132] Step 2: Preparation of 6-ethoxy-4-(5-(4-((5-methoxypyridin-2-yl)oxy)piperidin-1-yl)pyrimidin-2-yl)pyrazolo[1,5-a]pyridine-3-carbonitrile. A mixture of 4-(5-bromopyrimidin-2-yl)-6-ethoxypyrazolo[1,5-a]pyridine-3-carbonitrile (30 mg, 0.087 mmol), 5-methoxy-2-(piperidin-4-yloxy)pyridine (37 mg, 0.18mmol), Cs_2CO_3 (57 mg, 0.17 mmol), XPhos (4 mg, 0.0087 mmol) and $Pd_2(dba)_3$ (4 mg, 0.0044 mmol) in dioxane (0.44 mL) was sparged with argon, and stirred at 90 °C overnight. After cooling to RT, the reaction was partitioned in 1:1 DCM:water (20 mL). After phase-separation, the aqueous was extracted with DCM (2 × 10 mL). The combined organic extracts were dried (Na_2SO_4), filtered and concentrated. The crude material was purified by preparative TLC (10% MeOH in DCM) to afford the title product (1.4 mg, 3%). MS (apci) m/z = 472.2 (M+H).

[1137] A pressure vessel was charged with 6-(2-hydroxy-2-methylpropoxy)-4-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)pyrazolo[1,5-a]pyridine-3-carbonitrile **(P166** 76.0 mg, 0.213 mmol), 1-(5-chloropyrazin-2-yl)-4-((3-chloropyridin-2-yl)methyl)piperidin-4-ol **(R69,** 65.6 mg, 0.193 mmol), and K_3PO_4 (123 mg, 0.580 mmol), followed by 1,4-dioxane (1.5 mL) and water (0.2 mL). The reaction mixture was sparged with N_2 for 10 min before $Pd_2(dba)_3$ (8.85 mg, 0.00967 mmol) and XPhos (18.4 mg, 0.0387 mmol) were introduced. The reaction was sparged with N_2 for an additional 3 min before it was sealed and heated to 100°C for 3 d to reach ~79% conversion (LCMS). After cooling to RT, the reaction was diluted with 60/40 ACN:H_2O with 2% TFA and filtered through a Pall Acrodisc to remove solids. The filtrate was concentrated and purified by preparative HPLC (40-60% ACN/H_2O with 0.1% TFA). The combined fractions containing the product were concentrated, and the residue was taken up in MeOH and filtered through MP-HCO_3 resin. The filtrate was concentrated to yield the title product as yellow powder (2.0 mg, 1.9%). MS (apci)

m/z = 534.2 (M+H).

The reaction mixture was frozen at -78°C, and purged of air. The mixture was slowly warmed up to RT and stirred overnight. After diluting the reaction with H_2O, the mixture was extracted with EtOAc (3 x). The combined organic extracts were concentrated and purified by

preparative HPLC (20-80% ACN in H_2O with 0.1% TFA). The combined fractions containing the product were concentrated, dissolved in minimal amount of MeOH, and passed through PL-HCO3 resin. The filtrate was concentrated to afford the title product as a pale yellow solid (4.2 mg, 4%). MS (apci) m/z = 516.2 (M+H).

[1155] Step 1: Preparation of tert-butyl 3-(((4-(5-(4-(3-chloropicolinamido)-4-methylpiperidin-1-yl)pyrazin-2-yl)-3-cyanopyrazolo[1,5-a]pyridin-6-yl)oxy)methyl)-3-fluoroazetidine-1-carboxylate. A mixture of 3-chloropicolinic acid (24 mg, 0.15 mmol) and HATU (38 mg, 0.10 mmol) in DCM (2.5 mL) was treated with DIEA (88 µL, 0.50 mmol), then stirred for 30 min at RT before tert-butyl 3-(((4-(5-(4-amino-4-methylpiperidin-1-yl)pyrazm-2-yl)-3-cyanopyrazolo[1,5-a]pyridm-6-yl)oxy)methyl)-3-fluoroazetidme-1-carboxylate **(Intermediate P153;** 27 mg, 0.050 mmol) was added in one portion. After overnight stirring, the reaction was diluted with sat. NH_4Cl (aq) (2 mL) and passed through a Phase Separator frit. The filtrate was purified by silica chromatography (0-100% EtOAc in hexanes) to afford the title compound (34

mg, quantitative yield). LCMS m/z = 676.2 (M+H).

[1156] Step 2: Preparation of (R)-N-(4-benzyl-1-(5-(3-cyano-6-methoxypyrazolo[1,5-a]pyridin-4-yl)pyrazin-2-yl)piperidin-4-yl)-2,3-dihydroxypropanamide. A solution of tert-butyl 3-(((4-(5-(4-(3-chloropicolinamido)-4-methylpiperidin-1-yl)pyrazin-2-yl)-3-cyanopyrazolo[1,5-a]pyridin-6-yl)oxy)methyl)-3-fluoroazetidine-1-carboxylate (34 mg, 0.050 mmol) in DCM (2 mL) was treated with TFA (2 mL). The reaction was stirred for 20 min at ambient temperature before it was concentrated in vacuo and purified by silica chromatography (0-10% MeOH in DCM with 0.1% NH_4OH) to afford the title product (12 mg, 41%). MS (apci) m/z = 576.2 (M+H).

[1158] To a mixture of 3-chloropicolinic acid (15 mg, 0.096 mmol) and HATU (24 mg, 0.064 mmol) in DCM (1.6 mL) was added DIEA (56 µl, 0.32 mmol), then stirred for 30 min before 4-(5-(4-amino-4-methylpiperidin-1-yl)pyrazin-2-yl)-6-methoxypyrazolo[1,5-a]pyridine-3-carbonitrile bis(2,2,2-trifluoroacetate) **(Intermediate P174;** 20 mg, 0.032 mmol) was added in one portion. The reaction was stirred for 1 h at RT, then diluted with sat. NH_4Cl (aq) (2 mL) and passed through a Phase Separator frit. The organic filtrate was purified by silica chromatography (0-100% EtOAc in hexanes) to yield the title product as solid (14 mg, 87%). MS (apci) m/z = 503.2 (M+H).

[1159] The compounds in **Table X11** were prepared using a similar method as described in **Example 791,** replacing 3-chloropicolinic acid with the appropriate carboxylic acid.
